- 1 *Preconditions*: T meets the Cpp17CopyConstructible (Table 32) and Cpp17CopyAssignable (Table 34) requirements. In the range [first, last], binary_op neither modifies elements nor invalidates iterators or subranges.²²⁰
- 2 *Effects*: Computes its result by initializing the accumulator acc with the initial value init and then modifies it with acc = std::move(acc) + *i or acc = binary_op(std::move(acc), *i) for every iterator i in the range [first, last) in order.²²¹

27.10.4 Reduce

[reduce]

```
template<class InputIterator>
    constexpr typename iterator_traits<InputIterator>::value_type
        reduce(InputIterator first, InputIterator last);

1   Effects: Equivalent to:
        return reduce(first, last,
                      typename iterator_traits<InputIterator>::value_type{});

template<class ExecutionPolicy, class ForwardIterator>
    typename iterator_traits<ForwardIterator>::value_type
        reduce(ExecutionPolicy&& exec,
               ForwardIterator first, ForwardIterator last);

2   Effects: Equivalent to:
        return reduce(std::forward<ExecutionPolicy>(exec), first, last,
                      typename iterator_traits<ForwardIterator>::value_type{});

template<class InputIterator, class T>
    constexpr T reduce(InputIterator first, InputIterator last, T init);

3   Effects: Equivalent to:
        return reduce(first, last, init, plus<>());
```

²²⁰) The use of fully closed ranges is intentional.

²²¹) *accumulate* is similar to the APL reduction operator and Common Lisp reduce function, but it avoids the difficulty of defining the result of reduction on an empty sequence by always requiring an initial value.

```
template<class ExecutionPolicy, class ForwardIterator, class T>
T reduce(ExecutionPolicy&& exec,
         ForwardIterator first, ForwardIterator last, T init);
4   Effects: Equivalent to:
           return reduce(std::forward<ExecutionPolicy>(exec), first, last, init, plus<>());
```

```
template<class InputIterator, class T, class BinaryOperation>
constexpr T reduce(InputIterator first, InputIterator last, T init,
                  BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator, class T, class BinaryOperation>
T reduce(ExecutionPolicy&& exec,
         ForwardIterator first, ForwardIterator last, T init,
         BinaryOperation binary_op);
```

5 Mandates: All of

- (5.1) — `binary_op(init, *first)`,
- (5.2) — `binary_op(*first, init)`,
- (5.3) — `binary_op(init, init)`, and
- (5.4) — `binary_op(*first, *first)`

are convertible to `T`.

6 Preconditions:

- (6.1) — `T` meets the *Cpp17MoveConstructible* ([Table 31](#)) requirements.
- (6.2) — `binary_op` neither invalidates iterators or subranges, nor modifies elements in the range `[first, last]`.

7 Returns: `GENERALIZED_SUM(binary_op, init, *i, ...)` for every `i` in `[first, last]`.

8 Complexity: $\mathcal{O}(\text{last} - \text{first})$ applications of `binary_op`.

9 NOTE: The difference between `reduce` and `accumulate` is that `reduce` applies `binary_op` in an unspecified order, which yields a nondeterministic result for non-associative or non-commutative `binary_op` such as floating-point addition.

27.10.5 Inner product

[\[inner.product\]](#)

```
template<class InputIterator1, class InputIterator2, class T>
constexpr T inner_product(InputIterator1 first1, InputIterator1 last1,
                           InputIterator2 first2, T init);
template<class InputIterator1, class InputIterator2, class T,
         class BinaryOperation1, class BinaryOperation2>
constexpr T inner_product(InputIterator1 first1, InputIterator1 last1,
                           InputIterator2 first2, T init,
                           BinaryOperation1 binary_op1,
                           BinaryOperation2 binary_op2);
```

1 Preconditions: `T` meets the *Cpp17CopyConstructible* ([Table 32](#)) and *Cpp17CopyAssignable* ([Table 34](#)) requirements. In the ranges `[first1, last1]` and `[first2, first2 + (last1 - first1)]` `binary_op1` and `binary_op2` neither modifies elements nor invalidates iterators or subranges.²²²

2 Effects: Computes its result by initializing the accumulator `acc` with the initial value `init` and then modifying it with `acc = std::move(acc) + (*i1) * (*i2)` or `acc = binary_op1(std::move(acc), binary_op2(*i1, *i2))` for every iterator `i1` in the range `[first1, last1]` and iterator `i2` in the range `[first2, first2 + (last1 - first1)]` in order.

27.10.6 Transform reduce

[\[transform.reduce\]](#)

```
template<class InputIterator1, class InputIterator2, class T>
constexpr T transform_reduce(InputIterator1 first1, InputIterator1 last1,
                            InputIterator2 first2,
                            T init);
```

1 Effects: Equivalent to:

²²²) The use of fully closed ranges is intentional.

```

        return transform_reduce(first1, last1, first2, init, plus<>(), multiplies<>());

template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class T>
T transform_reduce(ExecutionPolicy&& exec,
                  ForwardIterator1 first1, ForwardIterator1 last1,
                  ForwardIterator2 first2,
                  T init);

```

2 *Effects:* Equivalent to:

```

        return transform_reduce(std::forward<ExecutionPolicy>(exec),
                               first1, last1, first2, init, plus<>(), multiplies<>());

```

```

template<class InputIterator1, class InputIterator2, class T,
         class BinaryOperation1, class BinaryOperation2>
constexpr T transform_reduce(InputIterator1 first1, InputIterator1 last1,
                            InputIterator2 first2,
                            T init,
                            BinaryOperation1 binary_op1,
                            BinaryOperation2 binary_op2);

```

```

template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class T,
         class BinaryOperation1, class BinaryOperation2>
T transform_reduce(ExecutionPolicy&& exec,
                  ForwardIterator1 first1, ForwardIterator1 last1,
                  ForwardIterator2 first2,
                  T init,
                  BinaryOperation1 binary_op1,
                  BinaryOperation2 binary_op2);

```

3 *Mandates:* All of

- (3.1) — `binary_op1(init, init)`,
- (3.2) — `binary_op1(init, binary_op2(*first1, *first2))`,
- (3.3) — `binary_op1(binary_op2(*first1, *first2), init)`, and
- (3.4) — `binary_op1(binary_op2(*first1, *first2), binary_op2(*first1, *first2))`

are convertible to `T`.

4 *Preconditions:*

- (4.1) — `T` meets the *Cpp17MoveConstructible* ([Table 31](#)) requirements.
- (4.2) — Neither `binary_op1` nor `binary_op2` invalidates subranges, nor modifies elements in the ranges $[first1, last1]$ and $[first2, first2 + (last1 - first1)]$.

5 *Returns:*

`GENERALIZED_SUM(binary_op1, init, binary_op2(*i, *(first2 + (i - first1))), ...)`

for every iterator `i` in $[first1, last1]$.

6 *Complexity:* $\mathcal{O}(last1 - first1)$ applications each of `binary_op1` and `binary_op2`.

```

template<class InputIterator, class T,
         class BinaryOperation, class UnaryOperation>
constexpr T transform_reduce(InputIterator first, InputIterator last, T init,
                           BinaryOperation binary_op, UnaryOperation unary_op);

template<class ExecutionPolicy,
         class ForwardIterator, class T,
         class BinaryOperation, class UnaryOperation>
T transform_reduce(ExecutionPolicy&& exec,
                  ForwardIterator first, ForwardIterator last,
                  T init, BinaryOperation binary_op, UnaryOperation unary_op);

```

7 *Mandates:* All of

- (7.1) — `binary_op(init, init)`,
- (7.2) — `binary_op(init, unary_op(*first))`,

(7.3) — `binary_op(unary_op(*first), init)`, and
 (7.4) — `binary_op(unary_op(*first), unary_op(*first))`
 are convertible to T.

8 *Preconditions:*

- (8.1) — T meets the *Cpp17MoveConstructible* ([Table 31](#)) requirements.
 (8.2) — Neither `unary_op` nor `binary_op` invalidates subranges, nor modifies elements in the range `[first, last]`.

9 *Returns:*

`GENERALIZED_SUM(binary_op, init, unary_op(*i), ...)`

for every iterator i in `[first, last]`.

10 *Complexity:* $\mathcal{O}(\text{last} - \text{first})$ applications each of `unary_op` and `binary_op`.

11 *NOTE:* `transform_reduce` does not apply `unary_op` to `init`.

27.10.7 Partial sum

[[partial.sum](#)]

```
template<class InputIterator, class OutputIterator>
constexpr OutputIterator
partial_sum(InputIterator first, InputIterator last,
            OutputIterator result);
template<class InputIterator, class OutputIterator, class BinaryOperation>
constexpr OutputIterator
partial_sum(InputIterator first, InputIterator last,
            OutputIterator result, BinaryOperation binary_op);
```

1 *Mandates:* InputIterator's value type is constructible from `*first`. The result of the expression `std::move(acc) + *i` or `binary_op(std::move(acc), *i)` is implicitly convertible to InputIterator's value type. acc is writable ([25.3.1](#)) to result.

2 *Preconditions:* In the ranges `[first, last]` and `[result, result + (last - first)]` `binary_op` neither modifies elements nor invalidates iterators or subranges.²²³

3 *Effects:* For a non-empty range, the function creates an accumulator acc whose type is InputIterator's value type, initializes it with `*first`, and assigns the result to `*result`. For every iterator i in `[first + 1, last)` in order, acc is then modified by `acc = std::move(acc) + *i` or `acc = binary_op(std::move(acc), *i)` and the result is assigned to `*(result + (i - first))`.

4 *Returns:* `result + (last - first)`.

5 *Complexity:* Exactly $(\text{last} - \text{first}) - 1$ applications of the binary operation.

6 *Remarks:* `result` may be equal to `first`.

27.10.8 Exclusive scan

[[exclusive.scan](#)]

```
template<class InputIterator, class OutputIterator, class T>
constexpr OutputIterator
exclusive_scan(InputIterator first, InputIterator last,
              OutputIterator result, T init);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class T>
ForwardIterator2
exclusive_scan(ExecutionPolicy&& exec,
              ForwardIterator1 first, ForwardIterator1 last,
              ForwardIterator2 result, T init);

1     Effects: Equivalent to:  

        return exclusive_scan(first, last, result, init, plus<>());  

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class T>
ForwardIterator2
exclusive_scan(ExecutionPolicy&& exec,
              ForwardIterator1 first, ForwardIterator1 last,
              ForwardIterator2 result, T init);

2     Effects: Equivalent to:  

        return exclusive_scan(std::forward<ExecutionPolicy>(exec),
                           first, last, result, init, plus<>());
```

²²³⁾ The use of fully closed ranges is intentional.

```

template<class InputIterator, class OutputIterator, class T, class BinaryOperation>
constexpr OutputIterator
exclusive_scan(InputIterator first, InputIterator last,
              OutputIterator result, T init, BinaryOperation binary_op);
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class T, class BinaryOperation>
ForwardIterator2
exclusive_scan(ExecutionPolicy&& exec,
               ForwardIterator1 first, ForwardIterator1 last,
               ForwardIterator2 result, T init, BinaryOperation binary_op);

3   Mandates: All of
(3.1)   — binary_op(init, init),
(3.2)   — binary_op(init, *first), and
(3.3)   — binary_op(*first, *first)

are convertible to T.
4   Preconditions:
(4.1)   — T meets the Cpp17MoveConstructible (Table 31) requirements.
(4.2)   — binary_op neither invalidates iterators or subranges, nor modifies elements in the ranges [first, last] or [result, result + (last - first)].
5   Effects: For each integer K in [0, last - first] assigns through result + K the value of:
    GENERALIZED_NONCOMMUTATIVE_SUM(  

        binary_op, init, *(first + 0), *(first + 1), ..., *(first + K - 1))
6   Returns: The end of the resulting range beginning at result.
7   Complexity:  $\mathcal{O}(\text{last} - \text{first})$  applications of binary_op.
8   Remarks: result may be equal to first.
9   NOTE: The difference between exclusive_scan and inclusive_scan is that exclusive_scan excludes the  $i^{\text{th}}$  input element from the  $i^{\text{th}}$  sum. If binary_op is not mathematically associative, the behavior of exclusive_scan can be nondeterministic.

```

27.10.9 Inclusive scan

[inclusive.scan]

```

template<class InputIterator, class OutputIterator>
constexpr OutputIterator
inclusive_scan(InputIterator first, InputIterator last,
               OutputIterator result);

1   Effects: Equivalent to:
    return inclusive_scan(first, last, result, plus<>());

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
inclusive_scan(ExecutionPolicy&& exec,
               ForwardIterator1 first, ForwardIterator1 last,
               ForwardIterator2 result);

2   Effects: Equivalent to:
    return inclusive_scan(std::forward<ExecutionPolicy>(exec), first, last, result, plus<>());

template<class InputIterator, class OutputIterator, class BinaryOperation>
constexpr OutputIterator
inclusive_scan(InputIterator first, InputIterator last,
               OutputIterator result, BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryOperation>
ForwardIterator2
inclusive_scan(ExecutionPolicy&& exec,
               ForwardIterator1 first, ForwardIterator1 last,
               ForwardIterator2 result, BinaryOperation binary_op);

```

```

template<class InputIterator, class OutputIterator, class BinaryOperation, class T>
constexpr OutputIterator
inclusive_scan(InputIterator first, InputIterator last,
               OutputIterator result, BinaryOperation binary_op, T init);
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class BinaryOperation, class T>
ForwardIterator2
inclusive_scan(ExecutionPolicy&& exec,
               ForwardIterator1 first, ForwardIterator1 last,
               ForwardIterator2 result, BinaryOperation binary_op, T init);

```

3 Let U be the value type of `decltype(first)`.

4 *Mandates*: If `init` is provided, all of

- (4.1) — `binary_op(init, init)`,
- (4.2) — `binary_op(init, *first)`, and
- (4.3) — `binary_op(*first, *first)`

are convertible to `T`; otherwise, `binary_op(*first, *first)` is convertible to `U`.

5 *Preconditions*:

- (5.1) — If `init` is provided, `T` meets the *Cpp17MoveConstructible* ([Table 31](#)) requirements; otherwise, `U` meets the *Cpp17MoveConstructible* requirements.
- (5.2) — `binary_op` neither invalidates iterators or subranges, nor modifies elements in the ranges `[first, last]` or `[result, result + (last - first)]`.

6 *Effects*: For each integer K in `[0, last - first]` assigns through `result + K` the value of

- (6.1) — *GENERALIZED_NONCOMMUTATIVE_SUM*

$$\text{binary_op, init, } *(\text{first} + 0), *(\text{first} + 1), \dots, *(\text{first} + K)$$
if `init` is provided, or
- (6.2) — *GENERALIZED_NONCOMMUTATIVE_SUM*

$$\text{binary_op, } *(\text{first} + 0), *(\text{first} + 1), \dots, *(\text{first} + K)$$
otherwise.

7 *Returns*: The end of the resulting range beginning at `result`.

8 *Complexity*: $\mathcal{O}(last - first)$ applications of `binary_op`.

9 *Remarks*: `result` may be equal to `first`.

10 NOTE: The difference between `exclusive_scan` and `inclusive_scan` is that `inclusive_scan` includes the i^{th} input element in the i^{th} sum. If `binary_op` is not mathematically associative, the behavior of `inclusive_scan` can be nondeterministic.

27.10.10 Transform exclusive scan

[`transform.exclusive.scan`]

```

template<class InputIterator, class OutputIterator, class T,
         class BinaryOperation, class UnaryOperation>
constexpr OutputIterator
transform_exclusive_scan(InputIterator first, InputIterator last,
                        OutputIterator result, T init,
                        BinaryOperation binary_op, UnaryOperation unary_op);
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class T,
         class BinaryOperation, class UnaryOperation>
ForwardIterator2
transform_exclusive_scan(ExecutionPolicy&& exec,
                        ForwardIterator1 first, ForwardIterator1 last,
                        ForwardIterator2 result, T init,
                        BinaryOperation binary_op, UnaryOperation unary_op);

```

1 *Mandates*: All of

- (1.1) — `binary_op(init, init)`,
- (1.2) — `binary_op(init, unary_op(*first))`, and

- (1.3) — `binary_op(unary_op(*first), unary_op(*first))`
 are convertible to T.
- 2 *Preconditions:*
- (2.1) — T meets the *Cpp17MoveConstructible* ([Table 31](#)) requirements.
 - (2.2) — Neither `unary_op` nor `binary_op` invalidates iterators or subranges, nor modifies elements in the ranges `[first, last]` or `[result, result + (last - first)]`.
- 3 *Effects:* For each integer K in $[0, \text{last} - \text{first}]$ assigns through `result + K` the value of:
`GENERALIZED_NONCOMMUTATIVE_SUM(`
 `binary_op, init,`
 `unary_op(*(first + 0)), unary_op(*(first + 1)), ..., unary_op(*(first + K - 1)))`
- 4 *Returns:* The end of the resulting range beginning at `result`.
- 5 *Complexity:* $\mathcal{O}(\text{last} - \text{first})$ applications each of `unary_op` and `binary_op`.
- 6 *Remarks:* `result` may be equal to `first`.
- 7 NOTE: The difference between `transform_exclusive_scan` and `transform_inclusive_scan` is that `transform_exclusive_scan` excludes the i^{th} input element from the i^{th} sum. If `binary_op` is not mathematically associative, the behavior of `transform_exclusive_scan` can be nondeterministic. `transform_exclusive_scan` does not apply `unary_op` to `init`.

27.10.11 Transform inclusive scan

[`transform.inclusive.scan`]

```
template<class InputIterator, class OutputIterator,
         class BinaryOperation, class UnaryOperation>
constexpr OutputIterator
  transform_inclusive_scan(InputIterator first, InputIterator last,
                           OutputIterator result,
                           BinaryOperation binary_op, UnaryOperation unary_op);

template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2,
         class BinaryOperation, class UnaryOperation>
ForwardIterator2
  transform_inclusive_scan(ExecutionPolicy&& exec,
                           ForwardIterator1 first, ForwardIterator1 last,
                           ForwardIterator2 result,
                           BinaryOperation binary_op, UnaryOperation unary_op);

template<class InputIterator, class OutputIterator,
         class BinaryOperation, class UnaryOperation, class T>
constexpr OutputIterator
  transform_inclusive_scan(InputIterator first, InputIterator last,
                           OutputIterator result,
                           BinaryOperation binary_op, UnaryOperation unary_op,
                           T init);

template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2,
         class BinaryOperation, class UnaryOperation, class T>
ForwardIterator2
  transform_inclusive_scan(ExecutionPolicy&& exec,
                           ForwardIterator1 first, ForwardIterator1 last,
                           ForwardIterator2 result,
                           BinaryOperation binary_op, UnaryOperation unary_op,
                           T init);
```

1 Let U be the value type of `decltype(first)`.

2 *Mandates:* If `init` is provided, all of

- (2.1) — `binary_op(init, init)`,
- (2.2) — `binary_op(init, unary_op(*first))`, and
- (2.3) — `binary_op(unary_op(*first), unary_op(*first))`

are convertible to T; otherwise, `binary_op(unary_op(*first), unary_op(*first))` is convertible to U.

3 *Preconditions:*

(3.1) — If `init` is provided, T meets the *Cpp17MoveConstructible* ([Table 31](#)) requirements; otherwise, U meets the *Cpp17MoveConstructible* requirements.

(3.2) — Neither `unary_op` nor `binary_op` invalidates iterators or subranges, nor modifies elements in the ranges `[first, last]` or `[result, result + (last - first)]`.

4 *Effects:* For each integer K in $[0, \text{last} - \text{first}]$ assigns through `result + K` the value of

(4.1) — `GENERALIZED_NONCOMMUTATIVE_SUM`

`binary_op, init,`

`unary_op(*(first + 0)), unary_op(*(first + 1)), …, unary_op(*(first + K))`
 if `init` is provided, or

(4.2) — `GENERALIZED_NONCOMMUTATIVE_SUM`

`binary_op,`

`unary_op(*(first + 0)), unary_op(*(first + 1)), …, unary_op(*(first + K))`
 otherwise.

5 *Returns:* The end of the resulting range beginning at `result`.

6 *Complexity:* $\mathcal{O}(\text{last} - \text{first})$ applications each of `unary_op` and `binary_op`.

7 *Remarks:* `result` may be equal to `first`.

8 NOTE: The difference between `transform_exclusive_scan` and `transform_inclusive_scan` is that `transform_inclusive_scan` includes the i^{th} input element in the i^{th} sum. If `binary_op` is not mathematically associative, the behavior of `transform_inclusive_scan` can be nondeterministic. `transform_inclusive_scan` does not apply `unary_op` to `init`.

27.10.12 Adjacent difference

[adjacent.difference]

```
template<class InputIterator, class OutputIterator>
constexpr OutputIterator
adjacent_difference(InputIterator first, InputIterator last,
                   OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
adjacent_difference(ExecutionPolicy&& exec,
                    ForwardIterator1 first, ForwardIterator1 last, ForwardIterator2 result);

template<class InputIterator, class OutputIterator, class BinaryOperation>
constexpr OutputIterator
adjacent_difference(InputIterator first, InputIterator last,
                   OutputIterator result, BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryOperation>
ForwardIterator2
adjacent_difference(ExecutionPolicy&& exec,
                    ForwardIterator1 first, ForwardIterator1 last,
                    ForwardIterator2 result, BinaryOperation binary_op);
```

1 Let T be the value type of `decltype(first)`. For the overloads that do not take an argument `binary_op`, let `binary_op` be an lvalue that denotes an object of type `minus<>`.

2 *Mandates:*

(2.1) — For the overloads with no `ExecutionPolicy`, T is constructible from `*first`. `acc` (defined below) is writable ([25.3.1](#)) to the `result` output iterator. The result of the expression `binary_op(val, std::move(acc))` is writable to `result`.

(2.2) — For the overloads with an `ExecutionPolicy`, the result of the expressions `binary_op(*first, *first)` and `*first` are writable to `result`.

3 *Preconditions:*

- (3.1) — For the overloads with no `ExecutionPolicy`, `T` meets the `Cpp17MoveAssignable` ([Table 33](#)) requirements.
- (3.2) — For all overloads, in the ranges `[first, last]` and `[result, result + (last - first)]`, `binary_-op` neither modifies elements nor invalidates iterators or subranges.²²⁴
- 4 *Effects:* For the overloads with no `ExecutionPolicy` and a non-empty range, the function creates an accumulator `acc` of type `T`, initializes it with `*first`, and assigns the result to `*result`. For every iterator `i` in `[first + 1, last)` in order, creates an object `val` whose type is `T`, initializes it with `*i`, computes `binary_op(val, std::move(acc))`, assigns the result to `*(result + (i - first))`, and move assigns from `val` to `acc`.
- 5 For the overloads with an `ExecutionPolicy` and a non-empty range, performs `*result = *first`. Then, for every `d` in `[1, last - first - 1]`, performs `*(result + d) = binary_op(*(first + d), *(first + (d - 1)))`.
- 6 *Returns:* `result + (last - first)`.
- 7 *Complexity:* Exactly `(last - first) - 1` applications of the binary operation.
- 8 *Remarks:* For the overloads with no `ExecutionPolicy`, `result` may be equal to `first`. For the overloads with an `ExecutionPolicy`, the ranges `[first, last)` and `[result, result + (last - first)]` shall not overlap.

27.10.13 Iota

[`numeric.iota`]

```
template<class ForwardIterator, class T>
constexpr void iota(ForwardIterator first, ForwardIterator last, T value);
```

1 *Mandates:* `T` is convertible to `ForwardIterator`'s value type. The expression `++val`, where `val` has type `T`, is well-formed.

2 *Effects:* For each element referred to by the iterator `i` in the range `[first, last)`, assigns `*i = value` and increments `value` as if by `++value`.

3 *Complexity:* Exactly `last - first` increments and assignments.

```
template<input_or_output_iterator O, sentinel_for<O> S, weakly_incrementable T>
    requires indirectly_writable<O, const T&>
    constexpr ranges::iota_result<O, T> ranges::iota(O first, S last, T value);
template<weakly_incrementable T, output_range<const T&> R>
    constexpr ranges::iota_result<borrowed_iterator_t<R>, T> ranges::iota(R&& r, T value);
```

4 *Effects:* Equivalent to:

```
while (first != last) {
    *first = as_const(value);
    ++first;
    ++value;
}
return {std::move(first), std::move(value)};
```

27.10.14 Greatest common divisor

[`numeric.ops.gcd`]

```
template<class M, class N>
constexpr common_type_t<M, N> gcd(M m, N n);
```

1 *Mandates:* `M` and `N` both are integer types other than `cv bool`.

2 *Preconditions:* $|m|$ and $|n|$ are representable as a value of `common_type_t<M, N>`.

NOTE: These requirements ensure, for example, that $\gcd(m, m) = |m|$ is representable as a value of type `M`.

3 *Returns:* Zero when `m` and `n` are both zero. Otherwise, returns the greatest common divisor of $|m|$ and $|n|$.

4 *Throws:* Nothing.

²²⁴ The use of fully closed ranges is intentional.

27.10.15 Least common multiple

[numeric.ops.lcm]

```
template<class M, class N>
constexpr common_type_t<M, N> lcm(M m, N n);
```

Mandates: M and N both are integer types other than cv bool.

Preconditions: |m| and |n| are representable as a value of common_type_t<M, N>. The least common multiple of |m| and |n| is representable as a value of type common_type_t<M, N>.

Returns: Zero when either m or n is zero. Otherwise, returns the least common multiple of |m| and |n|.

Throws: Nothing.

27.10.16 Midpoint

[numeric.ops.midpoint]

```
template<class T>
constexpr T midpoint(T a, T b) noexcept;
```

Constraints: T is an arithmetic type other than bool.

Returns: Half the sum of a and b. If T is an integer type and the sum is odd, the result is rounded towards a.

Remarks: No overflow occurs. If T is a floating-point type, at most one inexact operation occurs.

```
template<class T>
constexpr T* midpoint(T* a, T* b);
```

Constraints: T is an object type.

Mandates: T is a complete type.

Preconditions: a and b point to, respectively, elements i and j of the same array object x.

NOTE: As specified in 6.8.4, an object that is not an array element is considered to belong to a single-element array for this purpose and a pointer past the last element of an array of n elements is considered to be equivalent to a pointer to a hypothetical array element n for this purpose.

Returns: A pointer to array element $i + \frac{j-i}{2}$ of x, where the result of the division is truncated towards zero.

27.11 Specialized <memory> algorithms

[specialized.algorithms]

27.11.1 General

[specialized.algorithms.general]

- 1 The contents specified in 27.11 are declared in the header <memory> (20.2.2).
- 2 Unless otherwise specified, if an exception is thrown in the following algorithms, objects constructed by a placement new-expression (7.6.2.8) are destroyed in an unspecified order before allowing the exception to propagate.
- 3 Some algorithms specified in 27.11 make use of the exposition-only function voidify:

```
template<class T>
constexpr void* voidify(T& obj) noexcept {
    return addressof(obj);
}
```

27.11.2 Special memory concepts

[special.mem.concepts]

- 1 Some algorithms in this subclause are constrained with the following exposition-only concepts:

```
template<class I>
concept nothrow_input_iterator = // exposition only
    input_iterator<I> &&
    is_lvalue_reference_v<iter_reference_t<I>> &&
    same_as<remove_cvref_t<iter_reference_t<I>>, iter_value_t<I>>;
```

- 2 A type I models nothrow_input_iterator only if no exceptions are thrown from increment, copy construction, move construction, copy assignment, move assignment, or indirection through valid iterators.
- 3 NOTE 1: This concept allows some input_iterator (25.3.4.9) operations to throw exceptions.

```
template<class S, class I>
concept nothrow-sentinel-for = sentinel_for<S, I>; // exposition only
```

4 Types S and I model *nothrow-sentinel-for* only if no exceptions are thrown from copy construction, move construction, copy assignment, move assignment, or comparisons between valid values of type I and S.

5 NOTE 2: This concept allows some *sentinel_for* (25.3.4.7) operations to throw exceptions.

```
template<class R>
concept nothrow-input-range = // exposition only
    range<R> &&
    nothrow-input-iterator<iterator_t<R>> &&
    nothrow-sentinel-for<sentinel_t<R>, iterator_t<R>>;
```

6 A type R models *nothrow-input-range* only if no exceptions are thrown from calls to ranges::begin and ranges::end on an object of type R.

```
template<class I>
concept nothrow-forward-iterator = // exposition only
    nothrow-input-iterator<I> &&
    forward_iterator<I> &&
    nothrow-sentinel-for<I, I>;
```

7 NOTE 3: This concept allows some *forward_iterator* (25.3.4.11) operations to throw exceptions.

```
template<class R>
concept nothrow-forward-range = // exposition only
    nothrow-input-range<R> &&
    nothrow-forward-iterator<iterator_t<R>>;
```

27.11.3 uninitialized_default_construct [uninitialized.construct.default]

```
template<class NoThrowForwardIterator>
void uninitialized_default_construct(NoThrowForwardIterator first, NoThrowForwardIterator last);
```

1 *Effects*: Equivalent to:

```
for (; first != last; ++first)
    ::new (voidify(*first))
        typename iterator_traits<NoThrowForwardIterator>::value_type;
```

```
namespace ranges {
    template<nothrow-forward-iterator I, nothrow_sentinel_for<I> S>
        requires default_initializable<iter_value_t<I>>
        I uninitialized_default_construct(I first, S last);
    template<nothrow-forward-range R>
        requires default_initializable<range_value_t<R>>
        borrowed_iterator_t<R> uninitialized_default_construct(R&& r);
}
```

2 *Effects*: Equivalent to:

```
for (; first != last; ++first)
    ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>;
    return first;
```

```
template<class NoThrowForwardIterator, class Size>
NoThrowForwardIterator uninitialized_default_construct_n(NoThrowForwardIterator first, Size n);
```

3 *Effects*: Equivalent to:

```
for (; n > 0; (void)++first, --n)
    ::new (voidify(*first))
        typename iterator_traits<NoThrowForwardIterator>::value_type;
    return first;
```

```
namespace ranges {
    template<nothrow-forward-iterator I>
        requires default_initializable<iter_value_t<I>>
        I uninitialized_default_construct_n(I first, iter_difference_t<I> n);
```

}

4 Effects: Equivalent to

27.11.4 uninitialized value construct

[uninitialized.construct.value]

```
template<class NoThrowForwardIterator>
void uninitialized_value_construct(NoThrowForwardIterator first, NoThrowForwardIterator last);
```

1 Effects: Equivalent to

```
for ( ; first != last; ++first)
    ::new (voidify(*first))
        typename iterator_traits<NoThrowForwardIterator>::value_type();
```

```
namespace ranges {  
    template<nothrow-forward-iterator I, nothrow-sentinel-for<I> S>  
        requires default_initializable<iter_value_t<I>>  
        I uninitialized_value_construct(I first, S last);  
    template<nothrow-forward-range R>  
        requires default_initializable<range_value_t<R>>  
        borrowed_iterator_t<R> uninitialized_value_construct(R&& r);
```

```
for ( ; first != last; ++first)
    ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>()
```

```
template<class NoThrowForwardIterator, class Size>
    NoThrowForwardIterator uninitialized_value_construct_n(NoThrowForwardIterator first, Size n);
```

3 Effects: Equivalent to

```
for (; n > 0; (void)++first, --n)
    ::new (voidify(*first))
        typename iterator_traits<NoThrowForwardIterator>::value_type();
return first;
```

```
namespace ranges {
    template<nothrow_forward_iterator I>
    requires default_initializable<iter_value_t<I>>
    I uninitialized_value_construct_n(I first, iter_difference_t<I> n);
}
```

4 Effects: Equivalent to

27.11.5 uninitialized copy

[uninitialized, copy]

¹ *Preconditions:* `result + [0 .. (last - first))` does not overlap with `[first .. last)`

² Effects: Equivalent to

```
for ( ; first != last; ++result, (void) ++first)
    ::new (voidify(*result))
    typename iterator_traits<NoThrowForwardIterator>::value_type(*first);
```

3 *Returns: results*

```

namespace ranges {
    template<input_iterator I, sentinel_for<I> S1,
              nothrow_forward_iterator O, nothrow_sentinel_for<O> S2>
        requires constructible_from<iter_value_t<O>, iter_reference_t<I>>
        uninitialized_copy_result<I, O>
            uninitialized_copy(I ifirst, S1 ilast, O ofirst, S2 olast);
    template<input_range IR, nothrow_forward_range OR>
        requires constructible_from<range_value_t<OR>, range_reference_t<IR>>
        uninitialized_copy_result<borrowed_iterator_t<IR>, borrowed_iterator_t<OR>>
            uninitialized_copy(IR&& in_range, OR&& out_range);
}

```

4 *Preconditions:* [ofirst, olast) does not overlap with [ifirst, ilast).

5 *Effects:* Equivalent to:

```

        for ( ; ifirst != ilast && ofirst != olast; ++ofirst, (void)++ifirst)
            ::new (voidify(*ofirst)) remove_reference_t<iter_reference_t<O>>(*ifirst);
        return {std::move(ifirst), ofirst};

```

```

template<class InputIterator, class Size, class NoThrowForwardIterator>
NoThrowForwardIterator uninitialized_copy_n(InputIterator first, Size n,
                                             NoThrowForwardIterator result);

```

6 *Preconditions:* result + [0, n) does not overlap with first + [0, n).

7 *Effects:* Equivalent to:

```

        for ( ; n > 0; ++result, (void) ++first, --n)
            ::new (voidify(*result))
                typename iterator_traits<NoThrowForwardIterator>::value_type(*first);

```

8 *Returns:* result.

```

namespace ranges {
    template<input_iterator I, nothrow_forward_iterator O, nothrow_sentinel_for<O> S>
        requires constructible_from<iter_value_t<O>, iter_reference_t<I>>
        uninitialized_copy_n_result<I, O>
            uninitialized_copy_n(I ifirst, iter_difference_t<I> n, O ofirst, S olast);
}

```

9 *Preconditions:* [ofirst, olast) does not overlap with ifirst + [0, n).

10 *Effects:* Equivalent to:

```

        auto t = uninitialized_copy(counted_iterator(std::move(ifirst), n),
                                    default_sentinel, ofirst, olast);
        return {std::move(t.in).base(), t.out};

```

27.11.6 uninitialized_move

[uninitialized.move]

```

template<class InputIterator, class NoThrowForwardIterator>
NoThrowForwardIterator uninitialized_move(InputIterator first, InputIterator last,
                                         NoThrowForwardIterator result);

```

1 *Preconditions:* result + [0, (last - first)) does not overlap with [first, last).

2 *Effects:* Equivalent to:

```

        for ( ; first != last; (void)++result, ++first)
            ::new (voidify(*result))
                typename iterator_traits<NoThrowForwardIterator>::value_type(std::move(*first));
        return result;

```

```

namespace ranges {
    template<input_iterator I, sentinel_for<I> S1,
              nothrow_forward_iterator O, nothrow_sentinel_for<O> S2>
        requires constructible_from<iter_value_t<O>, iter_rvalue_reference_t<I>>
        uninitialized_move_result<I, O>
            uninitialized_move(I ifirst, S1 ilast, O ofirst, S2 olast);
}

```

```

template<input_range IR, nothrow-forward-range OR>
    requires constructible_from<range_value_t<OR>, range_rvalue_reference_t<IR>>
    uninitialized_move_result<borrowed_iterator_t<IR>, borrowed_iterator_t<OR>>
        uninitialized_move(IR&& in_range, OR&& out_range);
}

3   Preconditions: [ofirst,olast) does not overlap with [ifirst,ilast).
4   Effects: Equivalent to:
    for (; ifirst != ilast && ofirst != olast; ++ofirst, (void)++ifirst)
        ::new (voidify(*ofirst))
            remove_reference_t<iter_reference_t<0>>(ranges::iter_move(ifirst));
    return {std::move(ifirst), ofirst};

5   NOTE 1: If an exception is thrown, some objects in the range [ifirst,ilast) are left in a valid, but unspecified
state.

template<class InputIterator, class Size, class NoThrowForwardIterator>
pair<InputIterator, NoThrowForwardIterator>
    uninitialized_move_n(InputIterator first, Size n, NoThrowForwardIterator result);
6   Preconditions: result + [0, n) does not overlap with first + [0, n].
7   Effects: Equivalent to:
    for (; n > 0; ++result, (void) ++first, --n)
        ::new (voidify(*result))
            typename iterator_traits<NoThrowForwardIterator>::value_type(std::move(*first));
    return {first, result};

namespace ranges {
    template<input_iterator I, nothrow-forward-iterator O, nothrow-sentinel-for<O> S>
        requires constructible_from<iter_value_t<0>, iter_rvalue_reference_t<I>>
        uninitialized_move_n(I ifirst, iter_difference_t<I> n, O ofirst, S olast);
}
8   Preconditions: [ofirst,olast) does not overlap with ifirst + [0, n).
9   Effects: Equivalent to:
    auto t = uninitialized_move(counted_iterator(std::move(ifirst), n),
                                default_sentinel, ofirst, olast);
    return {std::move(t.in).base(), t.out};

10  NOTE 2: If an exception is thrown, some objects in the range ifirst + [0, n) are left in a valid but unspecified
state.

```

27.11.7 uninitialized_fill

[uninitialized.fill]

```

template<class NoThrowForwardIterator, class T>
void uninitialized_fill(NoThrowForwardIterator first, NoThrowForwardIterator last, const T& x);

1   Effects: Equivalent to:
    for (; first != last; ++first)
        ::new (voidify(*first))
            typename iterator_traits<NoThrowForwardIterator>::value_type(x);

namespace ranges {
    template<nothrow-forward-iterator I, nothrow-sentinel-for<I> S, class T>
        requires constructible_from<iter_value_t<I>, const T&>
        I uninitialized_fill(I first, S last, const T& x);
    template<nothrow-forward-range R, class T>
        requires constructible_from<range_value_t<R>, const T&>
        borrowed_iterator_t<R> uninitialized_fill(R&& r, const T& x);
}
2   Effects: Equivalent to:
    for (; first != last; ++first)
        ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>(x);

```

```

    return first;

template<class NoThrowForwardIterator, class Size, class T>
NoThrowForwardIterator uninitialized_fill_n(NoThrowForwardIterator first, Size n, const T& x);

3   Effects: Equivalent to:
    for ( ; n--; ++first)
        ::new (voidify(*first))
            typename iterator_traits<NoThrowForwardIterator>::value_type(x);
    return first;

namespace ranges {
    template<nothrow_forward_iterator I, class T>
    requires constructible_from<iter_value_t<I>, const T&>
    I uninitialized_fill_n(I first, iter_difference_t<I> n, const T& x);
}

4   Effects: Equivalent to:
    return uninitialized_fill(counted_iterator(first, n), default_sentinel, x).base();

```

27.11.8 construct_at**[specialized.construct]**

```

template<class T, class... Args>
constexpr T* construct_at(T* location, Args&&... args);

namespace ranges {
    template<class T, class... Args>
    constexpr T* construct_at(T* location, Args&&... args);
}

```

1 Constraints: The expression ::new (declval<void*>()) T(declval<Args>()...) is well-formed when treated as an unevaluated operand ([7.2.3](#)).

2 Effects: Equivalent to:

```
    return ::new (voidify(*location)) T(std::forward<Args>(args)...);
```

27.11.9 destroy**[specialized.destroy]**

```

template<class T>
constexpr void destroy_at(T* location);
namespace ranges {
    template<destructible T>
    constexpr void destroy_at(T* location) noexcept;
}

```

1 Effects:

- (1.1) — If T is an array type, equivalent to `destroy(begin(*location), end(*location))`.
- (1.2) — Otherwise, equivalent to `location->~T()`.

```

template<class NoThrowForwardIterator>
constexpr void destroy(NoThrowForwardIterator first, NoThrowForwardIterator last);

```

2 Effects: Equivalent to:

```
    for ( ; first != last; ++first)
        destroy_at(addressof(*first));
```

```

namespace ranges {
    template<nothrow_input_iterator I, nothrow_sentinel_for<I> S>
    requires destructible<iter_value_t<I>>
    constexpr I destroy(I first, S last) noexcept;
    template<nothrow_input_range R>
    requires destructible<range_value_t<R>>
    constexpr borrowed_iterator_t<R> destroy(R&& r) noexcept;
}

```

3 Effects: Equivalent to:

```

    for ( ; first != last; ++first)
        destroy_at(addressof(*first));
    return first;

template<class NoThrowForwardIterator, class Size>
constexpr NoThrowForwardIterator destroy_n(NoThrowForwardIterator first, Size n);

```

4 *Effects:* Equivalent to:

```

        for ( ; n > 0; (void)++first, --n)
            destroy_at(addressof(*first));
        return first;
    }
```

5 *Effects:* Equivalent to:

```

        return destroy(counted_iterator(std::move(first), n), default_sentinel).base();
    }
```

27.12 C library algorithms

[alg.c.library]

1 NOTE: The header `<cstdlib>` (17.2.2) declares the functions described in this subclause.

```

void* bsearch(const void* key, const void* base, size_t nmemb, size_t size,
              c-compare-pred* compar);
void* bsearch(const void* key, const void* base, size_t nmemb, size_t size,
              compare-pred* compar);
void qsort(void* base, size_t nmemb, size_t size, c-compare-pred* compar);
void qsort(void* base, size_t nmemb, size_t size, compare-pred* compar);

```

2 *Preconditions:* For `qsort`, the objects in the array pointed to by `base` are of trivially copyable type.

3 *Effects:* These functions have the semantics specified in the C standard library.

4 *Throws:* Any exception thrown by `compar` (16.4.6.13).

SEE ALSO: ISO C 7.22.5

28 Numerics library

[numerics]

28.1 General

[numerics.general]

- ¹ This Clause describes components that C++ programs may use to perform seminumerical operations.
- ² The following subclauses describe components for complex number types, random number generation, numeric (*n*-at-a-time) arrays, generalized numeric algorithms, and mathematical constants and functions for floating-point types, as summarized in [Table 94](#).

Table 94: Numerics library summary [tab:numerics.summary]

Subclause	Header
28.2 Requirements	
28.3 Floating-point environment	<code><cfenv></code>
28.4 Complex numbers	<code><complex></code>
28.5 Random number generation	<code><random></code>
28.6 Numeric arrays	<code><valarray></code>
28.7 Mathematical functions for floating-point types	<code><cmath>, <cstdlib></code>
28.8 Numbers	<code><numbers></code>

28.2 Numeric type requirements

[numeric.requirements]

- ¹ The `complex` and `valarray` components are parameterized by the type of information they contain and manipulate. A C++ program shall instantiate these components only with a numeric type. A *numeric type* is a cv-unqualified object type *T* that meets the *Cpp17DefaultConstructible*, *Cpp17CopyConstructible*, *Cpp17CopyAssignable*, and *Cpp17Destructible* requirements ([16.4.4.2](#)).²²⁵
- ² If any operation on *T* throws an exception the effects are undefined.
- ³ In addition, many member and related functions of `valarray<T>` can be successfully instantiated and will exhibit well-defined behavior if and only if *T* meets additional requirements specified for each such member or related function.
- ⁴ EXAMPLE: It is valid to instantiate `valarray<complex>`, but `operator>()` will not be successfully instantiated for `valarray<complex>` operands, since `complex` does not have any ordering operators.

28.3 The floating-point environment

[cfenv]

28.3.1 Header `<cfenv>` synopsis

[cfenv.syn]

```
#define FE_ALL_EXCEPT see below
#define FE_DIVBYZERO see below // optional
#define FE_INEXACT see below // optional
#define FE_INVALID see below // optional

int fetestexcept(int except);

int fegetround();
int fesetround(int mode);

int fegetenv(fenv_t* penv);
int feholdexcept(fenv_t* penv);
int fesetenv(const fenv_t* penv);
int feupdateenv(const fenv_t* penv);
}
```

- ¹ The contents and meaning of the header <cfenv> are the same as the C standard library header <fenv.h>.

NOTE: This document does not require an implementation to support the FENV_ACCESS pragma; it is implementation-defined (15.9) whether the pragma is supported. As a consequence, it is implementation-defined whether these functions can be used to test floating-point status flags, set floating-point control modes, or run under non-default mode settings. If the pragma is used to enable control over the floating-point environment, this document does not specify the effect on floating-point evaluation in constant expressions.

SEE ALSO: ISO C 7.6

28.3.2 Threads

[cfenv.thread]

- ¹ The floating-point environment has thread storage duration (6.7.5.3). The initial state for a thread's floating-point environment is the state of the floating-point environment of the thread that constructs the corresponding **thread** object (33.4.3) or **jthread** object (33.4.4) at the time it constructed the object.

NOTE: That is, the child thread gets the floating-point state of the parent thread at the time of the child's creation.

- ² A separate floating-point environment is maintained for each thread. Each function accesses the environment corresponding to its calling thread.

28.4 Complex numbers

[complex.numbers]

28.4.1 General

[complex.numbers.general]

- ¹ The header <complex> defines a class template, and numerous functions for representing and manipulating complex numbers.
- ² The effect of instantiating the template **complex** for any type that is not a cv-unqualified floating-point type (6.8.2) is unspecified. Specializations of **complex** for cv-unqualified floating-point types are trivially-copyable literal types (6.8.1).
- ³ If the result of a function is not mathematically defined or not in the range of representable values for its type, the behavior is undefined.
- ⁴ If **z** is an lvalue of type *cv complex*<*T*> then:

- (4.1) — the expression **reinterpret_cast**<*cv T*(*&*)*[2]*>(**z**) is well-formed,
- (4.2) — **reinterpret_cast**<*cv T*(*&*)*[2]*>(**z**)*[0]* designates the real part of **z**, and
- (4.3) — **reinterpret_cast**<*cv T*(*&*)*[2]*>(**z**)*[1]* designates the imaginary part of **z**.

Moreover, if **a** is an expression of type *cv complex*<*T**> and the expression **a**[*i*] is well-defined for an integer expression *i*, then:

- (4.4) — **reinterpret_cast**<*cv T**>(**a**)*[2*i]* designates the real part of **a**[*i*], and
- (4.5) — **reinterpret_cast**<*cv T**>(**a**)*[2*i + 1]* designates the imaginary part of **a**[*i*].

28.4.2 Header <complex> synopsis

        constexpr complex<double> operator""i(unsigned long long);
        constexpr complex<float> operator""if(long double);
        constexpr complex<float> operator""if(unsigned long long);
    }
}
}

```

28.4.3 Class template complex

[complex]

```

namespace std {
    template<class T> class complex {
        public:
            using value_type = T;

            constexpr complex(const T& re = T(), const T& im = T());
            constexpr complex(const complex&) = default;
            template<class X> constexpr explicit(see below) complex(const complex<X>&);

            constexpr T real() const;
            constexpr void real(T);
            constexpr T imag() const;
            constexpr void imag(T);

            constexpr complex& operator= (const T&);
            constexpr complex& operator+=(const T&);
            constexpr complex& operator-=(const T&);
            constexpr complex& operator*=(const T&);
            constexpr complex& operator/=(const T&);

            constexpr complex& operator=(const complex&);

            template<class X> constexpr complex& operator= (const complex<X>&);
            template<class X> constexpr complex& operator+=(const complex<X>&);
            template<class X> constexpr complex& operator-=(const complex<X>&);
            template<class X> constexpr complex& operator*=(const complex<X>&);
            template<class X> constexpr complex& operator/=(const complex<X>&);

        };
    };
}

```

- ¹ The class **complex** describes an object that can store the Cartesian components, **real()** and **imag()**, of a complex number.

28.4.4 Member functions

[complex.members]

```
constexpr complex(const T& re = T(), const T& im = T());
```

- ¹ *Postconditions:* **real()** == **re** && **imag()** == **im** is true.

```
template<class X> constexpr explicit(see below) complex(const complex<X>& other);
```

- ² *Effects:* Initializes the real part with **other.real()** and the imaginary part with **other.imag()**.

- ³ *Remarks:* The expression inside **explicit** evaluates to **false** if and only if the floating-point conversion rank of **T** is greater than or equal to the floating-point conversion rank of **X**.

```
constexpr T real() const;
```

- ⁴ *Returns:* The value of the real component.

```
constexpr void real(T val);
5   Effects: Assigns val to the real component.

constexpr T imag() const;
6   Returns: The value of the imaginary component.

constexpr void imag(T val);
7   Effects: Assigns val to the imaginary component.
```

28.4.5 Member operators

[complex.member.ops]

```
constexpr complex& operator+=(const T& rhs);
1   Effects: Adds the scalar value rhs to the real part of the complex value *this and stores the result in the real part of *this, leaving the imaginary part unchanged.

2   Returns: *this.

constexpr complex& operator-=(const T& rhs);
3   Effects: Subtracts the scalar value rhs from the real part of the complex value *this and stores the result in the real part of *this, leaving the imaginary part unchanged.

4   Returns: *this.

constexpr complex& operator*=(const T& rhs);
5   Effects: Multiplies the scalar value rhs by the complex value *this and stores the result in *this.

6   Returns: *this.

constexpr complex& operator/=(const T& rhs);
7   Effects: Divides the scalar value rhs into the complex value *this and stores the result in *this.

8   Returns: *this.

template<class X> constexpr complex& operator+=(const complex<X>& rhs);
9   Effects: Adds the complex value rhs to the complex value *this and stores the sum in *this.

10  Returns: *this.

template<class X> constexpr complex& operator-=(const complex<X>& rhs);
11  Effects: Subtracts the complex value rhs from the complex value *this and stores the difference in *this.

12  Returns: *this.

template<class X> constexpr complex& operator*=(const complex<X>& rhs);
13  Effects: Multiplies the complex value rhs by the complex value *this and stores the product in *this.

14  Returns: *this.

template<class X> constexpr complex& operator/=(const complex<X>& rhs);
15  Effects: Divides the complex value rhs into the complex value *this and stores the quotient in *this.

16  Returns: *this.
```

28.4.6 Non-member operations

[complex.ops]

```
template<class T> constexpr complex<T> operator+(const complex<T>& lhs);
1   Returns: complex<T>(lhs).

template<class T> constexpr complex<T> operator+(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator+(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator+(const T& lhs, const complex<T>& rhs);

2   Returns: complex<T>(lhs) += rhs.
```

template<class T> constexpr complex<T> operator-(const complex<T>& lhs);
 3 >Returns: complex<T>(-lhs.real(), -lhs.imag());

template<class T> constexpr complex<T> operator-(const complex<T>& lhs, const complex<T>& rhs);
 template<class T> constexpr complex<T> operator-(const complex<T>& lhs, const T& rhs);
 template<class T> constexpr complex<T> operator-(const T& lhs, const complex<T>& rhs);
 4 >Returns: complex<T>(lhs) -= rhs.

template<class T> constexpr complex<T> operator*(const complex<T>& lhs, const complex<T>& rhs);
 template<class T> constexpr complex<T> operator*(const complex<T>& lhs, const T& rhs);
 template<class T> constexpr complex<T> operator*(const T& lhs, const complex<T>& rhs);
 5 >Returns: complex<T>(lhs) *= rhs.

template<class T> constexpr complex<T> operator/(const complex<T>& lhs, const complex<T>& rhs);
 template<class T> constexpr complex<T> operator/(const complex<T>& lhs, const T& rhs);
 template<class T> constexpr complex<T> operator/(const T& lhs, const complex<T>& rhs);
 6 >Returns: complex<T>(lhs) /= rhs.

template<class T> constexpr bool operator==(const complex<T>& lhs, const complex<T>& rhs);
 template<class T> constexpr bool operator==(const complex<T>& lhs, const T& rhs);
 7 >Returns: lhs.real() == rhs.real() && lhs.imag() == rhs.imag().

8 >*Remarks:* The imaginary part is assumed to be T(), or 0.0, for the T arguments.

template<class T, class charT, class traits>
 basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& is, complex<T>& x);
 9 >*Preconditions:* The input values are convertible to T.

10 *Effects:* Extracts a complex number x of the form: u, (u), or (u,v), where u is the real part and v is the imaginary part (31.7.5.3).

11 If bad input is encountered, calls is.setstate(ios_base::failbit) (which may throw ios_base::failure (31.5.4.4)).

12 >Returns: is.

13 >*Remarks:* This extraction is performed as a series of simpler extractions. Therefore, the skipping of whitespace is specified to be the same for each of the simpler extractions.

template<class T, class charT, class traits>
 basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& o, const complex<T>& x);
 14 *Effects:* Inserts the complex number x onto the stream o as if it were implemented as follows:

```
    basic_ostringstream<charT, traits> s;
    s.flags(o.flags());
    s.imbue(o.getloc());
    s.precision(o.precision());
    s << '(' << x.real() << ',' << x.imag() << ')';
    return o << s.str();
```

15 NOTE: In a locale in which comma is used as a decimal point character, the use of comma as a field separator can be ambiguous. Inserting showpoint into the output stream forces all outputs to show an explicit decimal point character; as a result, all inserted sequences of complex numbers can be extracted unambiguously.

28.4.7 Value operations

[complex.value.ops]

template<class T> constexpr T real(const complex<T>& x);
 1 >Returns: x.real().

template<class T> constexpr T imag(const complex<T>& x);
 2 >Returns: x.imag().

template<class T> T abs(const complex<T>& x);
 3 >Returns: The magnitude of x.

```
template<class T> T arg(const complex<T>& x);
4   Returns: The phase angle of x, or atan2(imag(x), real(x)).
```

```
template<class T> constexpr T norm(const complex<T>& x);
5   Returns: The squared magnitude of x.
```

```
template<class T> constexpr complex<T> conj(const complex<T>& x);
6   Returns: The complex conjugate of x.
```

```
template<class T> complex<T> proj(const complex<T>& x);
7   Returns: The projection of x onto the Riemann sphere.
```

```
8   Remarks: Behaves the same as the C function cproj. SEE ALSO: ISO C 7.3.9.5
```

```
template<class T> complex<T> polar(const T& rho, const T& theta = T());
9   Preconditions: rho is non-negative and non-NaN. theta is finite.
```

```
10  Returns: The complex value corresponding to a complex number whose magnitude is rho and whose phase angle is theta.
```

28.4.8 Transcendentals

[complex.transcendentals]

```
template<class T> complex<T> acos(const complex<T>& x);
1   Returns: The complex arc cosine of x.
```

```
2   Remarks: Behaves the same as the C function cacos. SEE ALSO: ISO C 7.3.5.1
```

```
template<class T> complex<T> asin(const complex<T>& x);
3   Returns: The complex arc sine of x.
```

```
4   Remarks: Behaves the same as the C function casin. SEE ALSO: ISO C 7.3.5.2
```

```
template<class T> complex<T> atan(const complex<T>& x);
5   Returns: The complex arc tangent of x.
```

```
6   Remarks: Behaves the same as the C function catan. SEE ALSO: ISO C 7.3.5.3
```

```
template<class T> complex<T> acosh(const complex<T>& x);
7   Returns: The complex arc hyperbolic cosine of x.
```

```
8   Remarks: Behaves the same as the C function cacosh. SEE ALSO: ISO C 7.3.6.1
```

```
template<class T> complex<T> asinh(const complex<T>& x);
9   Returns: The complex arc hyperbolic sine of x.
```

```
10  Remarks: Behaves the same as the C function casinh. SEE ALSO: ISO C 7.3.6.2
```

```
template<class T> complex<T> atanh(const complex<T>& x);
11  Returns: The complex arc hyperbolic tangent of x.
```

```
12  Remarks: Behaves the same as the C function catanh. SEE ALSO: ISO C 7.3.6.3
```

```
template<class T> complex<T> cos(const complex<T>& x);
13  Returns: The complex cosine of x.
```

```
template<class T> complex<T> cosh(const complex<T>& x);
14  Returns: The complex hyperbolic cosine of x.
```

```
template<class T> complex<T> exp(const complex<T>& x);
15  Returns: The complex base-e exponential of x.
```

```
template<class T> complex<T> log(const complex<T>& x);
16  Returns: The complex natural (base-e) logarithm of x. For all x, imag(log(x)) lies in the interval [-π, π].
```

NOTE 1: The semantics of this function are intended to be the same in C++ as they are for `clog` in C.

17 *Remarks:* The branch cuts are along the negative real axis.

```
template<class T> complex<T> log10(const complex<T>& x);
```

18 *Returns:* The complex common (base-10) logarithm of `x`, defined as $\log(x) / \log(10)$.

19 *Remarks:* The branch cuts are along the negative real axis.

```
template<class T> complex<T> pow(const complex<T>& x, const complex<T>& y);
```

```
template<class T> complex<T> pow(const complex<T>& x, const T& y);
```

```
template<class T> complex<T> pow(const T& x, const complex<T>& y);
```

20 *Returns:* The complex power of base `x` raised to the `yth` power, defined as $\exp(y * \log(x))$. The value returned for `pow(0, 0)` is implementation-defined.

21 *Remarks:* The branch cuts are along the negative real axis.

```
template<class T> complex<T> sin(const complex<T>& x);
```

22 *Returns:* The complex sine of `x`.

```
template<class T> complex<T> sinh(const complex<T>& x);
```

23 *Returns:* The complex hyperbolic sine of `x`.

```
template<class T> complex<T> sqrt(const complex<T>& x);
```

24 *Returns:* The complex square root of `x`, in the range of the right half-plane.

NOTE 2: The semantics of this function are intended to be the same in C++ as they are for `csqrt` in C.

25 *Remarks:* The branch cuts are along the negative real axis.

```
template<class T> complex<T> tan(const complex<T>& x);
```

26 *Returns:* The complex tangent of `x`.

```
template<class T> complex<T> tanh(const complex<T>& x);
```

27 *Returns:* The complex hyperbolic tangent of `x`.

28.4.9 Additional overloads

[cmplx.over]

1 The following function templates shall have additional overloads:

<code>arg</code>	<code>norm</code>
<code>conj</code>	<code>proj</code>
<code>imag</code>	<code>real</code>

where `norm`, `conj`, `imag`, and `real` are `constexpr` overloads.

2 The additional overloads shall be sufficient to ensure:

(2.1) — If the argument has a floating-point type `T`, then it is effectively cast to `complex<T>`.

(2.2) — Otherwise, if the argument has integer type, then it is effectively cast to `complex<double>`.

3 Function template `pow` has additional overloads sufficient to ensure, for a call with one argument of type `complex<T1>` and the other argument of type `T2` or `complex<T2>`, both arguments are effectively cast to `complex<common_type_t<T1, T2>>`. If `common_type_t<T1, T2>` is not well-formed, then the program is ill-formed.

28.4.10 Suffixes for complex number literals

[complex.literals]

1 This subclause describes literal suffixes for constructing complex number literals. The suffixes `i`, `il`, and `if` create complex numbers of the types `complex<double>`, `complex<long double>`, and `complex<float>` respectively, with their imaginary part denoted by the given literal number and the real part being zero.

```
constexpr complex<long double> operator""il(long double d);
constexpr complex<long double> operator""il(unsigned long long d);
```

2 *Returns:* `complex<long double>{0.0L, static_cast<long double>(d)}`.

```

constexpr complex<double> operator""i(long double d);
constexpr complex<double> operator""i(unsigned long long d);

3   Returns: complex<double>{0.0, static_cast<double>(d)}.

constexpr complex<float> operator""if(long double d);
constexpr complex<float> operator""if(unsigned long long d);

4   Returns: complex<float>{0.0f, static_cast<float>(d)}.

```

28.5 Random number generation

[rand]

28.5.1 General

[rand.general]

- ¹ Subclause 28.5 defines a facility for generating (pseudo-)random numbers.
- ² In addition to a few utilities, four categories of entities are described: *uniform random bit generators*, *random number engines*, *random number engine adaptors*, and *random number distributions*. These categorizations are applicable to types that meet the corresponding requirements, to objects instantiated from such types, and to templates producing such types when instantiated.

NOTE: These entities are specified in such a way as to permit the binding of any uniform random bit generator object *e* as the argument to any random number distribution object *d*, thus producing a zero-argument function object such as given by `bind(d, e)`.

- ³ Each of the entities specified in 28.5 has an associated arithmetic type (6.8.2) identified as `result_type`. With *T* as the `result_type` thus associated with such an entity, that entity is characterized:
 - (3.1) — as *boolean* or equivalently as *boolean-valued*, if *T* is `bool`;
 - (3.2) — otherwise as *integral* or equivalently as *integer-valued*, if `numeric_limits<T>::is_integer` is `true`;
 - (3.3) — otherwise as *floating-point* or equivalently as *real-valued*.

If *integer-valued*, an entity may optionally be further characterized as *signed* or *unsigned*, according to `numeric_limits<T>::is_signed`.

- ⁴ Unless otherwise specified, all descriptions of calculations in 28.5 use mathematical real numbers.
- ⁵ Throughout 28.5, the operators `bitand`, `bitor`, and `xor` denote the respective conventional bitwise operations. Further:
 - (5.1) — the operator `rshift` denotes a bitwise right shift with zero-valued bits appearing in the high bits of the result, and
 - (5.2) — the operator `lshiftw` denotes a bitwise left shift with zero-valued bits appearing in the low bits of the result, and whose result is always taken modulo 2^w .

28.5.2 Header <random> synopsis

[rand.synopsis]

```

#include <initializer_list>      // see 17.10.2

```

28.5.3 Requirements

[rand.req]

28.5.3.1 General requirements

[rand.req.genl]

¹ Throughout this subclause 28.5, the effect of instantiating a template:

- (1.1) — that has a template type parameter named `Sseq` is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of seed sequence (28.5.3.2).
- (1.2) — that has a template type parameter named `URBG` is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of uniform random bit generator (28.5.3.3).

- (1.3) — that has a template type parameter named `Engine` is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of random number engine (28.5.3.4).
 - (1.4) — that has a template type parameter named `RealType` is undefined unless the corresponding template argument is cv-unqualified and is one of `float`, `double`, or `long double`.
 - (1.5) — that has a template type parameter named `IntType` is undefined unless the corresponding template argument is cv-unqualified and is one of `short`, `int`, `long`, `long long`, `unsigned short`, `unsigned int`, `unsigned long`, or `unsigned long long`.
 - (1.6) — that has a template type parameter named `UIIntType` is undefined unless the corresponding template argument is cv-unqualified and is one of `unsigned short`, `unsigned int`, `unsigned long`, or `unsigned long long`.
- 2 Throughout this subclause 28.5, phrases of the form “`x` is an iterator of a specific kind” shall be interpreted as equivalent to the more formal requirement that “`x` is a value of a type meeting the requirements of the specified iterator type”.
- 3 Throughout this subclause 28.5, any constructor that can be called with a single argument and that meets a requirement specified in this subclause shall be declared `explicit`.

28.5.3.2 Seed sequence requirements

[rand.req.seedseq]

- 1 A *seed sequence* is an object that consumes a sequence of integer-valued data and produces a requested number of unsigned integer values i , $0 \leq i < 2^{32}$, based on the consumed data.
NOTE: Such an object provides a mechanism to avoid replication of streams of random variates. This can be useful, for example, in applications requiring large numbers of random number engines.
- 2 A class `S` meets the requirements of a seed sequence if the expressions shown in Table 95 are valid and have the indicated semantics, and if `S` also meets all other requirements of this subclause 28.5.3.2. In that Table and throughout this subclause:
 - (2.1) — `T` is the type named by `S`'s associated `result_type`;
 - (2.2) — `q` is a value of type `S` and `r` is a value of type `S` or `const S`;
 - (2.3) — `ib` and `ie` are input iterators with an unsigned integer `value_type` of at least 32 bits;
 - (2.4) — `rb` and `re` are mutable random access iterators with an unsigned integer `value_type` of at least 32 bits;
 - (2.5) — `ob` is an output iterator; and
 - (2.6) — `il` is a value of type `initializer_list<T>`.

Table 95: Seed sequence requirements [tab:rand.req.seedseq]

Expression	Return type	Pre/post-condition	Complexity
<code>S::result_type</code>	<code>T</code>	<code>T</code> is an unsigned integer type (6.8.2) of at least 32 bits.	compile-time
<code>S()</code>		Creates a seed sequence with the same initial state as all other default-constructed seed sequences of type <code>S</code> .	constant
<code>S(ib, ie)</code>		Creates a seed sequence having internal state that depends on some or all of the bits of the supplied sequence [<code>ib</code> , <code>ie</code>].	$\mathcal{O}(ie - ib)$
<code>S(il)</code>		Same as <code>S(il.begin(), il.end())</code> .	same as <code>S(il.begin(), il.end())</code>

Table 95: Seed sequence requirements (continued)

Expression	Return type	Pre/post-condition	Complexity
<code>q.generate(rb,re)</code>	<code>void</code>	Does nothing if <code>rb == re</code> . Otherwise, fills the supplied sequence <code>[rb, re)</code> with 32-bit quantities that depend on the sequence supplied to the constructor and possibly also depend on the history of <code>generate</code> 's previous invocations.	$\mathcal{O}(re - rb)$
<code>r.size()</code>	<code>size_t</code>	The number of 32-bit units that would be copied by a call to <code>r.param</code> .	constant
<code>r.param(ob)</code>	<code>void</code>	Copies to the given destination a sequence of 32-bit units that can be provided to the constructor of a second object of type <code>S</code> , and that would reproduce in that second object a state indistinguishable from the state of the first object.	$\mathcal{O}(r.size())$

28.5.3.3 Uniform random bit generator requirements

[rand.req.urng]

- ¹ A *uniform random bit generator* `g` of type `G` is a function object returning unsigned integer values such that each value in the range of possible results has (ideally) equal probability of being returned.

NOTE: The degree to which `g`'s results approximate the ideal is often determined statistically.

```
template<class G>
concept uniform_random_bit_generator =
    invocable<G&> && unsigned_integral<invoke_result_t<G&>> &&
    requires {
        { G::min() } -> same_as<invoke_result_t<G&>>;
        { G::max() } -> same_as<invoke_result_t<G&>>;
        requires bool_constant<(G::min() < G::max())>::value;
    };
```

- ² Let `g` be an object of type `G`. `G` models `uniform_random_bit_generator` only if

- (2.1) — `G::min() <= g()`,
- (2.2) — `g() <= G::max()`, and
- (2.3) — `g()` has amortized constant complexity.

- ³ A class `G` meets the *uniform random bit generator* requirements if `G` models `uniform_random_bit_generator`, `invoke_result_t<G&>` is an unsigned integer type (6.8.2), and `G` provides a nested `typedef-name result_type` that denotes the same type as `invoke_result_t<G&>`.

28.5.3.4 Random number engine requirements

[rand.req.eng]

- ¹ A *random number engine* (commonly shortened to *engine*) `e` of type `E` is a uniform random bit generator that additionally meets the requirements (e.g., for seeding and for input/output) specified in this subclause.

- ² At any given time, `e` has a state `ei` for some integer $i \geq 0$. Upon construction, `e` has an initial state `e0`. An engine's state may be established via a constructor, a `seed` function, assignment, or a suitable `operator>>`.

- ³ `E`'s specification shall define:

- (3.1) — the size of `E`'s state in multiples of the size of `result_type`, given as an integral constant expression;
- (3.2) — the *transition algorithm* `TA` by which `e`'s state `ei` is advanced to its *successor state* `ei+1`; and
- (3.3) — the *generation algorithm* `GA` by which an engine's state is mapped to a value of type `result_type`.

⁴ A class **E** that meets the requirements of a uniform random bit generator (28.5.3.3) also meets the requirements of a *random number engine* if the expressions shown in Table 96 are valid and have the indicated semantics, and if **E** also meets all other requirements of this subclause 28.5.3.4. In that Table and throughout this subclause:

- (4.1) — **T** is the type named by **E**'s associated **result_type**;
- (4.2) — **e** is a value of **E**, **v** is an lvalue of **E**, **x** and **y** are (possibly const) values of **E**;
- (4.3) — **s** is a value of **T**;
- (4.4) — **q** is an lvalue meeting the requirements of a seed sequence (28.5.3.2);
- (4.5) — **z** is a value of type **unsigned long long**;
- (4.6) — **os** is an lvalue of the type of some class template specialization **basic_ostream<charT, traits>**; and
- (4.7) — **is** is an lvalue of the type of some class template specialization **basic_istream<charT, traits>**;

where **charT** and **traits** are constrained according to Clause 23 and Clause 31.

Table 96: Random number engine requirements [tab:rand.req.eng]

Expression	Return type	Pre/post-condition	Complexity
E()		Creates an engine with the same initial state as all other default-constructed engines of type E .	$\mathcal{O}(\text{size of state})$
E(x)		Creates an engine that compares equal to x .	$\mathcal{O}(\text{size of state})$
E(s)		Creates an engine with initial state determined by s .	$\mathcal{O}(\text{size of state})$
E(q)²²⁶		Creates an engine with an initial state that depends on a sequence produced by one call to q.generate .	same as complexity of q.generate called on a sequence whose length is size of state
e.seed()	void	<i>Postconditions:</i> $e == E()$.	same as E()
e.seed(s)	void	<i>Postconditions:</i> $e == E(s)$.	same as E(s)
e.seed(q)	void	<i>Postconditions:</i> $e == E(q)$.	same as E(q)
e()	T	Advances e 's state e_i to $e_{i+1} = \text{TA}(e_i)$ and returns $\text{GA}(e_i)$.	per 28.5.3.3
e.discard(z)²²⁷	void	Advances e 's state e_i to e_{i+z} by any means equivalent to z consecutive calls e() .	no worse than the complexity of z consecutive calls e()
x == y	bool	This operator is an equivalence relation. With S_x and S_y as the infinite sequences of values that would be generated by repeated future calls to x() and y() , respectively, returns true if $S_x = S_y$; else returns false .	$\mathcal{O}(\text{size of state})$
x != y	bool	$!(x == y)$.	$\mathcal{O}(\text{size of state})$

²²⁶) This constructor (as well as the subsequent corresponding **seed()** function) can be particularly useful to applications requiring a large number of independent random sequences.

²²⁷) This operation is common in user code, and can often be implemented in an engine-specific manner so as to provide significant performance improvements over an equivalent naive loop that makes **z** consecutive calls **e()**.

Expression	Return type	Pre/post-condition	Complexity
<code>os << x</code>	reference to the type of <code>os</code>	With <code>os.fmtflags</code> set to <code>ios_base::dec ios_base::left</code> and the fill character set to the space character, writes to <code>os</code> the textual representation of <code>x</code> 's current state. In the output, adjacent numbers are separated by one or more space characters. <i>Postconditions:</i> The <code>os.fmtflags</code> and fill character are unchanged.	$\mathcal{O}(\text{size of state})$
<code>is >> v</code>	reference to the type of <code>is</code>	With <code>is.fmtflags</code> set to <code>ios_base::dec</code> , sets <code>v</code> 's state as determined by reading its textual representation from <code>is</code> . If bad input is encountered, ensures that <code>v</code> 's state is unchanged by the operation and calls <code>is.setstate(ios_base::failbit)</code> (which may throw <code>ios_base::failure (31.5.4.4)</code>). If a textual representation written via <code>os << x</code> was subsequently read via <code>is >> v</code> , then <code>x == v</code> provided that there have been no intervening invocations of <code>x</code> or of <code>v</code> . <i>Preconditions:</i> <code>is</code> provides a textual representation that was previously written using an output stream whose imbued locale was the same as that of <code>is</code> , and whose type's template specialization arguments <code>charT</code> and <code>traits</code> were respectively the same as those of <code>is</code> . <i>Postconditions:</i> The <code>is.fmtflags</code> are unchanged.	$\mathcal{O}(\text{size of state})$

- ⁵ E shall meet the *Cpp17CopyConstructible* (Table 32) and *Cpp17CopyAssignable* (Table 34) requirements. These operations shall each be of complexity no worse than $\mathcal{O}(\text{size of state})$.

28.5.3.5 Random number engine adaptor requirements

[rand.req.adapt]

- 1 A *random number engine adaptor* (commonly shortened to *adaptor*) `a` of type `A` is a random number engine that takes values produced by some other random number engine, and applies an algorithm to those values in order to deliver a sequence of values with different randomness properties. An engine `b` of type `B` adapted in this way is termed a *base engine* in this context. The expression `a.base()` shall be valid and shall return a const reference to `a`'s base engine.
- 2 The requirements of a random number engine type shall be interpreted as follows with respect to a random number engine adaptor type.

`A::A();`

- 3 *Effects:* The base engine is initialized as if by its default constructor.

`bool operator==(const A& a1, const A& a2);`

- 4 *Returns:* true if `a1`'s base engine is equal to `a2`'s base engine. Otherwise returns false.

```

A::A(result_type s);
5   Effects: The base engine is initialized with s.

template<class Sseq> A::A(Sseq& q);
6   Effects: The base engine is initialized with q.

void seed();
7   Effects: With b as the base engine, invokes b.seed().

void seed(result_type s);
8   Effects: With b as the base engine, invokes b.seed(s).

template<class Sseq> void seed(Sseq& q);
9   Effects: With b as the base engine, invokes b.seed(q).
10 A shall also meet the following additional requirements:
(10.1) — The complexity of each function shall not exceed the complexity of the corresponding function applied to the base engine.
(10.2) — The state of A shall include the state of its base engine. The size of A's state shall be no less than the size of the base engine.
(10.3) — Copying A's state (e.g., during copy construction or copy assignment) shall include copying the state of the base engine of A.
(10.4) — The textual representation of A shall include the textual representation of its base engine.

```

28.5.3.6 Random number distribution requirements

[rand.req.dist]

- 1 A *random number distribution* (commonly shortened to *distribution*) d of type D is a function object returning values that are distributed according to an associated mathematical *probability density function* $p(z)$ or according to an associated *discrete probability function* $P(z_i)$. A distribution's specification identifies its associated probability function $p(z)$ or $P(z_i)$.
- 2 An associated probability function is typically expressed using certain externally-supplied quantities known as the *parameters of the distribution*. Such distribution parameters are identified in this context by writing, for example, $p(z | a, b)$ or $P(z_i | a, b)$, to name specific parameters, or by writing, for example, $p(z | \{p\})$ or $P(z_i | \{p\})$, to denote a distribution's parameters p taken as a whole.
- 3 A class D meets the requirements of a *random number distribution* if the expressions shown in Table 97 are valid and have the indicated semantics, and if D and its associated types also meet all other requirements of this subclause 28.5.3.6. In that Table and throughout this subclause,
 - (3.1) — T is the type named by D's associated `result_type`;
 - (3.2) — P is the type named by D's associated `param_type`;
 - (3.3) — d is a value of D, and x and y are (possibly const) values of D;
 - (3.4) — glb and lub are values of T respectively corresponding to the greatest lower bound and the least upper bound on the values potentially returned by d's `operator()`, as determined by the current values of d's parameters;
 - (3.5) — p is a (possibly const) value of P;
 - (3.6) — g, g1, and g2 are lvalues of a type meeting the requirements of a uniform random bit generator (28.5.3.3);
 - (3.7) — os is an lvalue of the type of some class template specialization `basic_ostream<charT, traits>`; and
 - (3.8) — is is an lvalue of the type of some class template specialization `basic_istream<charT, traits>`;

where `charT` and `traits` are constrained according to Clause 23 and Clause 31.

Table 97: Random number distribution requirements [tab:rand.req.dist]

Expression	Return type	Pre/post-condition	Complexity
D::result_type	T	T is an arithmetic type (6.8.2).	compile-time
D::param_type	P		compile-time

Expression	Return type	Pre/post-condition	Complexity
D()		Creates a distribution whose behavior is indistinguishable from that of any other newly default-constructed distribution of type D.	constant
D(p)		Creates a distribution whose behavior is indistinguishable from that of a distribution newly constructed directly from the values used to construct p.	same as p's construction
d.reset()	void	Subsequent uses of d do not depend on values produced by any engine prior to invoking reset.	constant
x.param()	P	Returns a value p such that $D(p).param() == p$.	no worse than the complexity of D(p)
d.param(p)	void	<i>Postconditions:</i> $d.param() == p$.	no worse than the complexity of D(p)
d(g)	T	With $p = d.param()$, the sequence of numbers returned by successive invocations with the same object g is randomly distributed according to the associated $p(z \{p\})$ or $P(z_i \{p\})$ function.	amortized constant number of invocations of g
d(g,p)	T	The sequence of numbers returned by successive invocations with the same objects g and p is randomly distributed according to the associated $p(z \{p\})$ or $P(z_i \{p\})$ function.	amortized constant number of invocations of g
x.min()	T	Returns glb.	constant
x.max()	T	Returns lub.	constant
x == y	bool	This operator is an equivalence relation. Returns true if $x.param() == y.param()$ and $S_1 = S_2$, where S_1 and S_2 are the infinite sequences of values that would be generated, respectively, by repeated future calls to x(g1) and y(g2) whenever g1 == g2. Otherwise returns false.	constant
x != y	bool	$!(x == y)$.	same as x == y.
os << x	reference to the type of os	Writes to os a textual representation for the parameters and the additional internal data of x. <i>Postconditions:</i> The os.fmtflags and fill character are unchanged.	

Expression	Return type	Pre/post-condition	Complexity
<code>is >> d</code>	reference to the type of <code>is</code>	<p>Restores from <code>is</code> the parameters and additional internal data of the lvalue <code>d</code>. If bad input is encountered, ensures that <code>d</code> is unchanged by the operation and calls <code>is.setstate(ios_base::failbit)</code> (which may throw <code>ios_base::failure</code> (31.5.4.4)).</p> <p><i>Preconditions:</i> <code>is</code> provides a textual representation that was previously written using an <code>os</code> whose imbued locale and whose type's template specialization arguments <code>charT</code> and <code>traits</code> were the same as those of <code>is</code>.</p> <p><i>Postconditions:</i> The <code>is(fmtflags</code> are unchanged.</p>	

- ⁴ D shall meet the *Cpp17CopyConstructible* (Table 32) and *Cpp17CopyAssignable* (Table 34) requirements.
 - ⁵ The sequence of numbers produced by repeated invocations of `d(g)` shall be independent of any invocation of `os << d` or of any `const` member function of D between any of the invocations of `d(g)`.
 - ⁶ If a textual representation is written using `os << x` and that representation is restored into the same or a different object `y` of the same type using `is >> y`, repeated invocations of `y(g)` shall produce the same sequence of numbers as would repeated invocations of `x(g)`.
 - ⁷ It is unspecified whether `D::param_type` is declared as a (nested) `class` or via a `typedef`. In this subclause 28.5, declarations of `D::param_type` are in the form of `typedefs` for convenience of exposition only.
 - ⁸ P shall meet the *Cpp17CopyConstructible* (Table 32), *Cpp17CopyAssignable* (Table 34), and *Cpp17EqualityComparable* (Table 28) requirements.
 - ⁹ For each of the constructors of D taking arguments corresponding to parameters of the distribution, P shall have a corresponding constructor subject to the same requirements and taking arguments identical in number, type, and default values. Moreover, for each of the member functions of D that return values corresponding to parameters of the distribution, P shall have a corresponding member function with the identical name, type, and semantics.
 - ¹⁰ P shall have a declaration of the form

```
using distribution_type = D;
```
- 28.5.4 Random number engine class templates** [rand.eng]
- 28.5.4.1 General** [rand.eng.general]
- ¹ Each type instantiated from a class template specified in 28.5.4 meets the requirements of a random number engine (28.5.3.4) type.
 - ² Except where specified otherwise, the complexity of each function specified in 28.5.4 is constant.
 - ³ Except where specified otherwise, no function described in 28.5.4 throws an exception.
 - ⁴ Every function described in 28.5.4 that has a function parameter q of type `Sseq&` for a template type parameter named `Sseq` that is different from type `seed_seq` throws what and when the invocation of `q.generate` throws.
 - ⁵ Descriptions are provided in 28.5.4 only for engine operations that are not described in 28.5.3.4 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

⁶ Each template specified in 28.5.4 requires one or more relationships, involving the value(s) of its non-type template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.

⁷ For every random number engine and for every random number engine adaptor X defined in 28.5.4 and in 28.5.5:

(7.1) — if the constructor

```
template<class Sseq> explicit X(Sseq& q);
```

is called with a type Sseq that does not qualify as a seed sequence, then this constructor shall not participate in overload resolution;

(7.2) — if the member function

```
template<class Sseq> void seed(Sseq& q);
```

is called with a type Sseq that does not qualify as a seed sequence, then this function shall not participate in overload resolution.

The extent to which an implementation determines that a type cannot be a seed sequence is unspecified, except that as a minimum a type shall not qualify as a seed sequence if it is implicitly convertible to X::result_type.

28.5.4.2 Class template linear_congruential_engine

[rand.eng.lcong]

¹ A linear_congruential_engine random number engine produces unsigned integer random numbers. The state x_i of a linear_congruential_engine object x is of size 1 and consists of a single integer. The transition algorithm is a modular linear function of the form $TA(x_i) = (a \cdot x_i + c) \bmod m$; the generation algorithm is $GA(x_i) = x_{i+1}$.

```
namespace std {
    template<class UIntType, UIntType a, UIntType c, UIntType m>
    class linear_congruential_engine {
        public:
            // types
            using result_type = UIntType;

            // engine characteristics
            static constexpr result_type multiplier = a;
            static constexpr result_type increment = c;
            static constexpr result_type modulus = m;
            static constexpr result_type min() { return c == 0u ? 1u : 0u; }
            static constexpr result_type max() { return m - 1u; }
            static constexpr result_type default_seed = 1u;

            // constructors and seeding functions
            linear_congruential_engine() : linear_congruential_engine(default_seed) {}
            explicit linear_congruential_engine(result_type s);
            template<class Sseq> explicit linear_congruential_engine(Sseq& q);
            void seed(result_type s = default_seed);
            template<class Sseq> void seed(Sseq& q);

            // equality operators
            friend bool operator==(const linear_congruential_engine& x,
                                   const linear_congruential_engine& y);

            // generating functions
            result_type operator()();
            void discard(unsigned long long z);

            // inserters and extractors
            template<class charT, class traits>
            friend basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& os, const linear_congruential_engine& x);
            template<class charT, class traits>
            friend basic_istream<charT, traits>&
            operator>>(basic_istream<charT, traits>& is, linear_congruential_engine& x);
    };
}
```

- };
}
- 2 If the template parameter m is 0, the modulus m used throughout this subclause 28.5.4.2 is `numeric_limits<result_type>::max()` plus 1.
 NOTE: m need not be representable as a value of type `result_type`.
- 3 If the template parameter m is not 0, the following relations shall hold: $a < m$ and $c < m$.
- 4 The textual representation consists of the value of x_i .
- ```
explicit linear_congruential_engine(result_type s);
```
- 5 *Effects:* If  $c \bmod m$  is 0 and  $s \bmod m$  is 0, sets the engine's state to 1, otherwise sets the engine's state to  $s \bmod m$ .

```
template<class Sseq> explicit linear_congruential_engine(Sseq& q);
```

- 6 *Effects:* With  $k = \lceil \frac{\log_2 m}{32} \rceil$  and  $a$  an array (or equivalent) of length  $k + 3$ , invokes `q.generate(a + 0, a + k + 3)` and then computes  $S = \left( \sum_{j=0}^{k-1} a_{j+3} \cdot 2^{32j} \right) \bmod m$ . If  $c \bmod m$  is 0 and  $S$  is 0, sets the engine's state to 1, else sets the engine's state to  $S$ .

### 28.5.4.3 Class template `mersenne_twister_engine`

[rand.eng.mers]

- 1 A `mersenne_twister_engine` random number engine<sup>228</sup> produces unsigned integer random numbers in the closed interval  $[0, 2^w - 1]$ . The state  $x_i$  of a `mersenne_twister_engine` object `x` is of size  $n$  and consists of a sequence  $X$  of  $n$  values of the type delivered by `x`; all subscripts applied to  $X$  are to be taken modulo  $n$ .
- 2 The transition algorithm employs a twisted generalized feedback shift register defined by shift values  $n$  and  $m$ , a twist value  $r$ , and a conditional xor-mask  $a$ . To improve the uniformity of the result, the bits of the raw shift register are additionally *tempered* (i.e., scrambled) according to a bit-scrambling matrix defined by values  $u, d, s, b, t, c$ , and  $\ell$ .

The state transition is performed as follows:

- (2.1) — Concatenate the upper  $w - r$  bits of  $X_{i-n}$  with the lower  $r$  bits of  $X_{i+1-n}$  to obtain an unsigned integer value  $Y$ .
- (2.2) — With  $\alpha = a \cdot (Y \text{ bitand } 1)$ , set  $X_i$  to  $X_{i+m-n} \text{ xor } (Y \text{ rshift } 1) \text{ xor } \alpha$ .

The sequence  $X$  is initialized with the help of an initialization multiplier  $f$ .

- 3 The generation algorithm determines the unsigned integer values  $z_1, z_2, z_3, z_4$  as follows, then delivers  $z_4$  as its result:

- (3.1) — Let  $z_1 = X_i \text{ xor } ((X_i \text{ rshift } u) \text{ bitand } d)$ .
- (3.2) — Let  $z_2 = z_1 \text{ xor } ((z_1 \text{ lshift}_w s) \text{ bitand } b)$ .
- (3.3) — Let  $z_3 = z_2 \text{ xor } ((z_2 \text{ lshift}_w t) \text{ bitand } c)$ .
- (3.4) — Let  $z_4 = z_3 \text{ xor } (z_3 \text{ rshift } \ell)$ .

```
namespace std {
 template<class UIntType, size_t w, size_t n, size_t m, size_t r,
 UIntType a, size_t u, UIntType d, size_t s,
 UIntType b, size_t t,
 UIntType c, size_t l, UIntType f>
 class mersenne_twister_engine {
 public:
 // types
 using result_type = UIntType;

 // engine characteristics
 static constexpr size_t word_size = w;
 static constexpr size_t state_size = n;
 static constexpr size_t shift_size = m;
 static constexpr size_t mask_bits = r;
```

<sup>228</sup>) The name of this engine refers, in part, to a property of its period: For properly-selected values of the parameters, the period is closely related to a large Mersenne prime number.

```

static constexpr UIntType xor_mask = a;
static constexpr size_t tempering_u = u;
static constexpr UIntType tempering_d = d;
static constexpr size_t tempering_s = s;
static constexpr UIntType tempering_b = b;
static constexpr size_t tempering_t = t;
static constexpr UIntType tempering_c = c;
static constexpr size_t tempering_l = l;
static constexpr UIntType initialization_multiplier = f;
static constexpr result_type min() { return 0; }
static constexpr result_type max() { return 2w - 1; }
static constexpr result_type default_seed = 5489u;

// constructors and seeding functions
mersenne_twister_engine() : mersenne_twister_engine(default_seed) {}
explicit mersenne_twister_engine(result_type value);
template<class Sseq> explicit mersenne_twister_engine(Sseq& q);
void seed(result_type value = default_seed);
template<class Sseq> void seed(Sseq& q);

// equality operators
friend bool operator==(const mersenne_twister_engine& x, const mersenne_twister_engine& y);

// generating functions
result_type operator()();
void discard(unsigned long long z);

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const mersenne_twister_engine& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, mersenne_twister_engine& x);
};

}

```

- <sup>4</sup> The following relations shall hold:  $0 < m, m \leq n, 2u < w, r \leq w, u \leq w, s \leq w, t \leq w, l \leq w, w \leq \text{numeric\_limits<} \text{UIntType} \text{>}::\text{digits}, a \leq (1u \ll w) - 1u, b \leq (1u \ll w) - 1u, c \leq (1u \ll w) - 1u, d \leq (1u \ll w) - 1u$ , and  $f \leq (1u \ll w) - 1u$ .
- <sup>5</sup> The textual representation of  $x_i$  consists of the values of  $X_{i-n}, \dots, X_{i-1}$ , in that order.

`explicit mersenne_twister_engine(result_type value);`

- <sup>6</sup> *Effects:* Sets  $X_{-n}$  to  $\text{value} \bmod 2^w$ . Then, iteratively for  $i = 1 - n, \dots, -1$ , sets  $X_i$  to

$$[f \cdot (X_{i-1} \text{ xor } (X_{i-1} \text{ rshift } (w - 2))) + i \bmod n] \bmod 2^w.$$

- <sup>7</sup> *Complexity:*  $\mathcal{O}(n)$ .

`template<class Sseq> explicit mersenne_twister_engine(Sseq& q);`

- <sup>8</sup> *Effects:* With  $k = \lceil w/32 \rceil$  and  $a$  an array (or equivalent) of length  $n \cdot k$ , invokes  $q.\text{generate}(a + 0, a + n \cdot k)$  and then, iteratively for  $i = -n, \dots, -1$ , sets  $X_i$  to  $(\sum_{j=0}^{k-1} a_{k(i+n)+j} \cdot 2^{32j}) \bmod 2^w$ . Finally, if the most significant  $w - r$  bits of  $X_{-n}$  are zero, and if each of the other resulting  $X_i$  is 0, changes  $X_{-n}$  to  $2^{w-1}$ .

#### 28.5.4.4 Class template `subtract_with_carry_engine`

[rand.eng.sub]

- <sup>1</sup> A `subtract_with_carry_engine` random number engine produces unsigned integer random numbers.
- <sup>2</sup> The state  $x_i$  of a `subtract_with_carry_engine` object  $x$  is of size  $\mathcal{O}(r)$ , and consists of a sequence  $X$  of  $r$  integer values  $0 \leq X_i < m = 2^w$ ; all subscripts applied to  $X$  are to be taken modulo  $r$ . The state  $x_i$  additionally consists of an integer  $c$  (known as the *carry*) whose value is either 0 or 1.
- <sup>3</sup> The state transition is performed as follows:

- (3.1) — Let  $Y = X_{i-s} - X_{i-r} - c$ .
- (3.2) — Set  $X_i$  to  $y = Y \bmod m$ . Set  $c$  to 1 if  $Y < 0$ , otherwise set  $c$  to 0.

NOTE: This algorithm corresponds to a modular linear function of the form  $\text{TA}(x_i) = (a \cdot x_i) \bmod b$ , where  $b$  is of the form  $m^r - m^s + 1$  and  $a = b - (b - 1)/m$ .

- 4 The generation algorithm is given by  $\text{GA}(x_i) = y$ , where  $y$  is the value produced as a result of advancing the engine's state as described above.

```
namespace std {
 template<class UIntType, size_t w, size_t s, size_t r>
 class subtract_with_carry_engine {
 public:
 // types
 using result_type = UIntType;

 // engine characteristics
 static constexpr size_t word_size = w;
 static constexpr size_t short_lag = s;
 static constexpr size_t long_lag = r;
 static constexpr result_type min() { return 0; }
 static constexpr result_type max() { return m - 1; }
 static constexpr result_type default_seed = 19780503u;

 // constructors and seeding functions
 subtract_with_carry_engine() : subtract_with_carry_engine(default_seed) {}
 explicit subtract_with_carry_engine(result_type value);
 template<class Sseq> explicit subtract_with_carry_engine(Sseq& q);
 void seed(result_type value = default_seed);
 template<class Sseq> void seed(Sseq& q);

 // equality operators
 friend bool operator==(const subtract_with_carry_engine& x,
 const subtract_with_carry_engine& y);

 // generating functions
 result_type operator()();
 void discard(unsigned long long z);

 // inserters and extractors
 template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const subtract_with_carry_engine& x);
 template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, subtract_with_carry_engine& x);
 };
}
```

- 5 The following relations shall hold:  $0u < s$ ,  $s < r$ ,  $0 < w$ , and  $w \leq \text{numeric_limits<} \text{UIntType}\text{>}::\text{digits}$ .
- 6 The textual representation consists of the values of  $X_{i-r}, \dots, X_{i-1}$ , in that order, followed by  $c$ .

```
explicit subtract_with_carry_engine(result_type value);
```

- 7 *Effects*: Sets the values of  $X_{-r}, \dots, X_{-1}$ , in that order, as specified below. If  $X_{-1}$  is then 0, sets  $c$  to 1; otherwise sets  $c$  to 0.

To set the values  $X_k$ , first construct  $e$ , a `linear_congruential_engine` object, as if by the following definition:

```
linear_congruential_engine<result_type,
 40014u, 0u, 2147483563u> e(value == 0u ? default_seed : value);
```

Then, to set each  $X_k$ , obtain new values  $z_0, \dots, z_{n-1}$  from  $n = \lceil w/32 \rceil$  successive invocations of  $e$ . Set  $X_k$  to  $\left( \sum_{j=0}^{n-1} z_j \cdot 2^{32j} \right) \bmod m$ .

- 8 *Complexity*: Exactly  $n \cdot r$  invocations of  $e$ .

`template<class Sseq> explicit subtract_with_carry_engine(Sseq& q);`

9     *Effects:* With  $k = \lceil w/32 \rceil$  and  $a$  an array (or equivalent) of length  $r \cdot k$ , invokes `q.generate(a + 0, a + r \cdot k)` and then, iteratively for  $i = -r, \dots, -1$ , sets  $X_i$  to  $\left( \sum_{j=0}^{k-1} a_{k(i+r)+j} \cdot 2^{32j} \right) \bmod m$ . If  $X_{-1}$  is then 0, sets  $c$  to 1; otherwise sets  $c$  to 0.

## 28.5.5 Random number engine adaptor class templates [rand.adapt]

### 28.5.5.1 In general [rand.adapt.general]

- 1 Each type instantiated from a class template specified in this subclause 28.5.5 meets the requirements of a random number engine adaptor (28.5.3.5) type.
- 2 Except where specified otherwise, the complexity of each function specified in this subclause 28.5.5 is constant.
- 3 Except where specified otherwise, no function described in this subclause 28.5.5 throws an exception.
- 4 Every function described in this subclause 28.5.5 that has a function parameter `q` of type `Sseq&` for a template type parameter named `Sseq` that is different from type `seed_seq` throws what and when the invocation of `q.generate` throws.
- 5 Descriptions are provided in this subclause 28.5.5 only for adaptor operations that are not described in subclause 28.5.3.5 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.
- 6 Each template specified in this subclause 28.5.5 requires one or more relationships, involving the value(s) of its non-type template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.

### 28.5.5.2 Class template `discard_block_engine` [rand.adapt.disc]

- 1 A `discard_block_engine` random number engine adaptor produces random numbers selected from those produced by some base engine `e`. The state  $x_i$  of a `discard_block_engine` engine adaptor object `x` consists of the state `e_i` of its base engine `e` and an additional integer  $n$ . The size of the state is the size of `e`'s state plus 1.
- 2 The transition algorithm discards all but  $r > 0$  values from each block of  $p \geq r$  values delivered by `e`. The state transition is performed as follows: If  $n \geq r$ , advance the state of `e` from `e_i` to `e_{i+p-r}` and set  $n$  to 0. In any case, then increment  $n$  and advance `e`'s then-current state `e_j` to `e_{j+1}`.
- 3 The generation algorithm yields the value returned by the last invocation of `e()` while advancing `e`'s state as described above.

```
namespace std {
 template<class Engine, size_t p, size_t r>
 class discard_block_engine {
 public:
 // types
 using result_type = typename Engine::result_type;

 // engine characteristics
 static constexpr size_t block_size = p;
 static constexpr size_t used_block = r;
 static constexpr result_type min() { return Engine::min(); }
 static constexpr result_type max() { return Engine::max(); }

 // constructors and seeding functions
 discard_block_engine();
 explicit discard_block_engine(const Engine& e);
 explicit discard_block_engine(Engine&& e);
 explicit discard_block_engine(result_type s);
 template<class Sseq> explicit discard_block_engine(Sseq& q);
 void seed();
 void seed(result_type s);
 template<class Sseq> void seed(Sseq& q);

 // equality operators
 friend bool operator==(const discard_block_engine& x, const discard_block_engine& y);
 };
}
```

```

// generating functions
result_type operator()();
void discard(unsigned long long z);

// property functions
const Engine& base() const noexcept { return e; }

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const discard_block_engine& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, discard_block_engine& x);

private:
 Engine e; // exposition only
 size_t n; // exposition only
};

}

```

- <sup>4</sup> The following relations shall hold:  $0 < r$  and  $r \leq p$ .
- <sup>5</sup> The textual representation consists of the textual representation of  $e$  followed by the value of  $n$ .
- <sup>6</sup> In addition to its behavior pursuant to subclause 28.5.3.5, each constructor that is not a copy constructor sets  $n$  to 0.

### 28.5.5.3 Class template independent\_bits\_engine

[rand.adapt.ibits]

- <sup>1</sup> An `independent_bits_engine` random number engine adaptor combines random numbers that are produced by some base engine  $e$ , so as to produce random numbers with a specified number of bits  $w$ . The state  $\mathbf{x}_i$  of an `independent_bits_engine` engine adaptor object  $x$  consists of the state  $e_i$  of its base engine  $e$ ; the size of the state is the size of  $e$ 's state.
- <sup>2</sup> The transition and generation algorithms are described in terms of the following integral constants:
  - (2.1) — Let  $R = e.\max() - e.\min() + 1$  and  $m = \lfloor \log_2 R \rfloor$ .
  - (2.2) — With  $n$  as determined below, let  $w_0 = \lfloor w/n \rfloor$ ,  $n_0 = n - w \bmod n$ ,  $y_0 = 2^{w_0} \lfloor R/2^{w_0} \rfloor$ , and  $y_1 = 2^{w_0+1} \lfloor R/2^{w_0+1} \rfloor$ .
  - (2.3) — Let  $n = \lceil w/m \rceil$  if and only if the relation  $R - y_0 \leq \lfloor y_0/n \rfloor$  holds as a result. Otherwise let  $n = 1 + \lceil w/m \rceil$ .

NOTE: The relation  $w = n_0 w_0 + (n - n_0)(w_0 + 1)$  always holds.
- <sup>3</sup> The transition algorithm is carried out by invoking  $e()$  as often as needed to obtain  $n_0$  values less than  $y_0 + e.\min()$  and  $n - n_0$  values less than  $y_1 + e.\min()$ .
- <sup>4</sup> The generation algorithm uses the values produced while advancing the state as described above to yield a quantity  $S$  obtained as if by the following algorithm:

```

S = 0;
for (k = 0; k != n_0; k += 1) {
 do u = e() - e.\min(); while (u \geq y_0);
 S = 2^{w_0} \cdot S + u \bmod 2^{w_0};
}
for (k = n_0; k != n; k += 1) {
 do u = e() - e.\min(); while (u \geq y_1);
 S = 2^{w_0+1} \cdot S + u \bmod 2^{w_0+1};
}

template<class Engine, size_t w, class UIntType>
class independent_bits_engine {
public:
 // types
 using result_type = UIntType;

 // engine characteristics
 static constexpr result_type min() { return 0; }

```

```

static constexpr result_type max() { return $2^w - 1$; }

// constructors and seeding functions
independent_bits_engine();
explicit independent_bits_engine(const Engine& e);
explicit independent_bits_engine(Engine&& e);
explicit independent_bits_engine(result_type s);
template<class Sseq> explicit independent_bits_engine(Sseq& q);
void seed();
void seed(result_type s);
template<class Sseq> void seed(Sseq& q);

// equality operators
friend bool operator==(const independent_bits_engine& x, const independent_bits_engine& y);

// generating functions
result_type operator()();
void discard(unsigned long long z);

// property functions
const Engine& base() const noexcept { return e; }

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const independent_bits_engine& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, independent_bits_engine& x);

private:
 Engine e; // exposition only
};

```

5 The following relations shall hold:  $0 < w$  and  $w \leq \text{numeric_limits<} \text{result\_type}\text{>}::\text{digits}$ .

6 The textual representation consists of the textual representation of `e`.

#### 28.5.5.4 Class template `shuffle_order_engine`

[rand.adapt.shuf]

<sup>1</sup> A `shuffle_order_engine` random number engine adaptor produces the same random numbers that are produced by some base engine `e`, but delivers them in a different sequence. The state  $x_i$  of a `shuffle_order_engine` engine adaptor object `x` consists of the state `ei` of its base engine `e`, an additional value  $Y$  of the type delivered by `e`, and an additional sequence  $V$  of  $k$  values also of the type delivered by `e`. The size of the state is the size of `e`'s state plus  $k + 1$ .

<sup>2</sup> The transition algorithm permutes the values produced by `e`. The state transition is performed as follows:

- (2.1) — Calculate an integer  $j = \left\lfloor \frac{k \cdot (Y - e_{\min})}{e_{\max} - e_{\min} + 1} \right\rfloor$ .
- (2.2) — Set  $Y$  to  $V_j$  and then set  $V_j$  to `e()`.

<sup>3</sup> The generation algorithm yields the last value of  $Y$  produced while advancing `e`'s state as described above.

```

namespace std {
 template<class Engine, size_t k>
 class shuffle_order_engine {
 public:
 // types
 using result_type = typename Engine::result_type;

 // engine characteristics
 static constexpr size_t table_size = k;
 static constexpr result_type min() { return Engine::min(); }
 static constexpr result_type max() { return Engine::max(); }
 };
}

```

```

// constructors and seeding functions
shuffle_order_engine();
explicit shuffle_order_engine(const Engine& e);
explicit shuffle_order_engine(Engine&& e);
explicit shuffle_order_engine(result_type s);
template<class Sseq> explicit shuffle_order_engine(Sseq& q);
void seed();
void seed(result_type s);
template<class Sseq> void seed(Sseq& q);

// equality operators
friend bool operator==(const shuffle_order_engine& x, const shuffle_order_engine& y);

// generating functions
result_type operator()();
void discard(unsigned long long z);

// property functions
const Engine& base() const noexcept { return e; }

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const shuffle_order_engine& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, shuffle_order_engine& x);

private:
 Engine e; // exposition only
 result_type V[k]; // exposition only
 result_type Y; // exposition only
};

}

```

<sup>4</sup> The following relation shall hold:  $0 < k$ .

<sup>5</sup> The textual representation consists of the textual representation of  $e$ , followed by the  $k$  values of  $V$ , followed by the value of  $Y$ .

<sup>6</sup> In addition to its behavior pursuant to subclause 28.5.3.5, each constructor that is not a copy constructor initializes  $V[0], \dots, V[k-1]$  and  $Y$ , in that order, with values returned by successive invocations of  $e()$ .

## 28.5.6 Engines and engine adaptors with predefined parameters

[rand.predef]

```
using minstd_rand0 =
 linear_congruential_engine<uint_fast32_t, 16'807, 0, 2'147'483'647>;
```

<sup>1</sup> *Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `minstd_rand0` produces the value 1043618065.

```
using minstd_rand =
 linear_congruential_engine<uint_fast32_t, 48'271, 0, 2'147'483'647>;
```

<sup>2</sup> *Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `minstd_rand` produces the value 399268537.

```
using mt19937 =
 mersenne_twister_engine<uint_fast32_t, 32, 624, 397, 31,
 0x9908'b0df, 11, 0xffff'ffff, 7, 0x9d2c'5680, 15, 0xefc6'0000, 18, 1'812'433'253>;
```

<sup>3</sup> *Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `mt19937` produces the value 4123659995.

```
using mt19937_64 =
 mersenne_twister_engine<uint_fast64_t, 64, 312, 156, 31,
 0xb502'6f5a'a966'19e9, 29, 0x5555'5555'5555, 17,
```

4           0x71d6'7fff'eda6'0000, 37, 0xffff7'eee0'0000'0000, 43, 6'364'136'223'846'793'005>;

4       *Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `mt19937_64` produces the value 9981545732273789042.

```
using ranlux24_base =
 subtract_with_carry_engine<uint_fast32_t, 24, 10, 24>;
```

5       *Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `ranlux24_base` produces the value 7937952.

```
using ranlux48_base =
 subtract_with_carry_engine<uint_fast64_t, 48, 5, 12>;
```

6       *Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `ranlux48_base` produces the value 61839128582725.

```
using ranlux24 = discard_block_engine<ranlux24_base, 223, 23>;
```

7       *Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `ranlux24` produces the value 9901578.

```
using ranlux48 = discard_block_engine<ranlux48_base, 389, 11>;
```

8       *Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `ranlux48` produces the value 249142670248501.

```
using knuth_b = shuffle_order_engine<minstd_rand0,256>;
```

9       *Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `knuth_b` produces the value 1112339016.

```
using default_random_engine = implementation-defined;
```

10      *Remarks:* The choice of engine type named by this `typedef` is implementation-defined.

NOTE: The implementation can select this type on the basis of performance, size, quality, or any combination of such factors, so as to provide at least acceptable engine behavior for relatively casual, inexpert, and/or lightweight use. Because different implementations can select different underlying engine types, code that uses this `typedef` need not generate identical sequences across implementations.

## 28.5.7 Class `random_device`

[`rand.device`]

- 1 A `random_device` uniform random bit generator produces nondeterministic random numbers.
- 2 If implementation limitations prevent generating nondeterministic random numbers, the implementation may employ a random number engine.

```
namespace std {
 class random_device {
 public:
 // types
 using result_type = unsigned int;

 // generator characteristics
 static constexpr result_type min() { return numeric_limits<result_type>::min(); }
 static constexpr result_type max() { return numeric_limits<result_type>::max(); }

 // constructors
 random_device() : random_device(implementation-defined) {}
 explicit random_device(const string& token);

 // generating functions
 result_type operator()();

 // property functions
 double entropy() const noexcept;

 // no copy functions
 random_device(const random_device&) = delete;
```

```

 void operator=(const random_device&) = delete;
 };
}

explicit random_device(const string& token);

3 Throws: A value of an implementation-defined type derived from exception if the random_device
cannot be initialized.

4 Remarks: The semantics of the token parameter and the token value used by the default constructor
are implementation-defined.229

double entropy() const noexcept;

5 Returns: If the implementation employs a random number engine, returns 0.0. Otherwise, returns
an entropy estimate230 for the random numbers returned by operator(), in the range min() to
 $\log_2(\max() + 1)$.

result_type operator()();

6 Returns: A nondeterministic random value, uniformly distributed between min() and max() (inclusive).
It is implementation-defined how these values are generated.

7 Throws: A value of an implementation-defined type derived from exception if a random number
cannot be obtained.

```

## 28.5.8 Utilities

[rand.util]

### 28.5.8.1 Class `seed_seq`

[rand.util.seedseq]

```

namespace std {
 class seed_seq {
public:
 // types
 using result_type = uint_least32_t;

 // constructors
 seed_seq() noexcept;
 template<class T>
 seed_seq(initializer_list<T> il);
 template<class InputIterator>
 seed_seq(InputIterator begin, InputIterator end);

 // generating functions
 template<class RandomAccessIterator>
 void generate(RandomAccessIterator begin, RandomAccessIterator end);

 // property functions
 size_t size() const noexcept;
 template<class OutputIterator>
 void param(OutputIterator dest) const;

 // no copy functions
 seed_seq(const seed_seq&) = delete;
 void operator=(const seed_seq&) = delete;

private:
 vector<result_type> v; // exposition only
};

seed_seq() noexcept;

```

1 *Postconditions:* `v.empty()` is true.

<sup>229</sup>) The parameter is intended to allow an implementation to differentiate between different sources of randomness.

<sup>230</sup>) If a device has  $n$  states whose respective probabilities are  $P_0, \dots, P_{n-1}$ , the device entropy  $S$  is defined as

$$S = -\sum_{i=0}^{n-1} P_i \cdot \log P_i.$$

```

template<class T>
seed_seq(initializer_list<T> il);
2 Constraints: T is an integer type.
3 Effects: Same as seed_seq(il.begin(), il.end()).

template<class InputIterator>
seed_seq(InputIterator begin, InputIterator end);
4 Mandates: iterator_traits<InputIterator>::value_type is an integer type.
5 Preconditions: InputIterator meets the Cpp17InputIterator requirements (25.3.5.3).
6 Effects: Initializes v by the following algorithm:
 for (InputIterator s = begin; s != end; ++s)
 v.push_back((*s)mod232);

template<class RandomAccessIterator>
void generate(RandomAccessIterator begin, RandomAccessIterator end);
7 Mandates: iterator_traits<RandomAccessIterator>::value_type is an unsigned integer type capable of accommodating 32-bit quantities.
8 Preconditions: RandomAccessIterator meets the Cpp17RandomAccessIterator requirements (25.3.5.7) and the requirements of a mutable iterator.
9 Effects: Does nothing if begin == end. Otherwise, with s = v.size() and n = end - begin, fills the supplied range [begin, end) according to the following algorithm in which each operation is to be carried out modulo 232, each indexing operator applied to begin is to be taken modulo n, and T(x) is defined as x xor (x rshift 27):
(9.1) — By way of initialization, set each element of the range to the value 0x8b8b8b8b. Additionally, for use in subsequent steps, let p = (n - t)/2 and let q = p + t, where

$$t = (n \geq 623) ? 11 : (n \geq 68) ? 7 : (n \geq 39) ? 5 : (n \geq 7) ? 3 : (n - 1)/2;$$

(9.2) — With m as the larger of s + 1 and n, transform the elements of the range: iteratively for k = 0, ..., m - 1, calculate values

$$\begin{aligned} r_1 &= 1664525 \cdot T(\text{begin}[k] \text{ xor } \text{begin}[k + p] \text{ xor } \text{begin}[k - 1]) \\ r_2 &= r_1 + \begin{cases} s & , k = 0 \\ k \text{ mod } n + v[k - 1] & , 0 < k \leq s \\ k \text{ mod } n & , s < k \end{cases} \end{aligned}$$

 and, in order, increment begin[k + p] by r_1 , increment begin[k + q] by r_2 , and set begin[k] to r_2 .
(9.3) — Transform the elements of the range again, beginning where the previous step ended: iteratively for k = m, ..., m + n - 1, calculate values

$$\begin{aligned} r_3 &= 1566083941 \cdot T(\text{begin}[k] + \text{begin}[k + p] + \text{begin}[k - 1]) \\ r_4 &= r_3 - (k \text{ mod } n) \end{aligned}$$

 and, in order, update begin[k + p] by xoring it with r_3 , update begin[k + q] by xoring it with r_4 , and set begin[k] to r_4 .
10 Throws: What and when RandomAccessIterator operations of begin and end throw.

size_t size() const noexcept;
11 Returns: The number of 32-bit units that would be returned by a call to param().
12 Complexity: Constant time.

template<class OutputIterator>
void param(OutputIterator dest) const;
13 Mandates: Values of type result_type are writable (25.3.1) to dest.
14 Preconditions: OutputIterator meets the Cpp17OutputIterator requirements (25.3.5.4).

```

15     *Effects:* Copies the sequence of prepared 32-bit units to the given destination, as if by executing the following statement:

```
copy(v.begin(), v.end(), dest);
```

16     *Throws:* What and when `OutputIterator` operations of `dest` throw.

### 28.5.8.2 Function template `generate_canonical`

[`rand.util.canonical`]

```
template<class RealType, size_t bits, class URBG>
RealType generate_canonical(URBG& g);
```

1     *Effects:* Invokes `g()`  $k$  times to obtain values  $g_0, \dots, g_{k-1}$ , respectively. Calculates a quantity

$$S = \sum_{i=0}^{k-1} (g_i - g.\min()) \cdot R^i$$

using arithmetic of type `RealType`.

2     *Returns:*  $S/R^k$ .

NOTE 1:  $0 \leq S/R^k < 1$ .

3     *Throws:* What and when `g` throws.

4     *Complexity:* Exactly  $k = \max(1, \lceil b/\log_2 R \rceil)$  invocations of `g`, where  $b$ <sup>231</sup> is the lesser of `numeric_limits<RealType>::digits` and `bits`, and  $R$  is the value of `g.max() - g.min() + 1`.

5     NOTE 2: If the values  $g_i$  produced by `g` are uniformly distributed, the instantiation's results are distributed as uniformly as possible. Obtaining a value in this way can be a useful step in the process of transforming a value generated by a uniform random bit generator into a value that can be delivered by a random number distribution.

## 28.5.9 Random number distribution class templates

[`rand.dist`]

### 28.5.9.1 In general

[`rand.dist.general`]

- 1 Each type instantiated from a class template specified in this subclause 28.5.9 meets the requirements of a random number distribution (28.5.3.6) type.
- 2 Descriptions are provided in this subclause 28.5.9 only for distribution operations that are not described in 28.5.3.6 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.
- 3 The algorithms for producing each of the specified distributions are implementation-defined.
- 4 The value of each probability density function  $p(z)$  and of each discrete probability function  $P(z_i)$  specified in this subclause is 0 everywhere outside its stated domain.

### 28.5.9.2 Uniform distributions

[`rand.dist.uni`]

#### 28.5.9.2.1 Class template `uniform_int_distribution`

[`rand.dist.uni.int`]

- 1 A `uniform_int_distribution` random number distribution produces random integers  $i$ ,  $a \leq i \leq b$ , distributed according to the constant discrete probability function

$$P(i | a, b) = 1/(b - a + 1).$$

```
namespace std {
 template<class IntType = int>
 class uniform_int_distribution {
 public:
 // types
 using result_type = IntType;
 using param_type = unspecified;
```

<sup>231</sup>  $b$  is introduced to avoid any attempt to produce more bits of randomness than can be held in `RealType`.

```

// constructors and reset functions
uniform_int_distribution() : uniform_int_distribution(0) {}
explicit uniform_int_distribution(IntType a, IntType b = numeric_limits<IntType>::max());
explicit uniform_int_distribution(const param_type& parm);
void reset();

// equality operators
friend bool operator==(const uniform_int_distribution& x, const uniform_int_distribution& y);

// generating functions
template<class URBG>
result_type operator()(URBG& g);
template<class URBG>
result_type operator()(URBG& g, const param_type& parm);

// property functions
result_type a() const;
result_type b() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const uniform_int_distribution& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, uniform_int_distribution& x);
};

}

explicit uniform_int_distribution(IntType a, IntType b = numeric_limits<IntType>::max());

```

2      *Preconditions:*  $a \leq b$ .

3      *Remarks:*  $a$  and  $b$  correspond to the respective parameters of the distribution.

result\_type a() const;

4      *Returns:* The value of the  $a$  parameter with which the object was constructed.

result\_type b() const;

5      *Returns:* The value of the  $b$  parameter with which the object was constructed.

#### 28.5.9.2.2 Class template uniform\_real\_distribution

[rand.dist.uni.real]

- 1 A `uniform_real_distribution` random number distribution produces random numbers  $x$ ,  $a \leq x < b$ , distributed according to the constant probability density function

$$p(x | a, b) = 1/(b - a) .$$

NOTE: This implies that  $p(x | a, b)$  is undefined when  $a == b$ .

```

namespace std {
 template<class RealType = double>
 class uniform_real_distribution {
public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructors and reset functions
 uniform_real_distribution() : uniform_real_distribution(0.0) {}
 explicit uniform_real_distribution(RealType a, RealType b = 1.0);
 explicit uniform_real_distribution(const param_type& parm);
}

```

```

void reset();

// equality operators
friend bool operator==(const uniform_real_distribution& x,
 const uniform_real_distribution& y);

// generating functions
template<class URBG>
result_type operator()(URBG& g);
template<class URBG>
result_type operator()(URBG& g, const param_type& parm);

// property functions
result_type a() const;
result_type b() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const uniform_real_distribution& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, uniform_real_distribution & x);
};

};

explicit uniform_real_distribution(RealType a, RealType b = 1.0);

2 Preconditions: a ≤ b and b - a ≤ numeric_limits<RealType>::max().
3 Remarks: a and b correspond to the respective parameters of the distribution.

result_type a() const;
4 Returns: The value of the a parameter with which the object was constructed.

result_type b() const;
5 Returns: The value of the b parameter with which the object was constructed.

```

### 28.5.9.3 Bernoulli distributions

[rand.dist.bern]

#### 28.5.9.3.1 Class bernoulli\_distribution

[rand.dist.bern.bernoulli]

- 1 A `bernoulli_distribution` random number distribution produces `bool` values *b* distributed according to the discrete probability function

$$P(b|p) = \begin{cases} p & \text{if } b = \text{true, or} \\ 1 - p & \text{if } b = \text{false.} \end{cases}$$

```

namespace std {
 class bernoulli_distribution {
public:
 // types
 using result_type = bool;
 using param_type = unspecified;

 // constructors and reset functions
 bernoulli_distribution() : bernoulli_distribution(0.5) {}
 explicit bernoulli_distribution(double p);
 explicit bernoulli_distribution(const param_type& parm);
 void reset();
}

```

```

// equality operators
friend bool operator==(const bernoulli_distribution& x, const bernoulli_distribution& y);

// generating functions
template<class URBG>
result_type operator()(URBG& g);
template<class URBG>
result_type operator()(URBG& g, const param_type& parm);

// property functions
double p() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const bernoulli_distribution& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, bernoulli_distribution& x);
};

};

explicit bernoulli_distribution(double p);

2 Preconditions: $0 \leq p \leq 1$.
3 Remarks: p corresponds to the parameter of the distribution.

double p() const;

4 Returns: The value of the p parameter with which the object was constructed.

```

#### 28.5.9.3.2 Class template binomial\_distribution [rand.dist.bern.bin]

- <sup>1</sup> A binomial\_distribution random number distribution produces integer values  $i \geq 0$  distributed according to the discrete probability function

$$P(i|t,p) = \binom{t}{i} \cdot p^i \cdot (1-p)^{t-i}.$$

```

namespace std {
 template<class IntType = int>
 class binomial_distribution {
public:
 // types
 using result_type = IntType;
 using param_type = unspecified;

 // constructors and reset functions
 binomial_distribution() : binomial_distribution(1) {}
 explicit binomial_distribution(IntType t, double p = 0.5);
 explicit binomial_distribution(const param_type& parm);
 void reset();

 // equality operators
 friend bool operator==(const binomial_distribution& x, const binomial_distribution& y);

 // generating functions
 template<class URBG>
 result_type operator()(URBG& g);
 template<class URBG>
 result_type operator()(URBG& g, const param_type& parm);
}

```

```

// property functions
IntType t() const;
double p() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const binomial_distribution& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, binomial_distribution& x);
};

}

explicit binomial_distribution(IntType t, double p = 0.5);

```

2      *Preconditions:*  $0 \leq p \leq 1$  and  $0 \leq t$ .

3      *Remarks:*  $t$  and  $p$  correspond to the respective parameters of the distribution.

IntType t() const;

4      *Returns:* The value of the  $t$  parameter with which the object was constructed.

double p() const;

5      *Returns:* The value of the  $p$  parameter with which the object was constructed.

#### 28.5.9.3.3 Class template geometric\_distribution

[rand.dist.bern.geo]

1 A geometric\_distribution random number distribution produces integer values  $i \geq 0$  distributed according to the discrete probability function

$$P(i | p) = p \cdot (1 - p)^i .$$

```

namespace std {
 template<class IntType = int>
 class geometric_distribution {
public:
 // types
 using result_type = IntType;
 using param_type = unspecified;

 // constructors and reset functions
 geometric_distribution() : geometric_distribution(0.5) {}
 explicit geometric_distribution(double p);
 explicit geometric_distribution(const param_type& parm);
 void reset();

 // equality operators
 friend bool operator==(const geometric_distribution& x, const geometric_distribution& y);

 // generating functions
 template<class URNG>
 result_type operator()(URNG& g);
 template<class URNG>
 result_type operator()(URNG& g, const param_type& parm);

 // property functions
 double p() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;
}

```

```

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const geometric_distribution& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, geometric_distribution& x);
};

}

explicit geometric_distribution(double p);

```

2        *Preconditions:*  $0 < p < 1$ .

3        *Remarks:*  $p$  corresponds to the parameter of the distribution.

double p() const;

4        *Returns:* The value of the  $p$  parameter with which the object was constructed.

#### 28.5.9.3.4 Class template negative\_binomial\_distribution

[rand.dist.bern.negbin]

<sup>1</sup> A negative\_binomial\_distribution random number distribution produces random integers  $i \geq 0$  distributed according to the discrete probability function

$$P(i | k, p) = \binom{k+i-1}{i} \cdot p^k \cdot (1-p)^i .$$

NOTE: This implies that  $P(i | k, p)$  is undefined when  $p == 1$ .

```

namespace std {
 template<class IntType = int>
 class negative_binomial_distribution {
public:
 // types
 using result_type = IntType;
 using param_type = unspecified;

 // constructor and reset functions
 negative_binomial_distribution() : negative_binomial_distribution(1) {}
 explicit negative_binomial_distribution(IntType k, double p = 0.5);
 explicit negative_binomial_distribution(const param_type& parm);
 void reset();

 // equality operators
 friend bool operator==(const negative_binomial_distribution& x,
 const negative_binomial_distribution& y);

 // generating functions
 template<class URNG>
 result_type operator()(URNG& g);
 template<class URNG>
 result_type operator()(URNG& g, const param_type& parm);

 // property functions
 IntType k() const;
 double p() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;

 // inserters and extractors
 template<class charT, class traits>
 friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const negative_binomial_distribution& x);

```

```

 template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, negative_binomial_distribution& x);
 };
}

explicit negative_binomial_distribution(IntType k, double p = 0.5);

```

2     *Preconditions:*  $0 < p \leq 1$  and  $0 < k$ .

3     *Remarks:*  $k$  and  $p$  correspond to the respective parameters of the distribution.

    IntType k() const;

4     *Returns:* The value of the  $k$  parameter with which the object was constructed.

    double p() const;

5     *Returns:* The value of the  $p$  parameter with which the object was constructed.

#### 28.5.9.4 Poisson distributions

[rand.dist.pois]

##### 28.5.9.4.1 Class template poisson\_distribution

[rand.dist.pois.poisson]

- 1 A `poisson_distribution` random number distribution produces integer values  $i \geq 0$  distributed according to the discrete probability function

$$P(i | \mu) = \frac{e^{-\mu} \mu^i}{i!}.$$

The distribution parameter  $\mu$  is also known as this distribution's *mean*.

```

template<class IntType = int>
class poisson_distribution
{
public:
 // types
 using result_type = IntType;
 using param_type = unspecified;

 // constructors and reset functions
 poisson_distribution() : poisson_distribution(1.0) {}
 explicit poisson_distribution(double mean);
 explicit poisson_distribution(const param_type& parm);
 void reset();

 // equality operators
 friend bool operator==(const poisson_distribution& x, const poisson_distribution& y);

 // generating functions
 template<class URNG>
 result_type operator()(URNG& g);
 template<class URNG>
 result_type operator()(URNG& g, const param_type& parm);

 // property functions
 double mean() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;

 // inserters and extractors
 template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const poisson_distribution& x);
 template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, poisson_distribution& x);
};

```

```

explicit poisson_distribution(double mean);
2 Preconditions: 0 < mean.
3 Remarks: mean corresponds to the parameter of the distribution.
double mean() const;
4 Returns: The value of the mean parameter with which the object was constructed.

```

#### 28.5.9.4.2 Class template exponential\_distribution [rand.dist.pois.exp]

- 1 An exponential\_distribution random number distribution produces random numbers  $x > 0$  distributed according to the probability density function

$$p(x | \lambda) = \lambda e^{-\lambda x}.$$

```

namespace std {
 template<class RealType = double>
 class exponential_distribution {
 public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructors and reset functions
 exponential_distribution() : exponential_distribution(1.0) {}
 explicit exponential_distribution(RealType lambda);
 explicit exponential_distribution(const param_type& parm);
 void reset();

 // equality operators
 friend bool operator==(const exponential_distribution& x, const exponential_distribution& y);

 // generating functions
 template<class URNG>
 result_type operator()(URNG& g);
 template<class URNG>
 result_type operator()(URNG& g, const param_type& parm);

 // property functions
 RealType lambda() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;

 // inserters and extractors
 template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const exponential_distribution& x);
 template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, exponential_distribution& x);
 };
}

explicit exponential_distribution(RealType lambda);
2 Preconditions: 0 < lambda.
3 Remarks: lambda corresponds to the parameter of the distribution.
RealType lambda() const;
4 Returns: The value of the lambda parameter with which the object was constructed.

```

28.5.9.4.3 Class template `gamma_distribution`

[rand.dist.pois.gamma]

- <sup>1</sup> A `gamma_distribution` random number distribution produces random numbers  $x > 0$  distributed according to the probability density function

$$p(x | \alpha, \beta) = \frac{e^{-x/\beta}}{\beta^\alpha \cdot \Gamma(\alpha)} \cdot x^{\alpha-1}.$$

```
namespace std {
 template<class RealType = double>
 class gamma_distribution {
 public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructors and reset functions
 gamma_distribution() : gamma_distribution(1.0) {}
 explicit gamma_distribution(RealType alpha, RealType beta = 1.0);
 explicit gamma_distribution(const param_type& parm);
 void reset();

 // equality operators
 friend bool operator==(const gamma_distribution& x, const gamma_distribution& y);

 // generating functions
 template<class URNG>
 result_type operator()(URNG& g);
 template<class URNG>
 result_type operator()(URNG& g, const param_type& parm);

 // property functions
 RealType alpha() const;
 RealType beta() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;

 // inserters and extractors
 template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const gamma_distribution& x);
 template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, gamma_distribution& x);
 };
}

explicit gamma_distribution(RealType alpha, RealType beta = 1.0);
```

<sup>2</sup> *Preconditions:*  $0 < \alpha$  and  $0 < \beta$ .

<sup>3</sup> *Remarks:*  $\alpha$  and  $\beta$  correspond to the parameters of the distribution.

`RealType alpha() const;`

<sup>4</sup> *Returns:* The value of the `alpha` parameter with which the object was constructed.

`RealType beta() const;`

<sup>5</sup> *Returns:* The value of the `beta` parameter with which the object was constructed.

#### 28.5.9.4.4 Class template `weibull_distribution`

[`rand.dist.pois.weibull`]

- <sup>1</sup> A `weibull_distribution` random number distribution produces random numbers  $x \geq 0$  distributed according to the probability density function

$$p(x | a, b) = \frac{a}{b} \cdot \left(\frac{x}{b}\right)^{a-1} \cdot \exp\left(-\left(\frac{x}{b}\right)^a\right).$$

```
namespace std {
 template<class RealType = double>
 class weibull_distribution {
 public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructor and reset functions
 weibull_distribution() : weibull_distribution(1.0) {}
 explicit weibull_distribution(RealType a, RealType b = 1.0);
 explicit weibull_distribution(const param_type& parm);
 void reset();

 // equality operators
 friend bool operator==(const weibull_distribution& x, const weibull_distribution& y);

 // generating functions
 template<class URNG>
 result_type operator()(URNG& g);
 template<class URNG>
 result_type operator()(URNG& g, const param_type& parm);

 // property functions
 RealType a() const;
 RealType b() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;

 // inserters and extractors
 template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const weibull_distribution& x);
 template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, weibull_distribution& x);
 };
}
```

`explicit weibull_distribution(RealType a, RealType b = 1.0);`

- <sup>2</sup> *Preconditions:*  $0 < a$  and  $0 < b$ .

- <sup>3</sup> *Remarks:*  $a$  and  $b$  correspond to the respective parameters of the distribution.

`RealType a() const;`

- <sup>4</sup> *Returns:* The value of the  $a$  parameter with which the object was constructed.

`RealType b() const;`

- <sup>5</sup> *Returns:* The value of the  $b$  parameter with which the object was constructed.

28.5.9.4.5 Class template `extreme_value_distribution`

[rand.dist.pois.extreme]

- <sup>1</sup> An `extreme_value_distribution` random number distribution produces random numbers  $x$  distributed according to the probability density function<sup>232</sup>

$$p(x | a, b) = \frac{1}{b} \cdot \exp\left(\frac{a-x}{b} - \exp\left(\frac{a-x}{b}\right)\right).$$

```
namespace std {
 template<class RealType = double>
 class extreme_value_distribution {
 public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructor and reset functions
 extreme_value_distribution() : extreme_value_distribution(0.0) {}
 explicit extreme_value_distribution(RealType a, RealType b = 1.0);
 explicit extreme_value_distribution(const param_type& parm);
 void reset();

 // equality operators
 friend bool operator==(const extreme_value_distribution& x,
 const extreme_value_distribution& y);

 // generating functions
 template<class URNG>
 result_type operator()(URNG& g);
 template<class URNG>
 result_type operator()(URNG& g, const param_type& parm);

 // property functions
 RealType a() const;
 RealType b() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;

 // inserters and extractors
 template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const extreme_value_distribution& x);
 template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, extreme_value_distribution& x);
 };
}

explicit extreme_value_distribution(RealType a, RealType b = 1.0);
```

<sup>2</sup> *Preconditions:*  $0 < b$ .

<sup>3</sup> *Remarks:*  $a$  and  $b$  correspond to the respective parameters of the distribution.

`RealType a() const;`

<sup>4</sup> *Returns:* The value of the  $a$  parameter with which the object was constructed.

`RealType b() const;`

<sup>5</sup> *Returns:* The value of the  $b$  parameter with which the object was constructed.

---

<sup>232)</sup> The distribution corresponding to this probability density function is also known (with a possible change of variable) as the Gumbel Type I, the log-Weibull, or the Fisher-Tippett Type I distribution.

### 28.5.9.5 Normal distributions

[rand.dist.norm]

#### 28.5.9.5.1 Class template `normal_distribution`

[rand.dist.norm.normal]

- <sup>1</sup> A `normal_distribution` random number distribution produces random numbers  $x$  distributed according to the probability density function

$$p(x | \mu, \sigma) = \frac{1}{\sigma\sqrt{2\pi}} \cdot \exp\left(-\frac{(x - \mu)^2}{2\sigma^2}\right).$$

The distribution parameters  $\mu$  and  $\sigma$  are also known as this distribution's *mean* and *standard deviation*.

```
namespace std {
 template<class RealType = double>
 class normal_distribution {
public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructors and reset functions
 normal_distribution() : normal_distribution(0.0) {}
 explicit normal_distribution(RealType mean, RealType stddev = 1.0);
 explicit normal_distribution(const param_type& parm);
 void reset();

 // equality operators
 friend bool operator==(const normal_distribution& x, const normal_distribution& y);

 // generating functions
 template<class URNG>
 result_type operator()(URNG& g);
 template<class URNG>
 result_type operator()(URNG& g, const param_type& parm);

 // property functions
 RealType mean() const;
 RealType stddev() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;

 // inserters and extractors
 template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const normal_distribution& x);
 template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, normal_distribution& x);
};

explicit normal_distribution(RealType mean, RealType stddev = 1.0);
```

<sup>2</sup> *Preconditions:*  $0 < \text{stddev}$ .

<sup>3</sup> *Remarks:* `mean` and `stddev` correspond to the respective parameters of the distribution.

`RealType mean() const;`

<sup>4</sup> *Returns:* The value of the `mean` parameter with which the object was constructed.

`RealType stddev() const;`

<sup>5</sup> *Returns:* The value of the `stddev` parameter with which the object was constructed.

28.5.9.5.2 Class template `lognormal_distribution`[`rand.dist.norm.lognormal`]

- <sup>1</sup> A `lognormal_distribution` random number distribution produces random numbers  $x > 0$  distributed according to the probability density function

$$p(x | m, s) = \frac{1}{sx\sqrt{2\pi}} \cdot \exp\left(-\frac{(\ln x - m)^2}{2s^2}\right).$$

```
namespace std {
 template<class RealType = double>
 class lognormal_distribution {
 public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructor and reset functions
 lognormal_distribution() : lognormal_distribution(0.0) {}
 explicit lognormal_distribution(RealType m, RealType s = 1.0);
 explicit lognormal_distribution(const param_type& parm);
 void reset();

 // equality operators
 friend bool operator==(const lognormal_distribution& x, const lognormal_distribution& y);

 // generating functions
 template<class URNG>
 result_type operator()(URNG& g);
 template<class URNG>
 result_type operator()(URNG& g, const param_type& parm);

 // property functions

 operator<<(basic_ostream<charT, traits>& os, const lognormal_distribution& x);
 template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, lognormal_distribution& x);
 };
}

explicit lognormal_distribution(RealType m, RealType s = 1.0);
```

- <sup>2</sup> *Preconditions:*  $0 < s$ .

- <sup>3</sup> *Remarks:*  $m$  and  $s$  correspond to the respective parameters of the distribution.

`RealType m() const;`

- <sup>4</sup> *Returns:* The value of the  $m$  parameter with which the object was constructed.

`RealType s() const;`

- <sup>5</sup> *Returns:* The value of the  $s$  parameter with which the object was constructed.

**28.5.9.5.3 Class template chi\_squared\_distribution**

[rand.dist.norm.chisq]

- <sup>1</sup> A `chi_squared_distribution` random number distribution produces random numbers  $x > 0$  distributed according to the probability density function

$$p(x | n) = \frac{x^{(n/2)-1} \cdot e^{-x/2}}{\Gamma(n/2) \cdot 2^{n/2}}.$$

```
namespace std {
 template<class RealType = double>
 class chi_squared_distribution {
 public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructor and reset functions
 chi_squared_distribution() : chi_squared_distribution(1.0) {}
 explicit chi_squared_distribution(RealType n);
 explicit chi_squared_distribution(const param_type& parm);

 result_type max() const;

 // inserters and extractors
 template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const chi_squared_distribution& x);
 template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, chi_squared_distribution& x);
 };
}

explicit chi_squared_distribution(RealType n);
```

<sup>2</sup> *Preconditions:*  $0 < n$ .

<sup>3</sup> *Remarks:*  $n$  corresponds to the parameter of the distribution.

`RealType n() const;`

<sup>4</sup> *Returns:* The value of the  $n$  parameter with which the object was constructed.

**28.5.9.5.4 Class template cauchy\_distribution**

[rand.dist.norm.cauchy]

- <sup>1</sup> A `cauchy_distribution` random number distribution produces random numbers  $x$  distributed according to the probability density function

$$p(x | a, b) = \left( \pi b \left( 1 + \left( \frac{x-a}{b} \right)^2 \right) \right)^{-1}.$$

```

namespace std {
 template<class RealType = double>
 class cauchy_distribution {
 public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructor and reset functions
 cauchy_distribution() : cauchy_distribution(0.0) {}
 explicit cauchy_distribution(RealType a, RealType b = 1.0);
 explicit cauchy_distribution(const param_type& parm);
 void reset();

 // equality operators
 friend bool operator==(const cauchy_distribution& x, const cauchy_distribution& y);

 // generating functions
 template<class URNG>
 result_type operator()(URNG& g);
 template<class URNG>
 result_type operator()(URNG& g, const param_type& parm);

 // property functions

 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, cauchy_distribution& x);
 };
 }
}

explicit cauchy_distribution(RealType a, RealType b = 1.0);

```

2        *Preconditions:*  $0 < b$ .

3        *Remarks:*  $a$  and  $b$  correspond to the respective parameters of the distribution.

RealType a() const;

4        *Returns:* The value of the  $a$  parameter with which the object was constructed.

RealType b() const;

5        *Returns:* The value of the  $b$  parameter with which the object was constructed.

#### 28.5.9.5.5 Class template fisher\_f\_distribution

[rand.dist.norm.f]

1 A *fisher\_f\_distribution* random number distribution produces random numbers  $x \geq 0$  distributed according to the probability density function

$$p(x | m, n) = \frac{\Gamma((m+n)/2)}{\Gamma(m/2) \Gamma(n/2)} \cdot \left(\frac{m}{n}\right)^{m/2} \cdot x^{(m/2)-1} \cdot \left(1 + \frac{mx}{n}\right)^{-(m+n)/2}.$$

```

namespace std {
 template<class RealType = double>
 class fisher_f_distribution {
 public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructor and reset functions
 fisher_f_distribution() : fisher_f_distribution(1.0) {}
 explicit fisher_f_distribution(RealType m, RealType n = 1.0);
 explicit fisher_f_distribution(const param_type& parm);

 operator>>(basic_istream<charT, traits>& is, fisher_f_distribution& x);
 };
}

explicit fisher_f_distribution(RealType m, RealType n = 1);

```

2        *Preconditions:*  $0 < m$  and  $0 < n$ .

3        *Remarks:*  $m$  and  $n$  correspond to the respective parameters of the distribution.

RealType m() const;

4        *Returns:* The value of the  $m$  parameter with which the object was constructed.

RealType n() const;

5        *Returns:* The value of the  $n$  parameter with which the object was constructed.

#### 28.5.9.5.6 Class template student\_t\_distribution

[rand.dist.norm.t]

1 A `student_t_distribution` random number distribution produces random numbers  $x$  distributed according to the probability density function

$$p(x | n) = \frac{1}{\sqrt{n\pi}} \cdot \frac{\Gamma((n+1)/2)}{\Gamma(n/2)} \cdot \left(1 + \frac{x^2}{n}\right)^{-(n+1)/2}.$$

```

namespace std {
 template<class RealType = double>
 class student_t_distribution {
 public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructor and reset functions
 student_t_distribution() : student_t_distribution(1.0) {}
 explicit student_t_distribution(RealType n);
 explicit student_t_distribution(const param_type& parm);
 void reset();

 // equality operators
 friend bool operator==(const student_t_distribution& x, const student_t_distribution& y);

 // generating functions
 template<class URNG>
 result_type operator()(URNG& g);
 template<class URNG>
 result_type operator()(URNG& g, const param_type& parm);

 // property functions
 RealType n() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;

 // inserters and extractors
 template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const student_t_distribution& x);
 template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, student_t_distribution& x);
 };
 }

 explicit student_t_distribution(RealType n);
}

```

2      *Preconditions:*  $0 < n$ .

3      *Remarks:*  $n$  corresponds to the parameter of the distribution.

RealType n() const;

4      *Returns:* The value of the  $n$  parameter with which the object was constructed.

## 28.5.9.6 Sampling distributions

[rand.dist.samp]

### 28.5.9.6.1 Class template discrete\_distribution

[rand.dist.samp.discrete]

1 A *discrete\_distribution* random number distribution produces random integers  $i$ ,  $0 \leq i < n$ , distributed according to the discrete probability function

$$P(i | p_0, \dots, p_{n-1}) = p_i .$$

2 Unless specified otherwise, the distribution parameters are calculated as:  $p_k = w_k / S$  for  $k = 0, \dots, n - 1$ , in which the values  $w_k$ , commonly known as the *weights*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold:  $0 < S = w_0 + \dots + w_{n-1}$ .

```

namespace std {
 template<class IntType = int>
 class discrete_distribution {
 public:

```

```

// types
using result_type = IntType;
using param_type = unspecified;

// constructor and reset functions
discrete_distribution();
template<class InputIterator>
 discrete_distribution(InputIterator firstW, InputIterator lastW);
discrete_distribution(initializer_list<double> wl);
template<class UnaryOperation>
 discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);
explicit discrete_distribution(const param_type& parm);
void reset();

// equality operators
friend bool operator==(const discrete_distribution& x, const discrete_distribution& y);

// generating functions
template<class URNG>
 result_type operator()(URNG& g);
template<class URNG>
 result_type operator()(URNG& g, const param_type& parm);

// property functions
vector<double> probabilities() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const discrete_distribution& x);
template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, discrete_distribution& x);
};

}

discrete_distribution();

```

3     *Effects:* Constructs a `discrete_distribution` object with  $n = 1$  and  $p_0 = 1$ .

NOTE: Such an object will always deliver the value 0.

```
template<class InputIterator>
 discrete_distribution(InputIterator firstW, InputIterator lastW);
```

4     *Mandates:* `is_convertible_v<iterator_traits<InputIterator>::value_type, double>` is true.

5     *Preconditions:* `InputIterator` meets the `Cpp17InputIterator` requirements (25.3.5.3). If `firstW == lastW`, let  $n = 1$  and  $w_0 = 1$ . Otherwise,  $[firstW, lastW)$  forms a sequence  $w$  of length  $n > 0$ .

6     *Effects:* Constructs a `discrete_distribution` object with probabilities given by the formula above.

```
discrete_distribution(initializer_list<double> wl);
```

7     *Effects:* Same as `discrete_distribution(wl.begin(), wl.end())`.

```
template<class UnaryOperation>
 discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);
```

8     *Mandates:* `is_invocable_r_v<double, UnaryOperation&, double>` is true.

9     *Preconditions:* If `nw = 0`, let  $n = 1$ , otherwise let  $n = nw$ . The relation  $0 < \delta = (xmax - xmin)/n$  holds.

10     *Effects:* Constructs a `discrete_distribution` object with probabilities given by the formula above, using the following values: If `nw` = 0, let  $w_0 = 1$ . Otherwise, let  $w_k = \text{fw}(\text{xmin} + k \cdot \delta + \delta/2)$  for  $k = 0, \dots, n - 1$ .

11     *Complexity:* The number of invocations of `fw` does not exceed  $n$ .

`vector<double> probabilities() const;`

12     *Returns:* A `vector<double>` whose `size` member returns  $n$  and whose `operator[]` member returns  $p_k$  when invoked with argument  $k$  for  $k = 0, \dots, n - 1$ .

#### 28.5.9.6.2 Class template `piecewise_constant_distribution` [rand.dist.samp.pconst]

<sup>1</sup> A `piecewise_constant_distribution` random number distribution produces random numbers  $x$ ,  $b_0 \leq x < b_n$ , uniformly distributed over each subinterval  $[b_i, b_{i+1})$  according to the probability density function

$$p(x | b_0, \dots, b_n, \rho_0, \dots, \rho_{n-1}) = \rho_i, \text{ for } b_i \leq x < b_{i+1}.$$

<sup>2</sup> The  $n + 1$  distribution parameters  $b_i$ , also known as this distribution's *interval boundaries*, shall satisfy the relation  $b_i < b_{i+1}$  for  $i = 0, \dots, n - 1$ . Unless specified otherwise, the remaining  $n$  distribution parameters are calculated as:

$$\rho_k = \frac{w_k}{S \cdot (b_{k+1} - b_k)} \text{ for } k = 0, \dots, n - 1,$$

in which the values  $w_k$ , commonly known as the *weights*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold:  $0 < S = w_0 + \dots + w_{n-1}$ .

```
namespace std {
 template<class RealType = double>
 class piecewise_constant_distribution {
public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructor and reset functions
 piecewise_constant_distribution();
 template<class InputIteratorB, class InputIteratorW>
 piecewise_constant_distribution(InputIteratorB firstB, InputIteratorB lastB,
 InputIteratorW firstW);
 template<class UnaryOperation>
 piecewise_constant_distribution(initializer_list<RealType> bl, UnaryOperation fw);
 template<class UnaryOperation>
 piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax,
 UnaryOperation fw);
 explicit piecewise_constant_distribution(const param_type& parm);
 void reset();

 // equality operators
 friend bool operator==(const piecewise_constant_distribution& x,
 const piecewise_constant_distribution& y);

 // generating functions
 template<class URNG>
 result_type operator()(URNG& g);
 template<class URNG>
 result_type operator()(URNG& g, const param_type& parm);

 // property functions
 vector<result_type> intervals() const;
 vector<result_type> densities() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;
};
```

```

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const piecewise_constant_distribution& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, piecewise_constant_distribution& x);
};

piecewise_constant_distribution();

Effects: Constructs a piecewise_constant_distribution object with $n = 1$, $\rho_0 = 1$, $b_0 = 0$, and $b_1 = 1$.
```

```

template<class InputIteratorB, class InputIteratorW>
piecewise_constant_distribution(InputIteratorB firstB, InputIteratorB lastB,
 InputIteratorW firstW);

Mandates: Both of
(4.1) — is_convertible_v<iterator_traits<InputIteratorB>::value_type, double>
(4.2) — is_convertible_v<iterator_traits<InputIteratorW>::value_type, double>
are true.

Preconditions: InputIteratorB and InputIteratorW each meet the Cpp17InputIterator requirements (25.3.5.3). If firstB == lastB or ++firstB == lastB, let $n = 1$, $w_0 = 1$, $b_0 = 0$, and $b_1 = 1$. Otherwise, $[firstB, lastB)$ forms a sequence b of length $n + 1$, the length of the sequence w starting from firstW is at least n , and any w_k for $k \geq n$ are ignored by the distribution.
```

```

Effects: Constructs a piecewise_constant_distribution object with parameters as specified above.
```

```

template<class UnaryOperation>
piecewise_constant_distribution(initializer_list<RealType> bl, UnaryOperation fw);

Mandates: is_invocable_r_v<double, UnaryOperation&, double> is true.

Effects: Constructs a piecewise_constant_distribution object with parameters taken or calculated from the following values: If bl.size() < 2, let $n = 1$, $w_0 = 1$, $b_0 = 0$, and $b_1 = 1$. Otherwise, let $[bl.begin(), bl.end())$ form a sequence b_0, \dots, b_n , and let $w_k = fw((b_{k+1} + b_k)/2)$ for $k = 0, \dots, n - 1$.
```

```

Complexity: The number of invocations of fw does not exceed n .
```

```

template<class UnaryOperation>
piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);

Mandates: is_invocable_r_v<double, UnaryOperation&, double> is true.

Preconditions: If nw = 0, let $n = 1$, otherwise let $n = nw$. The relation $0 < \delta = (xmax - xmin)/n$ holds.

Effects: Constructs a piecewise_constant_distribution object with parameters taken or calculated from the following values: Let $b_k = xmin + k \cdot \delta$ for $k = 0, \dots, n$, and $w_k = fw(b_k + \delta/2)$ for $k = 0, \dots, n - 1$.
```

```

Complexity: The number of invocations of fw does not exceed n .
```

```

vector<result_type> intervals() const;

Returns: A vector<result_type> whose size member returns $n + 1$ and whose operator[] member returns b_k when invoked with argument k for $k = 0, \dots, n$.
```

```

vector<result_type> densities() const;

Returns: A vector<result_type> whose size member returns n and whose operator[] member returns ρ_k when invoked with argument k for $k = 0, \dots, n - 1$.
```

### 28.5.9.6.3 Class template piecewise\_linear\_distribution [rand.dist.samp.plinear]

- <sup>1</sup> A piecewise\_linear\_distribution random number distribution produces random numbers  $x$ ,  $b_0 \leq x < b_n$ , distributed over each subinterval  $[b_i, b_{i+1})$  according to the probability density function

$$p(x | b_0, \dots, b_n, \rho_0, \dots, \rho_n) = \rho_i \cdot \frac{b_{i+1} - x}{b_{i+1} - b_i} + \rho_{i+1} \cdot \frac{x - b_i}{b_{i+1} - b_i}, \text{ for } b_i \leq x < b_{i+1}.$$

- <sup>2</sup> The  $n + 1$  distribution parameters  $b_i$ , also known as this distribution's *interval boundaries*, shall satisfy the relation  $b_i < b_{i+1}$  for  $i = 0, \dots, n - 1$ . Unless specified otherwise, the remaining  $n + 1$  distribution parameters are calculated as  $\rho_k = w_k/S$  for  $k = 0, \dots, n$ , in which the values  $w_k$ , commonly known as the *weights at boundaries*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold:

$$0 < S = \frac{1}{2} \cdot \sum_{k=0}^{n-1} (w_k + w_{k+1}) \cdot (b_{k+1} - b_k) .$$

```

namespace std {
 template<class RealType = double>
 class piecewise_linear_distribution {
public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructor and reset functions
 piecewise_linear_distribution();

 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;

 // inserters and extractors
 template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const piecewise_linear_distribution& x);
 template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, piecewise_linear_distribution& x);
};

piecewise_linear_distribution();

```

- <sup>3</sup> *Effects:* Constructs a `piecewise_linear_distribution` object with  $n = 1$ ,  $\rho_0 = \rho_1 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ .

```

template<class InputIteratorB, class InputIteratorW>
piecewise_linear_distribution(InputIteratorB firstB, InputIteratorB lastB,
 InputIteratorW firstW);

4 Mandates: is_invocable_r_v<double, UnaryOperation&, double> is true.

5 Preconditions: InputIteratorB and InputIteratorW each meet the Cpp17InputIterator requirements
(25.3.5.3). If firstB == lastB or ++firstB == lastB, let $n = 1$, $\rho_0 = \rho_1 = 1$, $b_0 = 0$, and $b_1 = 1$.
Otherwise, $[firstB, lastB)$ forms a sequence b of length $n + 1$, the length of the sequence w starting
from firstW is at least $n + 1$, and any w_k for $k \geq n + 1$ are ignored by the distribution.

6 Effects: Constructs a piecewise_linear_distribution object with parameters as specified above.

template<class UnaryOperation>
piecewise_linear_distribution(initializer_list<RealType> bl, UnaryOperation fw);

7 Mandates: is_invocable_r_v<double, UnaryOperation&, double> is true.

8 Effects: Constructs a piecewise_linear_distribution object with parameters taken or calculated
from the following values: If bl.size() < 2, let $n = 1$, $\rho_0 = \rho_1 = 1$, $b_0 = 0$, and $b_1 = 1$. Otherwise, let
 $[bl.begin(), bl.end())$ form a sequence b_0, \dots, b_n , and let $w_k = fw(b_k)$ for $k = 0, \dots, n$.

9 Complexity: The number of invocations of fw does not exceed $n + 1$.

template<class UnaryOperation>
piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);

10 Mandates: is_invocable_r_v<double, UnaryOperation&, double> is true.

11 Preconditions: If nw = 0, let $n = 1$, otherwise let $n = nw$. The relation $0 < \delta = (xmax - xmin)/n$ holds.

12 Effects: Constructs a piecewise_linear_distribution object with parameters taken or calculated
from the following values: Let $b_k = xmin + k \cdot \delta$ for $k = 0, \dots, n$, and $w_k = fw(b_k)$ for $k = 0, \dots, n$.

13 Complexity: The number of invocations of fw does not exceed $n + 1$.

vector<result_type> intervals() const;

14 Returns: A vector<result_type> whose size member returns $n + 1$ and whose operator[] member
returns b_k when invoked with argument k for $k = 0, \dots, n$.

vector<result_type> densities() const;

15 Returns: A vector<result_type> whose size member returns n and whose operator[] member
returns ρ_k when invoked with argument k for $k = 0, \dots, n$.

```

## 28.5.10 Low-quality random number generation

[c.math.rand]

<sup>1</sup> NOTE 1: The header `<cstdlib>` (17.2.2) declares the functions described in this subclause.

```

int rand();
void srand(unsigned int seed);

```

<sup>2</sup> *Effects:* The `rand` and `srand` functions have the semantics specified in the C standard library.

<sup>3</sup> *Remarks:* The implementation may specify that particular library functions may call `rand`. It is
implementation-defined whether the `rand` function may introduce data races (16.4.6.10).

NOTE 2: The other random number generation facilities in this document (28.5) are often preferable to `rand`,
because `rand`'s underlying algorithm is unspecified. Use of `rand` therefore continues to be non-portable, with
unpredictable and oft-questionable quality and performance.

}

```

- <sup>1</sup> The header `<valarray>` defines five class templates (`valarray`, `slice_array`, `gslice_array`, `mask_array`, and `indirect_array`), two classes (`slice` and `gslice`), and a series of related function templates for representing and manipulating arrays of values.
- <sup>2</sup> The `valarray` array classes are defined to be free of certain forms of aliasing, thus allowing operations on these classes to be optimized.
- <sup>3</sup> Any function returning a `valarray<T>` is permitted to return an object of another type, provided all the `const` member functions of `valarray<T>` are also applicable to this type. This return type shall not add more than two levels of template nesting over the most deeply nested argument type.<sup>233</sup>
- <sup>4</sup> Implementations introducing such replacement types shall provide additional functions and operators as follows:
  - (4.1) — for every function taking a `const valarray<T>&` other than `begin` and `end` (28.6.10), identical functions taking the replacement types shall be added;
  - (4.2) — for every function taking two `const valarray<T>&` arguments, identical functions taking every combination of `const valarray<T>&` and replacement types shall be added.
- <sup>5</sup> In particular, an implementation shall allow a `valarray<T>` to be constructed from such replacement types and shall allow assignments and compound assignments of such types to `valarray<T>`, `slice_array<T>`, `gslice_array<T>`, `mask_array<T>` and `indirect_array<T>` objects.
- <sup>6</sup> These library functions are permitted to throw a `bad_alloc` (17.6.4.1) exception if there are not sufficient resources available to carry out the operation. Note that the exception is not mandated.

## 28.6.2 Class template `valarray`

[template.valarray]

### 28.6.2.1 Overview

[template.valarray.overview]

```

namespace std {
 template<class T> class valarray {
 public:
 using value_type = T;

 // 28.6.2.2, construct/destroy
 valarray();
 explicit valarray(size_t);
 valarray(const T&, size_t);
 valarray(const T*, size_t);
 valarray(const valarray&);
 valarray(valarray&&) noexcept;
 valarray(const slice_array<T>&);
 valarray(const gslice_array<T>&);
 valarray(const mask_array<T>&);
 valarray(const indirect_array<T>&);
 valarray(initializer_list<T>);
 ~valarray();
 };
}

```

<sup>233)</sup> Annex B recommends a minimum number of recursively nested template instantiations. This requirement thus indirectly suggests a minimum allowable complexity for `valarray` expressions.

```

// 28.6.2.3, assignment
valarray& operator=(const valarray&);
valarray& operator=(valarray&&) noexcept;
valarray& operator=(initializer_list<T>);
valarray& operator=(const T&);
valarray& operator=(const slice_array<T>&);
valarray& operator=(const gslice_array<T>&);
valarray& operator=(const mask_array<T>&);
valarray& operator=(const indirect_array<T>&);

// 28.6.2.4, element access
const T& operator[](size_t) const;
T& operator[](size_t);

// 28.6.2.5, subset operations
valarray operator[](slice) const;
slice_array<T> operator[](slice);
valarray operator[](const gslice&) const;
gslice_array<T> operator[](const gslice&);
valarray operator[](const valarray<bool>&) const;
mask_array<T> operator[](const valarray<bool>&);
valarray operator[](const valarray<size_t>&) const;
indirect_array<T> operator[](const valarray<size_t>&);

// 28.6.2.6, unary operators
valarray operator+() const;
valarray operator-() const;
valarray operator~() const;
valarray<bool> operator!() const;

// 28.6.2.7, compound assignment
valarray& operator*=(const T&);
valarray& operator/=(const T&);
valarray& operator%=(const T&);
valarray& operator+==(const T&);
valarray& operator-==(const T&);
valarray& operator^=(const T&);
valarray& operator&=(const T&);
valarray& operator|==(const T&);
valarray& operator<=(const T&);
valarray& operator>=(const T&);

valarray& operator*=(const valarray&);
valarray& operator/=(const valarray&);
valarray& operator%=(const valarray&);
valarray& operator+==(const valarray&);
valarray& operator-==(const valarray&);
valarray& operator^=(const valarray&);
valarray& operator|==(const valarray&);
valarray& operator&=(const valarray&);
valarray& operator<=(const valarray&);
valarray& operator>=(const valarray&);

// 28.6.2.8, member functions
void swap(valarray&) noexcept;

size_t size() const;

T sum() const;
T min() const;
T max() const;

valarray shift (int) const;
valarray cshift(int) const;

```

```

 valarray apply(T func(T)) const;
 valarray apply(T func(const T&)) const;
 void resize(size_t sz, T c = T());
};

template<class T, size_t cnt> valarray(const T(&)[cnt], size_t) -> valarray<T>;
}

```

- <sup>1</sup> The class template `valarray<T>` is a one-dimensional smart array, with elements numbered sequentially from zero. It is a representation of the mathematical concept of an ordered set of values. For convenience, an object of type `valarray<T>` is referred to as an “array” throughout the remainder of 28.6. The illusion of higher dimensionality may be produced by the familiar idiom of computed indices, together with the powerful subsetting capabilities provided by the generalized subscript operators.<sup>234</sup>

### 28.6.2.2 Constructors

[`valarray.cons`]

```
valarray();
```

- <sup>1</sup> *Effects:* Constructs a `valarray` that has zero length.<sup>235</sup>

```
explicit valarray(size_t n);
```

- <sup>2</sup> *Effects:* Constructs a `valarray` that has length `n`. Each element of the array is value-initialized (9.4).

```
valarray(const T& v, size_t n);
```

- <sup>3</sup> *Effects:* Constructs a `valarray` that has length `n`. Each element of the array is initialized with `v`.

```
valarray(const T* p, size_t n);
```

- <sup>4</sup> *Preconditions:* `[p, p + n)` is a valid range.

- <sup>5</sup> *Effects:* Constructs a `valarray` that has length `n`. The values of the elements of the array are initialized with the first `n` values pointed to by the first argument.<sup>236</sup>

```
valarray(const valarray& v);
```

- <sup>6</sup> *Effects:* Constructs a `valarray` that has the same length as `v`. The elements are initialized with the values of the corresponding elements of `v`.<sup>237</sup>

```
valarray(valarray&& v) noexcept;
```

- <sup>7</sup> *Effects:* Constructs a `valarray` that has the same length as `v`. The elements are initialized with the values of the corresponding elements of `v`.

- <sup>8</sup> *Complexity:* Constant.

```
valarray(initializer_list<T> il);
```

- <sup>9</sup> *Effects:* Equivalent to `valarray(il.begin(), il.size())`.

```
valarray(const slice_array<T>&);
valarray(const gslice_array<T>&);
valarray(const mask_array<T>&);
valarray(const indirect_array<T>&);
```

- <sup>10</sup> These conversion constructors convert one of the four reference templates to a `valarray`.

```
~valarray();
```

- <sup>11</sup> *Effects:* The destructor is applied to every element of `*this`; an implementation may return all allocated memory.

<sup>234</sup>) The intent is to specify an array template that has the minimum functionality necessary to address aliasing ambiguities and the proliferation of temporary objects. Thus, the `valarray` template is neither a matrix class nor a field class. However, it is a very useful building block for designing such classes.

<sup>235</sup>) This default constructor is essential, since arrays of `valarray` can be useful. After initialization, the length of an empty array can be increased with the `resize` member function.

<sup>236</sup>) This constructor is the preferred method for converting a C array to a `valarray` object.

<sup>237</sup>) This copy constructor creates a distinct array rather than an alias. Implementations in which arrays share storage are permitted, but they would need to implement a copy-on-reference mechanism to ensure that arrays are conceptually distinct.

**28.6.2.3 Assignment**[**valarray.assign**]

```
valarray& operator=(const valarray& v);
```

1    *Effects:* Each element of the `*this` array is assigned the value of the corresponding element of `v`. If the length of `v` is not equal to the length of `*this`, resizes `*this` to make the two arrays the same length, as if by calling `resize(v.size())`, before performing the assignment.

2    *Postconditions:* `size() == v.size()`.

3    *Returns:* `*this`.

```
valarray& operator=(valarray&& v) noexcept;
```

4    *Effects:* `*this` obtains the value of `v`. The value of `v` after the assignment is not specified.

5    *Returns:* `*this`.

6    *Complexity:* Linear.

```
valarray& operator=(initializer_list<T> il);
```

7    *Effects:* Equivalent to: `return *this = valarray(il);`

```
valarray& operator=(const T& v);
```

8    *Effects:* Assigns `v` to each element of `*this`.

9    *Returns:* `*this`.

```
valarray& operator=(const slice_array<T>&);
```

```
valarray& operator=(const gslice_array<T>&);
```

```
valarray& operator=(const mask_array<T>&);
```

```
valarray& operator=(const indirect_array<T>&);
```

10    *Preconditions:* The length of the array to which the argument refers equals `size()`. The value of an element in the left-hand side of a `valarray` assignment operator does not depend on the value of another element in that left-hand side.

11    These operators allow the results of a generalized subscripting operation to be assigned directly to a `valarray`.

**28.6.2.4 Element access**[**valarray.access**]

```
const T& operator[](size_t n) const;
T& operator[](size_t n);
```

1    *Preconditions:* `n < size()` is true.

2    *Returns:* A reference to the corresponding element of the array.

NOTE 1: The expression `(a[i] = q, a[i]) == q` evaluates to `true` for any non-constant `valarray<T> a`, any `T q`, and for any `size_t i` such that the value of `i` is less than the length of `a`.

3    *Remarks:* The expression `addressof(a[i+j]) == addressof(a[i]) + j` evaluates to `true` for all `size_t i` and `size_t j` such that `i+j < a.size()`.

4    The expression `addressof(a[i]) != addressof(b[j])` evaluates to `true` for any two arrays `a` and `b` and for any `size_t i` and `size_t j` such that `i < a.size()` and `j < b.size()`.

NOTE 2: This property indicates an absence of aliasing and can be used to advantage by optimizing compilers. Compilers can take advantage of inlining, constant propagation, loop fusion, tracking of pointers obtained from `operator new`, and other techniques to generate efficient `valarrays`.

5    The reference returned by the subscript operator for an array shall be valid until the member function `resize(size_t, T)` (28.6.2.8) is called for that array or until the lifetime of that array ends, whichever happens first.

**28.6.2.5 Subset operations**[**valarray.sub**]

1    The member `operator[]` is overloaded to provide several ways to select sequences of elements from among those controlled by `*this`. Each of these operations returns a subset of the array. The const-qualified versions return this subset as a new `valarray` object. The non-const versions return a class template object which has reference semantics to the original array, working in conjunction with various overloads of `operator=`.

and other assigning operators to allow selective replacement (slicing) of the controlled sequence. In each case the selected element(s) shall exist.

```
valarray operator[](slice slicearr) const;
```

- 2     *Returns:* A valarray containing those elements of the controlled sequence designated by `slicearr`.

EXAMPLE 1:

```
const valarray<char> v0("abcdefghijklmnp", 16);
// v0[slice(2, 5, 3)] returns valarray<char>("cfile", 5)
```

```
slice_array<T> operator[](slice slicearr);
```

- 3     *Returns:* An object that holds references to elements of the controlled sequence selected by `slicearr`.

EXAMPLE 2:

```
valarray<char> v0("abcdefghijklmnp", 16);
valarray<char> v1("ABCDE", 5);
v0[slice(2, 5, 3)] = v1;
// v0 == valarray<char>("abAdeBghCjkDmnEp", 16);
```

```
valarray operator[](const gslice& gslicearr) const;
```

- 4     *Returns:* A valarray containing those elements of the controlled sequence designated by `gslicearr`.

EXAMPLE 3:

```
const valarray<char> v0("abcdefghijklmnp", 16);
const size_t lv[] = { 2, 3 };
const size_t dv[] = { 7, 2 };
const valarray<size_t> len(lv, 2), str(dv, 2);
// v0[gslice(3, len, str)] returns
// valarray<char>("dfhkmo", 6)
```

```
gslice_array<T> operator[](const gslice& gslicearr);
```

- 5     *Returns:* An object that holds references to elements of the controlled sequence selected by `gslicearr`.

EXAMPLE 4:

```
valarray<char> v0("abcdefghijklmnp", 16);
valarray<char> v1("ABCDEF", 6);
const size_t lv[] = { 2, 3 };
const size_t dv[] = { 7, 2 };
const valarray<size_t> len(lv, 2), str(dv, 2);
v0[gslice(3, len, str)] = v1;
// v0 == valarray<char>("abcAeBgCijDlEnFp", 16)
```

```
valarray operator[](const valarray<bool>& boolarr) const;
```

- 6     *Returns:* A valarray containing those elements of the controlled sequence designated by `boolarr`.

EXAMPLE 5:

```
const valarray<char> v0("abcdefghijklmnp", 16);
const bool vb[] = { false, false, true, true, false, true };
// v0[valarray<bool>(vb, 6)] returns
// valarray<char>("cdf", 3)
```

```
mask_array<T> operator[](const valarray<bool>& boolarr);
```

- 7     *Returns:* An object that holds references to elements of the controlled sequence selected by `boolarr`.

EXAMPLE 6:

```
valarray<char> v0("abcdefghijklmnp", 16);
valarray<char> v1("ABC", 3);
const bool vb[] = { false, false, true, true, false, true };
v0[valarray<bool>(vb, 6)] = v1;
// v0 == valarray<char>("abABeCghijklmnop", 16)
```

```
valarray operator[](const valarray<size_t>& indarr) const;
```

- 8     *Returns:* A valarray containing those elements of the controlled sequence designated by `indarr`.

EXAMPLE 7:

```
const valarray<char> v0("abcdefghijklmnp", 16);
const size_t vi[] = { 7, 5, 2, 3, 8 };
// v0[valarray<size_t>(vi, 5)] returns
// valarray<char>("hfcdi", 5)

indirect_array<T> operator[](const valarray<size_t>& indarr);
```

- 9 *Returns*: An object that holds references to elements of the controlled sequence selected by `indarr`.

EXAMPLE 8:

```
valarray<char> v0("abcdefghijklmnp", 16);
valarray<char> v1("ABCDE", 5);
const size_t vi[] = { 7, 5, 2, 3, 8 };
v0[valarray<size_t>(vi, 5)] = v1;
// v0 == valarray<char>("abCDeBgAEjklmnop", 16)
```

#### 28.6.2.6 Unary operators

[`valarray.unary`]

```
valarray operator+() const;
valarray operator-() const;
valarray operator~() const;
valarray<bool> operator!() const;
```

- 1 *Mandates*: The indicated operator can be applied to operands of type `T` and returns a value of type `T` (`bool` for `operator!`) or which may be unambiguously implicitly converted to type `T` (`bool` for `operator!`).
- 2 *Returns*: A `valarray` whose length is `size()`. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array.

#### 28.6.2.7 Compound assignment

[`valarray.cassign`]

```
valarray& operator*=(const valarray& v);
valarray& operator/=(const valarray& v);
valarray& operator%=(const valarray& v);
valarray& operator+==(const valarray& v);
valarray& operator-==(const valarray& v);
valarray& operator^=(const valarray& v);
valarray& operator&=(const valarray& v);
valarray& operator|==(const valarray& v);
valarray& operator<<=(const valarray& v);
valarray& operator>>=(const valarray& v);
```

- 1 *Mandates*: The indicated operator can be applied to two operands of type `T`.

- 2 *Preconditions*: `size() == v.size()` is `true`.

The value of an element in the left-hand side of a `valarray` compound assignment operator does not depend on the value of another element in that left hand side.

- 3 *Effects*: Each of these operators performs the indicated operation on each of the elements of `*this` and the corresponding element of `v`.

- 4 *Returns*: `*this`.

- 5 *Remarks*: The appearance of an array on the left-hand side of a compound assignment does not invalidate references or pointers.

```
valarray& operator*=(const T& v);
valarray& operator/=(const T& v);
valarray& operator%=(const T& v);
valarray& operator+==(const T& v);
valarray& operator-==(const T& v);
valarray& operator^=(const T& v);
valarray& operator&=(const T& v);
valarray& operator|==(const T& v);
valarray& operator<<=(const T& v);
```

```
valarray& operator>>=(const T& v);
```

6     *Mandates*: The indicated operator can be applied to two operands of type T.

7     *Effects*: Each of these operators applies the indicated operation to each element of **\*this** and v.

8     *Returns*: **\*this**

9     *Remarks*: The appearance of an array on the left-hand side of a compound assignment does not invalidate references or pointers to the elements of the array.

#### 28.6.2.8 Member functions

**[valarray.members]**

```
void swap(valarray& v) noexcept;
```

1     *Effects*: **\*this** obtains the value of v. v obtains the value of **\*this**.

2     *Complexity*: Constant.

```
size_t size() const;
```

3     *Returns*: The number of elements in the array.

4     *Complexity*: Constant time.

```
T sum() const;
```

5     *Mandates*: **operator+=** can be applied to operands of type T.

6     *Preconditions*: **size()** > 0 is true.

7     *Returns*: The sum of all the elements of the array. If the array has length 1, returns the value of element 0. Otherwise, the returned value is calculated by applying **operator+=** to a copy of an element of the array and all other elements of the array in an unspecified order.

```
T min() const;
```

8     *Preconditions*: **size()** > 0 is true.

9     *Returns*: The minimum value contained in **\*this**. For an array of length 1, the value of element 0 is returned. For all other array lengths, the determination is made using **operator<**.

```
T max() const;
```

10    *Preconditions*: **size()** > 0 is true.

11    *Returns*: The maximum value contained in **\*this**. For an array of length 1, the value of element 0 is returned. For all other array lengths, the determination is made using **operator<**.

```
valarray shift(int n) const;
```

12    *Returns*: A valarray of length **size()**, each of whose elements *I* is **(\*this)[I + n]** if *I + n* is non-negative and less than **size()**, otherwise T().

NOTE: If element zero is taken as the leftmost element, a positive value of n shifts the elements left n places, with zero fill.

13    EXAMPLE: If the argument has the value -2, the first two elements of the result will be value-initialized (9.4); the third element of the result will be assigned the value of the first element of **\*this**; etc.

```
valarray cshift(int n) const;
```

14    *Returns*: A valarray of length **size()** that is a circular shift of **\*this**. If element zero is taken as the leftmost element, a non-negative value of n shifts the elements circularly left n places and a negative value of n shifts the elements circularly right -n places.

```
valarray apply(T func(T)) const;
```

```
valarray apply(T func(const T&)) const;
```

15    *Returns*: A valarray whose length is **size()**. Each element of the returned array is assigned the value returned by applying the argument function to the corresponding element of **\*this**.

```
void resize(size_t sz, T c = T());
```

16    *Effects*: Changes the length of the **\*this** array to **sz** and then assigns to each element the value of the second argument. Resizing invalidates all pointers and references to elements in the array.

### 28.6.3 valarray non-member operations

[valarray.nonmembers]

#### 28.6.3.1 Binary operators

[valarray.binary]

```
template<class T> valarray<T> operator* (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator/ (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator% (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator+ (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator- (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator^ (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator& (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator| (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator<<(const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator>>(const valarray<T>&, const valarray<T>&);
```

1 *Mandates*: The indicated operator can be applied to operands of type T and returns a value of type T or which can be unambiguously implicitly converted to T.

2 *Preconditions*: The argument arrays have the same length.

3 *Returns*: A valarray whose length is equal to the lengths of the argument arrays. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.

```
template<class T> valarray<T> operator* (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator* (const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<T> operator/ (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator/ (const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<T> operator% (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator% (const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<T> operator+ (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator+ (const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<T> operator- (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator- (const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<T> operator^ (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator^ (const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<T> operator& (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator& (const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<T> operator| (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator| (const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<T> operator<<(const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator<<(const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<T> operator>>(const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator>>(const typename valarray<T>::value_type&,
 const valarray<T>&);
```

4 *Mandates*: The indicated operator can be applied to operands of type T and returns a value of type T or which can be unambiguously implicitly converted to T.

- 5     *Returns:* A `valarray` whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array argument and the non-array argument.

### 28.6.3.2 Logical operators

[`valarray.comparison`]

```
template<class T> valarray<bool> operator==(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator!=(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator< (const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator> (const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator<=(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator>=(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator&&(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator||(const valarray<T>&, const valarray<T>&);
```

- 1     *Mandates:* The indicated operator can be applied to operands of type T and returns a value of type `bool` or which can be unambiguously implicitly converted to `bool`.

- 2     *Preconditions:* The two array arguments have the same length.

- 3     *Returns:* A `valarray<bool>` whose length is equal to the length of the array arguments. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.

```
template<class T> valarray<bool> operator==(const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator==(const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<bool> operator!=(const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator!=(const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<bool> operator< (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator< (const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<bool> operator> (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator> (const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<bool> operator<=(const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator<=(const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<bool> operator>=(const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator>=(const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<bool> operator&&(const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator&&(const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<bool> operator||(const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator||(const typename valarray<T>::value_type&,
 const valarray<T>&);
```

- 4     *Mandates:* The indicated operator can be applied to operands of type T and returns a value of type `bool` or which can be unambiguously implicitly converted to `bool`.

- 5     *Returns:* A `valarray<bool>` whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array and the non-array argument.

### 28.6.3.3 Transcendentals

[`valarray.transcend`]

```
template<class T> valarray<T> abs (const valarray<T>&);
```

```
template<class T> valarray<T> acos (const valarray<T>&);
template<class T> valarray<T> asin (const valarray<T>&);
template<class T> valarray<T> atan (const valarray<T>&);
template<class T> valarray<T> atan2(const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> atan2(const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> atan2(const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<T> cos (const valarray<T>&);
template<class T> valarray<T> cosh (const valarray<T>&);
template<class T> valarray<T> exp (const valarray<T>&);
template<class T> valarray<T> log (const valarray<T>&);
template<class T> valarray<T> log10(const valarray<T>&);
template<class T> valarray<T> pow (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> pow (const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> pow (const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<T> sin (const valarray<T>&);
template<class T> valarray<T> sinh (const valarray<T>&);
template<class T> valarray<T> sqrt (const valarray<T>&);
template<class T> valarray<T> tan (const valarray<T>&);
template<class T> valarray<T> tanh (const valarray<T>&);
```

- <sup>1</sup> *Mandates:* A unique function with the indicated name can be applied (unqualified) to an operand of type T. This function returns a value of type T or which can be unambiguously implicitly converted to type T.

#### 28.6.3.4 Specialized algorithms

[valarray.special]

```
template<class T> void swap(valarray<T>& x, valarray<T>& y) noexcept;
```

- <sup>1</sup> *Effects:* Equivalent to x.swap(y).

#### 28.6.4 Class slice

[class.slice]

##### 28.6.4.1 Overview

[class.slice.overview]

```
namespace std {
 class slice {
 public:
 slice();
 slice(size_t, size_t, size_t);
 slice(const slice&);

 size_t start() const;
 size_t size() const;
 size_t stride() const;

 friend bool operator==(const slice& x, const slice& y);
 };
 }
}
```

- <sup>1</sup> The slice class represents a BLAS-like slice from an array. Such a slice is specified by a starting index, a length, and a stride.<sup>238</sup>

##### 28.6.4.2 Constructors

[cons.slice]

```
slice();
slice(size_t start, size_t length, size_t stride);
```

- <sup>1</sup> The default constructor is equivalent to slice(0, 0, 0). A default constructor is provided only to permit the declaration of arrays of slices. The constructor with arguments for a slice takes a start, length, and stride parameter.
- <sup>2</sup> EXAMPLE: slice(3, 8, 2) constructs a slice which selects elements 3, 5, 7, ..., 17 from an array.

---

<sup>238</sup>) BLAS stands for *Basic Linear Algebra Subprograms*. C++ programs can instantiate this class. See, for example, Dongarra, Du Croz, Duff, and Hammerling: *A set of Level 3 Basic Linear Algebra Subprograms*; Technical Report MCS-P1-0888, Argonne National Laboratory (USA), Mathematics and Computer Science Division, August, 1988.

**28.6.4.3 Access functions**

[slice.access]

```
size_t start() const;
size_t size() const;
size_t stride() const;
```

<sup>1</sup> *Returns:* The start, length, or stride specified by a `slice` object.

<sup>2</sup> *Complexity:* Constant time.

**28.6.4.4 Operators**

[slice.ops]

```
friend bool operator==(const slice& x, const slice& y);
```

<sup>1</sup> *Effects:* Equivalent to:

```
return x.start() == y.start() && x.size() == y.size() && x.stride() == y.stride();
```

**28.6.5 Class template slice\_array**

[template.slice.array]

**28.6.5.1 Overview**

[template.slice.array.overview]

```
namespace std {
 template<class T> class slice_array {
 public:
 using value_type = T;

 void operator= (const valarray<T>&) const;
 void operator*=(const valarray<T>&) const;
 void operator/=(const valarray<T>&) const;
 void operator%=(const valarray<T>&) const;
 void operator+= (const valarray<T>&) const;
 void operator-= (const valarray<T>&) const;
 void operator^=(const valarray<T>&) const;
 void operator&=(const valarray<T>&) const;
 void operator|=(const valarray<T>&) const;
 void operator<<=(const valarray<T>&) const;
 void operator>>=(const valarray<T>&) const;

 slice_array(const slice_array&);
 ~slice_array();
 const slice_array& operator=(const slice_array&) const;
 void operator=(const T&) const;

 slice_array() = delete; // as implied by declaring copy constructor above
 };
}
```

<sup>1</sup> This template is a helper template used by the `slice` subscript operator

```
slice_array<T> valarray<T>::operator[](slice);
```

<sup>2</sup> It has reference semantics to a subset of an array specified by a `slice` object.

EXAMPLE: The expression `a[slice(1, 5, 3)] = b;` has the effect of assigning the elements of `b` to a slice of the elements in `a`. For the slice shown, the elements selected from `a` are 1, 4, ..., 13.

**28.6.5.2 Assignment**

[slice.arr.assign]

```
void operator=(const valarray<T>&) const;
const slice_array& operator=(const slice_array&) const;
```

<sup>1</sup> These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `slice_array` object refers.

**28.6.5.3 Compound assignment**

[slice.arr.comp.assign]

```
void operator*=(const valarray<T>&) const;
void operator/=(const valarray<T>&) const;
void operator%=(const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
```

```
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
```

- <sup>1</sup> These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `slice_array` object refers.

#### 28.6.5.4 Fill function

[slice.arr.fill]

```
void operator=(const T&) const;
```

- <sup>1</sup> This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `slice_array` object refers.

### 28.6.6 The `gslice` class

[class.gslice]

#### 28.6.6.1 Overview

[class.gslice.overview]

```
namespace std {
 class gslice {
 public:
 gslice();
 gslice(size_t s, const valarray<size_t>& l, const valarray<size_t>& d);

 size_t start() const;
 valarray<size_t> size() const;
 valarray<size_t> stride() const;
 };
}
```

- <sup>1</sup> This class represents a generalized slice out of an array. A `gslice` is defined by a starting offset ( $s$ ), a set of lengths ( $l_j$ ), and a set of strides ( $d_j$ ). The number of lengths shall equal the number of strides.
- <sup>2</sup> A `gslice` represents a mapping from a set of indices ( $i_j$ ), equal in number to the number of strides, to a single index  $k$ . It is useful for building multidimensional array classes using the `valarray` template, which is one-dimensional. The set of one-dimensional index values specified by a `gslice` are

$$k = s + \sum_j i_j d_j$$

where the multidimensional indices  $i_j$  range in value from 0 to  $l_{ij} - 1$ .

- <sup>3</sup> EXAMPLE 1: The `gslice` specification

```
start = 3
length = {2, 4, 3}
stride = {19, 4, 1}
```

yields the sequence of one-dimensional indices

$$k = 3 + (0, 1) \times 19 + (0, 1, 2, 3) \times 4 + (0, 1, 2) \times 1$$

which are ordered as shown in the following table:

| $(i_0, i_1, i_2, k)$ | $=$ |
|----------------------|-----|
| (0, 0, 0, 3),        |     |
| (0, 0, 1, 4),        |     |
| (0, 0, 2, 5),        |     |
| (0, 1, 0, 7),        |     |
| (0, 1, 1, 8),        |     |
| (0, 1, 2, 9),        |     |
| (0, 2, 0, 11),       |     |
| (0, 2, 1, 12),       |     |
| (0, 2, 2, 13),       |     |
| (0, 3, 0, 15),       |     |
| (0, 3, 1, 16),       |     |

```
(0, 3, 2, 17),
(1, 0, 0, 22),
(1, 0, 1, 23),
...
(1, 3, 2, 36)
```

That is, the highest-ordered index turns fastest.

- <sup>4</sup> It is possible to have degenerate generalized slices in which an address is repeated.
- <sup>5</sup> EXAMPLE 2: If the stride parameters in the previous example are changed to {1, 1, 1}, the first few elements of the resulting sequence of indices will be

```
(0, 0, 0, 3),
(0, 0, 1, 4),
(0, 0, 2, 5),
(0, 1, 0, 4),
(0, 1, 1, 5),
(0, 1, 2, 6),
...
```

- <sup>6</sup> If a degenerate slice is used as the argument to the non-const version of `operator[] (const gslice&)`, the behavior is undefined.

### 28.6.6.2 Constructors

[`gslice.cons`]

```
gslice();
gslice(size_t start, const valarray<size_t>& lengths,
 const valarray<size_t>& strides);
```

- <sup>1</sup> The default constructor is equivalent to `gslice(0, valarray<size_t>(), valarray<size_t>())`. The constructor with arguments builds a `gslice` based on a specification of start, lengths, and strides, as explained in the previous subclause.

### 28.6.6.3 Access functions

[`gslice.access`]

```
size_t start() const;
valarray<size_t> size() const;
valarray<size_t> stride() const;
```

- <sup>1</sup> *Returns:* The representation of the start, lengths, or strides specified for the `gslice`.
- <sup>2</sup> *Complexity:* `start()` is constant time. `size()` and `stride()` are linear in the number of strides.

### 28.6.7 Class template `gslice_array`

[`template.gslice.array`]

#### 28.6.7.1 Overview

[`template.gslice.array.overview`]

```
namespace std {
 template<class T> class gslice_array {
 public:
 using value_type = T;

 void operator= (const valarray<T>&) const;
 void operator*=(const valarray<T>&) const;
 void operator/=(const valarray<T>&) const;
 void operator%=(const valarray<T>&) const;
 void operator+= (const valarray<T>&) const;
 void operator-= (const valarray<T>&) const;
 void operator^=(const valarray<T>&) const;
 void operator&=(const valarray<T>&) const;
 void operator|=(const valarray<T>&) const;
 void operator<<=(const valarray<T>&) const;
 void operator>>=(const valarray<T>&) const;

 gslice_array(const gslice_array&);
 ~gslice_array();
 const gslice_array& operator=(const gslice_array&) const;
 void operator=(const T&) const;
```

```

 gslice_array() = delete; // as implied by declaring copy constructor above
 };
}

```

- <sup>1</sup> This template is a helper template used by the `gslice` subscript operator

```
gslice_array<T> valarray<T>::operator[](const gslice&);
```

- <sup>2</sup> It has reference semantics to a subset of an array specified by a `gslice` object. Thus, the expression `a[gslice(1, length, stride)] = b` has the effect of assigning the elements of `b` to a generalized slice of the elements in `a`.

### 28.6.7.2 Assignment

[`gslice.array.assign`]

```
void operator=(const valarray<T>&) const;
const gslice_array& operator=(const gslice_array&) const;
```

- <sup>1</sup> These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `gslice_array` refers.

### 28.6.7.3 Compound assignment

[`gslice.array.comp.assign`]

```
void operator*=(const valarray<T>&) const;
void operator/=(const valarray<T>&) const;
void operator%=(const valarray<T>&) const;
void operator+==(const valarray<T>&) const;
void operator-==(const valarray<T>&) const;
void operator^=(const valarray<T>&) const;
void operator&=(const valarray<T>&) const;
void operator|=(const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
```

- <sup>1</sup> These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `gslice_array` object refers.

### 28.6.7.4 Fill function

[`gslice.array.fill`]

```
void operator=(const T&) const;
```

- <sup>1</sup> This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `gslice_array` object refers.

## 28.6.8 Class template `mask_array`

[`template.mask.array`]

### 28.6.8.1 Overview

[`template.mask.array.overview`]

```

namespace std {
 template<class T> class mask_array {
 public:
 using value_type = T;

 void operator= (const valarray<T>&) const;
 void operator*=(const valarray<T>&) const;
 void operator/=(const valarray<T>&) const;
 void operator%=(const valarray<T>&) const;
 void operator+==(const valarray<T>&) const;
 void operator-==(const valarray<T>&) const;
 void operator^=(const valarray<T>&) const;
 void operator&=(const valarray<T>&) const;
 void operator|=(const valarray<T>&) const;
 void operator<<=(const valarray<T>&) const;
 void operator>>=(const valarray<T>&) const;

 mask_array(const mask_array&);
 ~mask_array();
 const mask_array& operator=(const mask_array&) const;
 void operator=(const T&) const;
 };
}

```

```

 mask_array() = delete; // as implied by declaring copy constructor above
 };
}

```

- <sup>1</sup> This template is a helper template used by the mask subscript operator:

```
mask_array<T> valarray<T>::operator[] (const valarray<bool>&);
```

- <sup>2</sup> It has reference semantics to a subset of an array specified by a boolean mask. Thus, the expression `a[mask] = b;` has the effect of assigning the elements of `b` to the masked elements in `a` (those for which the corresponding element in `mask` is `true`).

### 28.6.8.2 Assignment

[mask.array.assign]

```
void operator=(const valarray<T>&) const;
const mask_array& operator=(const mask_array&) const;
```

- <sup>1</sup> These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `mask_array` object refers.

### 28.6.8.3 Compound assignment

[mask.array.comp.assign]

```
void operator*=(const valarray<T>&) const;
void operator/=(const valarray<T>&) const;
void operator%=(const valarray<T>&) const;
void operator+=(const valarray<T>&) const;
void operator-=(const valarray<T>&) const;
void operator^=(const valarray<T>&) const;
void operator&=(const valarray<T>&) const;
void operator|=(const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
```

- <sup>1</sup> These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `mask_array` object refers.

### 28.6.8.4 Fill function

[mask.array.fill]

```
void operator=(const T&) const;
```

- <sup>1</sup> This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `mask_array` object refers.

## 28.6.9 Class template indirect\_array

[template.indirect.array]

### 28.6.9.1 Overview

[template.indirect.array.overview]

```

namespace std {
 template<class T> class indirect_array {
 public:
 using value_type = T;

 void operator= (const valarray<T>&) const;
 void operator*=(const valarray<T>&) const;
 void operator/=(const valarray<T>&) const;
 void operator%=(const valarray<T>&) const;
 void operator+=(const valarray<T>&) const;
 void operator-=(const valarray<T>&) const;
 void operator^=(const valarray<T>&) const;
 void operator&=(const valarray<T>&) const;
 void operator|=(const valarray<T>&) const;
 void operator<<=(const valarray<T>&) const;
 void operator>>=(const valarray<T>&) const;

 indirect_array(const indirect_array&);
 ~indirect_array();
 const indirect_array& operator=(const indirect_array&) const;
 void operator=(const T&) const;
 };
}

```

```
 indirect_array() = delete; // as implied by declaring copy constructor above
};

}
```

- <sup>1</sup> This template is a helper template used by the indirect subscript operator

```
indirect_array<T> valarray<T>::operator[](const valarray<size_t>&);
```

- <sup>2</sup> It has reference semantics to a subset of an array specified by an `indirect_array`. Thus, the expression `a[indirect] = b;` has the effect of assigning the elements of `b` to the elements in `a` whose indices appear in `indirect`.

#### 28.6.9.2 Assignment

[`indirect.array.assign`]

```
void operator=(const valarray<T>&) const;
const indirect_array& operator=(const indirect_array&) const;
```

- <sup>1</sup> These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which it refers.
- <sup>2</sup> If the `indirect_array` specifies an element in the `valarray<T>` object to which it refers more than once, the behavior is undefined.
- <sup>3</sup> EXAMPLE:

```
int addr[] = {2, 3, 1, 4, 4};
valarray<size_t> indirect(addr, 5);
valarray<double> a(0., 10), b(1., 5);
a[indirect] = b;
```

results in undefined behavior since element 4 is specified twice in the indirection.

#### 28.6.9.3 Compound assignment

[`indirect.array.comp.assign`]

```
void operator*=(const valarray<T>&) const;
void operator/=(const valarray<T>&) const;
void operator%=(const valarray<T>&) const;
void operator+==(const valarray<T>&) const;
void operator-=(const valarray<T>&) const;
void operator^=(const valarray<T>&) const;
void operator&=(const valarray<T>&) const;
void operator|=(const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
```

- <sup>1</sup> These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `indirect_array` object refers.
- <sup>2</sup> If the `indirect_array` specifies an element in the `valarray<T>` object to which it refers more than once, the behavior is undefined.

#### 28.6.9.4 Fill function

[`indirect.array.fill`]

```
void operator=(const T&) const;
```

- <sup>1</sup> This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `indirect_array` object refers.

#### 28.6.10 valarray range access

[`valarray.range`]

- <sup>1</sup> In the `begin` and `end` function templates that follow, `unspecified1` is a type that meets the requirements of a mutable `Cpp17RandomAccessIterator` (25.3.5.7) and models `contiguous_iterator` (25.3.4.14), whose `value_type` is the template parameter `T` and whose `reference` type is `T&`. `unspecified2` is a type that meets the requirements of a constant `Cpp17RandomAccessIterator` and models `contiguous_iterator`, whose `value_type` is the template parameter `T` and whose `reference` type is `const T&`.
- <sup>2</sup> The iterators returned by `begin` and `end` for an array are guaranteed to be valid until the member function `resize(size_t, T)` (28.6.2.8) is called for that array or until the lifetime of that array ends, whichever happens first.

```
template<class T> unspecified1 begin(valarray<T>& v);
template<class T> unspecified2 begin(const valarray<T>& v);
```

3     >Returns: An iterator referencing the first value in the array.

```
template<class T> unspecified1 end(valarray<T>& v);
template<class T> unspecified2 end(const valarray<T>& v);
```

4     >Returns: An iterator referencing one past the last value in the array.

## 28.7 Mathematical functions for floating-point types

[c.math]

### 28.7.1 Header <cmath> synopsis

[cmath.syn]

long double sph_neumannl(unsigned n, long double x);
}

```

- <sup>1</sup> The contents and meaning of the header <cmath> are the same as the C standard library header <math.h>, with the addition of a three-dimensional hypotenuse function (28.7.3), a linear interpolation function (28.7.4), and the mathematical special functions described in 28.7.6.
- NOTE: Several functions have additional overloads in this document, but they have the same behavior as in the C standard library (16.2).
- <sup>2</sup> For each function with at least one parameter of type *floating-point-type*, the implementation provides an overload for each cv-unqualified floating-point type (6.8.2) where all uses of *floating-point-type* in the function signature are replaced with that floating-point type.
- <sup>3</sup> For each function with at least one parameter of type *floating-point-type* other than **abs**, the implementation also provides additional overloads sufficient to ensure that, if every argument corresponding to a *floating-point-type* parameter has arithmetic type, then every such argument is effectively cast to the floating-point type with the greatest floating-point conversion rank and greatest floating-point conversion subrank among the types of all such arguments, where arguments of integer type are considered to have the same floating-point conversion rank as **double**. If no such floating-point type with the greatest rank and subrank exists, then overload resolution does not result in a usable candidate (12.2.1) from the overloads provided by the implementation.
- <sup>4</sup> An invocation of **nexttoward** is ill-formed if the argument corresponding to the *floating-point-type* parameter has extended floating-point type.

SEE ALSO: ISO C 7.12

## 28.7.2 Absolute values

[c.math.abs]

- <sup>1</sup> NOTE 1: The headers <cstdlib> (17.2.2) and <cmath> (28.7.1) declare the functions described in this subclause.

```

constexpr int abs(int j);
constexpr long int abs(long int j);
constexpr long long int abs(long long int j);

```

- <sup>2</sup> Effects: These functions have the semantics specified in the C standard library for the functions **abs**, **labs**, and **llabs**, respectively.

- <sup>3</sup> Remarks: If **abs** is called with an argument of type X for which **is\_unsigned\_v<X>** is **true** and if X cannot be converted to **int** by integral promotion (7.3.7), the program is ill-formed.

NOTE 2: Arguments that can be promoted to **int** are permitted for compatibility with C.

```
constexpr floating-point-type abs(floating-point-type x);
```

- <sup>4</sup> Returns: The absolute value of x.

SEE ALSO: ISO C 7.12.7.2, 7.22.6.1

**28.7.6.3 Associated Legendre functions**

[sf.cmath.assoc.legendre]

```
floating-point-type assoc_legendre(unsigned l, unsigned m, floating-point-type x);
float assoc_legendref(unsigned l, unsigned m, float x);
long double assoc_legendrel(unsigned l, unsigned m, long double x);
```

1    *Effects:* These functions compute the associated Legendre functions of their respective arguments *l*, *m*, and *x*.

2    *Returns:*

$$P_\ell^m(x) = (1 - x^2)^{m/2} \frac{d^m}{dx^m} P_\ell(x), \quad \text{for } |x| \leq 1,$$

where *l* is *l*, *m* is *m*, and *x* is *x*.

3    *Remarks:* The effect of calling each of these functions is implementation-defined if *l* >= 128.

**28.7.6.4 Beta function**

[sf.cmath.beta]

```
floating-point-type beta(floating-point-type x, floating-point-type y);
float betaf(float x, float y);
long double betal(long double x, long double y);
```

1    *Effects:* These functions compute the beta function of their respective arguments *x* and *y*.

2    *Returns:*

$$\Beta(x, y) = \frac{\Gamma(x) \Gamma(y)}{\Gamma(x + y)}, \quad \text{for } x > 0, y > 0,$$

where *x* is *x* and *y* is *y*.

**28.7.6.5 Complete elliptic integral of the first kind**

[sf.cmath.comp.ellint.1]

```
floating-point-type comp_ellint_1(floating-point-type k);
float comp_ellint_1f(float k);
long double comp_ellint_1l(long double k);
```

1    *Effects:* These functions compute the complete elliptic integral of the first kind of their respective arguments *k*.

2    *Returns:*

$$K(k) = F(k, \pi/2), \quad \text{for } |k| \leq 1,$$

where *k* is *k*.

3    See also [28.7.6.12](#).

**28.7.6.6 Complete elliptic integral of the second kind**

[sf.cmath.comp.ellint.2]

```
floating-point-type comp_ellint_2(floating-point-type k);
float comp_ellint_2f(float k);
long double comp_ellint_2l(long double k);
```

1    *Effects:* These functions compute the complete elliptic integral of the second kind of their respective arguments *k*.

2    *Returns:*

$$E(k) = E(k, \pi/2), \quad \text{for } |k| \leq 1,$$

where *k* is *k*.

3    See also [28.7.6.13](#).

**28.7.6.7 Complete elliptic integral of the third kind**

[sf.cmath.comp.ellint.3]

```
floating-point-type comp_ellint_3(floating-point-type k, floating-point-type nu);
float comp_ellint_3f(float k, float nu);
long double comp_ellint_3l(long double k, long double nu);
```

1    *Effects:* These functions compute the complete elliptic integral of the third kind of their respective arguments *k* and *nu*.

2    *Returns:*

$$\Pi(\nu, k) = \Pi(\nu, k, \pi/2), \quad \text{for } |k| \leq 1,$$

where  $k$  is `nu` and  $\nu$  is `nu`.

3 See also 28.7.6.14.

#### 28.7.6.8 Regular modified cylindrical Bessel functions

[sf.cmath.cyl.bessel.i]

```
floating-point-type cyl_bessel_i(floating-point-type nu, floating-point-type x);
float cyl_bessel_if(float nu, float x);
long double cyl_bessel_il(long double nu, long double x);
```

1 *Effects:* These functions compute the regular modified cylindrical Bessel functions of their respective arguments `nu` and `x`.

2 *Returns:*

$$I_\nu(x) = i^{-\nu} J_\nu(ix) = \sum_{k=0}^{\infty} \frac{(x/2)^{\nu+2k}}{k! \Gamma(\nu + k + 1)}, \quad \text{for } x \geq 0,$$

where  $\nu$  is `nu` and  $x$  is `x`.

3 *Remarks:* The effect of calling each of these functions is implementation-defined if `nu >= 128`.

4 See also 28.7.6.9.

#### 28.7.6.9 Cylindrical Bessel functions of the first kind

[sf.cmath.cyl.bessel.j]

```
floating-point-type cyl_bessel_j(floating-point-type nu, floating-point-type x);
float cyl_bessel_jf(float nu, float x);
long double cyl_bessel_jl(long double nu, long double x);
```

1 *Effects:* These functions compute the cylindrical Bessel functions of the first kind of their respective arguments `nu` and `x`.

2 *Returns:*

$$J_\nu(x) = \sum_{k=0}^{\infty} \frac{(-1)^k (x/2)^{\nu+2k}}{k! \Gamma(\nu + k + 1)}, \quad \text{for } x \geq 0,$$

where  $\nu$  is `nu` and  $x$  is `x`.

3 *Remarks:* The effect of calling each of these functions is implementation-defined if `nu >= 128`.

#### 28.7.6.10 Irregular modified cylindrical Bessel functions

[sf.cmath.cyl.bessel.k]

```
floating-point-type cyl_bessel_k(floating-point-type nu, floating-point-type x);
float cyl_bessel_kf(float nu, float x);
long double cyl_bessel_kl(long double nu, long double x);
```

1 *Effects:* These functions compute the irregular modified cylindrical Bessel functions of their respective arguments `nu` and `x`.

2 *Returns:*

$$K_\nu(x) = (\pi/2)i^{\nu+1}(J_\nu(ix) + iN_\nu(ix)) = \begin{cases} \frac{\pi}{2} \frac{I_{-\nu}(x) - I_\nu(x)}{\sin \nu \pi}, & \text{for } x \geq 0 \text{ and non-integral } \nu \\ \frac{\pi}{2} \lim_{\mu \rightarrow \nu} \frac{I_{-\mu}(x) - I_\mu(x)}{\sin \mu \pi}, & \text{for } x \geq 0 \text{ and integral } \nu \end{cases}$$

where  $\nu$  is `nu` and  $x$  is `x`.

3 *Remarks:* The effect of calling each of these functions is implementation-defined if `nu >= 128`.

4 See also 28.7.6.8, 28.7.6.9, 28.7.6.11.

#### 28.7.6.11 Cylindrical Neumann functions

[sf.cmath.cyl.neumann]

```
floating-point-type cyl_neumann(floating-point-type nu, floating-point-type x);
float cyl_neumannf(float nu, float x);
long double cyl_neumannl(long double nu, long double x);
```

1 *Effects:* These functions compute the cylindrical Neumann functions, also known as the cylindrical Bessel functions of the second kind, of their respective arguments `nu` and `x`.

2      Returns:

$$N_\nu(x) = \begin{cases} \frac{J_\nu(x) \cos \nu\pi - J_{-\nu}(x)}{\sin \nu\pi}, & \text{for } x \geq 0 \text{ and non-integral } \nu \\ \lim_{\mu \rightarrow \nu} \frac{J_\mu(x) \cos \mu\pi - J_{-\mu}(x)}{\sin \mu\pi}, & \text{for } x \geq 0 \text{ and integral } \nu \end{cases}$$

where  $\nu$  is nu and  $x$  is x.

3      Remarks: The effect of calling each of these functions is implementation-defined if nu >= 128.

4      See also 28.7.6.9.

#### 28.7.6.12 Incomplete elliptic integral of the first kind

[sf.cmath.ellint.1]

```
floating-point-type ellint_1(floating-point-type k, floating-point-type phi);
float ellint_1f(float k, float phi);
long double ellint_1l(long double k, long double phi);
```

1      Effects: These functions compute the incomplete elliptic integral of the first kind of their respective arguments k and phi (phi measured in radians).

2      Returns:

$$F(k, \phi) = \int_0^\phi \frac{d\theta}{\sqrt{1 - k^2 \sin^2 \theta}}, \quad \text{for } |k| \leq 1,$$

where k is k and  $\phi$  is phi.

#### 28.7.6.13 Incomplete elliptic integral of the second kind

[sf.cmath.ellint.2]

```
floating-point-type ellint_2(floating-point-type k, floating-point-type phi);
float ellint_2f(float k, float phi);
long double ellint_2l(long double k, long double phi);
```

1      Effects: These functions compute the incomplete elliptic integral of the second kind of their respective arguments k and phi (phi measured in radians).

2      Returns:

$$E(k, \phi) = \int_0^\phi \sqrt{1 - k^2 \sin^2 \theta} d\theta, \quad \text{for } |k| \leq 1,$$

where k is k and  $\phi$  is phi.

#### 28.7.6.14 Incomplete elliptic integral of the third kind

[sf.cmath.ellint.3]

```
floating-point-type ellint_3(floating-point-type k, floating-point-type nu,
 floating-point-type phi);
float ellint_3f(float k, float nu, float phi);
long double ellint_3l(long double k, long double nu, long double phi);
```

1      Effects: These functions compute the incomplete elliptic integral of the third kind of their respective arguments k, nu, and phi (phi measured in radians).

2      Returns:

$$\Pi(\nu, k, \phi) = \int_0^\phi \frac{d\theta}{(1 - \nu \sin^2 \theta) \sqrt{1 - k^2 \sin^2 \theta}}, \quad \text{for } |k| \leq 1,$$

where  $\nu$  is nu,  $k$  is k, and  $\phi$  is phi.

#### 28.7.6.15 Exponential integral

[sf.cmath.expint]

```
floating-point-type expint(floating-point-type x);
float expintf(float x);
long double expintl(long double x);
```

1      Effects: These functions compute the exponential integral of their respective arguments x.

2      Returns:

$$Ei(x) = - \int_{-x}^{\infty} \frac{e^{-t}}{t} dt$$

where x is x.

**28.7.6.16 Hermite polynomials**

[sf.cmath.hermite]

```
floating-point-type hermite(unsigned n, floating-point-type x);
float hermitef(unsigned n, float x);
long double hermitel(unsigned n, long double x);
```

1    *Effects:* These functions compute the Hermite polynomials of their respective arguments *n* and *x*.

2    *Returns:*

$$H_n(x) = (-1)^n e^{x^2} \frac{d^n}{dx^n} e^{-x^2}$$

where *n* is *n* and *x* is *x*.

3    *Remarks:* The effect of calling each of these functions is implementation-defined if *n* >= 128.

**28.7.6.17 Laguerre polynomials**

[sf.cmath.laguerre]

```
floating-point-type laguerre(unsigned n, floating-point-type x);
float laguerref(unsigned n, float x);
long double laguerrel(unsigned n, long double x);
```

1    *Effects:* These functions compute the Laguerre polynomials of their respective arguments *n* and *x*.

2    *Returns:*

$$L_n(x) = \frac{e^x}{n!} \frac{d^n}{dx^n} (x^n e^{-x}), \quad \text{for } x \geq 0,$$

where *n* is *n* and *x* is *x*.

3    *Remarks:* The effect of calling each of these functions is implementation-defined if *n* >= 128.

**28.7.6.18 Legendre polynomials**

[sf.cmath.legendre]

```
floating-point-type legendre(unsigned l, floating-point-type x);
float legendref(unsigned l, float x);
long double legendrel(unsigned l, long double x);
```

1    *Effects:* These functions compute the Legendre polynomials of their respective arguments *l* and *x*.

2    *Returns:*

$$P_l(x) = \frac{1}{2^l l!} \frac{d^l}{dx^l} (x^2 - 1)^l, \quad \text{for } |x| \leq 1,$$

where *l* is *l* and *x* is *x*.

3    *Remarks:* The effect of calling each of these functions is implementation-defined if *l* >= 128.

**28.7.6.19 Riemann zeta function**

[sf.cmath.riemann.zeta]

```
floating-point-type riemann_zeta(floating-point-type x);
float riemann_zetaf(float x);
long double riemann_zetal(long double x);
```

1    *Effects:* These functions compute the Riemann zeta function of their respective arguments *x*.

2    *Returns:*

$$\zeta(x) = \begin{cases} \sum_{k=1}^{\infty} k^{-x}, & \text{for } x > 1 \\ \frac{1}{1 - 2^{1-x}} \sum_{k=1}^{\infty} (-1)^{k-1} k^{-x}, & \text{for } 0 \leq x \leq 1 \\ 2^x \pi^{x-1} \sin\left(\frac{\pi x}{2}\right) \Gamma(1-x) \zeta(1-x), & \text{for } x < 0 \end{cases}$$

where *x* is *x*.

## 28.7.6.20 Spherical Bessel functions of the first kind

[sf.cmath.sph.bessel]

```
floating-point-type sph_bessel(unsigned n, floating-point-type x);
float sph_besself(unsigned n, float x);
long double sph_bessell(unsigned n, long double x);
```

1    *Effects:* These functions compute the spherical Bessel functions of the first kind of their respective arguments *n* and *x*.

2    *Returns:*

$$j_n(x) = (\pi/2x)^{1/2} J_{n+1/2}(x), \quad \text{for } x \geq 0,$$

where *n* is *n* and *x* is *x*.

3    *Remarks:* The effect of calling each of these functions is implementation-defined if *n* >= 128.

4    See also 28.7.6.9.

## 28.7.6.21 Spherical associated Legendre functions

[sf.cmath.sph.legendre]

```
floating-point-type sph_legendre(unsigned l, unsigned m, floating-point-type theta);
float sph_legendref(unsigned l, unsigned m, float theta);
long double sph_legendrel(unsigned l, unsigned m, long double theta);
```

1    *Effects:* These functions compute the spherical associated Legendre functions of their respective arguments *l*, *m*, and *theta* (*theta* measured in radians).

2    *Returns:*

$$Y_\ell^m(\theta, 0)$$

where

$$Y_\ell^m(\theta, \phi) = (-1)^m \left[ \frac{(2\ell+1)}{4\pi} \frac{(\ell-m)!}{(\ell+m)!} \right]^{1/2} P_\ell^m(\cos \theta) e^{im\phi}, \quad \text{for } |m| \leq \ell,$$

and *l* is *l*, *m* is *m*, and *theta* is *theta*.

3    *Remarks:* The effect of calling each of these functions is implementation-defined if *l* >= 128.

4    See also 28.7.6.3.

## 28.7.6.22 Spherical Neumann functions

[sf.cmath.sph.neumann]

```
floating-point-type sph_neumann(unsigned n, floating-point-type x);
float sph_neumannf(unsigned n, float x);
long double sph_neumannl(unsigned n, long double x);
```

1    *Effects:* These functions compute the spherical Neumann functions, also known as the spherical Bessel functions of the second kind, of their respective arguments *n* and *x*.

2    *Returns:*

$$n_n(x) = (\pi/2x)^{1/2} N_{n+1/2}(x), \quad \text{for } x \geq 0,$$

where *n* is *n* and *x* is *x*.

3    *Remarks:* The effect of calling each of these functions is implementation-defined if *n* >= 128.

4    See also 28.7.6.11.

## 28.8 Numbers

[numbers]

## 28.8.1 Header &lt;numbers&gt; synopsis

[numbers.syn]

```
namespace std::numbers {

```

## 28.8.2 Mathematical constants

[math.constants]

- <sup>1</sup> The library-defined partial specializations of mathematical constant variable templates are initialized with the nearest representable values of  $e$ ,  $\log_2 e$ ,  $\log_{10} e$ ,  $\pi$ ,  $\frac{1}{\pi}$ ,  $\frac{1}{\sqrt{\pi}}$ ,  $\ln 2$ ,  $\ln 10$ ,  $\sqrt{2}$ ,  $\sqrt{3}$ ,  $\frac{1}{\sqrt{3}}$ , the Euler-Mascheroni  $\gamma$  constant, and the golden ratio  $\phi$  constant  $\frac{1+\sqrt{5}}{2}$ , respectively.
- 2 Pursuant to 16.4.5.2.1, a program may partially or explicitly specialize a mathematical constant variable template provided that the specialization depends on a program-defined type.
- 3 A program that instantiates a primary template of a mathematical constant variable template is ill-formed.

# 29 Time library

[time]

## 29.1 General

[time.general]

- <sup>1</sup> This Clause describes the chrono library (29.2) and various C functions (29.14) that provide generally useful time utilities, as summarized in Table 98.

Table 98: Time library summary [tab:time.summary]

| Subclause | Header                           |
|-----------|----------------------------------|
| 29.3      | <i>Cpp17Clock</i> requirements   |
| 29.4      | Time-related traits <chrono>     |
| 29.5      | Class template duration          |
| 29.6      | Class template time_point        |
| 29.7      | Clocks                           |
| 29.8      | Civil calendar                   |
| 29.9      | Class template hh_mm_ss          |
| 29.10     | 12/24 hour functions             |
| 29.11     | Time zones                       |
| 29.12     | Formatting                       |
| 29.13     | Parsing                          |
| 29.14     | C library time utilities <ctime> |

- <sup>2</sup> Let *STATICALLY-WIDEN*<charT>("...") be "..." if charT is char and L"..." if charT is wchar\_t.

## 29.2 Header <chrono> synopsis

[time.syn]

```
#include <compare> // see 17.11.1

### 29.3 Cpp17Clock requirements

[time.clock.req]

- 1 A clock is a bundle consisting of a `duration`, a `time_point`, and a function `now()` to get the current `time_point`. The origin of the clock's `time_point` is referred to as the clock's *epoch*. A clock shall meet the requirements in [Table 99](#).
  - 2 In [Table 99](#) `C1` and `C2` denote clock types. `t1` and `t2` are values returned by `C1::now()` where the call returning `t1` happens before [\(6.9.2\)](#) the call returning `t2` and both of these calls occur before `C1::time_point::max()`.
- NOTE 1: This means `C1` did not wrap around between `t1` and `t2`.

Table 99: *Cpp17Clock* requirements [tab:time.clock]

| Expression                  | Return type                                                                                          | Operational semantics                                                                                                                                  |
|-----------------------------|------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>C1::rep</code>        | An arithmetic type or a class emulating an arithmetic type                                           | The representation type of <code>C1::duration</code> .                                                                                                 |
| <code>C1::period</code>     | a specialization of <code>ratio</code>                                                               | The tick period of the clock in seconds.                                                                                                               |
| <code>C1::duration</code>   | <code>chrono::duration&lt;C1::rep, C1::period&gt;</code>                                             | The <code>duration</code> type of the clock.                                                                                                           |
| <code>C1::time_point</code> | <code>chrono::time_point&lt;C1&gt;</code> or <code>chrono::time_point&lt;C2, C1::duration&gt;</code> | The <code>time_point</code> type of the clock. <code>C1</code> and <code>C2</code> shall refer to the same epoch.                                      |
| <code>C1::is_steady</code>  | <code>const bool</code>                                                                              | <code>true</code> if <code>t1 &lt;= t2</code> is always <code>true</code> and the time between clock ticks is constant, otherwise <code>false</code> . |
| <code>C1::now()</code>      | <code>C1::time_point</code>                                                                          | Returns a <code>time_point</code> object representing the current point in time.                                                                       |

<sup>3</sup> NOTE 2: The relative difference in durations between those reported by a given clock and the SI definition is a measure of the quality of implementation.

<sup>4</sup> A type `TC` meets the *Cpp17TrivialClock* requirements if:

- (4.1) — `TC` meets the *Cpp17Clock* requirements,
- (4.2) — the types `TC::rep`, `TC::duration`, and `TC::time_point` meet the *Cpp17EqualityComparable* ([Table 28](#)) and *Cpp17LessThanComparable* ([Table 29](#)) and *Cpp17Swappable* ([16.4.4.3](#)) requirements and the requirements of numeric types ([28.2](#)),

NOTE 3: This means, in particular, that operations on these types will not throw exceptions.

- (4.3) — the function `TC::now()` does not throw exceptions, and
- (4.4) — the type `TC::time_point::clock` meets the *Cpp17TrivialClock* requirements, recursively.

## 29.4 Time-related traits

[time.traits]

### 29.4.1 treat\_as\_floating\_point

[time.traits.is.fp]

```
template<class Rep> struct treat_as_floating_point : is_floating_point<Rep> { };
```

- <sup>1</sup> The duration template uses the `treat_as_floating_point` trait to help determine if a `duration` object can be converted to another `duration` with a different tick period. If `treat_as_floating_point_v<Rep>` is `true`, then implicit conversions are allowed among `durations`. Otherwise, the implicit convertibility depends on the tick periods of the `durations`.

NOTE: The intention of this trait is to indicate whether a given class behaves like a floating-point type, and thus allows division of one value by another with acceptable loss of precision. If `treat_as_floating_point_v<Rep>` is `false`, `Rep` will be treated as if it behaved like an integral type for the purpose of these conversions.

### 29.4.2 duration\_values

[time.traits.duration.values]

```
template<class Rep>
struct duration_values {
public:
 static constexpr Rep zero() noexcept;
 static constexpr Rep min() noexcept;
 static constexpr Rep max() noexcept;
};
```

- <sup>1</sup> The duration template uses the `duration_values` trait to construct special values of the duration's representation (`Rep`). This is done because the representation can be a class type with behavior that requires some other implementation to return these special values. In that case, the author of that class type should specialize `duration_values` to return the indicated values.

`static constexpr Rep zero() noexcept;`

- <sup>2</sup> *Returns:* `Rep(0)`.

NOTE: `Rep(0)` is specified instead of `Rep()` because `Rep()` can have some other meaning, such as an uninitialized value.

- <sup>3</sup> *Remarks:* The value returned shall be the additive identity.

`static constexpr Rep min() noexcept;`

- <sup>4</sup> *Returns:* `numeric_limits<Rep>::lowest()`.

- <sup>5</sup> *Remarks:* The value returned shall compare less than or equal to `zero()`.

`static constexpr Rep max() noexcept;`

- <sup>6</sup> *Returns:* `numeric_limits<Rep>::max()`.

- <sup>7</sup> *Remarks:* The value returned shall compare greater than `zero()`.

### 29.4.3 Specializations of common\_type

[time.traits.specializations]

```
template<class Rep1, class Period1, class Rep2, class Period2>
struct common_type<chrono::duration<Rep1, Period1>, chrono::duration<Rep2, Period2>> {
 using type = chrono::duration<common_type_t<Rep1, Rep2>, see below>;
};
```

- <sup>1</sup> The period of the duration indicated by this specialization of `common_type` is the greatest common divisor of `Period1` and `Period2`.

NOTE 1: This can be computed by forming a ratio of the greatest common divisor of `Period1::num` and `Period2::num` and the least common multiple of `Period1::den` and `Period2::den`.

- <sup>2</sup> NOTE 2: The `typedef` name `type` is a synonym for the `duration` with the largest tick period possible where both `duration` arguments will convert to it without requiring a division operation. The representation of this type is intended to be able to hold any value resulting from this conversion with no truncation error, although floating-point durations can have round-off errors.

```
template<class Clock, class Duration1, class Duration2>
struct common_type<chrono::time_point<Clock, Duration1>, chrono::time_point<Clock, Duration2>> {
 using type = chrono::time_point<Clock, common_type_t<Duration1, Duration2>>;
```

};

- 3 The common type of two `time_point` types is a `time_point` with the same clock as the two types and the common type of their two `durations`.

#### 29.4.4 Class template `is_clock`

[`time.traits.is.clock`]

```
template<class T> struct is_clock;
```

- <sup>1</sup> `is_clock` is a *Cpp17UnaryTypeTrait* (21.3.2) with a base characteristic of `true_type` if `T` meets the *Cpp17Clock* requirements (29.3), otherwise `false_type`. For the purposes of the specification of this trait, the extent to which an implementation determines that a type cannot meet the *Cpp17Clock* requirements is unspecified, except that as a minimum a type `T` shall not qualify as a *Cpp17Clock* unless it meets all of the following conditions:

- (1.1) — the *qualified-ids* `T::rep`, `T::period`, `T::duration`, and `T::time_point` are valid and each denotes a type (13.10.3),
- (1.2) — the expression `T::is_steady` is well-formed when treated as an unevaluated operand (7.2.3),
- (1.3) — the expression `T::now()` is well-formed when treated as an unevaluated operand.

- <sup>2</sup> The behavior of a program that adds specializations for `is_clock` is undefined.

#### 29.5 Class template `duration`

[`time.duration`]

##### 29.5.1 General

[`time.duration.general`]

- <sup>1</sup> A `duration` type measures time between two points in time (`time_points`). A `duration` has a representation which holds a count of ticks and a tick period. The tick period is the amount of time which occurs from one tick to the next, in units of seconds. It is expressed as a rational constant using the template `ratio`.

```
namespace std::chrono {
 template<class Rep, class Period = ratio<1>>
 class duration {
 public:
 using rep = Rep;
 using period = typename Period::type;

 private:
 rep rep_; // exposition only

 public:
 // 29.5.2, construct/copy/destroy
 constexpr duration() = default;
 template<class Rep2>
 constexpr explicit duration(const Rep2& r);
 template<class Rep2, class Period2>
 constexpr duration(const duration<Rep2, Period2>& d);
 ~duration() = default;
 duration(const duration&) = default;
 duration& operator=(const duration&) = default;

 // 29.5.3, observer
 constexpr rep count() const;

 // 29.5.4, arithmetic
 constexpr common_type_t<duration> operator+() const;
 constexpr common_type_t<duration> operator-() const;
 constexpr duration& operator++();
 constexpr duration operator++(int);
 constexpr duration& operator--();
 constexpr duration operator--(int);

 constexpr duration& operator+=(const duration& d);
 constexpr duration& operator-=(const duration& d);
 };
}
```

```

constexpr duration& operator*=(const rep& rhs);
constexpr duration& operator/=(const rep& rhs);
constexpr duration& operator%=(const rep& rhs);
constexpr duration& operator%=(const duration& rhs);

// 29.5.5, special values
static constexpr duration zero() noexcept;
static constexpr duration min() noexcept;
static constexpr duration max() noexcept;
};

}

```

- 2 Rep shall be an arithmetic type or a class emulating an arithmetic type. If duration is instantiated with a duration type as the argument for the template parameter Rep, the program is ill-formed.
- 3 If Period is not a specialization of ratio, the program is ill-formed. If Period::num is not positive, the program is ill-formed.
- 4 Members of duration do not throw exceptions other than those thrown by the indicated operations on their representations.
- 5 The defaulted copy constructor of duration shall be a constexpr function if and only if the required initialization of the member rep\_ for copy and move, respectively, would be constexpr-suitable (9.2.6).

6 EXAMPLE:

```

duration<long, ratio<60>> d0; // holds a count of minutes using a long
duration<long long, milli> d1; // holds a count of milliseconds using a long long
duration<double, ratio<1, 30>> d2; // holds a count with a tick period of $\frac{1}{30}$ of a second
 // (30 Hz) using a double

```

## 29.5.2 Constructors

[time.duration.cons]

```
template<class Rep2>
constexpr explicit duration(const Rep2& r);
```

- 1 Constraints: is\_convertible\_v<const Rep2&, rep> is true and
  - (1.1) — treat\_as\_floating\_point\_v<rep> is true or
  - (1.2) — treat\_as\_floating\_point\_v<Rep2> is false.

EXAMPLE 1:

```

duration<int, milli> d(3); // OK
duration<int, milli> d(3.5); // error

```

- 2 Effects: Initializes rep\_ with r.

```
template<class Rep2, class Period2>
constexpr duration(const duration<Rep2, Period2>& d);
```

- 3 Constraints: No overflow is induced in the conversion and treat\_as\_floating\_point\_v<rep> is true or both ratio\_divide<Period2, period>::den is 1 and treat\_as\_floating\_point\_v<Rep2> is false.

NOTE: This requirement prevents implicit truncation error when converting between integral-based duration types. Such a construction can lead to confusion about the value of the duration.

EXAMPLE 2:

```

duration<int, milli> ms(3);
duration<int, micro> us = ms; // OK
duration<int, milli> ms2 = us; // error

```

- 4 Effects: Initializes rep\_ with duration\_cast<duration>(d).count().

## 29.5.3 Observer

[time.duration.observer]

```
constexpr rep count() const;
```

- 1 Returns: rep\_.

### 29.5.4 Arithmetic

[time.duration.arithmetic]

```

constexpr common_type_t<duration> operator+() const;
1 Returns: common_type_t<duration>(*this).

constexpr common_type_t<duration> operator-() const;
2 Returns: common_type_t<duration>(-rep_).

constexpr duration& operator++();
3 Effects: Equivalent to: ++rep_.
4 Returns: *this.

constexpr duration operator++(int);
5 Effects: Equivalent to: return duration(rep_++);
constexpr duration& operator--();
6 Effects: Equivalent to: --rep_.
7 Returns: *this.

constexpr duration operator--(int);
8 Effects: Equivalent to: return duration(rep_--);

constexpr duration& operator+=(const duration& d);
9 Effects: Equivalent to: rep_ += d.count().
10 Returns: *this.

constexpr duration& operator-=(const duration& d);
11 Effects: Equivalent to: rep_ -= d.count().
12 Returns: *this.

constexpr duration& operator*=(const rep& rhs);
13 Effects: Equivalent to: rep_ *= rhs.
14 Returns: *this.

constexpr duration& operator/=(const rep& rhs);
15 Effects: Equivalent to: rep_ /= rhs.
16 Returns: *this.

constexpr duration& operator%=(const rep& rhs);
17 Effects: Equivalent to: rep_ %= rhs.
18 Returns: *this.

constexpr duration& operator%=(const duration& rhs);
19 Effects: Equivalent to: rep_ %= rhs.count().
20 Returns: *this.

```

### 29.5.5 Special values

[time.duration.special]

```

static constexpr duration zero() noexcept;
1 Returns: duration(duration_values<rep>::zero()).

static constexpr duration min() noexcept;
2 Returns: duration(duration_values<rep>::min()).

static constexpr duration max() noexcept;
3 Returns: duration(duration_values<rep>::max()) .

```

### 29.5.6 Non-member arithmetic

[time.duration.nonmember]

- <sup>1</sup> In the function descriptions that follow, unless stated otherwise, let CD represent the return type of the function.

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator+(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
```

<sup>2</sup> *Returns:* CD(CD(lhs).count() + CD(rhs).count()).

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator-(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
```

<sup>3</sup> *Returns:* CD(CD(lhs).count() - CD(rhs).count()).

```
template<class Rep1, class Period, class Rep2>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator*(const duration<Rep1, Period>& d, const Rep2& s);
```

<sup>4</sup> *Constraints:* is\_convertible\_v<const Rep2&, common\_type\_t<Rep1, Rep2>> is true.

<sup>5</sup> *Returns:* CD(CD(d).count() \* s).

```
template<class Rep1, class Rep2, class Period>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator*(const Rep1& s, const duration<Rep2, Period>& d);
```

<sup>6</sup> *Constraints:* is\_convertible\_v<const Rep1&, common\_type\_t<Rep1, Rep2>> is true.

<sup>7</sup> *Returns:* d \* s.

```
template<class Rep1, class Period, class Rep2>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator/(const duration<Rep1, Period>& d, const Rep2& s);
```

<sup>8</sup> *Constraints:* is\_convertible\_v<const Rep2&, common\_type\_t<Rep1, Rep2>> is true and Rep2 is not a specialization of duration.

<sup>9</sup> *Returns:* CD(CD(d).count() / s).

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<Rep1, Rep2>
operator/(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
```

<sup>10</sup> Let CD be common\_type\_t<duration<Rep1, Period1>, duration<Rep2, Period2>>.

<sup>11</sup> *Returns:* CD(lhs).count() / CD(rhs).count().

```
template<class Rep1, class Period, class Rep2>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator%(const duration<Rep1, Period>& d, const Rep2& s);
```

<sup>12</sup> *Constraints:* is\_convertible\_v<const Rep2&, common\_type\_t<Rep1, Rep2>> is true and Rep2 is not a specialization of duration.

<sup>13</sup> *Returns:* CD(CD(d).count() % s).

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator%(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
```

<sup>14</sup> *Returns:* CD(CD(lhs).count() % CD(rhs).count()).

### 29.5.7 Comparisons

[time.duration.comparisons]

- <sup>1</sup> In the function descriptions that follow, CT represents common\_type\_t<A, B>, where A and B are the types of the two arguments to the function.

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator==(const duration<Rep1, Period1>& lhs,
```

```

 const duration<Rep2, Period2>& rhs);

2 Returns: CT(lhs).count() == CT(rhs).count().

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator<(const duration<Rep1, Period1>& lhs,
 const duration<Rep2, Period2>& rhs);

3 Returns: CT(lhs).count() < CT(rhs).count().

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator>(const duration<Rep1, Period1>& lhs,
 const duration<Rep2, Period2>& rhs);

4 Returns: rhs < lhs.

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator<=(const duration<Rep1, Period1>& lhs,
 const duration<Rep2, Period2>& rhs);

5 Returns: !(rhs < lhs).

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator>=(const duration<Rep1, Period1>& lhs,
 const duration<Rep2, Period2>& rhs);

6 Returns: !(lhs < rhs).

template<class Rep1, class Period1, class Rep2, class Period2>
requires three_way_comparable<typename CT::rep>
constexpr auto operator<=>(const duration<Rep1, Period1>& lhs,
 const duration<Rep2, Period2>& rhs);

7 Returns: CT(lhs).count() <= CT(rhs).count().

```

### 29.5.8 Conversions

[time.duration.cast]

```

template<class ToDuration, class Rep, class Period>
constexpr ToDuration duration_cast(const duration<Rep, Period>& d);

```

1     *Constraints:* ToDuration is a specialization of duration.

2     *Returns:* Let CF be ratio\_divide<Period, typename ToDuration::period>, and CR be common\_type<typename ToDuration::rep, Rep, intmax\_t>::type.

(2.1)   — If CF::num == 1 and CF::den == 1, returns

```
ToDuration(static_cast<typename ToDuration::rep>(d.count()))
```

(2.2)   — otherwise, if CF::num != 1 and CF::den == 1, returns

```
ToDuration(static_cast<typename ToDuration::rep>(
 static_cast<CR>(d.count()) * static_cast<CR>(CF::num)))
```

(2.3)   — otherwise, if CF::num == 1 and CF::den != 1, returns

```
ToDuration(static_cast<typename ToDuration::rep>(
 static_cast<CR>(d.count()) / static_cast<CR>(CF::den)))
```

(2.4)   — otherwise, returns

```
ToDuration(static_cast<typename ToDuration::rep>(
 static_cast<CR>(d.count()) * static_cast<CR>(CF::num) / static_cast<CR>(CF::den)))
```

3     NOTE: This function does not use any implicit conversions; all conversions are done with static\_cast. It avoids multiplications and divisions when it is known at compile time that one or more arguments is 1. Intermediate computations are carried out in the widest representation and only converted to the destination representation at the final step.

```

template<class ToDuration, class Rep, class Period>
constexpr ToDuration floor(const duration<Rep, Period>& d);

```

4     *Constraints:* ToDuration is a specialization of duration.

5     *Returns:* The greatest result t representable in ToDuration for which t <= d.

```
template<class ToDuration, class Rep, class Period>
constexpr ToDuration ceil(const duration<Rep, Period>& d);

Constraints: ToDuration is a specialization of duration.

Returns: The least result t representable in ToDuration for which t >= d.
```

```
template<class ToDuration, class Rep, class Period>
constexpr ToDuration round(const duration<Rep, Period>& d);

Constraints: ToDuration is a specialization of duration and treat_as_floating_point_v<typename ToDuration::rep> is false.

Returns: The value of ToDuration that is closest to d. If there are two closest values, then return the value t for which t % 2 == 0.
```

### 29.5.9 Suffixes for duration literals

### [time.duration.literals]

- <sup>1</sup> This subclause describes literal suffixes for constructing duration literals. The suffixes `h`, `min`, `s`, `ms`, `us`, `ns` denote duration values of the corresponding types `hours`, `minutes`, `seconds`, `milliseconds`, `microseconds`, and `nanoseconds` respectively if they are applied to *integer-literals*.
  - <sup>2</sup> If any of these suffixes are applied to a *floating-point-literal* the result is a `chrono::duration` literal with an unspecified floating-point representation.
  - <sup>3</sup> If any of these suffixes are applied to an *integer-literal* and the resulting `chrono::duration` value cannot be represented in the result type because of overflow, the program is ill-formed.
  - <sup>4</sup> EXAMPLE: The following code shows some duration literals.

```
using namespace std::chrono_literals;
auto constexpr aday=24h;
auto constexpr lesson=45min;
auto constexpr halfanhour=0.5h;
```

```
constexpr chrono::hours operator""h(unsigned long long hours);
constexpr chrono::duration<unspecified, ratio<3600, 1>> operator""h(long double hours);
```

5       >Returns: A duration literal representing hours hours.

```
constexpr chrono::minutes operator""min(unsigned long long minutes);
constexpr chrono::duration<unspecified, ratio<60, 1> operator""min(long double minutes);
```

*Returns:* A duration literal representing minutes minutes.

```
constexpr chrono::seconds operator""s(unsigned long long sec);
```

```
constexpr chrono::duration<unspecified> operator""s(long double sec);
```

The `duration` argument must be a duration literal representing time in seconds.

NOTE: The same suffixes used for `basic_string` but there is no conflict, since duration suffixes apply to numbers and string literal suffixes apply to character array literals.

```
constexpr chrono::milliseconds operator ms(unsigned long long msec);
constexpr chrono::duration<unspecified, milli> operator""ms(long double msec);
```

*Returns:* A duration literal representing msec milliseconds.

```
constexpr chrono::microseconds operator""us(unsigned long long usec);
constexpr chrono::duration<unspecified, micro> operator""us(long double usec);
```

Returns: A duration literal representing usec microseconds.

```
constexpr chrono::nanoseconds operator""ns(unsigned long long nsec);
constexpr chrono::duration<unspecified, nano> operator""ns(long double nsec);
```

11       *Returns:* A duration literal representing nsec nanoseconds

**29.5.10 Algorithms** [time.duration.alg]

```
template<class Rep, class Period>
 constexpr duration<Rep, Period> abs(duration<Rep, Period> d)
```

1       *Constraints:* numeric\_limits<Rep>::is signed is true

2     >Returns: If `d >= d.zero()`, return `d`, otherwise return `-d`.

### 29.5.11 I/O

[time.duration.io]

```
template<class charT, class traits, class Rep, class Period>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const duration<Rep, Period>& d);
```

1     >Effects: Inserts the duration `d` onto the stream `os` as if it were implemented as follows:

```
basic_ostringstream<charT, traits> s;
s.flags(os.flags());
s.imbue(os.getloc());
s.precision(os.precision());
s << d.count() << units-suffix;
return os << s.str();
```

where `units-suffix` depends on the type `Period::type` as follows:

- (1.1) — If `Period::type` is atto, `units-suffix` is "as".
- (1.2) — Otherwise, if `Period::type` is femto, `units-suffix` is "fs".
- (1.3) — Otherwise, if `Period::type` is pico, `units-suffix` is "ps".
- (1.4) — Otherwise, if `Period::type` is nano, `units-suffix` is "ns".
- (1.5) — Otherwise, if `Period::type` is micro, it is implementation-defined whether `units-suffix` is "μs" ("`\u00b5\u0073`") or "us".
- (1.6) — Otherwise, if `Period::type` is milli, `units-suffix` is "ms".
- (1.7) — Otherwise, if `Period::type` is centi, `units-suffix` is "cs".
- (1.8) — Otherwise, if `Period::type` is deci, `units-suffix` is "ds".
- (1.9) — Otherwise, if `Period::type` is ratio<1>, `units-suffix` is "s".
- (1.10) — Otherwise, if `Period::type` is deca, `units-suffix` is "das".
- (1.11) — Otherwise, if `Period::type` is hecto, `units-suffix` is "hs".
- (1.12) — Otherwise, if `Period::type` is kilo, `units-suffix` is "ks".
- (1.13) — Otherwise, if `Period::type` is mega, `units-suffix` is "Ms".
- (1.14) — Otherwise, if `Period::type` is giga, `units-suffix` is "Gs".
- (1.15) — Otherwise, if `Period::type` is tera, `units-suffix` is "Ts".
- (1.16) — Otherwise, if `Period::type` is peta, `units-suffix` is "Ps".
- (1.17) — Otherwise, if `Period::type` is exa, `units-suffix` is "Es".
- (1.18) — Otherwise, if `Period::type` is ratio<60>, `units-suffix` is "min".
- (1.19) — Otherwise, if `Period::type` is ratio<3600>, `units-suffix` is "h".
- (1.20) — Otherwise, if `Period::type` is ratio<86400>, `units-suffix` is "d".
- (1.21) — Otherwise, if `Period::type::den == 1`, `units-suffix` is "[num]s".
- (1.22) — Otherwise, `units-suffix` is "[num/den]s".

In the list above, the use of `num` and `den` refers to the static data members of `Period::type`, which are converted to arrays of `charT` using a decimal conversion with no leading zeroes.

2     >Returns: `os`.

```
template<class charT, class traits, class Rep, class Period, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
 duration<Rep, Period>& d,
 basic_string<charT, traits, Alloc>* abbrev = nullptr,
 minutes* offset = nullptr);
```

3     >Effects: Attempts to parse the input stream `is` into the duration `d` using the format flags given in the NTCTS `fmt` as specified in 29.13. If the parse fails to decode a valid duration, `is.setstate(ios_base::failbit)` is called and `d` is not modified. If %Z is used and successfully parsed, that value will

be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

<sup>4</sup> *Returns:* `is`.

## 29.6 Class template `time_point` [time.point]

### 29.6.1 General [time.point.general]

```
namespace std::chrono {
 template<class Clock, class Duration = typename Clock::duration>
 class time_point {
 public:
 using clock = Clock;
 using duration = Duration;
 using rep = typename duration::rep;
 using period = typename duration::period;

 private:
 duration d_; // exposition only

 public:
 // 29.6.2, construct
 constexpr time_point(); // has value epoch
 constexpr explicit time_point(const duration& d); // same as time_point() + d
 template<class Duration2>
 constexpr time_point(const time_point<clock, Duration2>& t);

 // 29.6.3, observer
 constexpr duration time_since_epoch() const;

 // 29.6.4, arithmetic
 constexpr time_point& operator++();
 constexpr time_point operator++(int);
 constexpr time_point& operator--();
 constexpr time_point operator--(int);
 constexpr time_point& operator+=(const duration& d);
 constexpr time_point& operator-=(const duration& d);

 // 29.6.5, special values
 static constexpr time_point min() noexcept;
 static constexpr time_point max() noexcept;
 };
}
```

<sup>1</sup> If `Duration` is not a specialization of `duration`, the program is ill-formed.

### 29.6.2 Constructors [time.point.cons]

```
constexpr time_point();
```

<sup>1</sup> *Effects:* Initializes `d_` with `duration::zero()`. Such a `time_point` object represents the epoch.

```
constexpr explicit time_point(const duration& d);
```

<sup>2</sup> *Effects:* Initializes `d_` with `d`. Such a `time_point` object represents the epoch + `d`.

```
template<class Duration2>
 constexpr time_point(const time_point<clock, Duration2>& t);
```

<sup>3</sup> *Constraints:* `is_convertible_v<Duration2, duration>` is `true`.

<sup>4</sup> *Effects:* Initializes `d_` with `t.time_since_epoch()`.

### 29.6.3 Observer [time.point.observer]

```
constexpr duration time_since_epoch() const;
```

<sup>1</sup> *Returns:* `d_`.

**29.6.4 Arithmetic**

[time.point.arithmetic]

```
constexpr time_point& operator++();
1 Effects: Equivalent to: ++d_.
2 Returns: *this.

constexpr time_point operator++(int);
3 Effects: Equivalent to: return time_point{d_++};

constexpr time_point& operator--();
4 Effects: Equivalent to: --d_.
5 Returns: *this.

constexpr time_point operator--(int);
6 Effects: Equivalent to: return time_point{d_--};

constexpr time_point& operator+=(const duration& d);
7 Effects: Equivalent to: d_ += d.
8 Returns: *this.

constexpr time_point& operator-=(const duration& d);
9 Effects: Equivalent to: d_ -= d.
10 Returns: *this.
```

**29.6.5 Special values**

[time.point.special]

```
static constexpr time_point min() noexcept;
1 Returns: time_point(duration::min());
static constexpr time_point max() noexcept;
2 Returns: time_point(duration::max());
```

**29.6.6 Non-member arithmetic**

[time.point.nonmember]

```
template<class Clock, class Duration1, class Rep2, class Period2>
constexpr time_point<Clock, common_type_t<Duration1, duration<Rep2, Period2>>>
operator+(const time_point<Clock, Duration1>& lhs, const duration<Rep2, Period2>& rhs);
1 Returns: CT(lhs.time_since_epoch() + rhs), where CT is the type of the return value.

template<class Rep1, class Period1, class Clock, class Duration2>
constexpr time_point<Clock, common_type_t<duration<Rep1, Period1>, Duration2>>>
operator+(const duration<Rep1, Period1>& lhs, const time_point<Clock, Duration2>& rhs);
2 Returns: rhs + lhs.

template<class Clock, class Duration1, class Rep2, class Period2>
constexpr time_point<Clock, common_type_t<Duration1, duration<Rep2, Period2>>>
operator-(const time_point<Clock, Duration1>& lhs, const duration<Rep2, Period2>& rhs);
3 Returns: CT(lhs.time_since_epoch() - rhs), where CT is the type of the return value.

template<class Clock, class Duration1, class Duration2>
constexpr common_type_t<Duration1, Duration2>
operator-(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);
4 Returns: lhs.time_since_epoch() - rhs.time_since_epoch().
```

**29.6.7 Comparisons**

[time.point.comparisons]

```
template<class Clock, class Duration1, class Duration2>
constexpr bool operator==(const time_point<Clock, Duration1>& lhs,
```

```

 const time_point<Clock, Duration2>& rhs);
1 Returns: lhs.time_since_epoch() == rhs.time_since_epoch().

template<class Clock, class Duration1, class Duration2>
constexpr bool operator<(const time_point<Clock, Duration1>& lhs,
 const time_point<Clock, Duration2>& rhs);
2 Returns: lhs.time_since_epoch() < rhs.time_since_epoch().

template<class Clock, class Duration1, class Duration2>
constexpr bool operator>(const time_point<Clock, Duration1>& lhs,
 const time_point<Clock, Duration2>& rhs);
3 Returns: rhs < lhs.

template<class Clock, class Duration1, class Duration2>
constexpr bool operator<=(const time_point<Clock, Duration1>& lhs,
 const time_point<Clock, Duration2>& rhs);
4 Returns: !(rhs < lhs).

template<class Clock, class Duration1, class Duration2>
constexpr bool operator>=(const time_point<Clock, Duration1>& lhs,
 const time_point<Clock, Duration2>& rhs);
5 Returns: !(lhs < rhs).

template<class Clock, class Duration1,
 three_way_comparable_with<Duration1> Duration2>
constexpr auto operator<=>(const time_point<Clock, Duration1>& lhs,
 const time_point<Clock, Duration2>& rhs);
6 Returns: lhs.time_since_epoch() <=> rhs.time_since_epoch().

```

## 29.6.8 Conversions

[time.point.cast]

```

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> time_point_cast(const time_point<Clock, Duration>& t);

1 Constraints: ToDuration is a specialization of duration.

2 Returns:
 time_point<Clock, ToDuration>(duration_cast<ToDuration>(t.time_since_epoch()))

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> floor(const time_point<Clock, Duration>& tp);

3 Constraints: ToDuration is a specialization of duration.

4 Returns: time_point<Clock, ToDuration>(floor<ToDuration>(tp.time_since_epoch()));

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> ceil(const time_point<Clock, Duration>& tp);

5 Constraints: ToDuration is a specialization of duration.

6 Returns: time_point<Clock, ToDuration>(ceil<ToDuration>(tp.time_since_epoch()));

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> round(const time_point<Clock, Duration>& tp);

7 Constraints: ToDuration is a specialization of duration, and treat_as_floating_point_v<typename
 ToDuration::rep> is false.

8 Returns: time_point<Clock, ToDuration>(round<ToDuration>(tp.time_since_epoch()));

```

## 29.7 Clocks

[time.clock]

### 29.7.1 General

[time.clock.general]

<sup>1</sup> The types defined in 29.7 meet the *Cpp17TrivialClock* requirements (29.3) unless otherwise specified.

## 29.7.2 Class system\_clock

### 29.7.2.1 Overview

[time.clock.system]

[time.clock.system.overview]

```
namespace std::chrono {
 class system_clock {
 public:
 using rep = see below;
 using period = ratio<unspecified, unspecified>;
 using duration = chrono::duration<rep, period>;
 using time_point = chrono::time_point<system_clock>;
 static constexpr bool is_steady = unspecified;

 static time_point now() noexcept;

 // mapping to/from C type time_t
 static time_t to_time_t (const time_point& t) noexcept;
 static time_point from_time_t(time_t t) noexcept;
 };
}
```

- <sup>1</sup> Objects of type `system_clock` represent wall clock time from the system-wide realtime clock. Objects of type `sys_time<Duration>` measure time since 1970-01-01 00:00:00 UTC excluding leap seconds. This measure is commonly referred to as *Unix time*. This measure facilitates an efficient mapping between `sys_time` and calendar types (29.8).

EXAMPLE:

```
sys_seconds{sys_days{1970y/January/1}}.time_since_epoch() is 0s.
sys_seconds{sys_days{2000y/January/1}}.time_since_epoch() is 946'684'800s, which is 10'957 * 86'400s.
```

### 29.7.2.2 Members

[time.clock.system.members]

- `using system_clock::rep = unspecified;`
- Constraints:* `system_clock::duration::min() < system_clock::duration::zero()` is true.  
*Note:* This implies that `rep` is a signed type.
- `static time_t to_time_t(const time_point& t) noexcept;`
- Returns:* A `time_t` object that represents the same point in time as `t` when both values are restricted to the coarser of the precisions of `time_t` and `time_point`. It is implementation-defined whether values are rounded or truncated to the required precision.
- `static time_point from_time_t(time_t t) noexcept;`
- Returns:* A `time_point` object that represents the same point in time as `t` when both values are restricted to the coarser of the precisions of `time_t` and `time_point`. It is implementation-defined whether values are rounded or truncated to the required precision.

### 29.7.2.3 Non-member functions

[time.clock.system.nonmembers]

- ```
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const sys_time<Duration>& tp);
```
- Constraints:* `treat_as_floating_point_v<typename Duration::rep>` is false, and `Duration{1} < days{1}` is true.
 - Effects:* Equivalent to:
`return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), tp);`
 - EXAMPLE:
`cout << sys_seconds{0s} << '\n'; // 1970-01-01 00:00:00`
`cout << sys_seconds{946'684'800s} << '\n'; // 2000-01-01 00:00:00`
`cout << sys_seconds{946'688'523s} << '\n'; // 2000-01-01 01:02:03`

template<class charT, class traits>
 basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const sys_days& dp);

4 *Effects:* os << year_month_day{dp}.

5 *Returns:* os.

template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
 basic_istream<charT, traits>&
 from_stream(basic_istream<charT, traits>& is, const charT* fmt,
 sys_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
 minutes* offset = nullptr);

6 *Effects:* Attempts to parse the input stream is into the sys_time tp using the format flags given in the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid date, is.setstate(ios_base::failbit) is called and tp is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.

7 *Returns:* is.

29.7.3 Class utc_clock

[time.clock.utc]

29.7.3.1 Overview

[time.clock.utc.overview]

```
namespace std::chrono {
  class utc_clock {
    public:
      using rep           = a signed arithmetic type;
      using period        = ratio<unspecified, unspecified>;
      using duration      = chrono::duration<rep, period>;
      using time_point    = chrono::time_point<utc_clock>;
      static constexpr bool is_steady = unspecified;

      static time_point now();

      template<class Duration>
      static sys_time<common_type_t<Duration, seconds>>
      to_sys(const utc_time<Duration>& t);
      template<class Duration>
      static utc_time<common_type_t<Duration, seconds>>
      from_sys(const sys_time<Duration>& t);
    };
}
```

¹ In contrast to sys_time, which does not take leap seconds into account, utc_clock and its associated time_point, utc_time, count time, including leap seconds, since 1970-01-01 00:00:00 UTC.

NOTE 1: The UTC time standard began on 1972-01-01 00:00:10 TAI. To measure time since this epoch instead, one can add/subtract the constant sys_days{1972y/1/1} - sys_days{1970y/1/1} (63'072'000s) from the utc_time.

EXAMPLE:

```
clock_cast<utc_clock>(sys_seconds{sys_days{1970y/January/1}}).time_since_epoch() is 0s.
clock_cast<utc_clock>(sys_seconds{sys_days{2000y/January/1}}).time_since_epoch() is 946'684'822s,
which is 10'957 * 86'400s + 22s.
```

² utc_clock is not a Cpp17TrivialClock unless the implementation can guarantee that utc_clock::now() does not propagate an exception.

NOTE 2: noexcept(from_sys(system_clock::now())) is false.

29.7.3.2 Member functions

[time.clock.utc.members]

```
static time_point now();
```

¹ *Returns:* from_sys(system_clock::now()), or a more accurate value of utc_time.

`template<class Duration>`
`static sys_time<common_type_t<Duration, seconds>>`
`to_sys(const utc_time<Duration>& u);`

2 *Returns:* A `sys_time` `t`, such that `from_sys(t) == u` if such a mapping exists. Otherwise `u` represents a `time_point` during a positive leap second insertion, the conversion counts that leap second as not inserted, and the last representable value of `sys_time` prior to the insertion of the leap second is returned.

`template<class Duration>`
`static utc_time<common_type_t<Duration, seconds>>`
`from_sys(const sys_time<Duration>& t);`

3 *Returns:* A `utc_time` `u`, such that `u.time_since_epoch() - t.time_since_epoch()` is equal to the sum of leap seconds that were inserted between `t` and 1970-01-01. If `t` is exactly the date of leap second insertion, then the conversion counts that leap second as inserted.

EXAMPLE:

```
auto t = sys_days{July/1/2015} - 2ns;
auto u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 25s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 25s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 26s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 26s);
```

29.7.3.3 Non-member functions

[time.clock.utc.nonmembers]

`template<class charT, class traits, class Duration>`
`basic_ostream<charT, traits>&`
`operator<<(basic_ostream<charT, traits>& os, const utc_time<Duration>& t);`

1 *Effects:* Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);
```

2 EXAMPLE:

```
auto t = sys_days{July/1/2015} - 500ms;
auto u = clock_cast<utc_clock>(t);
for (auto i = 0; i < 8; ++i, u += 250ms)
    cout << u << " UTC\n";
```

Produces this output:

```
2015-06-30 23:59:59.500 UTC
2015-06-30 23:59:59.750 UTC
2015-06-30 23:59:60.000 UTC
2015-06-30 23:59:60.250 UTC
2015-06-30 23:59:60.500 UTC
2015-06-30 23:59:60.750 UTC
2015-07-01 00:00:00.000 UTC
2015-07-01 00:00:00.250 UTC
```

`template<class charT, class traits, class Duration, class Alloc = allocator<charT>>`
`basic_istream<charT, traits>&`
`from_stream(basic_istream<charT, traits>& is, const charT* fmt,`
 `utc_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,`
 `minutes* offset = nullptr);`

3 *Effects:* Attempts to parse the input stream `is` into the `utc_time` `tp` using the format flags given in the NTCTS `fmt` as specified in 29.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully

parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

⁴ *Returns:* `is`.

```
struct leap_second_info {
    bool    is_leap_second;
    seconds elapsed;
};
```

⁵ The type `leap_second_info` has data members and special members specified above. It has no base classes or members other than those specified.

```
template<class Duration>
leap_second_info get_leap_second_info(const utc_time<Duration>& ut);
```

⁶ *Returns:* A `leap_second_info lsi`, where `lsi.is_leap_second` is `true` if `ut` is during a positive leap second insertion, and otherwise `false`. `lsi.elapsed` is the sum of leap seconds between 1970-01-01 and `ut`. If `lsi.is_leap_second` is `true`, the leap second referred to by `ut` is included in the sum.

29.7.4 Class `tai_clock`

[time.clock.tai]

29.7.4.1 Overview

[time.clock.tai.overview]

```
namespace std::chrono {
    class tai_clock {
        public:
            using rep           = a signed arithmetic type;
            using period        = ratio<unspecified, unspecified>;
            using duration      = chrono::duration<rep, period>;
            using time_point    = chrono::time_point<tai_clock>;
            static constexpr bool is_steady = unspecified;

            static time_point now();

            template<class Duration>
            static utc_time<common_type_t<Duration, seconds>>
                to_utc(const tai_time<Duration>&) noexcept;
            template<class Duration>
            static tai_time<common_type_t<Duration, seconds>>
                from_utc(const utc_time<Duration>&) noexcept;
    };
}
```

¹ The clock `tai_clock` measures seconds since 1958-01-01 00:00:00 and is offset 10s ahead of UTC at this date. That is, 1958-01-01 00:00:00 TAI is equivalent to 1957-12-31 23:59:50 UTC. Leap seconds are not inserted into TAI. Therefore every time a leap second is inserted into UTC, UTC shifts another second with respect to TAI. For example by 2000-01-01 there had been 22 positive and 0 negative leap seconds inserted so 2000-01-01 00:00:00 UTC is equivalent to 2000-01-01 00:00:32 TAI (22s plus the initial 10s offset).

² `tai_clock` is not a *Cpp17TrivialClock* unless the implementation can guarantee that `tai_clock::now()` does not propagate an exception.

NOTE: `noexcept(from_utc(utc_clock::now()))` is `false`.

29.7.4.2 Member functions

[time.clock.tai.members]

```
static time_point now();
```

¹ *Returns:* `from_utc(utc_clock::now())`, or a more accurate value of `tai_time`.

```
template<class Duration>
static utc_time<common_type_t<Duration, seconds>>
    to_utc(const tai_time<Duration>& t) noexcept;
```

² *Returns:*

```
utc_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} - 378691210s
```

NOTE 1:

```
378691210s == sys_days{1970y/January/1} - sys_days{1958y/January/1} + 10s
```

```
template<class Duration>
static tai_time<common_type_t<Duration, seconds>>
from_utc(const utc_time<Duration>& t) noexcept;
```

3 *Returns:*

```
          tai_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} + 378691210s
```

NOTE 2:

```
378691210s == sys_days{1970y/january/1} - sys_days{1958y/january/1} + 10s
```

29.7.4.3 Non-member functions

[time,clock,tai,nonmembers]

```
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const tai_time<Duration>& t);

1   Effects: Equivalent to:
           return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);

2   EXAMPLE:
           auto st = sys_days{2000y/January/1};
           auto tt = clock_cast<tai_clock>(st);
           cout << format("{0:%F %T %Z} == {1:%F %T %Z}\n", st, tt);
```

Produces this output:

2000-01-01 00:00:00 UTC == 2000-01-01 00:00:32 TAI

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            tai_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);
```

Effects: Attempts to parse the input stream `is` into the `tai_time tp` using the format flags given in the NTCTS `fmt` as specified in 29.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

Returns: is

29.7.5 Class gps_clock

[time,clock,gps]

29.7.5.1 Overview

[time.clock.gps.overview]

```
namespace std::chrono {
    class gps_clock {
public:
    using rep = a signed arithmetic type;
    using period = ratio<unspecified, unspecified>;
    using duration = chrono::duration<rep, period>;
    using time_point = chrono::time_point<gps_clock>;
    static constexpr bool is_steady = unspecified;

    static time_point now();

    template<class Duration>
    static utc_time<common_type_t<Duration, seconds>>
        to_utc(const gps_time<Duration>&) noexcept;
    template<class Duration>
    static gps_time<common_type_t<Duration, seconds>>
        from_utc(const utc_time<Duration>&) noexcept;
};

}
```

¹ The clock `gps_clock` measures seconds since the first Sunday of January, 1980 00:00:00 UTC. Leap seconds are not inserted into GPS. Therefore every time a leap second is inserted into UTC, UTC shifts another second with respect to GPS. Aside from the offset from 1958y/January/1 to 1980y/January/Sunday[1], GPS is behind TAI by 19s due to the 10s offset between 1958 and 1970 and the additional 9 leap seconds inserted between 1970 and 1980.

² `gps_clock` is not a *Cpp17TrivialClock* unless the implementation can guarantee that `gps_clock::now()` does not propagate an exception.

NOTE: `noexcept(from_utc(utc_clock::now()))` is false.

29.7.5.2 Member functions

[time.clock.gps.members]

`static time_point now();`

¹ Returns: `from_utc(utc_clock::now())`, or a more accurate value of `gps_time`.

```
template<class Duration>
static utc_time<common_type_t<Duration, seconds>>
    to_utc(const gps_time<Duration>& t) noexcept;
```

² Returns:

```
utc_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} + 315964809s
```

NOTE 1:

$315964809\text{s} == \text{sys_days}\{1980\text{y}/\text{January}/\text{Sunday}[1]\} - \text{sys_days}\{1970\text{y}/\text{January}/1\} + 9\text{s}$

```
template<class Duration>
static gps_time<common_type_t<Duration, seconds>>
    from_utc(const utc_time<Duration>& t) noexcept;
```

³ Returns:

```
gps_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} - 315964809s
```

NOTE 2:

$315964809\text{s} == \text{sys_days}\{1980\text{y}/\text{January}/\text{Sunday}[1]\} - \text{sys_days}\{1970\text{y}/\text{January}/1\} + 9\text{s}$

29.7.5.3 Non-member functions

[time.clock.gps.nonmembers]

```
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const gps_time<Duration>& t);
```

¹ Effects: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);
```

² EXAMPLE:

```
auto st = sys_days{2000y/January/1};
auto gt = clock_cast<gps_clock>(st);
cout << format("{0:%F %T %Z} == {1:%F %T %Z}\n", st, gt);
```

Produces this output:

2000-01-01 00:00:00 UTC == 2000-01-01 00:00:13 GPS

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            gps_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);
```

³ Effects: Attempts to parse the input stream `is` into the `gps_time` `tp` using the format flags given in the NTCTS `fmt` as specified in 29.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

⁴ Returns: `is`.

29.7.6 Type `file_clock`

[time.clock.file]

29.7.6.1 Overview

[time.clock.file.overview]

```
namespace std::chrono {
    using file_clock = see below;
}
```

- ¹ `file_clock` is an alias for a type meeting the *Cpp17TrivialClock* requirements (29.3), and using a signed arithmetic type for `file_clock::rep`. `file_clock` is used to create the `time_point` system used for `file_time_type` (31.12). Its epoch is unspecified, and `noexcept(file_clock::now())` is true.

NOTE: The type that `file_clock` denotes can be in a different namespace than `std::chrono`, such as `std::filesystem`.

29.7.6.2 Member functions

[time.clock.file.members]

- ¹ The type denoted by `file_clock` provides precisely one of the following two sets of static member functions:

```
template<class Duration>
static sys_time<see below>
to_sys(const file_time<Duration>&);

template<class Duration>
static file_time<see below>
from_sys(const sys_time<Duration>&);
```

or:

```
template<class Duration>
static utc_time<see below>
to_utc(const file_time<Duration>&);

template<class Duration>
static file_time<see below>
from_utc(const utc_time<Duration>&);
```

These member functions shall provide `time_point` conversions consistent with those specified by `utc_clock`, `tai_clock`, and `gps_clock`. The `Duration` of the resultant `time_point` is computed from the `Duration` of the input `time_point`.

29.7.6.3 Non-member functions

[time.clock.file.nonmembers]

```
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const file_time<Duration>& t);
```

- ¹ *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);
```

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            file_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);
```

- ² *Effects*: Attempts to parse the input stream `is` into the `file_time` `tp` using the format flags given in the NTCTS `fmt` as specified in 29.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

- ³ *Returns*: `is`.

29.7.7 Class `steady_clock`

[time.clock.steady]

```
namespace std::chrono {
    class steady_clock {
    public:
        using rep      = unspecified;
        using period   = ratio<unspecified, unspecified>;
        using duration = chrono::duration<rep, period>;
        using time_point = chrono::time_point<unspecified, duration>;
    };
}
```

```

    static constexpr bool is_steady = true;

    static time_point now() noexcept;
};

}

```

- ¹ Objects of class `steady_clock` represent clocks for which values of `time_point` never decrease as physical time advances and for which values of `time_point` advance at a steady rate relative to real time. That is, the clock may not be adjusted.

29.7.8 Class `high_resolution_clock`

[time.clock.hires]

```

namespace std::chrono {
    class high_resolution_clock {
public:
    using rep      = unspecified;
    using period   = ratio<unspecified, unspecified>;
    using duration = chrono::duration<rep, period>;
    using time_point = chrono::time_point<unspecified, duration>;
    static constexpr bool is_steady = unspecified;

    static time_point now() noexcept;
};
}

```

- ¹ Objects of class `high_resolution_clock` represent clocks with the shortest tick period. `high_resolution_clock` may be a synonym for `system_clock` or `steady_clock`.

29.7.9 Local time

[time.clock.local]

- ¹ The family of time points denoted by `local_time<Duration>` are based on the pseudo clock `local_t`. `local_t` has no member `now()` and thus does not meet the clock requirements. Nevertheless `local_time<Duration>` serves the vital role of representing local time with respect to a not-yet-specified time zone. Aside from being able to get the current time, the complete `time_point` algebra is available for `local_time<Duration>` (just as for `sys_time<Duration>`).

```

template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const local_time<Duration>& lt);

```

² *Effects:*

os << sys_time<Duration>{lt.time_since_epoch()};

³ *Returns:* os.

```

template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            local_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);

```

- ⁴ *Effects:* Attempts to parse the input stream is into the `local_time` tp using the format flags given in the NTCTS fmt as specified in [29.13](#). If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and tp is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

⁵ *Returns:* is.

29.7.10 `time_point` conversions

[time.clock.cast]

29.7.10.1 Class template `clock_time_conversion`

[time.clock.conv]

```

namespace std::chrono {
    template<class DestClock, class SourceClock>
    struct clock_time_conversion {};
}

```

- ¹ `clock_time_conversion` serves as a trait which can be used to specify how to convert a source `time_point` of type `time_point<SourceClock, Duration>` to a destination `time_point` of type `time_point<DestClock, Duration>` via a specialization: `clock_time_conversion<DestClock, SourceClock>`. A specialization of `clock_time_conversion<DestClock, SourceClock>` shall provide a const-qualified operator() that takes a parameter of type `time_point<SourceClock, Duration>` and returns a `time_point<DestClock, OtherDuration>` representing an equivalent point in time. `OtherDuration` is a `chrono::duration` whose specialization is computed from the input `Duration` in a manner which can vary for each `clock_time_conversion` specialization. A program may specialize `clock_time_conversion` if at least one of the template parameters is a user-defined clock type.
- ² Several specializations are provided by the implementation, as described in [29.7.10.2](#), [29.7.10.3](#), [29.7.10.4](#), and [29.7.10.5](#).

29.7.10.2 Identity conversions

[time.clock.cast.id]

```
template<class Clock>
struct clock_time_conversion<Clock, Clock> {
    template<class Duration>
    time_point<Clock, Duration>
        operator()(const time_point<Clock, Duration>& t) const;
};

template<class Duration>
time_point<Clock, Duration>
operator()(const time_point<Clock, Duration>& t) const;

1   Returns: t.

template<>
struct clock_time_conversion<system_clock, system_clock> {
    template<class Duration>
    sys_time<Duration>
        operator()(const sys_time<Duration>& t) const;
};

template<class Duration>
sys_time<Duration>
operator()(const sys_time<Duration>& t) const;

2   Returns: t.

template<>
struct clock_time_conversion<utc_clock, utc_clock> {
    template<class Duration>
    utc_time<Duration>
        operator()(const utc_time<Duration>& t) const;
};

template<class Duration>
utc_time<Duration>
operator()(const utc_time<Duration>& t) const;

3   Returns: t.
```

29.7.10.3 Conversions between `system_clock` and `utc_clock`

[time.clock.cast.sys.utc]

```
template<>
struct clock_time_conversion<utc_clock, system_clock> {
    template<class Duration>
    utc_time<common_type_t<Duration, seconds>>
        operator()(const sys_time<Duration>& t) const;
};

template<class Duration>
utc_time<common_type_t<Duration, seconds>>
operator()(const sys_time<Duration>& t) const;

1   Returns: utc_clock::from_sys(t).
```

```

template<>
struct clock_time_conversion<system_clock, utc_clock> {
    template<class Duration>
    sys_time<common_type_t<Duration, seconds>>
        operator()(const utc_time<Duration>& t) const;
};

template<class Duration>
sys_time<common_type_t<Duration, seconds>>
operator()(const utc_time<Duration>& t) const;

2   Returns: utc_clock::to_sys(t).

```

29.7.10.4 Conversions between system_clock and other clocks

[time.clock.cast.sys]

```

template<class SourceClock>
struct clock_time_conversion<system_clock, SourceClock> {
    template<class Duration>
    auto operator()(const time_point<SourceClock, Duration>& t) const
        -> decltype(SourceClock::to_sys(t));
};

template<class Duration>
auto operator()(const time_point<SourceClock, Duration>& t) const
    -> decltype(SourceClock::to_sys(t));

1   Constraints: SourceClock::to_sys(t) is well-formed.

2   Mandates: SourceClock::to_sys(t) returns a sys_time<Duration2> for some type Duration2
(29.6.1).

3   Returns: SourceClock::to_sys(t).

template<class DestClock>
struct clock_time_conversion<DestClock, system_clock> {
    template<class Duration>
    auto operator()(const sys_time<Duration>& t) const
        -> decltype(DestClock::from_sys(t));
};

template<class Duration>
auto operator()(const sys_time<Duration>& t) const
    -> decltype(DestClock::from_sys(t));

4   Constraints: DestClock::from_sys(t) is well-formed.

5   Mandates: DestClock::from_sys(t) returns a time_point<DestClock, Duration2> for some type
Duration2 (29.6.1).

6   Returns: DestClock::from_sys(t).

```

29.7.10.5 Conversions between utc_clock and other clocks

[time.clock.cast.utc]

```

template<class SourceClock>
struct clock_time_conversion<utc_clock, SourceClock> {
    template<class Duration>
    auto operator()(const time_point<SourceClock, Duration>& t) const
        -> decltype(SourceClock::to_utc(t));
};

template<class Duration>
auto operator()(const time_point<SourceClock, Duration>& t) const
    -> decltype(SourceClock::to_utc(t));

1   Constraints: SourceClock::to_utc(t) is well-formed.

2   Mandates: SourceClock::to_utc(t) returns a utc_time<Duration2> for some type Duration2
(29.6.1).

3   Returns: SourceClock::to_utc(t).

```

```

template<class DestClock>
struct clock_time_conversion<DestClock, utc_clock> {
    template<class Duration>
    auto operator()(const utc_time<Duration>& t) const
        -> decltype(DestClock::from_utc(t));
};

template<class Duration>
auto operator()(const utc_time<Duration>& t) const
    -> decltype(DestClock::from_utc(t));

4   Constraints: DestClock::from_utc(t) is well-formed.

5   Mandates: DestClock::from_utc(t) returns a time_point<DestClock, Duration2> for some type
        Duration2 (29.6.1).

6   Returns: DestClock::from_utc(t).

```

29.7.10.6 Function template `clock_cast`

[time.clock.cast.fn]

```

template<class DestClock, class SourceClock, class Duration>
auto clock_cast(const time_point<SourceClock, Duration>& t);

1   Constraints: At least one of the following clock time conversion expressions is well-formed:
(1.1)   — clock_time_conversion<DestClock, SourceClock>{}(t)
(1.2)   — clock_time_conversion<DestClock, system_clock>{}(
            clock_time_conversion<system_clock, SourceClock>{}(t))
(1.3)   — clock_time_conversion<DestClock, utc_clock>{}(
            clock_time_conversion<utc_clock, SourceClock>{}(t))
(1.4)   — clock_time_conversion<DestClock, utc_clock>{}(
            clock_time_conversion<utc_clock, system_clock>{}(
                clock_time_conversion<system_clock, SourceClock>{}(t)))
(1.5)   — clock_time_conversion<DestClock, system_clock>{}(
            clock_time_conversion<system_clock, utc_clock>{}(
                clock_time_conversion<utc_clock, SourceClock>{}(t)))

```

A clock time conversion expression is considered better than another clock time conversion expression if it involves fewer `operator()` calls on `clock_time_conversion` specializations.

- 2 *Mandates:* Among the well-formed clock time conversion expressions from the above list, there is a unique best expression.
- 3 *Returns:* The best well-formed clock time conversion expression in the above list.

29.8 The civil calendar

[time.cal]

29.8.1 In general

[time.cal.general]

- 1 The types in 29.8 describe the civil (Gregorian) calendar and its relationship to `sys_days` and `local_days`.

29.8.2 Class `last_spec`

[time.cal.last]

```

namespace std::chrono {
    struct last_spec {
        explicit last_spec() = default;
    };
}

```

- 1 The type `last_spec` is used in conjunction with other calendar types to specify the last in a sequence. For example, depending on context, it can represent the last day of a month, or the last day of the week of a month.

29.8.3 Class `day`

[time.cal.day]

29.8.3.1 Overview

[time.cal.day.overview]

```

namespace std::chrono {
    class day {
        unsigned char d_;           // exposition only
    };
}

```

```

public:
    day() = default;
    constexpr explicit day(unsigned d) noexcept;

    constexpr day& operator++() noexcept;
    constexpr day operator++(int) noexcept;
    constexpr day& operator--() noexcept;
    constexpr day operator--(int) noexcept;

    constexpr day& operator+=(const days& d) noexcept;
    constexpr day& operator-=(const days& d) noexcept;

    constexpr explicit operator unsigned() const noexcept;
    constexpr bool ok() const noexcept;
};

}

```

¹ day represents a day of a month. It normally holds values in the range 1 to 31, but may hold non-negative values outside this range. It can be constructed with any `unsigned` value, which will be subsequently truncated to fit into day's unspecified internal storage. day meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements, and participates in basic arithmetic with days objects, which represent a difference between two day objects.

² day is a trivially copyable and standard-layout class type.

29.8.3.2 Member functions

[time.cal.day.members]

```
constexpr explicit day(unsigned d) noexcept;
```

¹ *Effects:* Initializes `d_` with `d`. The value held is unspecified if `d` is not in the range [0, 255].

```
constexpr day& operator++() noexcept;
```

² *Effects:* `++d_`.

³ *Returns:* `*this`.

```
constexpr day operator++(int) noexcept;
```

⁴ *Effects:* `++(*this)`.

⁵ *Returns:* A copy of `*this` as it existed on entry to this member function.

```
constexpr day& operator--() noexcept;
```

⁶ *Effects:* Equivalent to: `--d_`.

⁷ *Returns:* `*this`.

```
constexpr day operator--(int) noexcept;
```

⁸ *Effects:* `--(*this)`.

⁹ *Returns:* A copy of `*this` as it existed on entry to this member function.

```
constexpr day& operator+=(const days& d) noexcept;
```

¹⁰ *Effects:* `*this = *this + d`.

¹¹ *Returns:* `*this`.

```
constexpr day& operator-=(const days& d) noexcept;
```

¹² *Effects:* `*this = *this - d`.

¹³ *Returns:* `*this`.

```
constexpr explicit operator unsigned() const noexcept;
```

¹⁴ *Returns:* `d_`.

```
constexpr bool ok() const noexcept;
```

¹⁵ *Returns:* `1 <= d_ && d_ <= 31`.

29.8.3.3 Non-member functions

[time.cal.day.nonmembers]

```
constexpr bool operator==(const day& x, const day& y) noexcept;
```

1 >Returns: `unsigned{x} == unsigned{y}`.

```
constexpr strong_ordering operator<=(const day& x, const day& y) noexcept;
```

2 >Returns: `unsigned{x} <= unsigned{y}`.

```
constexpr day operator+(const day& x, const days& y) noexcept;
```

3 >Returns: `day(unsigned{x} + y.count())`.

```
constexpr day operator+(const days& x, const day& y) noexcept;
```

4 >Returns: `y + x`.

```
constexpr day operator-(const day& x, const days& y) noexcept;
```

5 >Returns: `x + -y`.

```
constexpr days operator-(const day& x, const day& y) noexcept;
```

6 >Returns: `days{int(unsigned{x}) - int(unsigned{y})}`.

```
template<class charT, class traits>
```

```
basic_ostream<charT, traits>&
```

```
operator<<(basic_ostream<charT, traits>& os, const day& d);
```

7 >Effects: Equivalent to:

```
return os << (d.ok() ?
    format(STATICALLY-WIDEN<charT>("{:%d}"), d) :
    format(STATICALLY-WIDEN<charT>("{:%d} is not a valid day"), d));
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
```

```
basic_istream<charT, traits>&
```

```
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
```

```
    day& d, basic_string<charT, traits, Alloc>* abbrev = nullptr,
    minutes* offset = nullptr);
```

8 >Effects: Attempts to parse the input stream `is` into the day `d` using the format flags given in the NTCTS `fmt` as specified in 29.13. If the parse fails to decode a valid day, `is.setstate(ios_base::failbit)` is called and `d` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

9 >Returns: `is`.

```
constexpr chrono::day operator""d(unsigned long long d) noexcept;
```

10 >Returns: `day{static_cast<unsigned>(d)}`.

29.8.4 Class month

[time.cal.month]

29.8.4.1 Overview

[time.cal.month.overview]

```
namespace std::chrono {
    class month {
        unsigned char m_; // exposition only
    public:
        month() = default;
        constexpr explicit month(unsigned m) noexcept;

        constexpr month& operator++() noexcept;
        constexpr month operator++(int) noexcept;
        constexpr month& operator--() noexcept;
        constexpr month operator--(int) noexcept;

        constexpr month& operator+=(const months& m) noexcept;
        constexpr month& operator-=(const months& m) noexcept;
```

```

    constexpr explicit operator unsigned() const noexcept;
    constexpr bool ok() const noexcept;
};

}

```

- ¹ month represents a month of a year. It normally holds values in the range 1 to 12, but may hold non-negative values outside this range. It can be constructed with any `unsigned` value, which will be subsequently truncated to fit into month's unspecified internal storage. month meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements, and participates in basic arithmetic with months objects, which represent a difference between two month objects.

- ² month is a trivially copyable and standard-layout class type.

29.8.4.2 Member functions

[time.cal.month.members]

```
constexpr explicit month(unsigned m) noexcept;
```

- ¹ *Effects*: Initializes `m_` with `m`. The value held is unspecified if `m` is not in the range [0, 255].

```
constexpr month& operator++() noexcept;
```

- ² *Effects*: `*this += months{1}`.

- ³ *Returns*: `*this`.

```
constexpr month operator++(int) noexcept;
```

- ⁴ *Effects*: `++(*this)`.

- ⁵ *Returns*: A copy of `*this` as it existed on entry to this member function.

```
constexpr month& operator--() noexcept;
```

- ⁶ *Effects*: `*this -= months{1}`.

- ⁷ *Returns*: `*this`.

```
constexpr month operator--(int) noexcept;
```

- ⁸ *Effects*: `--(*this)`.

- ⁹ *Returns*: A copy of `*this` as it existed on entry to this member function.

```
constexpr month& operator+=(const months& m) noexcept;
```

- ¹⁰ *Effects*: `*this = *this + m`.

- ¹¹ *Returns*: `*this`.

```
constexpr month& operator-=(const months& m) noexcept;
```

- ¹² *Effects*: `*this = *this - m`.

- ¹³ *Returns*: `*this`.

```
constexpr explicit operator unsigned() const noexcept;
```

- ¹⁴ *Returns*: `m_`.

```
constexpr bool ok() const noexcept;
```

- ¹⁵ *Returns*: `1 <= m_ && m_ <= 12`.

29.8.4.3 Non-member functions

[time.cal.month.nonmembers]

```
constexpr bool operator==(const month& x, const month& y) noexcept;
```

- ¹ *Returns*: `unsigned{x} == unsigned{y}`.

```
constexpr strong_ordering operator<=(const month& x, const month& y) noexcept;
```

- ² *Returns*: `unsigned{x} <= unsigned{y}`.

```
constexpr month operator+(const month& x, const months& y) noexcept;
```

- ³ *Returns*:

```
month{modulo(static_cast<long long>(unsigned{x}) + (y.count() - 1), 12) + 1}
```

where `modulo(n, 12)` computes the remainder of `n` divided by 12 using Euclidean division.

NOTE: Given a divisor of 12, Euclidean division truncates towards negative infinity and always produces a remainder in the range of [0, 11]. Assuming no overflow in the signed summation, this operation results in a month holding a value in the range [1, 12] even if `!x.ok()`.

EXAMPLE 1: February + months{11} == January.

```
constexpr month operator+(const months& x, const month& y) noexcept;
4   Returns: y + x.

constexpr month operator-(const month& x, const months& y) noexcept;
5   Returns: x + -y.

constexpr months operator-(const month& x, const month& y) noexcept;
6   Returns: If x.ok() == true and y.ok() == true, returns a value m in the range [months{0}, months{11}] satisfying y + m == x. Otherwise the value returned is unspecified.
```

EXAMPLE 2: January - February == months{11}.

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month& m);
7   Effects: Equivalent to:
    return os << (m.ok() ?
        format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%b}"), m) :
        format(os.getloc(), STATICALLY-WIDEN<charT>("{} is not a valid month"),
            static_cast<unsigned>(m)));
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
    month& m, basic_string<charT, traits, Alloc>* abbrev = nullptr,
    minutes* offset = nullptr);
```

8 Effects: Attempts to parse the input stream `is` into the month `m` using the format flags given in the NTCTS `fmt` as specified in 29.13. If the parse fails to decode a valid month, `is.setstate(ios_base::failbit)` is called and `m` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

9 Returns: `is`.

29.8.5 Class year

[time.cal.year]

29.8.5.1 Overview

[time.cal.year.overview]

```
namespace std::chrono {
    class year {
        short y_;                                // exposition only
    public:
        year() = default;
        constexpr explicit year(int y) noexcept;

        constexpr year& operator++()    noexcept;
        constexpr year& operator++(int) noexcept;
        constexpr year& operator--()    noexcept;
        constexpr year& operator--(int) noexcept;

        constexpr year& operator+=(const years& y) noexcept;
        constexpr year& operator-=(const years& y) noexcept;

        constexpr year operator+() const noexcept;
        constexpr year operator-() const noexcept;

        constexpr bool is_leap() const noexcept;
```

```

    constexpr explicit operator int() const noexcept;
    constexpr bool ok() const noexcept;

    static constexpr year min() noexcept;
    static constexpr year max() noexcept;
};

}

```

¹ `year` represents a year in the civil calendar. It can represent values in the range [`min()`,`max()`]. It can be constructed with any `int` value, which will be subsequently truncated to fit into `year`'s unspecified internal storage. `year` meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements, and participates in basic arithmetic with `years` objects, which represent a difference between two `year` objects.

² `year` is a trivially copyable and standard-layout class type.

29.8.5.2 Member functions

[time.cal.year.members]

```
constexpr explicit year(int y) noexcept;
```

¹ *Effects:* Initializes `y_` with `y`. The value held is unspecified if `y` is not in the range [-32767, 32767].

```
constexpr year& operator++() noexcept;
```

² *Effects:* `++y_`.

³ *Returns:* `*this`.

```
constexpr year operator++(int) noexcept;
```

⁴ *Effects:* `++(*this)`.

⁵ *Returns:* A copy of `*this` as it existed on entry to this member function.

```
constexpr year& operator--() noexcept;
```

⁶ *Effects:* `--y_`.

⁷ *Returns:* `*this`.

```
constexpr year operator--(int) noexcept;
```

⁸ *Effects:* `--(*this)`.

⁹ *Returns:* A copy of `*this` as it existed on entry to this member function.

```
constexpr year& operator+=(const years& y) noexcept;
```

¹⁰ *Effects:* `*this = *this + y`.

¹¹ *Returns:* `*this`.

```
constexpr year& operator-=(const years& y) noexcept;
```

¹² *Effects:* `*this = *this - y`.

¹³ *Returns:* `*this`.

```
constexpr year operator+() const noexcept;
```

¹⁴ *Returns:* `*this`.

```
constexpr year operator-() const noexcept;
```

¹⁵ *Returns:* `year{-y_}`.

```
constexpr bool is_leap() const noexcept;
```

¹⁶ *Returns:* `y_ % 4 == 0 && (y_ % 100 != 0 || y_ % 400 == 0)`.

```
constexpr explicit operator int() const noexcept;
```

¹⁷ *Returns:* `y_`.

```
constexpr bool ok() const noexcept;
```

¹⁸ *Returns:* `min().y_ <= y_ && y_ <= max().y_`.

```
static constexpr year min() noexcept;
19   Returns: year{-32767}.

static constexpr year max() noexcept;
20   Returns: year{32767}.
```

29.8.5.3 Non-member functions

[time.cal.year.nonmembers]

```
constexpr bool operator==(const year& x, const year& y) noexcept;
1   Returns: int{x} == int{y}.

constexpr strong_ordering operator<=(const year& x, const year& y) noexcept;
2   Returns: int{x} <= int{y}.

constexpr year operator+(const year& x, const years& y) noexcept;
3   Returns: year{int{x} + static_cast<int>(y.count())}.

constexpr year operator+(const years& x, const year& y) noexcept;
4   Returns: y + x.

constexpr year operator-(const year& x, const years& y) noexcept;
5   Returns: x + -y.

constexpr years operator-(const year& x, const year& y) noexcept;
6   Returns: years{int{x} - int{y}}.
```

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year& y);
7   Effects: Equivalent to:
    return os << (y.ok() ?
        format(STATICALLY-WIDEN<charT>("{:%Y}"), y) :
        format(STATICALLY-WIDEN<charT>("{:%Y} is not a valid year"), y));
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            year& y, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);
```

8 Effects: Attempts to parse the input stream *is* into the *year* *y* using the format flags given in the NTCTS *fmt* as specified in [29.13](#). If the parse fails to decode a valid year, *is.setstate(ios_base::failbit)* is called and *y* is not modified. If %Z is used and successfully parsed, that value will be assigned to **abbrev* if *abbrev* is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to **offset* if *offset* is non-null.

9 Returns: *is*.

```
constexpr chrono::year operator""y(unsigned long long y) noexcept;
10  Returns: year{static_cast<int>(y)}.
```

29.8.6 Class weekday

[time.cal.wd]

29.8.6.1 Overview

[time.cal.wd.overview]

```
namespace std::chrono {
    class weekday {
        unsigned char wd_;           // exposition only
    public:
        weekday() = default;
        constexpr explicit weekday(unsigned wd) noexcept;
        constexpr weekday(const sys_days& dp) noexcept;
        constexpr explicit weekday(const local_days& dp) noexcept;
```

```

constexpr weekday& operator++()      noexcept;
constexpr weekday  operator++(int) noexcept;
constexpr weekday& operator--()      noexcept;
constexpr weekday  operator--(int) noexcept;

constexpr weekday& operator+=(const days& d) noexcept;
constexpr weekday& operator-=(const days& d) noexcept;

constexpr unsigned c_encoding() const noexcept;
constexpr unsigned iso_encoding() const noexcept;
constexpr bool ok() const noexcept;

constexpr weekday_indexed operator[](unsigned index) const noexcept;
constexpr weekday_last    operator[](last_spec) const noexcept;
};

}

```

- ¹ `weekday` represents a day of the week in the civil calendar. It normally holds values in the range 0 to 6, corresponding to Sunday through Saturday, but it may hold non-negative values outside this range. It can be constructed with any `unsigned` value, which will be subsequently truncated to fit into `weekday`'s unspecified internal storage. `weekday` meets the *Cpp17EqualityComparable* (Table 28) requirements.

NOTE: `weekday` is not *Cpp17LessThanComparable* because there is no universal consensus on which day is the first day of the week. `weekday`'s arithmetic operations treat the days of the week as a circular range, with no beginning and no end.

- ² `weekday` is a trivially copyable and standard-layout class type.

29.8.6.2 Member functions

[time.cal.wd.members]

```
constexpr explicit weekday(unsigned wd) noexcept;
```

- ¹ *Effects:* Initializes `wd_` with `wd == 7 ? 0 : wd`. The value held is unspecified if `wd` is not in the range [0, 255].

```
constexpr weekday(const sys_days& dp) noexcept;
```

- ² *Effects:* Computes what day of the week corresponds to the `sys_days` `dp`, and initializes that day of the week in `wd_`.

- ³ EXAMPLE: If `dp` represents 1970-01-01, the constructed `weekday` represents Thursday by storing 4 in `wd_`.

```
constexpr explicit weekday(const local_days& dp) noexcept;
```

- ⁴ *Effects:* Computes what day of the week corresponds to the `local_days` `dp`, and initializes that day of the week in `wd_`.

- ⁵ *Postconditions:* The value is identical to that constructed from `sys_days{dp.time_since_epoch()}`.

```
constexpr weekday& operator++() noexcept;
```

- ⁶ *Effects:* `*this += days{1}`.

- ⁷ *Returns:* `*this`.

```
constexpr weekday operator++(int) noexcept;
```

- ⁸ *Effects:* `++(*this)`.

- ⁹ *Returns:* A copy of `*this` as it existed on entry to this member function.

```
constexpr weekday& operator--() noexcept;
```

- ¹⁰ *Effects:* `*this -= days{1}`.

- ¹¹ *Returns:* `*this`.

```
constexpr weekday operator--(int) noexcept;
```

- ¹² *Effects:* `--(*this)`.

- ¹³ *Returns:* A copy of `*this` as it existed on entry to this member function.

```

constexpr weekday& operator+=(const days& d) noexcept;
14   Effects: *this = *this + d.
15   Returns: *this.

constexpr weekday& operator-=(const days& d) noexcept;
16   Effects: *this = *this - d.
17   Returns: *this.

constexpr unsigned c_encoding() const noexcept;
18   Returns: wd_.

constexpr unsigned iso_encoding() const noexcept;
19   Returns: wd_ == 0u ? 7u : wd_.

constexpr bool ok() const noexcept;
20   Returns: wd_ <= 6.

constexpr weekday_indexed operator[](unsigned index) const noexcept;
21   Returns: {*this, index}.

constexpr weekday_last operator[](last_spec) const noexcept;
22   Returns: weekday_last{*this}.

```

29.8.6.3 Non-member functions

[time.cal.wd.nonmembers]

```
constexpr bool operator==(const weekday& x, const weekday& y) noexcept;
```

1 >Returns: x.wd_ == y.wd_.

```
constexpr weekday operator+(const weekday& x, const days& y) noexcept;
```

2 >Returns:

```
    weekday{modulo(static_cast<long long>(x.wd_) + y.count(), 7)}
```

where modulo(n, 7) computes the remainder of n divided by 7 using Euclidean division.

NOTE: Given a divisor of 7, Euclidean division truncates towards negative infinity and always produces a remainder in the range of [0,6]. Assuming no overflow in the signed summation, this operation results in a weekday holding a value in the range [0,6] even if !x.ok().

EXAMPLE 1: Monday + days{6} == Sunday.

```
constexpr weekday operator+(const days& x, const weekday& y) noexcept;
```

3 >Returns: y + x.

```
constexpr weekday operator-(const weekday& x, const days& y) noexcept;
```

4 >Returns: x + -y.

```
constexpr days operator-(const weekday& x, const weekday& y) noexcept;
```

5 >Returns: If x.ok() == true and y.ok() == true, returns a value d in the range [days{0},days{6}] satisfying y + d == x. Otherwise the value returned is unspecified.

EXAMPLE 2: Sunday - Monday == days{6}.

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const weekday& wd);
```

6 Effects: Equivalent to:

```
    return os << (wd.ok() ?
        format(os.getloc(), STATICALLY_WIDEN<charT>("{L%a}"), wd) :
        format(os.getloc(), STATICALLY_WIDEN<charT>("{} is not a valid weekday"),
              static_cast<unsigned>(wd.wd_)));
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
weekday& wd, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);
```

⁷ *Effects:* Attempts to parse the input stream *is* into the *weekday* *wd* using the format flags given in the NTCTS *fmt* as specified in 29.13. If the parse fails to decode a valid weekday, *is.setstate(ios_base::failbit)* is called and *wd* is not modified. If %Z is used and successfully parsed, that value will be assigned to **abbrev* if *abbrev* is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to **offset* if *offset* is non-null.

⁸ *Returns:* *is*.

29.8.7 Class weekday_indexed

[time.cal.wdidx]

29.8.7.1 Overview

[time.cal.wdidx.overview]

```
namespace std::chrono {
class weekday_indexed {
    chrono::weekday wd_;           // exposition only
    unsigned char index_;          // exposition only

public:
    weekday_indexed() = default;
    constexpr weekday_indexed(const chrono::weekday& wd, unsigned index) noexcept;

    constexpr chrono::weekday weekday() const noexcept;
    constexpr unsigned index() const noexcept;
    constexpr bool ok() const noexcept;
};

}
```

¹ *weekday_indexed* represents a *weekday* and a small index in the range 1 to 5. This class is used to represent the first, second, third, fourth, or fifth weekday of a month.

² NOTE: A *weekday_indexed* object can be constructed by indexing a *weekday* with an *unsigned*.

EXAMPLE:

```
constexpr auto wdi = Sunday[2]; // wdi is the second Sunday of an as yet unspecified month
static_assert(wdi.weekday() == Sunday);
static_assert(wdi.index() == 2);
```

³ *weekday_indexed* is a trivially copyable and standard-layout class type.

29.8.7.2 Member functions

[time.cal.wdidx.members]

```
constexpr weekday_indexed(const chrono::weekday& wd, unsigned index) noexcept;
```

¹ *Effects:* Initializes *wd_* with *wd* and *index_* with *index*. The values held are unspecified if !*wd.ok()* or *index* is not in the range [0, 7].

```
constexpr chrono::weekday weekday() const noexcept;
```

² *Returns:* *wd_*.

```
constexpr unsigned index() const noexcept;
```

³ *Returns:* *index_*.

```
constexpr bool ok() const noexcept;
```

⁴ *Returns:* *wd_.ok() && 1 <= index_ && index_ <= 5.*

29.8.7.3 Non-member functions

[time.cal.wdidx.nonmembers]

```
constexpr bool operator==(const weekday_indexed& x, const weekday_indexed& y) noexcept;
```

¹ *Returns:* *x.weekday() == y.weekday() && x.index() == y.index()*.

```

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const weekday_indexed& wdi);
2 Effects: Equivalent to:
    auto i = wdi.index();
    return os << (i >= 1 && i <= 5 ?
        format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}[{}]", wdi.weekday(), i) :
        format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}[{} is not a valid index]", wdi.weekday(), i));

```

29.8.8 Class weekday_last

[time.cal.wdlast]

29.8.8.1 Overview

[time.cal.wdlast.overview]

```

namespace std::chrono {
    class weekday_last {
        chrono::weekday wd_; // exposition only

        public:
            constexpr explicit weekday_last(const chrono::weekday& wd) noexcept;

            constexpr chrono::weekday weekday() const noexcept;
            constexpr bool ok() const noexcept;
    };
}

```

1 weekday_last represents the last weekday of a month.

2 NOTE: A weekday_last object can be constructed by indexing a weekday with last.

EXAMPLE:

```

constexpr auto wdl = Sunday[last]; // wdl is the last Sunday of an as yet unspecified month
static_assert(wdl.weekday() == Sunday);

```

3 weekday_last is a trivially copyable and standard-layout class type.

29.8.8.2 Member functions

[time.cal.wdlast.members]

```
constexpr explicit weekday_last(const chrono::weekday& wd) noexcept;
```

1 Effects: Initializes wd_ with wd.

```
constexpr chrono::weekday weekday() const noexcept;
```

2 Returns: wd_.

```
constexpr bool ok() const noexcept;
```

3 Returns: wd_.ok().

29.8.8.3 Non-member functions

[time.cal.wdlast.nonmembers]

```
constexpr bool operator==(const weekday_last& x, const weekday_last& y) noexcept;
```

1 Returns: x.weekday() == y.weekday().

```

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const weekday_last& wdl);

```

2 Effects: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}[last]", wdl.weekday()));
```

29.8.9 Class month_day

[time.cal.md]

29.8.9.1 Overview

[time.cal.md.overview]

```

namespace std::chrono {
    class month_day {
        chrono::month m_; // exposition only
        chrono::day d_; // exposition only

```

```

public:
    month_day() = default;
    constexpr month_day(const chrono::month& m, const chrono::day& d) noexcept;

    constexpr chrono::month month() const noexcept;
    constexpr chrono::day day() const noexcept;
    constexpr bool ok() const noexcept;
};

}

```

¹ `month_day` represents a specific day of a specific month, but with an unspecified year. `month_day` meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements.

² `month_day` is a trivially copyable and standard-layout class type.

29.8.9.2 Member functions

[time.cal.md.members]

```
constexpr month_day(const chrono::month& m, const chrono::day& d) noexcept;
```

¹ *Effects:* Initializes `m_` with `m`, and `d_` with `d`.

```
constexpr chrono::month month() const noexcept;
```

² *Returns:* `m_`.

```
constexpr chrono::day day() const noexcept;
```

³ *Returns:* `d_`.

```
constexpr bool ok() const noexcept;
```

⁴ *Returns:* `true` if `m_.ok()` is `true`, `1d <= d_`, and `d_` is less than or equal to the number of days in month `m_`; otherwise returns `false`. When `m_ == February`, the number of days is considered to be 29.

29.8.9.3 Non-member functions

[time.cal.md.nonmembers]

```
constexpr bool operator==(const month_day& x, const month_day& y) noexcept;
```

¹ *Returns:* `x.month() == y.month() && x.day() == y.day()`.

```
constexpr strong_ordering operator<=(const month_day& x, const month_day& y) noexcept;
```

² *Effects:* Equivalent to:

```
if (auto c = x.month() <= y.month(); c != 0) return c;
return x.day() <= y.day();
```

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month_day& md);
```

³ *Effects:* Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}/{})", 
md.month(), md.day());
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
month_day& md, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);
```

⁴ *Effects:* Attempts to parse the input stream `is` into the `month_day` `md` using the format flags given in the NTCTS `fmt` as specified in 29.13. If the parse fails to decode a valid `month_day`, `is.setstate(ios_base::failbit)` is called and `md` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

⁵ *Returns:* `is`.

29.8.10 Class month_day_last

[time.cal.mdlst]

```
namespace std::chrono {
    class month_day_last {
        chrono::month m_;           // exposition only

    public:
        constexpr explicit month_day_last(const chrono::month& m) noexcept;

        constexpr chrono::month month() const noexcept;
        constexpr bool ok() const noexcept;
    };
}
```

¹ `month_day_last` represents the last day of a month.

² NOTE: A `month_day_last` object can be constructed using the expression `m/last` or `last/m`, where `m` is an expression of type `month`.

EXAMPLE:

```
constexpr auto mdl = February/last;      // mdl is the last day of February of an as yet unspecified year
static_assert(mdl.month() == February);
```

³ `month_day_last` is a trivially copyable and standard-layout class type.

```
constexpr explicit month_day_last(const chrono::month& m) noexcept;
```

⁴ Effects: Initializes `m_` with `m`.

```
constexpr month month() const noexcept;
```

⁵ Returns: `m_`.

```
constexpr bool ok() const noexcept;
```

⁶ Returns: `m_.ok()`.

```
constexpr bool operator==(const month_day_last& x, const month_day_last& y) noexcept;
```

⁷ Returns: `x.month() == y.month()`.

```
constexpr strong_ordering operator<=(const month_day_last& x, const month_day_last& y) noexcept;
```

⁸ Returns: `x.month() <= y.month()`.

```
template<class charT, class traits>
```

```
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month_day_last& mdl);
```

⁹ Effects: Equivalent to:

```
return os << format(os.getloc(), STATICALLY_WIDEN<charT>("{:L}/last"), mdl.month());
```

29.8.11 Class month_weekday

[time.cal.mwd]

29.8.11.1 Overview

[time.cal.mwd.overview]

```
namespace std::chrono {
    class month_weekday {
        chrono::month          m_;           // exposition only
        chrono::weekday_indexed wdi_;         // exposition only

    public:
        constexpr month_weekday(const chrono::month& m, const chrono::weekday_indexed& wdi) noexcept;

        constexpr chrono::month          month()          const noexcept;
        constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
        constexpr bool ok() const noexcept;
    };
}
```

¹ `month_weekday` represents the n^{th} weekday of a month, of an as yet unspecified year. To do this the `month_weekday` stores a `month` and a `weekday_indexed`.

² EXAMPLE:

```
constexpr auto mwd
    = February/Tuesday[3]; // mwd is the third Tuesday of February of an as yet unspecified year
static_assert(mwd.month() == February);
static_assert(mwd.weekday_indexed() == Tuesday[3]);
```

- ³ month_weekday is a trivially copyable and standard-layout class type.

29.8.11.2 Member functions

[time.cal.mwd.members]

```
constexpr month_weekday(const chrono::month& m, const chrono::weekday_indexed& wdi) noexcept;
```

- ¹ *Effects:* Initializes `m_` with `m`, and `wdi_` with `wdi`.

```
constexpr chrono::month month() const noexcept;
```

- ² *Returns:* `m_`.

```
constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
```

- ³ *Returns:* `wdi_`.

```
constexpr bool ok() const noexcept;
```

- ⁴ *Returns:* `m_.ok() && wdi_.ok()`.

29.8.11.3 Non-member functions

[time.cal.mwd.nonmembers]

```
constexpr bool operator==(const month_weekday& x, const month_weekday& y) noexcept;
```

- ¹ *Returns:* `x.month() == y.month() && x.weekday_indexed() == y.weekday_indexed()`.

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month_weekday& mwd);
```

- ² *Effects:* Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}/{:L}"),
mwd.month(), mwd.weekday_indexed());
```

29.8.12 Class month_weekday_last

[time.cal.mwdlast]

29.8.12.1 Overview

[time.cal.mwdlast.overview]

```
namespace std::chrono {
    class month_weekday_last {
        chrono::month      m_; // exposition only
        chrono::weekday_last wdl_; // exposition only
    public:
        constexpr month_weekday_last(const chrono::month& m,
                                     const chrono::weekday_last& wdl) noexcept;

        constexpr chrono::month      month()      const noexcept;
        constexpr chrono::weekday_last weekday_last() const noexcept;
        constexpr bool ok() const noexcept;
    };
}
```

- ¹ month_weekday_last represents the last weekday of a month, of an as yet unspecified year. To do this the month_weekday_last stores a month and a weekday_last.

- ² EXAMPLE:

```
constexpr auto mwd
    = February/Tuesday[last]; // mwd is the last Tuesday of February of an as yet unspecified year
static_assert(mwd.month() == February);
static_assert(mwd.weekday_last() == Tuesday[last]);
```

- ³ month_weekday_last is a trivially copyable and standard-layout class type.

29.8.12.2 Member functions

[time.cal.mwdlast.members]

```
constexpr month_weekday_last(const chrono::month& m,
                           const chrono::weekday_last& wdl) noexcept;
```

¹ *Effects:* Initializes `m_` with `m`, and `wdl_` with `wdl`.

```
constexpr chrono::month month() const noexcept;
```

² *Returns:* `m_`.

```
constexpr chrono::weekday_last weekday_last() const noexcept;
```

³ *Returns:* `wdl_`.

```
constexpr bool ok() const noexcept;
```

⁴ *Returns:* `m_.ok() && wdl_.ok()`.

29.8.12.3 Non-member functions

[time.cal.mwdlast.nonmembers]

```
constexpr bool operator==(const month_weekday_last& x, const month_weekday_last& y) noexcept;
```

¹ *Returns:* `x.month() == y.month() && x.weekday_last() == y.weekday_last()`.

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month_weekday_last& mwdl);
```

² *Effects:* Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}/{:L}"),
                      mwdl.month(), mwdl.weekday_last());
```

29.8.13 Class year_month

[time.cal.ym]

29.8.13.1 Overview

[time.cal.ym.overview]

```
namespace std::chrono {
class year_month {
    chrono::year y_;           // exposition only
    chrono::month m_;          // exposition only

public:
    year_month() = default;
    constexpr year_month(const chrono::year& y, const chrono::month& m) noexcept;

    constexpr chrono::year year() const noexcept;
    constexpr chrono::month month() const noexcept;

    constexpr year_month& operator+=(const months& dm) noexcept;
    constexpr year_month& operator-=(const months& dm) noexcept;
    constexpr year_month& operator+=(const years& dy) noexcept;
    constexpr year_month& operator-=(const years& dy) noexcept;

    constexpr bool ok() const noexcept;
};

}
```

¹ `year_month` represents a specific month of a specific year, but with an unspecified day. `year_month` is a field-based time point with a resolution of `months`. `year_month` meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements.

² `year_month` is a trivially copyable and standard-layout class type.

29.8.13.2 Member functions

[time.cal.ym.members]

```
constexpr year_month(const chrono::year& y, const chrono::month& m) noexcept;
```

¹ *Effects:* Initializes `y_` with `y`, and `m_` with `m`.

```

constexpr chrono::year year() const noexcept;
2   Returns: y_.

constexpr chrono::month month() const noexcept;
3   Returns: m_.

constexpr year_month& operator+=(const months& dm) noexcept;
4   Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
5   Effects: *this = *this + dm.
6   Returns: *this.

constexpr year_month& operator-=(const months& dm) noexcept;
7   Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
8   Effects: *this = *this - dm.
9   Returns: *this.

constexpr year_month& operator+=(const years& dy) noexcept;
10  Effects: *this = *this + dy.
11  Returns: *this.

constexpr year_month& operator-=(const years& dy) noexcept;
12  Effects: *this = *this - dy.
13  Returns: *this.

constexpr bool ok() const noexcept;
14  Returns: y_.ok() && m_.ok().

```

29.8.13.3 Non-member functions

[time.cal.ym.nonmembers]

```

constexpr bool operator==(const year_month& x, const year_month& y) noexcept;
1   Returns: x.year() == y.year() && x.month() == y.month().

constexpr strong_ordering operator<=(const year_month& x, const year_month& y) noexcept;
2   Effects: Equivalent to:
      if (auto c = x.year() <= y.year(); c != 0) return c;
      return x.month() <= y.month();

constexpr year_month operator+(const year_month& ym, const months& dm) noexcept;
3   Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
4   Returns: A year_month value z such that z.ok() && z - ym == dm is true.
5   Complexity:  $\mathcal{O}(1)$  with respect to the value of dm.

constexpr year_month operator+(const months& dm, const year_month& ym) noexcept;
6   Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
7   Returns: ym + dm.

constexpr year_month operator-(const year_month& ym, const months& dm) noexcept;
8   Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
9   Returns: ym + -dm.

```

```

constexpr months operator-(const year_month& x, const year_month& y) noexcept;
10   Returns:
        x.year() - y.year() + months{static_cast<int>(unsigned{x.month()}) -
                                         static_cast<int>(unsigned{y.month()})}

constexpr year_month operator+(const year_month& ym, const years& dy) noexcept;
11   Returns: (ym.year() + dy) / ym.month().

constexpr year_month operator+(const years& dy, const year_month& ym) noexcept;
12   Returns: ym + dy.

constexpr year_month operator-(const year_month& ym, const years& dy) noexcept;
13   Returns: ym + -dy.

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year_month& ym);

14   Effects: Equivalent to:
        return os << format(os.getloc(), STATICALLY_WIDEN<charT>("{}/{:L}"),
                               ym.year(), ym.month());

```

```

template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            year_month& ym, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);

```

15 Effects: Attempts to parse the input stream *is* into the *year_month* *ym* using the format flags given in the NTCTS *fmt* as specified in 29.13. If the parse fails to decode a valid *year_month*, *is.setstate(ios_base::failbit)* is called and *ym* is not modified. If %Z is used and successfully parsed, that value will be assigned to **abbrev* if *abbrev* is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to **offset* if *offset* is non-null.

16 Returns: *is*.

29.8.14 Class year_month_day

[time.cal.ymd]

29.8.14.1 Overview

[time.cal.ymd.overview]

```

namespace std::chrono {
    class year_month_day {
        chrono::year y_;           // exposition only
        chrono::month m_;          // exposition only
        chrono::day d_;            // exposition only

    public:
        year_month_day() = default;
        constexpr year_month_day(const chrono::year& y, const chrono::month& m,
                                const chrono::day& d) noexcept;
        constexpr year_month_day(const year_month_day_last& ymdl) noexcept;
        constexpr year_month_day(const sys_days& dp) noexcept;
        constexpr explicit year_month_day(const local_days& dp) noexcept;

        constexpr year_month_day& operator+=(const months& m) noexcept;
        constexpr year_month_day& operator-=(const months& m) noexcept;
        constexpr year_month_day& operator+=(const years& y) noexcept;
        constexpr year_month_day& operator-=(const years& y) noexcept;

        constexpr chrono::year year() const noexcept;
        constexpr chrono::month month() const noexcept;
        constexpr chrono::day day() const noexcept;

        constexpr operator sys_days() const noexcept;
        constexpr explicit operator local_days() const noexcept;
    };
}

```

```
    constexpr bool ok() const noexcept;
};

}
```

- ¹ `year_month_day` represents a specific year, month, and day. `year_month_day` is a field-based time point with a resolution of days.

NOTE: `year_month_day` supports `years`- and `months`-oriented arithmetic, but not `days`-oriented arithmetic. For the latter, there is a conversion to `sys_days`, which efficiently supports `days`-oriented arithmetic.

`year_month_day` meets the *Cpp17EqualityComparable* ([Table 28](#)) and *Cpp17LessThanComparable* ([Table 29](#)) requirements.

- ² `year_month_day` is a trivially copyable and standard-layout class type.

29.8.14.2 Member functions

[time.cal.ymd.members]

```
constexpr year_month_day(const chrono::year& y, const chrono::month& m,
                         const chrono::day& d) noexcept;
```

- ¹ *Effects*: Initializes `y_` with `y`, `m_` with `m`, and `d_` with `d`.

```
constexpr year_month_day(const year_month_day_last& ymdl) noexcept;
```

- ² *Effects*: Initializes `y_` with `ymdl.year()`, `m_` with `ymdl.month()`, and `d_` with `ymdl.day()`.

NOTE: This conversion from `year_month_day_last` to `year_month_day` can be more efficient than converting a `year_month_day_last` to a `sys_days`, and then converting that `sys_days` to a `year_month_day`.

```
constexpr year_month_day(const sys_days& dp) noexcept;
```

- ³ *Effects*: Constructs an object of type `year_month_day` that corresponds to the date represented by `dp`.

- ⁴ *Remarks*: For any value `ymd` of type `year_month_day` for which `ymd.ok()` is `true`, `ymd == year_month_day{sys_days{ymd}}` is `true`.

```
constexpr explicit year_month_day(const local_days& dp) noexcept;
```

- ⁵ *Effects*: Equivalent to constructing with `sys_days{dp.time_since_epoch()}`.

```
constexpr year_month_day& operator+=(const months& m) noexcept;
```

- ⁶ *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` ([12.2.4.3](#)).

⁷ *Effects*: `*this = *this + m`.

- ⁸ *Returns*: `*this`.

```
constexpr year_month_day& operator-=(const months& m) noexcept;
```

- ⁹ *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` ([12.2.4.3](#)).

¹⁰ *Effects*: `*this = *this - m`.

- ¹¹ *Returns*: `*this`.

```
constexpr year_month_day& year_month_day::operator+=(const years& y) noexcept;
```

- ¹² *Effects*: `*this = *this + y`.

- ¹³ *Returns*: `*this`.

```
constexpr year_month_day& year_month_day::operator-=(const years& y) noexcept;
```

- ¹⁴ *Effects*: `*this = *this - y`.

- ¹⁵ *Returns*: `*this`.

```
constexpr chrono::year year() const noexcept;
```

- ¹⁶ *Returns*: `y_`.

```
constexpr chrono::month month() const noexcept;
```

- ¹⁷ *Returns*: `m_`.

```

constexpr chrono::day day() const noexcept;
18   Returns: d_.

constexpr operator sys_days() const noexcept;
19   Returns: If ok(), returns a sys_days holding a count of days from the sys_days epoch to *this
(a negative value if *this represents a date prior to the sys_days epoch). Otherwise, if y_.ok()
&& m_.ok() is true, returns sys_days{y_/_m_/_1d} + (d_ - 1d). Otherwise the value returned is
unspecified.

20   Remarks: A sys_days in the range [days{-12687428},days{11248737}] which is converted to a
year_month_day has the same value when converted back to a sys_days.

21 EXAMPLE:
    static_assert(year_month_day{sys_days{2017y/January/0}} == 2016y/December/31);
    static_assert(year_month_day{sys_days{2017y/January/31}} == 2017y/January/31);
    static_assert(year_month_day{sys_days{2017y/January/32}} == 2017y/February/1);

constexpr explicit operator local_days() const noexcept;
22   Returns: local_days{sys_days{*this}.time_since_epoch()}.

constexpr bool ok() const noexcept;
23   Returns: If y_.ok() is true, and m_.ok() is true, and d_ is in the range [1d,(y_/_m_/_last).day()],
then returns true; otherwise returns false.

```

29.8.14.3 Non-member functions

[time.cal.ymd.nonmembers]

```

constexpr bool operator==(const year_month_day& x, const year_month_day& y) noexcept;
1   Returns: x.year() == y.year() && x.month() == y.month() && x.day() == y.day().

constexpr strong_ordering operator<=(const year_month_day& x, const year_month_day& y) noexcept;
2   Effects: Equivalent to:
    if (auto c = x.year() <= y.year(); c != 0) return c;
    if (auto c = x.month() <= y.month(); c != 0) return c;
    return x.day() <= y.day();

constexpr year_month_day operator+(const year_month_day& ymd, const months& dm) noexcept;
3   Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its
implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
4   Returns: (ymd.year() / ymd.month() + dm) / ymd.day().
5   NOTE 1: If ymd.day() is in the range [1d,28d], ok() will return true for the resultant year_month_day.

constexpr year_month_day operator+(const months& dm, const year_month_day& ymd) noexcept;
6   Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its
implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
7   Returns: ymd + dm.

constexpr year_month_day operator-(const year_month_day& ymd, const months& dm) noexcept;
8   Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its
implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
9   Returns: ymd + (-dm).

constexpr year_month_day operator+(const year_month_day& ymd, const years& dy) noexcept;
10  Returns: (ymd.year() + dy) / ymd.month() / ymd.day().
11  NOTE 2: If ymd.month() is February and ymd.day() is not in the range [1d,28d], ok() can return false for the
resultant year_month_day.

constexpr year_month_day operator+(const years& dy, const year_month_day& ymd) noexcept;
12  Returns: ymd + dy.

```

`constexpr year_month_day operator-(const year_month_day& ymd, const years& dy) noexcept;`

13 *Returns:* `ymd + (-dy)`.

`template<class charT, class traits>`
`basic_ostream<charT, traits>&`
`operator<<(basic_ostream<charT, traits>& os, const year_month_day& ymd);`

14 *Effects:* Equivalent to:

```
return os << (ymd.ok() ?  
    format(STATICALLY-WIDEN<charT>("{.%F}"), ymd) :  
    format(STATICALLY-WIDEN<charT>("{.%F} is not a valid date"), ymd));
```

`template<class charT, class traits, class Alloc = allocator<charT>>`
`basic_istream<charT, traits>&`
`from_stream(basic_istream<charT, traits>& is, const charT* fmt,`
`year_month_day& ymd, basic_string<charT, traits, Alloc>* abbrev = nullptr,`
`minutes* offset = nullptr);`

15 *Effects:* Attempts to parse the input stream `is` into the `year_month_day` `ymd` using the format flags given in the NTCTS `fmt` as specified in 29.13. If the parse fails to decode a valid `year_month_day`, `is.setstate(ios_base::failbit)` is called and `ymd` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

16 *Returns:* `is`.

29.8.15 Class `year_month_day_last`

[time.cal.ymdlast]

29.8.15.1 Overview

[time.cal.ymdlast.overview]

```
namespace std::chrono {  
    class year_month_day_last {  
        chrono::year          y_;           // exposition only  
        chrono::month_day_last mdl_;       // exposition only  
  
    public:  
        constexpr year_month_day_last(const chrono::year& y,  
                                         const chrono::month_day_last& mdl) noexcept;  
  
        constexpr year_month_day_last& operator+=(const months& m) noexcept;  
        constexpr year_month_day_last& operator-=(const months& m) noexcept;  
        constexpr year_month_day_last& operator+=(const years& y)   noexcept;  
        constexpr year_month_day_last& operator-=(const years& y)   noexcept;  
  
        constexpr chrono::year          year()          const noexcept;  
        constexpr chrono::month         month()         const noexcept;  
        constexpr chrono::month_day_last month_day_last() const noexcept;  
        constexpr chrono::day          day()          const noexcept;  
  
        constexpr          operator sys_days() const noexcept;  
        constexpr explicit operator local_days() const noexcept;  
        constexpr bool ok() const noexcept;  
    };  
}
```

¹ `year_month_day_last` represents the last day of a specific year and month. `year_month_day_last` is a field-based time point with a resolution of days, except that it is restricted to pointing to the last day of a year and month.

NOTE: `year_month_day_last` supports `years-` and `months-`oriented arithmetic, but not `days-`oriented arithmetic. For the latter, there is a conversion to `sys_days`, which efficiently supports `days-`oriented arithmetic.

`year_month_day_last` meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements.

² `year_month_day_last` is a trivially copyable and standard-layout class type.

29.8.15.2 Member functions

[time.cal.ymdlast.members]

```
constexpr year_month_day_last(const chrono::year& y,
                             const chrono::month_day_last& mdl) noexcept;
```

1 *Effects:* Initializes `y_` with `y` and `mdl_` with `mdl`.

```
constexpr year_month_day_last& operator+=(const months& m) noexcept;
```

2 *Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

3 *Effects:* `*this = *this + m`.

4 *Returns:* `*this`.

```
constexpr year_month_day_last& operator-=(const months& m) noexcept;
```

5 *Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

6 *Effects:* `*this = *this - m`.

7 *Returns:* `*this`.

```
constexpr year_month_day_last& operator+=(const years& y) noexcept;
```

8 *Effects:* `*this = *this + y`.

9 *Returns:* `*this`.

```
constexpr year_month_day_last& operator-=(const years& y) noexcept;
```

10 *Effects:* `*this = *this - y`.

11 *Returns:* `*this`.

```
constexpr chrono::year year() const noexcept;
```

12 *Returns:* `y_`.

```
constexpr chrono::month month() const noexcept;
```

13 *Returns:* `mdl_.month()`.

```
constexpr chrono::month_day_last month_day_last() const noexcept;
```

14 *Returns:* `mdl_`.

```
constexpr chrono::day day() const noexcept;
```

15 *Returns:* If `ok()` is `true`, returns a `day` representing the last day of the (`year`, `month`) pair represented by `*this`. Otherwise, the returned value is unspecified.

16 *NOTE:* This value can be computed on demand.

```
constexpr operator sys_days() const noexcept;
```

17 *Returns:* `sys_days{year()/month()/day()}`.

```
constexpr explicit operator local_days() const noexcept;
```

18 *Returns:* `local_days{sys_days{*this}.time_since_epoch()}`.

```
constexpr bool ok() const noexcept;
```

19 *Returns:* `y_.ok() && mdl_.ok()`.

29.8.15.3 Non-member functions

[time.cal.ymdlast.nonmembers]

```
constexpr bool operator==(const year_month_day_last& x, const year_month_day_last& y) noexcept;
```

1 *Returns:* `x.year() == y.year() && x.month_day_last() == y.month_day_last()`.

```
constexpr strong_ordering operator<=(const year_month_day_last& x,
                                         const year_month_day_last& y) noexcept;
```

2 *Effects:* Equivalent to:

```

    if (auto c = x.year() <= y.year(); c != 0) return c;
    return x.month_day_last() <= y.month_day_last();

constexpr year_month_day_last
operator+(const year_month_day_last& ymdl, const months& dm) noexcept;
3   Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
4   Returns: (ymdl.year() / ymdl.month() + dm) / last.
constexpr year_month_day_last
operator+(const months& dm, const year_month_day_last& ymdl) noexcept;
5   Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
6   Returns: ymdl + dm.
constexpr year_month_day_last
operator-(const year_month_day_last& ymdl, const months& dm) noexcept;
7   Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
8   Returns: ymdl + (-dm).
constexpr year_month_day_last
operator+(const year_month_day_last& ymdl, const years& dy) noexcept;
9   Returns: {ymdl.year() + dy, ymdl.month_day_last()}.

constexpr year_month_day_last
operator+(const years& dy, const year_month_day_last& ymdl) noexcept;
10  Returns: ymdl + dy.
constexpr year_month_day_last
operator-(const year_month_day_last& ymdl, const years& dy) noexcept;
11  Returns: ymdl + (-dy).
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year_month_day_last& ymdl);
12  Effects: Equivalent to:
    return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/{:L}"),
                           ymdl.year(), ymdl.month_day_last());

```

29.8.16 Class `year_month_weekday`

[time.cal.ymwd]

29.8.16.1 Overview

[time.cal.ymwd.overview]

```

namespace std::chrono {
    class year_month_weekday {
        chrono::year          y_;           // exposition only
        chrono::month         m_;           // exposition only
        chrono::weekday_indexed wdi_;       // exposition only

    public:
        year_month_weekday() = default;
        constexpr year_month_weekday(const chrono::year& y, const chrono::month& m,
                                      const chrono::weekday_indexed& wdi) noexcept;
        constexpr year_month_weekday(const sys_days& dp) noexcept;
        constexpr explicit year_month_weekday(const local_days& dp) noexcept;

        constexpr year_month_weekday& operator+=(const months& m) noexcept;
        constexpr year_month_weekday& operator-=(const months& m) noexcept;
        constexpr year_month_weekday& operator+=(const years& y)  noexcept;
        constexpr year_month_weekday& operator-=(const years& y)  noexcept;
    };
}
```

```

constexpr chrono::year          year()           const noexcept;
constexpr chrono::month         month()          const noexcept;
constexpr chrono::weekday       weekday()        const noexcept;
constexpr unsigned              index()          const noexcept;
constexpr chrono::weekday_indexed weekday_indexed() const noexcept;

constexpr      operator sys_days()  const noexcept;
constexpr explicit operator local_days() const noexcept;
constexpr bool ok() const noexcept;
};

}

```

¹ `year_month_weekday` represents a specific year, month, and n^{th} weekday of the month. `year_month_weekday` is a field-based time point with a resolution of `days`.

NOTE: `year_month_weekday` supports `years`- and `months`-oriented arithmetic, but not `days`-oriented arithmetic. For the latter, there is a conversion to `sys_days`, which efficiently supports `days`-oriented arithmetic.

`year_month_weekday` meets the *C_{pp17}EqualityComparable* ([Table 28](#)) requirements.

² `year_month_weekday` is a trivially copyable and standard-layout class type.

29.8.16.2 Member functions

[time.cal.ymwd.members]

```
constexpr year_month_weekday(const chrono::year& y, const chrono::month& m,
                             const chrono::weekday_indexed& wdi) noexcept;
```

¹ *Effects*: Initializes `y_` with `y`, `m_` with `m`, and `wdi_` with `wdi`.

```
constexpr year_month_weekday(const sys_days& dp) noexcept;
```

² *Effects*: Constructs an object of type `year_month_weekday` which corresponds to the date represented by `dp`.

³ *Remarks*: For any value `ymwd` of type `year_month_weekday` for which `ymwd.ok()` is `true`, `ymwd == year_month_weekday{sys_days{ymwd}}` is `true`.

```
constexpr explicit year_month_weekday(const local_days& dp) noexcept;
```

⁴ *Effects*: Equivalent to constructing with `sys_days{dp.time_since_epoch()}`.

```
constexpr year_month_weekday& operator+=(const months& m) noexcept;
```

⁵ *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` ([12.2.4.3](#)).

⁶ *Effects*: `*this = *this + m`.

⁷ *Returns*: `*this`.

```
constexpr year_month_weekday& operator-=(const months& m) noexcept;
```

⁸ *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` ([12.2.4.3](#)).

⁹ *Effects*: `*this = *this - m`.

¹⁰ *Returns*: `*this`.

```
constexpr year_month_weekday& operator+=(const years& y) noexcept;
```

¹¹ *Effects*: `*this = *this + y`.

¹² *Returns*: `*this`.

```
constexpr year_month_weekday& operator-=(const years& y) noexcept;
```

¹³ *Effects*: `*this = *this - y`.

¹⁴ *Returns*: `*this`.

```
constexpr chrono::year year() const noexcept;
```

¹⁵ *Returns*: `y_`.

```

constexpr chrono::month month() const noexcept;
16   Returns: m_.

constexpr chrono::weekday weekday() const noexcept;
17   Returns: wdi_.weekday().

constexpr unsigned index() const noexcept;
18   Returns: wdi_.index().

constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
19   Returns: wdi_.

constexpr operator sys_days() const noexcept;
20   Returns: If y_.ok() && m_.ok() && wdi_.weekday().ok(), returns a sys_days that represents
              the date (index() - 1) * 7 days after the first weekday() of year()/month(). If index() is 0
              the returned sys_days represents the date 7 days prior to the first weekday() of year()/month().
              Otherwise the returned value is unspecified.

constexpr explicit operator local_days() const noexcept;
21   Returns: local_days{sys_days{*this}.time_since_epoch()}.

constexpr bool ok() const noexcept;
22   Returns: If any of y_.ok(), m_.ok(), or wdi_.ok() is false, returns false. Otherwise, if *this
              represents a valid date, returns true. Otherwise, returns false.

```

29.8.16.3 Non-member functions

[time.cal.ymwd.nonmembers]

```

constexpr bool operator==(const year_month_weekday& x, const year_month_weekday& y) noexcept;
1   Returns:
        x.year() == y.year() && x.month() == y.month() && x.weekday_indexed() == y.weekday_indexed()

constexpr year_month_weekday operator+(const year_month_weekday& ymwd, const months& dm) noexcept;
2   Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its
                  implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
3   Returns: (ymwd.year() / ymwd.month() + dm) / ymwd.weekday_indexed().

constexpr year_month_weekday operator+(const months& dm, const year_month_weekday& ymwd) noexcept;
4   Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its
                  implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
5   Returns: ymwd + dm.

constexpr year_month_weekday operator-(const year_month_weekday& ymwd, const months& dm) noexcept;
6   Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its
                  implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
7   Returns: ymwd + (-dm).

constexpr year_month_weekday operator+(const year_month_weekday& ymwd, const years& dy) noexcept;
8   Returns: {ymwd.year() + dy, ymwd.month(), ymwd.weekday_indexed()}.

constexpr year_month_weekday operator+(const years& dy, const year_month_weekday& ymwd) noexcept;
9   Returns: ymwd + dy.

constexpr year_month_weekday operator-(const year_month_weekday& ymwd, const years& dy) noexcept;
10  Returns: ymwd + (-dy).

```

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year_month_weekday& ymwd);
11 Effects: Equivalent to:

           return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/{:L}/{:L}"),
                                ymwdl.year(), ymwdl.month(), ymwdl.weekday_last());

```

29.8.18 Conventional syntax operators

[time.cal.operators]

- 1 A set of overloaded operator/ functions provides a conventional syntax for the creation of civil calendar dates.
- 2 NOTE 1: The year, month, and day are accepted in any of the following 3 orders:

year/month/day
month/day/year
day/month/year

Anywhere a *day* is required, any of the following can also be specified:

last
weekday [i]
weekday [last]

- 3 NOTE 2: Partial-date types such as *year_month* and *month_day* can be created by not applying the second division operator for any of the three orders. For example:

```

year_month ym = 2015y/April;
month_day md1 = April/4;
month_day md2 = 4d/April;

```

- 4 EXAMPLE:

```

auto a = 2015/4/4;           // a == int(125)
auto b = 2015y/4/4;          // b == year_month_day{year(2015), month(4), day(4)}
auto c = 2015y/4d/April;    // error: no viable operator/ for first /
auto d = 2015/April/4;      // error: no viable operator/ for first /

constexpr year_month
operator/(const year& y, const month& m) noexcept;
5   Returns: {y, m}.

constexpr year_month
operator/(const year& y, int m) noexcept;
6   Returns: y / month(m).

constexpr month_day
operator/(const month& m, const day& d) noexcept;
7   Returns: {m, d}.

constexpr month_day
operator/(const month& m, int d) noexcept;
8   Returns: m / day(d).

```

```

constexpr month_day
operator/(int m, const day& d) noexcept;
9   Returns: month(m) / d.

constexpr month_day
operator/(const day& d, const month& m) noexcept;
10  Returns: m / d.

constexpr month_day
operator/(const day& d, int m) noexcept;
11  Returns: month(m) / d.

constexpr month_day_last
operator/(const month& m, last_spec) noexcept;
12  Returns: month_day_last{m}.

constexpr month_day_last
operator/(int m, last_spec) noexcept;
13  Returns: month(m) / last.

constexpr month_day_last
operator/(last_spec, const month& m) noexcept;
14  Returns: m / last.

constexpr month_day_last
operator/(last_spec, int m) noexcept;
15  Returns: month(m) / last.

constexpr month_weekday
operator/(const month& m, const weekday_indexed& wdi) noexcept;
16  Returns: {m, wdi}.

constexpr month_weekday
operator/(int m, const weekday_indexed& wdi) noexcept;
17  Returns: month(m) / wdi.

constexpr month_weekday
operator/(const weekday_indexed& wdi, const month& m) noexcept;
18  Returns: m / wdi.

constexpr month_weekday
operator/(const weekday_indexed& wdi, int m) noexcept;
19  Returns: month(m) / wdi.

constexpr month_weekday_last
operator/(const month& m, const weekday_last& wdl) noexcept;
20  Returns: {m, wdl}.

constexpr month_weekday_last
operator/(int m, const weekday_last& wdl) noexcept;
21  Returns: month(m) / wdl.

constexpr month_weekday_last
operator/(const weekday_last& wdl, const month& m) noexcept;
22  Returns: m / wdl.

constexpr month_weekday_last
operator/(const weekday_last& wdl, int m) noexcept;
23  Returns: month(m) / wdl.

```

```

constexpr year_month_day
operator/(const year_month& ym, const day& d) noexcept;
24   Returns: {ym.year(), ym.month(), d}.

constexpr year_month_day
operator/(const year_month& ym, int d) noexcept;
25   Returns: ym / day(d).

constexpr year_month_day
operator/(const year& y, const month_day& md) noexcept;
26   Returns: y / md.month() / md.day().

constexpr year_month_day
operator/(int y, const month_day& md) noexcept;
27   Returns: year(y) / md.

constexpr year_month_day
operator/(const month_day& md, const year& y) noexcept;
28   Returns: y / md.

constexpr year_month_day
operator/(const month_day& md, int y) noexcept;
29   Returns: year(y) / md.

constexpr year_month_day_last
operator/(const year_month& ym, last_spec) noexcept;
30   Returns: {ym.year(), month_day_last{ym.month()}};

constexpr year_month_day_last
operator/(const year& y, const month_day_last& mdl) noexcept;
31   Returns: {y, mdl}.

constexpr year_month_day_last
operator/(int y, const month_day_last& mdl) noexcept;
32   Returns: year(y) / mdl.

constexpr year_month_day_last
operator/(const month_day_last& mdl, const year& y) noexcept;
33   Returns: y / mdl.

constexpr year_month_day_last
operator/(const month_day_last& mdl, int y) noexcept;
34   Returns: year(y) / mdl.

constexpr year_month_weekday
operator/(const year_month& ym, const weekday_indexed& wdi) noexcept;
35   Returns: {ym.year(), ym.month(), wdi}.

constexpr year_month_weekday
operator/(const year& y, const month_weekday& mwd) noexcept;
36   Returns: {y, mwd.month(), mwd.weekday_indexed()}.

constexpr year_month_weekday
operator/(int y, const month_weekday& mwd) noexcept;
37   Returns: year(y) / mwd.

constexpr year_month_weekday
operator/(const month_weekday& mwd, const year& y) noexcept;
38   Returns: y / mwd.

```

```

constexpr year_month_weekday
operator/(const month_weekday& mwd, int y) noexcept;
39   Returns: year(y) / mwd.

constexpr year_month_weekday_last
operator/(const year_month& ym, const weekday_last& wdl) noexcept;
40   Returns: {ym.year(), ym.month(), wdl}.

constexpr year_month_weekday_last
operator/(const year& y, const month_weekday_last& mwdl) noexcept;
41   Returns: {y, mwdl.month(), mwdl.weekday_last()}.

constexpr year_month_weekday_last
operator/(int y, const month_weekday_last& mwdl) noexcept;
42   Returns: year(y) / mwdl.

constexpr year_month_weekday_last
operator/(const month_weekday_last& mwdl, const year& y) noexcept;
43   Returns: y / mwdl.

constexpr year_month_weekday_last
operator/(const month_weekday_last& mwdl, int y) noexcept;
44   Returns: year(y) / mwdl.

```

29.9 Class template hh_mm_ss

[time.hms]

29.9.1 Overview

[time.hms.overview]

```

namespace std::chrono {
    template<class Duration> class hh_mm_ss {
        public:
            static constexpr unsigned fractional_width = see below;
            using precision = see below;

            constexpr hh_mm_ss() noexcept : hh_mm_ss{Duration::zero()} {}
            constexpr explicit hh_mm_ss(Duration d);

            constexpr bool is_negative() const noexcept;
            constexpr chrono::hours hours() const noexcept;
            constexpr chrono::minutes minutes() const noexcept;
            constexpr chrono::seconds seconds() const noexcept;
            constexpr precision subseconds() const noexcept;

            constexpr explicit operator precision() const noexcept;
            constexpr precision to_duration() const noexcept;

        private:
            bool is_neg; // exposition only
            chrono::hours h; // exposition only
            chrono::minutes m; // exposition only
            chrono::seconds s; // exposition only
            precision ss; // exposition only
    };
}

```

¹ The `hh_mm_ss` class template splits a `duration` into a multi-field time structure `hours:minutes:seconds` and possibly `subseconds`, where `subseconds` will be a duration unit based on a non-positive power of 10. The `Duration` template parameter dictates the precision to which the time is split. A `hh_mm_ss` models negative durations with a distinct `is_negative` getter that returns `true` when the input duration is negative. The individual duration fields always return non-negative durations even when `is_negative()` indicates the structure is representing a negative duration.

² If `Duration` is not a specialization of `duration`, the program is ill-formed.

29.9.2 Members

[time.hms.members]

```
static constexpr unsigned fractional_width = see below;
```

1 **fractional_width** is the number of fractional decimal digits represented by **precision**. **fractional_width** has the value of the smallest possible integer in the range [0, 18] such that **precision** will exactly represent all values of **Duration**. If no such value of **fractional_width** exists, then **fractional_width** is 6.

EXAMPLE: See [Table 100](#) for some durations, the resulting **fractional_width**, and the formatted fractional second output of **Duration{1}**.

Table 100: Examples for **fractional_width** [tab:time.hms.width]

Duration	fractional_width	Formatted fractional second output
hours, minutes, and seconds	0	
milliseconds	3	0.001
microseconds	6	0.000001
nanoseconds	9	0.000000001
duration<int, ratio<1, 2>>	1	0.5
duration<int, ratio<1, 3>>	6	0.333333
duration<int, ratio<1, 4>>	2	0.25
duration<int, ratio<1, 5>>	1	0.2
duration<int, ratio<1, 6>>	6	0.166666
duration<int, ratio<1, 7>>	6	0.142857
duration<int, ratio<1, 8>>	3	0.125
duration<int, ratio<1, 9>>	6	0.111111
duration<int, ratio<1, 10>>	1	0.1
duration<int, ratio<756, 625>>	4	0.2096

```
using precision = see below;
```

2 **precision** is

```
duration<common_type_t<Duration::rep, seconds::rep>, ratio<1, 10fractional_width>>
```

```
constexpr explicit hh_mm_ss(Duration d);
```

3 *Effects:* Constructs an object of type **hh_mm_ss** which represents the Duration **d** with precision **precision**.

- (3.1) — Initializes **is_neg** with **d < Duration::zero()**.
- (3.2) — Initializes **h** with **duration_cast<chrono::hours>(abs(d))**.
- (3.3) — Initializes **m** with **duration_cast<chrono::minutes>(abs(d) - hours())**.
- (3.4) — Initializes **s** with **duration_cast<chrono::seconds>(abs(d) - hours() - minutes())**.
- (3.5) — If **treat_as_floating_point_v<precision::rep>** is true, initializes **ss** with **abs(d) - hours() - minutes() - seconds()**. Otherwise, initializes **ss** with **duration_cast<precision>(abs(d) - hours() - minutes() - seconds())**.

NOTE: When **precision::rep** is integral and **precision::period** is **ratio<1>**, **subseconds()** always returns a value equal to 0s.

4 *Postconditions:* If **treat_as_floating_point_v<precision::rep>** is true, **to_duration()** returns **d**, otherwise **to_duration()** returns **duration_cast<precision>(d)**.

```
constexpr bool is_negative() const noexcept;
```

5 *Returns:* **is_neg**.

```
constexpr chrono::hours hours() const noexcept;
```

6 *Returns:* **h**.

```
constexpr chrono::minutes minutes() const noexcept;
```

7 *Returns:* **m**.

```

constexpr chrono::seconds seconds() const noexcept;
8   Returns: s.

constexpr precision subseconds() const noexcept;
9   Returns: ss.

constexpr precision to_duration() const noexcept;
10  Returns: If is_neg, returns -(h + m + s + ss), otherwise returns h + m + s + ss.

constexpr explicit operator precision() const noexcept;
11  Returns: to_duration().

```

29.9.3 Non-members

[time.hms.nonmembers]

```

template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const hh_mm_ss<Duration>& hms);

```

1 Effects: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%T}"), hms);
```

2 EXAMPLE:

```

for (auto ms : {-4083007ms, 4083007ms, 65745123ms}) {
    hh_mm_ss hms{ms};
    cout << hms << '\n';
}
cout << hh_mm_ss{65745s} << '\n';

```

Produces the output (assuming the "C" locale):

```

-01:08:03.007
01:08:03.007
18:15:45.123
18:15:45

```

29.10 12/24 hours functions

[time.12]

1 These functions aid in translating between a 12h format time of day and a 24h format time of day.

```
constexpr bool is_am(const hours& h) noexcept;
```

2 Returns: 0h <= h && h <= 11h.

```
constexpr bool is_pm(const hours& h) noexcept;
```

3 Returns: 12h <= h && h <= 23h.

```
constexpr hours make12(const hours& h) noexcept;
```

4 Returns: The 12-hour equivalent of h in the range [1h, 12h]. If h is not in the range [0h, 23h], the value returned is unspecified.

```
constexpr hours make24(const hours& h, bool is_pm) noexcept;
```

5 Returns: If is_pm is false, returns the 24-hour equivalent of h in the range [0h, 11h], assuming h represents an ante meridiem hour. Otherwise, returns the 24-hour equivalent of h in the range [12h, 23h], assuming h represents a post meridiem hour. If h is not in the range [1h, 12h], the value returned is unspecified.

29.11 Time zones

[time.zone]

29.11.1 In general

[time.zone.general]

1 29.11 describes an interface for accessing the IANA Time Zone Database that interoperates with `sys_time` and `local_time`. This interface provides time zone support to both the civil calendar types (29.8) and to user-defined calendars.

29.11.2 Time zone database

[time.zone.db]

29.11.2.1 Class tzdb

[time.zone.db.tzdb]

```
namespace std::chrono {
    struct tzdb {
        string             version;
        vector<time_zone> zones;
        vector<time_zone_link> links;
        vector<leap_second> leap_seconds;

        const time_zone* locate_zone(string_view tz_name) const;
        const time_zone* current_zone() const;
    };
}
```

- ¹ Each vector in a `tzdb` object is sorted to enable fast lookup.

```
const time_zone* locate_zone(string_view tz_name) const;
```

- ² *Returns:*

- (2.1) — If `zones` contains an element `tz` for which `tz.name() == tz_name`, a pointer to `tz`;
- (2.2) — otherwise, if `links` contains an element `tz_1` for which `tz_1.name() == tz_name`, then a pointer to the element `tz` of `zones` for which `tz.name() == tz_1.target()`.

NOTE 1: A `time_zone_link` specifies an alternative name for a `time_zone`.

- ³ *Throws:* If a `const time_zone*` cannot be found as described in the *Returns:* element, throws a `runtime_error`.

NOTE 2: On non-exceptional return, the return value is always a pointer to a valid `time_zone`.

```
const time_zone* current_zone() const;
```

- ⁴ *Returns:* A pointer to the time zone which the computer has set as its local time zone.

29.11.2.2 Class tzdb_list

[time.zone.db.list]

```
namespace std::chrono {
    class tzdb_list {
        public:
            tzdb_list(const tzdb_list&) = delete;
            tzdb_list& operator=(const tzdb_list&) = delete;

            // unspecified additional constructors

            class const_iterator;

            const tzdb& front() const noexcept;

            const_iterator erase_after(const_iterator p);

            const_iterator begin() const noexcept;
            const_iterator end() const noexcept;

            const_iterator cbegin() const noexcept;
            const_iterator cend() const noexcept;
    };
}
```

- ¹ The `tzdb_list` database is a singleton; the unique object of type `tzdb_list` can be accessed via the `get_tzdb_list()` function.

NOTE 1: This access is only needed for those applications that need to have long uptimes and have a need to update the time zone database while running. Other applications can implicitly access the `front()` of this list via the read-only namespace scope functions `get_tzdb()`, `locate_zone()`, and `current_zone()`.

The `tzdb_list` object contains a list of `tzdb` objects.

- ² `tzdb_list::const_iterator` is a constant iterator which meets the *Cpp17ForwardIterator* requirements and has a value type of `tzdb`.

```

const tzdb& front() const noexcept;
3   Synchronization: This operation is thread-safe with respect to reload_tzdb().
   NOTE 2: reload_tzdb() pushes a new tzdb onto the front of this container.
4   Returns: A reference to the first tzdb in the container.

const_iterator erase_after(const_iterator p);
5   Preconditions: The iterator following p is dereferenceable.
6   Effects: Erases the tzdb referred to by the iterator following p.
7   Postconditions: No pointers, references, or iterators are invalidated except those referring to the erased
   tzdb.
   NOTE 3: It is not possible to erase the tzdb referred to by begin().
8   Returns: An iterator pointing to the element following the one that was erased, or end() if no such
   element exists.
9   Throws: Nothing.

const_iterator begin() const noexcept;
10  Returns: An iterator referring to the first tzdb in the container.

const_iterator end() const noexcept;
11  Returns: An iterator referring to the position one past the last tzdb in the container.

const_iterator cbegin() const noexcept;
12  Returns: begin().

const_iterator cend() const noexcept;
13  Returns: end().

```

29.11.2.3 Time zone database access

[time.zone.db.access]

```

tzdb_list& get_tzdb_list();
1   Effects: If this is the first access to the time zone database, initializes the database. If this call initializes
   the database, the resulting database will be a tzdb_list holding a single initialized tzdb.
2   Synchronization: It is safe to call this function from multiple threads at one time.
3   Returns: A reference to the database.
4   Throws: runtime_error if for any reason a reference cannot be returned to a valid tzdb_list containing
   one or more valid tzdbs.

const tzdb& get_tzdb();
5   Returns: get_tzdb_list().front().

const time_zone* locate_zone(string_view tz_name);
6   Returns: get_tzdb().locate_zone(tz_name).
7   NOTE: The time zone database will be initialized if this is the first reference to the database.

const time_zone* current_zone();
8   Returns: get_tzdb().current_zone().

```

29.11.2.4 Remote time zone database support

[time.zone.db.remote]

- The local time zone database is that supplied by the implementation when the program first accesses the database, for example via `current_zone()`. While the program is running, the implementation may choose to update the time zone database. This update shall not impact the program in any way unless the program calls the functions in this subclause. This potentially updated time zone database is referred to as the *remote time zone database*.

```
const tzdb& reload_tzdb();

2 Effects: This function first checks the version of the remote time zone database. If the versions of the local and remote databases are the same, there are no effects. Otherwise the remote database is pushed to the front of the tzdb_list accessed by get_tzdb_list().

3 Synchronization: This function is thread-safe with respect to get_tzdb_list().front() and get_tzdb_list().erase_after().

4 Postconditions: No pointers, references, or iterators are invalidated.

5 Returns: get_tzdb_list().front().

6 Throws: runtime_error if for any reason a reference cannot be returned to a valid tzdb.
```

`string remote_version();`

7 *Returns:* The latest remote database version.

NOTE: This can be compared with `get_tzdb().version` to discover if the local and remote databases are equivalent.

29.11.3 Exception classes

[time.zone.exception]

29.11.3.1 Class nonexistent_local_time

[time.zone.exception.nonexist]

```
namespace std::chrono {
    class nonexistent_local_time : public runtime_error {
        public:
            template<class Duration>
            nonexistent_local_time(const local_time<Duration>& tp, const local_info& i);
    };
}
```

- 1 *nonexistent_local_time* is thrown when an attempt is made to convert a non-existent `local_time` to a `sys_time` without specifying `choose::earliest` or `choose::latest`.

```
template<class Duration>
nonexistent_local_time(const local_time<Duration>& tp, const local_info& i);
```

- 2 *Preconditions:* `i.result == local_info::nonexistent` is true.

- 3 *Effects:* Initializes the base class with a sequence of `char` equivalent to that produced by `os.str()` initialized as shown below:

```
ostringstream os;
os << tp << " is in a gap between\n"
    << local_seconds{i.first.end.time_since_epoch()} + i.first.offset << ' '
    << i.first.abbrev << " and\n"
    << local_seconds{i.second.begin.time_since_epoch()} + i.second.offset << ' '
    << i.second.abbrev
    << " which are both equivalent to\n"
    << i.first.end << " UTC";
```

- 4 EXAMPLE:

```
#include <chrono>
#include <iostream>

int main() {
    using namespace std::chrono;
    try {
        auto zt = zoned_time{"America/New_York",
                            local_days{Sunday[2]/March/2016} + 2h + 30min};
    } catch (const nonexistent_local_time& e) {
        std::cout << e.what() << '\n';
    }
}
```

Produces the output:

```
2016-03-13 02:30:00 is in a gap between
2016-03-13 02:00:00 EST and
```

2016-03-13 03:00:00 EDT which are both equivalent to
2016-03-13 07:00:00 UTC

29.11.3.2 Class ambiguous_local_time

[time.zone.exception.ambig]

```
namespace std::chrono {
    class ambiguous_local_time : public runtime_error {
public:
    template<class Duration>
    ambiguous_local_time(const local_time<Duration>& tp, const local_info& i);
};
}
```

- ¹ `ambiguous_local_time` is thrown when an attempt is made to convert an ambiguous `local_time` to a `sys_time` without specifying `choose::earliest` or `choose::latest`.

`template<class Duration>`
`ambiguous_local_time(const local_time<Duration>& tp, const local_info& i);`

- ² *Preconditions:* `i.result == local_info::ambiguous` is true.

- ³ *Effects:* Initializes the base class with a sequence of `char` equivalent to that produced by `os.str()` initialized as shown below:

```
ostringstream os;
os << tp << " is ambiguous. It could be\n"
<< tp << ' ' << i.first.abbrev << " == "
<< tp - i.first.offset << " UTC or\n"
<< tp << ' ' << i.second.abbrev << " == "
<< tp - i.second.offset << " UTC";
```

- ⁴ EXAMPLE:

```
#include <chrono>
#include <iostream>

int main() {
    using namespace std::chrono;
    try {
        auto zt = zoned_time{"America/New_York",
                            local_days{Sunday[1]/November/2016} + 1h + 30min};
    } catch (const ambiguous_local_time& e) {
        std::cout << e.what() << '\n';
    }
}
```

Produces the output:

```
2016-11-06 01:30:00 is ambiguous. It could be
2016-11-06 01:30:00 EDT == 2016-11-06 05:30:00 UTC or
2016-11-06 01:30:00 EST == 2016-11-06 06:30:00 UTC
```

29.11.4 Information classes

[time.zone.info]

29.11.4.1 Class sys_info

[time.zone.info.sys]

```
namespace std::chrono {
    struct sys_info {
        sys_seconds begin;
        sys_seconds end;
        seconds offset;
        minutes save;
        string abbrev;
    };
}
```

- ¹ A `sys_info` object can be obtained from the combination of a `time_zone` and either a `sys_time` or `local_time`. It can also be obtained from a `zoned_time`, which is effectively a pair of a `time_zone` and `sys_time`.
- ² NOTE: This type provides a low-level interface to time zone information. Typical conversions from `sys_time` to `local_time` will use this class implicitly, not explicitly.

- ³ The `begin` and `end` data members indicate that, for the associated `time_zone` and `time_point`, the `offset` and `abbrev` are in effect in the range `[begin, end)`. This information can be used to efficiently iterate the transitions of a `time_zone`.
- ⁴ The `offset` data member indicates the UTC offset in effect for the associated `time_zone` and `time_point`. The relationship between `local_time` and `sys_time` is:
- ```
offset = local_time - sys_time
```
- <sup>5</sup> The `save` data member is extra information not normally needed for conversion between `local_time` and `sys_time`. If `save != 0min`, this `sys_info` is said to be on “daylight saving” time, and `offset - save` provides a non-authoritative suggestion of the offset this `time_zone` would use if it were off daylight saving time. A correct offset for the `time_zone` off daylight saving time can be obtained by querying the `time_zone` with a `time_point` that returns a `sys_info` where `save == 0min`. There is no guarantee what `time_point` (if any) returns such a `sys_info` except that it is guaranteed not to be in the range `[begin, end)` (if `save != 0min` for this `sys_info`).
- <sup>6</sup> The `abbrev` data member indicates the current abbreviation used for the associated `time_zone` and `time_point`. Abbreviations are not unique among the `time_zones`, and so one cannot reliably map abbreviations back to a `time_zone` and UTC offset.

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const sys_info& r);
```

<sup>7</sup> *Effects*: Streams out the `sys_info` object `r` in an unspecified format.

<sup>8</sup> *Returns*: `os`.

#### 29.11.4.2 Class `local_info`

[time.zone.info.local]

```
namespace std::chrono {
struct local_info {
 static constexpr int unique = 0;
 static constexpr int nonexistent = 1;
 static constexpr int ambiguous = 2;

 int result;
 sys_info first;
 sys_info second;
};}
```

<sup>1</sup> NOTE: This type provides a low-level interface to time zone information. Typical conversions from `local_time` to `sys_time` will use this class implicitly, not explicitly.

<sup>2</sup> Describes the result of converting a `local_time` to a `sys_time` as follows:

- (2.1) — When a `local_time` to `sys_time` conversion is unique, `result == unique`, `first` will be filled out with the correct `sys_info`, and `second` will be zero-initialized.
- (2.2) — If the conversion stems from a nonexistent `local_time` then `result == nonexistent`, `first` will be filled out with the `sys_info` that ends just prior to the `local_time`, and `second` will be filled out with the `sys_info` that begins just after the `local_time`.
- (2.3) — If the conversion stems from an ambiguous `local_time`, then `result == ambiguous`, `first` will be filled out with the `sys_info` that ends just after the `local_time`, and `second` will be filled out with the `sys_info` that starts just before the `local_time`.

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const local_info& r);
```

<sup>3</sup> *Effects*: Streams out the `local_info` object `r` in an unspecified format.

<sup>4</sup> *Returns*: `os`.

#### 29.11.5 Class `time_zone`

[time.zone.timezone]

##### 29.11.5.1 Overview

[time.zone.overview]

```
namespace std::chrono {
```

```
class time_zone {
public:
 time_zone(time_zone&&) = default;
 time_zone& operator=(time_zone&&) = default;

 // unspecified additional constructors

 string_view name() const noexcept;

 template<class Duration> sys_info get_info(const sys_time<Duration>& st) const;
 template<class Duration> local_info get_info(const local_time<Duration>& tp) const;

 template<class Duration>
 sys_time<common_type_t<Duration, seconds>>
 to_sys(const local_time<Duration>& tp) const;

 template<class Duration>
 sys_time<common_type_t<Duration, seconds>>
 to_sys(const local_time<Duration>& tp, choose z) const;

 template<class Duration>
 local_time<common_type_t<Duration, seconds>>
 to_local(const sys_time<Duration>& tp) const;
};

};
```

- <sup>1</sup> A `time_zone` represents all time zone transitions for a specific geographic area. `time_zone` construction is unspecified, and performed as part of database initialization.

NOTE: const time\_zone objects can be accessed via functions such as `locate_zone`.

### 29.11.5.2 Member functions

[time.zone.members]

```
string_view name() const noexcept;
```

- 1**        *Returns:* The name of the time zone.

EXAMPLE: "America/New York"

```
template<class Duration>
 sys info get info(const sys time<Duration>& st) const
```

- 3 Returns:* A `sys_info` *i* for which `st` is in the range [*i.begin,i.end*]).

```
template<class Duration>
local info get_info(const local_time<Duration>& tp) const
```

- <sup>4</sup> *Returns: A local info for tp*

```
template<class Duration>
 sys_time<common_type_t<Duration, seconds>>
 to sys(const local_time<Duration>& tp) const
```

- Returns:* A `sys_time` that is at least as fine as `seconds`, and will be finer if the argument `tp` has finer precision. This `sys_time` is the UTC equivalent of `tp` according to the rules of this `time_zone`.

- Throws:** If the conversion from `tp` to a `sys_time` is ambiguous, throws `ambiguous_local_time`. If the `tp` represents a non-existent time between two UTC time points, throws `nonexistent_local_time`.

```
template<class Duration>
 sys_time<common_type_t<Duration, seconds>>
 to sys(const local_time<Duration>& tp, choose z) const
```

- Returns:* A `sys_time` that is at least as fine as `seconds`, and will be finer if the argument `tp` has finer precision. This `sys_time` is the UTC equivalent of `tp` according to the rules of this `time_zone`. If the conversion from `tp` to a `sys_time` is ambiguous, returns the earlier `sys_time` if `z == choose::earliest`, and returns the later `sys_time` if `z == choose::latest`. If the `tp` represents a non-existent time between two UTC `time_points`, then the two UTC `time_points` will be the same, and that UTC `time_point` will be returned.

```
template<class Duration>
local_time<common_type_t<Duration, seconds>>
 to_local(const sys_time<Duration>& tp) const;
```

8     >Returns: The local\_time associated with tp and this time\_zone.

**29.11.5.3 Non-member functions**

[time.zone.nonmembers]

```
bool operator==(const time_zone& x, const time_zone& y) noexcept;
1 >Returns: x.name() == y.name().
```

```
strong_ordering operator<=>(const time_zone& x, const time_zone& y) noexcept;
2 >Returns: x.name() <=> y.name().
```

**29.11.6 Class template zoned\_traits**

[time.zone.zonedtraits]

```
namespace std::chrono {
 template<class T> struct zoned_traits {};
}
```

1 zoned\_traits provides a means for customizing the behavior of zoned\_time<Duration, TimeZonePtr> for the zoned\_time default constructor, and constructors taking string\_view. A specialization for const time\_zone\* is provided by the implementation:

```
namespace std::chrono {
 template<> struct zoned_traits<const time_zone*> {
 static const time_zone* default_zone();
 static const time_zone* locate_zone(string_view name);
 };
}

static const time_zone* default_zone();
2 >Returns: std::chrono::locate_zone("UTC").
```

```
static const time_zone* locate_zone(string_view name);
3 >Returns: std::chrono::locate_zone(name).
```

**29.11.7 Class template zoned\_time**

[time.zone.zonedtime]

**29.11.7.1 Overview**

[time.zone.zonedtime.overview]

```
namespace std::chrono {
 template<class Duration, class TimeZonePtr = const time_zone*>
 class zoned_time {
public:
 using duration = common_type_t<Duration, seconds>;
```

```
private:
 TimeZonePtr zone_; // exposition only
 sys_time<duration> tp_; // exposition only
```

```
using traits = zoned_traits<TimeZonePtr>; // exposition only
```

```
public:
 zoned_time();
 zoned_time(const zoned_time&) = default;
 zoned_time& operator=(const zoned_time&) = default;
```

```
zoned_time(const sys_time<Duration>& st);
explicit zoned_time(TimeZonePtr z);
explicit zoned_time(string_view name);
```

```
template<class Duration2>
 zoned_time(const zoned_time<Duration2, TimeZonePtr>& y);
```

```
zoned_time(TimeZonePtr z, const sys_time<Duration>& st);
zoned_time(string_view name, const sys_time<Duration>& st);
```

```

zoned_time(TimeZonePtr z, const local_time<Duration>& tp);
zoned_time(string_view name, const local_time<Duration>& tp);
zoned_time(TimeZonePtr z, const local_time<Duration>& tp, choose c);
zoned_time(string_view name, const local_time<Duration>& tp, choose c);

template<class Duration2, class TimeZonePtr2>
zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y);
template<class Duration2, class TimeZonePtr2>
zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y, choose);

template<class Duration2, class TimeZonePtr2>
zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y);
template<class Duration2, class TimeZonePtr2>
zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y, choose c);

zoned_time& operator=(const sys_time<Duration>& st);
zoned_time& operator=(const local_time<Duration>& lt);

operator sys_time<duration>() const;
explicit operator local_time<duration>() const;

TimeZonePtr get_time_zone() const;
local_time<duration> get_local_time() const;
sys_time<duration> get_sys_time() const;
sys_info get_info() const;
};

zoned_time() -> zoned_time<seconds>;

template<class Duration>
zoned_time(sys_time<Duration>)
-> zoned_time<common_type_t<Duration, seconds>>;

template<class TimeZonePtrOrName>
using time-zone-representation = // exposition only
conditional_t<is_convertible_v<TimeZonePtrOrName, string_view>,
const time_zone*,
remove_cvref_t<TimeZonePtrOrName>>;

template<class TimeZonePtrOrName>
zoned_time(TimeZonePtrOrName&&)
-> zoned_time<seconds, time-zone-representation<TimeZonePtrOrName>>;

template<class TimeZonePtrOrName, class Duration>
zoned_time(TimeZonePtrOrName&&, sys_time<Duration>)
-> zoned_time<common_type_t<Duration, seconds>,
time-zone-representation<TimeZonePtrOrName>>;

template<class TimeZonePtrOrName, class Duration>
zoned_time(TimeZonePtrOrName&&, local_time<Duration>,
choose = choose::earliest)
-> zoned_time<common_type_t<Duration, seconds>,
time-zone-representation<TimeZonePtrOrName>>;

template<class Duration, class TimeZonePtrOrName, class TimeZonePtr2>
zoned_time(TimeZonePtrOrName&&, zoned_time<Duration, TimeZonePtr2>,
choose = choose::earliest)
-> zoned_time<common_type_t<Duration, seconds>,
time-zone-representation<TimeZonePtrOrName>>;
}

```

<sup>1</sup> zoned\_time represents a logical pairing of a time\_zone and a time\_point with precision Duration. zoned\_time<Duration> maintains the invariant that it always refers to a valid time zone and represents a point in time that exists and is not ambiguous in that time zone.

- <sup>2</sup> If `Duration` is not a specialization of `chrono::duration`, the program is ill-formed.
- <sup>3</sup> Every constructor of `zoned_time` that accepts a `string_view` as its first parameter does not participate in class template argument deduction ([12.2.2.9](#)).

### 29.11.7.2 Constructors

[`time.zone.zonedtime.ctor`]

```

zoned_time();

1 Constraints: traits::default_zone() is a well-formed expression.
2 Effects: Initializes zone_ with traits::default_zone() and default constructs tp_.

zoned_time(const sys_time<Duration>& st);

3 Constraints: traits::default_zone() is a well-formed expression.
4 Effects: Initializes zone_ with traits::default_zone() and tp_ with st.

explicit zoned_time(TimeZonePtr z);

5 Preconditions: z refers to a time zone.
6 Effects: Initializes zone_ with std::move(z) and default constructs tp_.

explicit zoned_time(string_view name);

7 Constraints: traits::locate_zone(string_view{}) is a well-formed expression and zoned_time is
 constructible from the return type of traits::locate_zone(string_view{}).
8 Effects: Initializes zone_ with traits::locate_zone(name) and default constructs tp_.

template<class Duration2>
zoned_time(const zoned_time<Duration2, TimeZonePtr>& y);

9 Constraints: is_convertible_v<sys_time<Duration2>, sys_time<Duration>> is true.
10 Effects: Initializes zone_ with y.zone_ and tp_ with y.tp_.

zoned_time(TimeZonePtr z, const sys_time<Duration>& st);

11 Preconditions: z refers to a time zone.
12 Effects: Initializes zone_ with std::move(z) and tp_ with st.

zoned_time(string_view name, const sys_time<Duration>& st);

13 Constraints: zoned_time is constructible from the return type of traits::locate_zone(name) and
 st.
14 Effects: Equivalent to construction with {traits::locate_zone(name), st}.

zoned_time(TimeZonePtr z, const local_time<Duration>& tp);

15 Constraints:

 is_convertible_v<
 decltype(declval<TimeZonePtr&>() -> to_sys(local_time<Duration>{})),
 sys_time<duration>>

 is true.

16 Preconditions: z refers to a time zone.
17 Effects: Initializes zone_ with std::move(z) and tp_ with zone_->to_sys(tp).

zoned_time(string_view name, const local_time<Duration>& tp);

18 Constraints: zoned_time is constructible from the return type of traits::locate_zone(name) and
 tp.
19 Effects: Equivalent to construction with {traits::locate_zone(name), tp}.

zoned_time(TimeZonePtr z, const local_time<Duration>& tp, choose c);

20 Constraints:
```

```

 is_convertible_v<
 decltype(declval<TimeZonePtr>()>to_sys(local_time<Duration>{}, choose::earliest)),
 sys_time<duration>>
is true.

21 Preconditions: z refers to a time zone.

22 Effects: Initializes zone_ with std::move(z) and tp_ with zone_->to_sys(tp, c).

23 zoned_time(string_view name, const local_time<Duration>& tp, choose c);

24 Constraints: zoned_time is constructible from the return type of traits::locate_zone(name),
local_time<Duration>, and choose.

25 Effects: Equivalent to construction with {traits::locate_zone(name), tp, c}.

template<class Duration2, class TimeZonePtr2>
 zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y);

25 Constraints: is_convertible_v<sys_time<Duration2>, sys_time<Duration>> is true.

26 Preconditions: z refers to a valid time zone.

27 Effects: Initializes zone_ with std::move(z) and tp_ with y.tp_.

template<class Duration2, class TimeZonePtr2>
 zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y, choose);

28 Constraints: is_convertible_v<sys_time<Duration2>, sys_time<Duration>> is true.

29 Preconditions: z refers to a valid time zone.

30 Effects: Equivalent to construction with {z, y}.

31 NOTE 1: The choose parameter has no effect.

template<class Duration2, class TimeZonePtr2>
 zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y);

32 Constraints: zoned_time is constructible from the return type of traits::locate_zone(name) and
the type zoned_time<Duration2, TimeZonePtr2>.

33 Effects: Equivalent to construction with {traits::locate_zone(name), y}.

template<class Duration2, class TimeZonePtr2>
 zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y, choose c);

34 Constraints: zoned_time is constructible from the return type of traits::locate_zone(name), the
type zoned_time<Duration2, TimeZonePtr2>, and the type choose.

35 Effects: Equivalent to construction with {traits::locate_zone(name), y, c}.

36 NOTE 2: The choose parameter has no effect.

```

### 29.11.7.3 Member functions

[time.zone.zonedtime.members]

```
zoned_time& operator=(const sys_time<Duration>& st);
```

1 *Effects:* After assignment, get\_sys\_time() == st. This assignment has no effect on the return value
of get\_time\_zone().  
2 *Returns:* \*this.

```
zoned_time& operator=(const local_time<Duration>& lt);
```

3 *Effects:* After assignment, get\_local\_time() == lt. This assignment has no effect on the return
value of get\_time\_zone().  
4 *Returns:* \*this.

```
operator sys_time<duration>() const;
```

5 *Returns:* get\_sys\_time().

```
explicit operator local_time<duration>() const;
```

6 *Returns:* get\_local\_time().

```

TimeZonePtr get_time_zone() const;
7 Returns: zone_.

local_time<duration> get_local_time() const;
8 Returns: zone_->to_local(tp_).

sys_time<duration> get_sys_time() const;
9 Returns: tp_.

sys_info get_info() const;
10 Returns: zone_->get_info(tp_).

```

**29.11.7.4 Non-member functions**

[time.zone.zonedtime.nonmembers]

```

template<class Duration1, class Duration2, class TimeZonePtr>
bool operator==(const zoned_time<Duration1, TimeZonePtr>& x,
 const zoned_time<Duration2, TimeZonePtr>& y);

1 Returns: x.zone_ == y.zone_ && x.tp_ == y.tp_.

template<class charT, class traits, class Duration, class TimeZonePtr>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os,
 const zoned_time<Duration, TimeZonePtr>& t);

2 Effects: Equivalent to:
 return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T %Z}"), t);

```

**29.11.8 Class leap\_second**

[time.zone.leap]

**29.11.8.1 Overview**

[time.zone.leap.overview]

```

namespace std::chrono {
 class leap_second {
 public:
 leap_second(const leap_second&) = default;
 leap_second& operator=(const leap_second&) = default;

 // unspecified additional constructors

 constexpr sys_seconds date() const noexcept;
 constexpr seconds value() const noexcept;
 };
}

```

<sup>1</sup> Objects of type `leap_second` representing the date and value of the leap second insertions are constructed and stored in the time zone database when initialized.

<sup>2</sup> EXAMPLE:

```

for (auto& l : get_tzdb().leap_seconds)
 if (l <= 2018y/March/17d)
 cout << l.date() << ":" << l.value() << '\n';

```

Produces the output:

```

1972-07-01 00:00:00: 1s
1973-01-01 00:00:00: 1s
1974-01-01 00:00:00: 1s
1975-01-01 00:00:00: 1s
1976-01-01 00:00:00: 1s
1977-01-01 00:00:00: 1s
1978-01-01 00:00:00: 1s
1979-01-01 00:00:00: 1s
1980-01-01 00:00:00: 1s
1981-07-01 00:00:00: 1s
1982-07-01 00:00:00: 1s
1983-07-01 00:00:00: 1s

```

```
1985-07-01 00:00:00: 1s
1988-01-01 00:00:00: 1s
1990-01-01 00:00:00: 1s
1991-01-01 00:00:00: 1s
1992-07-01 00:00:00: 1s
1993-07-01 00:00:00: 1s
1994-07-01 00:00:00: 1s
1996-01-01 00:00:00: 1s
1997-07-01 00:00:00: 1s
1999-01-01 00:00:00: 1s
2006-01-01 00:00:00: 1s
2009-01-01 00:00:00: 1s
2012-07-01 00:00:00: 1s
2015-07-01 00:00:00: 1s
2017-01-01 00:00:00: 1s
```

### 29.11.8.2 Member functions

[time.zone.leap.members]

```
constexpr sys_seconds date() const noexcept;
```

1     *Returns:* The date and time at which the leap second was inserted.

```
constexpr seconds value() const noexcept;
```

2     *Returns:* +1s to indicate a positive leap second or -1s to indicate a negative leap second.

NOTE: All leap seconds inserted up through 2022 were positive leap seconds.

### 29.11.8.3 Non-member functions

[time.zone.leap.nonmembers]

```
constexpr bool operator==(const leap_second& x, const leap_second& y) noexcept;
```

1     *Returns:* x.date() == y.date().

```
constexpr strong_ordering operator<=(const leap_second& x, const leap_second& y) noexcept;
```

2     *Returns:* x.date() <= y.date().

```
template<class Duration>
```

```
constexpr bool operator==(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

3     *Returns:* x.date() == y.

```
template<class Duration>
```

```
constexpr bool operator<(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

4     *Returns:* x.date() < y.

```
template<class Duration>
```

```
constexpr bool operator<(const sys_time<Duration>& x, const leap_second& y) noexcept;
```

5     *Returns:* x < y.date().

```
template<class Duration>
```

```
constexpr bool operator>(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

6     *Returns:* y < x.

```
template<class Duration>
```

```
constexpr bool operator>(const sys_time<Duration>& x, const leap_second& y) noexcept;
```

7     *Returns:* y < x.

```
template<class Duration>
```

```
constexpr bool operator<=(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

8     *Returns:* !(y < x).

```
template<class Duration>
```

```
constexpr bool operator<=(const sys_time<Duration>& x, const leap_second& y) noexcept;
```

9     *Returns:* !(y < x).

```

template<class Duration>
constexpr bool operator>=(const leap_second& x, const sys_time<Duration>& y) noexcept;
10 Returns: !(x < y).

template<class Duration>
constexpr bool operator>=(const sys_time<Duration>& x, const leap_second& y) noexcept;
11 Returns: !(x < y).

template<class Duration>
requires three_way_comparable_with<sys_seconds, sys_time<Duration>>
constexpr auto operator<=>(const leap_second& x, const sys_time<Duration>& y) noexcept;
12 Returns: x.date() <= y.

```

## 29.11.9 Class time\_zone\_link

[time.zone.link]

### 29.11.9.1 Overview

[time.zone.link.overview]

```

namespace std::chrono {
 class time_zone_link {
 public:
 time_zone_link(time_zone_link&&) = default;
 time_zone_link& operator=(time_zone_link&&) = default;

 // unspecified additional constructors

 string_view name() const noexcept;
 string_view target() const noexcept;
 };
}

```

- <sup>1</sup> A `time_zone_link` specifies an alternative name for a `time_zone`. `time_zone_links` are constructed when the time zone database is initialized.

### 29.11.9.2 Member functions

[time.zone.link.members]

```

string_view name() const noexcept;
1 Returns: The alternative name for the time zone.

string_view target() const noexcept;
2 Returns: The name of the time_zone for which this time_zone_link provides an alternative name.

```

### 29.11.9.3 Non-member functions

[time.zone.link.nonmembers]

```

bool operator==(const time_zone_link& x, const time_zone_link& y) noexcept;
1 Returns: x.name() == y.name();

strong_ordering operator<=>(const time_zone_link& x, const time_zone_link& y) noexcept;
2 Returns: x.name() <= y.name().

```

## 29.12 Formatting

[time.format]

- <sup>1</sup> Each `formatter` (22.14.6) specialization in the chrono library (29.2) meets the *Formatter* requirements (22.14.6.1). The `parse` member functions of these formatters interpret the format specification as a `chrono-format-spec` according to the following syntax:

```

chrono-format-spec:
 fill-and-alignopt widthopt precisionopt Lopt chrono-specsopt

chrono-specs:
 conversion-spec
 chrono-specs conversion-spec
 chrono-specs literal-char

literal-char:
 any character other than {, }, or %

```

```

conversion-spec:
 % modifieropt type
modifier: one of
 E 0
type: one of
 a A b B c C d D e F g G h H I j m M n
 p q Q r R S t T u U V w W x X y Y z Z %

```

The productions *fill-and-align*, *width*, and *precision* are described in 22.14.2. Giving a *precision* specification in the *chrono-format-spec* is valid only for types that are specializations of `std::chrono::duration` for which the nested *typedef-name* `rep` denotes a floating-point type. For all other types, an exception of type `format_error` is thrown if the *chrono-format-spec* contains a *precision* specification. All ordinary multibyte characters represented by *literal-char* are copied unchanged to the output.

- 2 A *formatting locale* is an instance of `locale` used by a formatting function, defined as
  - (2.1) — the "C" locale if the L option is not present in *chrono-format-spec*, otherwise
  - (2.2) — the locale passed to the formatting function if any, otherwise
  - (2.3) — the global locale.
- 3 Each conversion specifier *conversion-spec* is replaced by appropriate characters as described in Table 101; the formats specified in ISO 8601:2004 shall be used where so described. Some of the conversion specifiers depend on the formatting locale. If the string literal encoding is a Unicode encoding form and the locale is among an implementation-defined set of locales, each replacement that depends on the locale is performed as if the replacement character sequence is converted to the string literal encoding. If the formatted object does not contain the information the conversion specifier refers to, an exception of type `format_error` is thrown.
- 4 The result of formatting a `std::chrono::duration` instance holding a negative value, or an `hh_mm_ss` object `h` for which `h.is_negative()` is `true`, is equivalent to the output of the corresponding positive value, with a `STATICALLY-WIDEN<charT>("-")` character sequence placed before the replacement of the initial conversion specifier.

EXAMPLE 1:

```

cout << format("{::T}", -10'000s); // prints: -02:46:40
cout << format("{::H::M::S}", -10'000s); // prints: -02:46:40
cout << format("minutes {::M, hours %H, seconds %S}", -10'000s);
 // prints: minutes -46, hours 02, seconds 40

```

- 5 Unless explicitly requested, the result of formatting a chrono type does not contain time zone abbreviation and time zone offset information. If the information is available, the conversion specifiers `%Z` and `%z` will format this information (respectively).

NOTE: If the information is not available and a `%Z` or `%z` conversion specifier appears in the *chrono-format-spec*, an exception of type `format_error` is thrown, as described above.

- 6 If the type being formatted does not contain the information that the format flag needs, an exception of type `format_error` is thrown.

EXAMPLE 2: A `duration` does not contain enough information to format as a `weekday`.

However, if a flag refers to a "time of day" (e.g., `%H`, `%I`, `%p`, etc.), then a specialization of `duration` is interpreted as the time of day elapsed since midnight.

Table 101: Meaning of conversion specifiers [tab:time.format.spec]

| Specifier       | Replacement                                                                                                                                     |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>%a</code> | The locale's abbreviated weekday name. If the value does not contain a valid weekday, an exception of type <code>format_error</code> is thrown. |
| <code>%A</code> | The locale's full weekday name. If the value does not contain a valid weekday, an exception of type <code>format_error</code> is thrown.        |
| <code>%b</code> | The locale's abbreviated month name. If the value does not contain a valid month, an exception of type <code>format_error</code> is thrown.     |
| <code>%B</code> | The locale's full month name. If the value does not contain a valid month, an exception of type <code>format_error</code> is thrown.            |

Table 101: Meaning of conversion specifiers (continued)

| Specifier | Replacement                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| %c        | The locale's date and time representation. The modified command %Ec produces the locale's alternate date and time representation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| %C        | The year divided by 100 using floored division. If the result is a single decimal digit, it is prefixed with 0. The modified command %EC produces the locale's alternative representation of the century.                                                                                                                                                                                                                                                                                                                                                                                                |
| %d        | The day of month as a decimal number. If the result is a single decimal digit, it is prefixed with 0. The modified command %0d produces the locale's alternative representation.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| %D        | Equivalent to %m/%d/%y.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| %e        | The day of month as a decimal number. If the result is a single decimal digit, it is prefixed with a space. The modified command %0e produces the locale's alternative representation.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| %F        | Equivalent to %Y-%m-%d.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| %g        | The last two decimal digits of the ISO week-based year. If the result is a single digit it is prefixed by 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| %G        | The ISO week-based year as a decimal number. If the result is less than four digits it is left-padded with 0 to four digits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

The modified command %0M produces the locale's alternative representation.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| %n        | A new-line character.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| %p        | The locale's equivalent of the AM/PM designations associated with a 12-hour clock.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| %q        | The duration's unit suffix as specified in 29.5.11.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| %Q        | The duration's numeric value (as if extracted via <code>.count()</code> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| %r        | The locale's 12-hour clock time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| %R        | Equivalent to %H:%M.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| %S        | Seconds as a decimal number. If the number of seconds is less than 10, the result is prefixed with 0. If the precision of the input cannot be exactly represented with seconds, then the format is a decimal floating-point number with a fixed format and a precision matching that of the precision of the input (or to a microseconds precision if the conversion to floating-point decimal seconds cannot be made within 18 fractional digits). The character for the decimal point is localized according to the locale. The modified command %0S produces the locale's alternative representation. |
| %t        | A horizontal-tab character.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| %T        | Equivalent to %H:%M:%S.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| %u        | The ISO weekday as a decimal number (1-7), where Monday is 1. The modified command %0u produces the locale's alternative representation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| %U        | The week number of the year as a decimal number. The first Sunday of the year is the first day of week 01. Days of the same year prior to that are in week 00. If the result is a single digit, it is prefixed with 0. The modified command %0U produces the locale's alternative representation.                                                                                                                                                                                                                                                                                                        |
| %V        | The ISO week-based week number as a decimal number. If the result is a single digit, it is prefixed with 0. The modified command %0V produces the locale's alternative representation.                                                                                                                                                                                                                                                                                                                                                                                                                   |

Table 101: Meaning of conversion specifiers (continued)

| Specifier | Replacement                                                                                                                                                                                                                                                                                                                                 |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| %w        | The weekday as a decimal number (0-6), where Sunday is 0. The modified command %0w produces the locale's alternative representation.                                                                                                                                                                                                        |
| %W        | The week number of the year as a decimal number. The first Monday of the year is the first day of week 01. Days of the same year prior to that are in week 00. If the result is a single digit, it is prefixed with 0. The modified command %0W produces the locale's alternative representation.                                           |
| %x        | The locale's date representation. The modified command %Ex produces the locale's alternate date representation.                                                                                                                                                                                                                             |
| %X        | The locale's time representation. The modified command %EX produces the locale's alternate time representation.                                                                                                                                                                                                                             |
| %y        | The last two decimal digits of the year. If the result is a single digit it is prefixed by 0. The modified command %0y produces the locale's alternative representation. The modified command %Ey produces the locale's alternative representation of offset from %EC (year only).                                                          |
| %Y        | The year as a decimal number. If the result is less than four digits it is left-padded with 0 to four digits. The modified command %EY produces the locale's alternative full year representation.                                                                                                                                          |
| %z        | The offset from UTC in the ISO 8601:2004 format. For example -0430 refers to 4 hours 30 minutes behind UTC. If the offset is zero, +0000 is used. The modified commands %Ez and %0z insert a : between the hours and minutes: -04:30. If the offset information is not available, an exception of type <code>format_error</code> is thrown. |
| %Z        | The time zone abbreviation. If the time zone abbreviation is not available, an exception of type <code>format_error</code> is thrown.                                                                                                                                                                                                       |
| %%        | A % character.                                                                                                                                                                                                                                                                                                                              |

- <sup>7</sup> If the `chrono-specs` is omitted, the chrono object is formatted as if by streaming it to `basic_ostring-stream<charT> os` with the formatting locale imbued and copying `os.str()` through the output iterator of the context with additional padding and adjustments as specified by the format specifiers.

EXAMPLE 3:

```
string s = format("{:=>8}", 42ms); // value of s is "====42ms"
```

```
template<class Duration, class charT>
struct formatter<chrono::sys_time<Duration>, charT>;
```

- <sup>8</sup> Remarks: If %Z is used, it is replaced with `STATICALLY-WIDEN<charT>"UTC"`. If %z (or a modified variant of %z) is used, an offset of 0min is formatted.

```
template<class Duration, class charT>
struct formatter<chrono::utc_time<Duration>, charT>;
```

- <sup>9</sup> Remarks: If %Z is used, it is replaced with `STATICALLY-WIDEN<charT>"UTC"`. If %z (or a modified variant of %z) is used, an offset of 0min is formatted. If the argument represents a time during a positive leap second insertion, and if a seconds field is formatted, the integral portion of that format is `STATICALLY-WIDEN<charT>"60"`.

```
template<class Duration, class charT>
struct formatter<chrono::tai_time<Duration>, charT>;
```

- <sup>10</sup> Remarks: If %Z is used, it is replaced with `STATICALLY-WIDEN<charT>"TAI"`. If %z (or a modified variant of %z) is used, an offset of 0min is formatted. The date and time formatted are equivalent to those formatted by a `sys_time` initialized with

```
sys_time<Duration>{tp.time_since_epoch() -
(sys_days{1970y/January/1} - sys_days{1958y/January/1})}
```

```
template<class Duration, class charT>
```

11     struct formatter<chrono::gps\_time<Duration>, charT>;

11     *Remarks:* If %Z is used, it is replaced with *STATICALLY-WIDEN*<charT>("GPS"). If %z (or a modified variant of %z) is used, an offset of 0min is formatted. The date and time formatted are equivalent to those formatted by a sys\_time initialized with

```
sys_time<Duration>{tp.time_since_epoch()} +
(sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1})
```

12     template<class Duration, class charT>
        struct formatter<chrono::file\_time<Duration>, charT>;

12     *Remarks:* If %Z is used, it is replaced with *STATICALLY-WIDEN*<charT>("UTC"). If %z (or a modified variant of %z) is used, an offset of 0min is formatted. The date and time formatted are equivalent to those formatted by a sys\_time initialized with *clock\_cast*<system\_clock>(t), or by a utc\_time initialized with *clock\_cast*<utc\_clock>(t), where t is the first argument to format.

```
template<class Duration, class charT>
struct formatter<chrono::local_time<Duration>, charT>;
```

13     *Remarks:* If %Z, %z, or a modified version of %z is used, an exception of type *format\_error* is thrown.

```
template<class Duration> struct local-time-format-t { // exposition only
 local_time<Duration> time; // exposition only
 const string* abbrev; // exposition only
 const seconds* offset_sec; // exposition only
};
```

```
template<class Duration>
local-time-format-t<Duration>
local_time_format(local_time<Duration> time, const string* abbrev = nullptr,
 const seconds* offset_sec = nullptr);
```

14     *Returns:* {time, abbrev, offset\_sec}.

```
template<class Duration, class charT>
struct formatter<chrono::local-time-format-t<Duration>, charT>;
```

15     Let f be a local-time-format-t<Duration> object passed to formatter::format.

16     *Remarks:* If %Z is used, it is replaced with \*f.abbrev if f.abbrev is not a null pointer value. If %Z is used and f.abbrev is a null pointer value, an exception of type *format\_error* is thrown. If %z (or a modified variant of %z) is used, it is formatted with the value of \*f.offset\_sec if f.offset\_sec is not a null pointer value. If %z (or a modified variant of %z) is used and f.offset\_sec is a null pointer value, then an exception of type *format\_error* is thrown.

```
template<class Duration, class TimeZonePtr, class charT>
struct formatter<chrono::zoned_time<Duration, TimeZonePtr>, charT>
 : formatter<chrono::local-time-format-t<Duration>, charT> {
 template<class FormatContext>
 typename FormatContext::iterator
 format(const chrono::zoned_time<Duration, TimeZonePtr>& tp, FormatContext& ctx) const;
};
```

```
template<class FormatContext>
typename FormatContext::iterator
format(const chrono::zoned_time<Duration, TimeZonePtr>& tp, FormatContext& ctx) const;
```

17     *Effects:* Equivalent to:

```
 sys_info info = tp.get_info();
 return formatter<chrono::local-time-format-t<Duration>, charT>::
 format({tp.get_local_time(), &info.abbrev, &info.offset}, ctx);
```

## 29.13 Parsing

[time.parse]

- 1     Each *parse* overload specified in this subclause calls *from\_stream* unqualified, so as to enable argument dependent lookup (6.5.4). In the following paragraphs, let *is* denote an object of type *basic\_istream*<charT, traits> and let *I* be *basic\_istream*<charT, traits>&, where charT and traits are template parameters in that context.

- <sup>2</sup> *Recommended practice:* Implementations should make it difficult to accidentally store or use a manipulator that may contain a dangling reference to a format string, for example by making the manipulators produced by `parse` immovable and preventing stream extraction into an lvalue of such a manipulator type.

```
template<class charT, class Parsable>
 unspecified
 parse(const charT* fmt, Parsable& tp);
template<class charT, class traits, class Alloc, class Parsable>
 unspecified
 parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp);
```

- <sup>3</sup> Let  $F$  be `fmt` for the first overload and `fmt.c_str()` for the second overload. Let `traits` be `char_traits<charT>` for the first overload.

- <sup>4</sup> *Constraints:* The expression

```
from_stream(declval<basic_istream<charT, traits>&>(), F, tp)
```

is well-formed when treated as an unevaluated operand ([7.2.3](#)).

- <sup>5</sup> *Returns:* A manipulator such that the expression `is >> parse(fmt, tp)` has type `I`, has value `is`, and calls `from_stream(is, F, tp)`.

```
template<class charT, class traits, class Alloc, class Parsable>
 unspecified
 parse(const charT* fmt, Parsable& tp,
 basic_string<charT, traits, Alloc>& abbrev);
template<class charT, class traits, class Alloc, class Parsable>
 unspecified
 parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
 basic_string<charT, traits, Alloc>& abbrev);
```

- <sup>6</sup> Let  $F$  be `fmt` for the first overload and `fmt.c_str()` for the second overload.

- <sup>7</sup> *Constraints:* The expression

```
from_stream(declval<basic_istream<charT, traits>&>(), F, tp, addressof(abbrev))
```

is well-formed when treated as an unevaluated operand ([7.2.3](#)).

- <sup>8</sup> *Returns:* A manipulator such that the expression `is >> parse(fmt, tp, abbrev)` has type `I`, has value `is`, and calls `from_stream(is, F, tp, addressof(abbrev))`.

```
template<class charT, class Parsable>
 unspecified
 parse(const charT* fmt, Parsable& tp, minutes& offset);
template<class charT, class traits, class Alloc, class Parsable>
 unspecified
 parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
 minutes& offset);
```

- <sup>9</sup> Let  $F$  be `fmt` for the first overload and `fmt.c_str()` for the second overload. Let `traits` be `char_traits<charT>` and `Alloc` be `allocator<charT>` for the first overload.

- <sup>10</sup> *Constraints:* The expression

```
from_stream(declval<basic_istream<charT, traits>&>(),
 F, tp,
 declval<basic_string<charT, traits, Alloc>>*(),
 &offset)
```

is well-formed when treated as an unevaluated operand ([7.2.3](#)).

- <sup>11</sup> *Returns:* A manipulator such that the expression `is >> parse(fmt, tp, offset)` has type `I`, has value `is`, and calls:

```
from_stream(is,
 F, tp,
 static_cast<basic_string<charT, traits, Alloc>>*(nullptr),
 &offset)
```

```

template<class charT, class traits, class Alloc, class Parsable>
unspecified
parse(const charT* fmt, Parsable& tp,
 basic_string<charT, traits, Alloc>& abbrev, minutes& offset);
template<class charT, class traits, class Alloc, class Parsable>
unspecified
parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
 basic_string<charT, traits, Alloc>& abbrev, minutes& offset);

```

12 Let  $F$  be `fmt` for the first overload and `fmt.c_str()` for the second overload.

13 *Constraints:* The expression

```

from_stream(declval<basic_istream<charT, traits>&>(),
 F, tp, addressof(abbrev), &offset)

```

is well-formed when treated as an unevaluated operand (7.2.3).

14 *Returns:* A manipulator such that the expression `is >> parse(fmt, tp, abbrev, offset)` has type `I`, has value `is`, and calls `from_stream(is, F, tp, addressof(abbrev), &offset)`.

15 All `from_stream` overloads behave as unformatted input functions, except that they have an unspecified effect on the value returned by subsequent calls to `basic_istream<>::gcount()`. Each overload takes a format string containing ordinary characters and flags which have special meaning. Each flag begins with a `%`. Some flags can be modified by `E` or `O`. During parsing each flag interprets characters as parts of date and time types according to Table 102. Some flags can be modified by a width parameter given as a positive decimal integer called out as  $N$  below which governs how many characters are parsed from the stream in interpreting the flag. All characters in the format string that are not represented in Table 102, except for whitespace, are parsed unchanged from the stream. A whitespace character matches zero or more whitespace characters in the input stream.

16 If the type being parsed cannot represent the information that the format flag refers to, `is.setstate(ios_base::failbit)` is called.

EXAMPLE: A `duration` cannot represent a `weekday`.

However, if a flag refers to a “time of day” (e.g., `%H`, `%I`, `%p`, etc.), then a specialization of `duration` is parsed as the time of day elapsed since midnight.

17 If the `from_stream` overload fails to parse everything specified by the format string, or if insufficient information is parsed to specify a complete duration, time point, or calendrical data structure, `setstate(ios_base::failbit)` is called on the `basic_istream`.

Table 102: Meaning of `parse` flags [tab:time.parse.spec]

| Flag            | Parsed value                                                                                                                                                                                                                                                                                                                                    |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>%a</code> | The locale’s full or abbreviated case-insensitive weekday name.                                                                                                                                                                                                                                                                                 |
| <code>%A</code> | Equivalent to <code>%a</code> .                                                                                                                                                                                                                                                                                                                 |
| <code>%b</code> | The locale’s full or abbreviated case-insensitive month name.                                                                                                                                                                                                                                                                                   |
| <code>%B</code> | Equivalent to <code>%b</code> .                                                                                                                                                                                                                                                                                                                 |
| <code>%c</code> | The locale’s date and time representation. The modified command <code>%Ec</code> interprets the locale’s alternate date and time representation.                                                                                                                                                                                                |
| <code>%C</code> | The century as a decimal number. The modified command <code>%NC</code> specifies the maximum number of characters to read. If $N$ is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command <code>%EC</code> interprets the locale’s alternative representation of the century.                   |
| <code>%d</code> | The day of the month as a decimal number. The modified command <code>%Nd</code> specifies the maximum number of characters to read. If $N$ is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command <code>%0d</code> interprets the locale’s alternative representation of the day of the month. |
| <code>%D</code> | Equivalent to <code>%m/%d/%y</code> .                                                                                                                                                                                                                                                                                                           |
| <code>%e</code> | Equivalent to <code>%d</code> and can be modified like <code>%d</code> .                                                                                                                                                                                                                                                                        |
| <code>%F</code> | Equivalent to <code>%Y-%m-%d</code> . If modified with a width $N$ , the width is applied to only <code>%Y</code> .                                                                                                                                                                                                                             |
| <code>%g</code> | The last two decimal digits of the ISO week-based year. The modified command <code>%Ng</code> specifies the maximum number of characters to read. If $N$ is not specified, the default is 2. Leading zeroes are permitted but not required.                                                                                                     |

Table 102: Meaning of parse flags (continued)

| Flag | Parsed value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| %G   | The ISO week-based year as a decimal number. The modified command %NG specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 4. Leading zeroes are permitted but not required.                                                                                                                                                                                                                                                                                                                                                      |
| %h   | Equivalent to %b.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| %H   | The hour (24-hour clock) as a decimal number. The modified command %NH specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %OH interprets the locale's alternative representation.                                                                                                                                                                                                                                                                        |
| %I   | The hour (12-hour clock) as a decimal number. The modified command %NI specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %OI interprets the locale's alternative representation.                                                                                                                                                                                                                                                                        |
| %j   | If the type being parsed is a specialization of <b>duration</b> , a decimal number of <b>days</b> . Otherwise, the day of the year as a decimal number. Jan 1 is 1. In either case, the modified command %Nj specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 3. Leading zeroes are permitted but not required.                                                                                                                                                                                                               |
| %m   | The month as a decimal number. Jan is 1. The modified command %Nm specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %Om interprets the locale's alternative representation.                                                                                                                                                                                                                                                                             |
| %M   | The minutes as a decimal number. The modified command %NM specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %OM interprets the locale's alternative representation.                                                                                                                                                                                                                                                                                     |
| %n   | Matches one whitespace character.<br>NOTE: %n, %t, and a space can be combined to match a wide range of whitespace patterns. For example, "%n " matches one or more whitespace characters, and "%n%t%t" matches one to three whitespace characters.                                                                                                                                                                                                                                                                                                                           |
| %p   | The locale's equivalent of the AM/PM designations associated with a 12-hour clock.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| %r   | The locale's 12-hour clock time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| %R   | Equivalent to %H:%M.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| %S   | The seconds as a decimal number. The modified command %NS specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2 if the input time has a precision convertible to seconds. Otherwise the default width is determined by the decimal precision of the input and the field is interpreted as a <b>long double</b> in a fixed format. If encountered, the locale determines the decimal point character. Leading zeroes are permitted but not required. The modified command %OS interprets the locale's alternative representation. |
| %t   | Matches zero or one whitespace characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| %T   | Equivalent to %H:%M:%S.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| %u   | The ISO weekday as a decimal number (1-7), where Monday is 1. The modified command %Nu specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 1. Leading zeroes are permitted but not required.                                                                                                                                                                                                                                                                                                                                     |
| %U   | The week number of the year as a decimal number. The first Sunday of the year is the first day of week 01. Days of the same year prior to that are in week 00. The modified command %NU specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %OU interprets the locale's alternative representation.                                                                                                                                                       |
| %V   | The ISO week-based week number as a decimal number. The modified command %NV specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required.                                                                                                                                                                                                                                                                                                                                               |
| %w   | The weekday as a decimal number (0-6), where Sunday is 0. The modified command %Nw specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 1. Leading zeroes are permitted but not required. The modified command %Ow interprets the locale's alternative representation.                                                                                                                                                                                                                                                            |

Table 102: Meaning of parse flags (continued)

| Flag | Parsed value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| %W   | The week number of the year as a decimal number. The first Monday of the year is the first day of week 01. Days of the same year prior to that are in week 00. The modified command %NW specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %0W interprets the locale's alternative representation.                                                                                                              |
| %x   | The locale's date representation. The modified command %Ex interprets the locale's alternate date representation.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| %X   | The locale's time representation. The modified command %EX interprets the locale's alternate time representation.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| %y   | The last two decimal digits of the year. If the century is not otherwise specified (e.g., with %C), values in the range [69, 99] are presumed to refer to the years 1969 to 1999, and values in the range [00, 68] are presumed to refer to the years 2000 to 2068. The modified command %Ny specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified commands %Ey and %0y interpret the locale's alternative representation. |
| %Y   | The year as a decimal number. The modified command %NY specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 4. Leading zeroes are permitted but not required. The modified command %EY interprets the locale's alternative representation.                                                                                                                                                                                                                                               |
| %z   | The offset from UTC in the format [+ -]hh[mm]. For example -0430 refers to 4 hours 30 minutes behind UTC, and 04 refers to 4 hours ahead of UTC. The modified commands %Ez and %0z parse a : between the hours and minutes and render leading zeroes on the hour field optional: [+ -]h[h] [:mm]. For example -04:30 refers to 4 hours 30 minutes behind UTC, and 4 refers to 4 hours ahead of UTC.                                                                                                                                  |
| %Z   | The time zone abbreviation or name. A single word is parsed. This word can only contain characters from the basic character set (5.3) that are alphanumeric, or one of ', ', '/', '- ', or '+ '.                                                                                                                                                                                                                                                                                                                                     |
| %%   | A % character is extracted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## 29.14 Header <ctime> synopsis

[ctime.syn]

```
#define NULL see 17.2.3
#define CLOCKS_PER_SEC see below
#define TIME_UTC see below

namespace std {
 using size_t = see 17.2.4;
 using clock_t = see below;
 using time_t = see below;

 struct timespec;
 struct tm;

 clock_t clock();
 double difftime(time_t time1, time_t time0);
 time_t mktime(tm* timeptr);
 time_t time(time_t* timer);
 int timespec_get(timespec* ts, int base);
 char* asctime(const tm* timeptr);
 char* ctime(const time_t* timer);
 tm* gmtime(const time_t* timer);
 tm* localtime(const time_t* timer);
 size_t strftime(char* s, size_t maxsize, const char* format, const tm* timeptr);
}
```

<sup>1</sup> The contents of the header <ctime> are the same as the C standard library header <time.h>. <sup>240</sup>

<sup>240</sup>) strftime supports the C conversion specifiers C, D, e, F, g, G, h, r, R, t, T, u, V, and z, and the modifiers E and O.

<sup>2</sup> The functions `asctime`, `ctime`, `gmtime`, and `localtime` are not required to avoid data races (16.4.6.10).

# 30 Localization library [localization]

## 30.1 General [localization.general]

- <sup>1</sup> This Clause describes components that C++ programs may use to encapsulate (and therefore be more portable when confronting) cultural differences. The locale facility includes internationalization support for character classification and string collation, numeric, monetary, and date/time formatting and parsing, and message retrieval.
- <sup>2</sup> The following subclauses describe components for locales themselves, the standard facets, and facilities from the ISO C library, as summarized in [Table 103](#).

Table 103: Localization library summary [tab:localization.summary]

| Subclause                                                    | Header    |
|--------------------------------------------------------------|-----------|
| <a href="#">30.3</a> Locales                                 | <locale>  |
| <a href="#">30.4</a> Standard <code>locale</code> categories |           |
| <a href="#">30.5</a> C library locales                       | <clocale> |

## 30.2 Header <locale> synopsis

[locale.syn]

```

namespace std {
 // 30.3.1, locale
 class locale;
 template<class Facet> const Facet& use_facet(const locale& loc);
 template<class Facet> bool has_facet(const locale& loc) noexcept;

 // 30.3.3, convenience interfaces
 template<class charT> bool isspace (charT c, const locale& loc);
 template<class charT> bool isprint (charT c, const locale& loc);

template<class charT, bool Intl = false>
class moneypunct_byname;

// 30.4.8, message retrieval
class messages_base;
template<class charT> class messages;
template<class charT> class messages_byname;
}

```

<sup>1</sup> The header <locale> defines classes and declares functions that encapsulate and manipulate the information peculiar to a locale.<sup>241</sup>

### 30.3 Locales

[locales]

#### 30.3.1 Class locale

[locale]

##### 30.3.1.1 General

[locale.general]

```

namespace std {
 class locale {
 public:
 // types
 class facet;
 class id;
 using category = int;
 static const category // values assigned here are for exposition only
 none = 0,
 collate = 0x010, ctype = 0x020,
 monetary = 0x040, numeric = 0x080,
 time = 0x100, messages = 0x200,
 all = collate | ctype | monetary | numeric | time | messages;

 // construct/copy/destroy
 locale() noexcept;
 locale(const locale& other) noexcept;
 explicit locale(const char* std_name);
 explicit locale(const string& std_name);
 locale(const locale& other, const char* std_name, category);

```

<sup>241</sup> In this subclause, the type name tm is an incomplete type that is defined in <ctime> (29.14).

```

locale(const locale& other, const string& std_name, category);
template<class Facet> locale(const locale& other, Facet* f);
locale(const locale& other, const locale& one, category);
~locale(); // not virtual
const locale& operator=(const locale& other) noexcept;
template<class Facet> locale combine(const locale& other) const;

// locale operations
string name() const;

bool operator==(const locale& other) const;

template<class charT, class traits, class Allocator>
bool operator()(const basic_string<charT, traits, Allocator>& s1,
 const basic_string<charT, traits, Allocator>& s2) const;

// global locale objects
static locale global(const locale&);
static const locale& classic();
};

}

```

- <sup>1</sup> Class `locale` implements a type-safe polymorphic set of facets, indexed by facet *type*. In other words, a facet has a dual role: in one sense, it's just a class interface; at the same time, it's an index into a locale's set of facets.
- <sup>2</sup> Access to the facets of a `locale` is via two function templates, `use_facet<>` and `has_facet<>`.
- <sup>3</sup> EXAMPLE: An iostream `operator<<` can be implemented as:<sup>242</sup>

```

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<< (basic_ostream<charT, traits>& s, Date d) {
 typename basic_ostream<charT, traits>::sentry cerberos(s);
 if (cerberos) {
 tm tmbuf; d.extract(tmbuf);
 bool failed =
 use_facet<time_put<charT, ostreambuf_iterator<charT, traits>>>(s.getloc()).put(s, s, s.fill(), &tmbuf, 'x').failed();
 if (failed)
 s.setstate(s.badbit); // can throw
 }
 return s;
}

```

- <sup>4</sup> In the call to `use_facet<Facet>(loc)`, the type argument chooses a facet, making available all members of the named type. If `Facet` is not present in a locale, it throws the standard exception `bad_cast`. A C++ program can check if a locale implements a particular facet with the function template `has_facet<Facet>()`. User-defined facets may be installed in a locale, and used identically as may standard facets.
- <sup>5</sup> NOTE: All locale semantics are accessed via `use_facet<>` and `has_facet<>`, except that:
  - (5.1) — A member operator template
 

```
operator()(const basic_string<C, T, A>&, const basic_string<C, T, A>&)
```

 is provided so that a locale can be used as a predicate argument to the standard collections, to collate strings.
  - (5.2) — Convenient global interfaces are provided for traditional `ctype` functions such as `isdigit()` and `isspace()`, so that given a locale object `loc` a C++ program can call `isspace(c, loc)`. (This eases upgrading existing extractors (31.7.5.3).)
- <sup>6</sup> Once a facet reference is obtained from a locale object by calling `use_facet<>`, that reference remains usable, and the results from member functions of it may be cached and re-used, as long as some locale object refers to that facet.
- <sup>7</sup> In successive calls to a locale facet member function on a facet object installed in the same locale, the returned result shall be identical.

<sup>242</sup>) Note that in the call to `put`, the stream is implicitly converted to an `ostreambuf_iterator<charT, traits>`.

- <sup>8</sup> A `locale` constructed from a name string (such as "POSIX"), or from parts of two named locales, has a name; all others do not. Named locales may be compared for equality; an unnamed locale is equal only to (copies of) itself. For an unnamed locale, `locale::name()` returns the string "\*".
- <sup>9</sup> Whether there is one global locale object for the entire program or one global locale object per thread is implementation-defined. Implementations should provide one global locale object per thread. If there is a single global locale object for the entire program, implementations are not required to avoid data races on it ([16.4.6.10](#)).

### 30.3.1.2 Types

[`locale.types`]

#### 30.3.1.2.1 Type `locale::category`

[`locale.category`]

```
using category = int;
```

- <sup>1</sup> Valid `category` values include the `locale` member bitmask elements `collate`, `ctype`, `monetary`, `numeric`, `time`, and `messages`, each of which represents a single locale category. In addition, `locale` member bitmask constant `none` is defined as zero and represents no category. And `locale` member bitmask constant `all` is defined such that the expression

```
(collate | ctype | monetary | numeric | time | messages | all) == all
```

is `true`, and represents the union of all categories. Further, the expression `(X | Y)`, where `X` and `Y` each represent a single category, represents the union of the two categories.

- <sup>2</sup> `locale` member functions expecting a `category` argument require one of the `category` values defined above, or the union of two or more such values. Such a `category` value identifies a set of locale categories. Each locale category, in turn, identifies a set of locale facets, including at least those shown in [Table 104](#).

Table 104: Locale category facets [tab:`locale.category.facets`]

| Category | Includes facets                                                                                                                                                                                                                                                                                                                      |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| collate  | <code>collate&lt;char&gt;</code> , <code>collate&lt;wchar_t&gt;</code>                                                                                                                                                                                                                                                               |
| ctype    | <code>ctype&lt;char&gt;</code> , <code>ctype&lt;wchar_t&gt;</code><br><code>codecvt&lt;char, char, mbstate_t&gt;</code><br><code>codecvt&lt;char16_t, char8_t, mbstate_t&gt;</code><br><code>codecvt&lt;char32_t, char8_t, mbstate_t&gt;</code><br><code>codecvt&lt;wchar_t, char, mbstate_t&gt;</code>                              |
| monetary | <code>moneypunct&lt;char&gt;</code> , <code>moneypunct&lt;wchar_t&gt;</code><br><code>moneypunct&lt;char, true&gt;</code> , <code>moneypunct&lt;wchar_t, true&gt;</code><br><code>money_get&lt;char&gt;</code> , <code>money_get&lt;wchar_t&gt;</code><br><code>money_put&lt;char&gt;</code> , <code>money_put&lt;wchar_t&gt;</code> |
| numeric  | <code>numpunct&lt;char&gt;</code> , <code>numpunct&lt;wchar_t&gt;</code><br><code>num_get&lt;char&gt;</code> , <code>num_get&lt;wchar_t&gt;</code><br><code>num_put&lt;char&gt;</code> , <code>num_put&lt;wchar_t&gt;</code>                                                                                                         |
| time     | <code>time_get&lt;char&gt;</code> , <code>time_get&lt;wchar_t&gt;</code><br><code>time_put&lt;char&gt;</code> , <code>time_put&lt;wchar_t&gt;</code>                                                                                                                                                                                 |
| messages | <code>messages&lt;char&gt;</code> , <code>messages&lt;wchar_t&gt;</code>                                                                                                                                                                                                                                                             |

- <sup>3</sup> For any locale `loc` either constructed, or returned by `locale::classic()`, and any facet `Facet` shown in [Table 104](#), `has_facet<Facet>(loc)` is `true`. Each `locale` member function which takes a `locale::category` argument operates on the corresponding set of facets.
- <sup>4</sup> An implementation is required to provide those specializations for facet templates identified as members of a category, and for those shown in [Table 105](#).
- <sup>5</sup> The provided implementation of members of facets `num_get<charT>` and `num_put<charT>` calls `use_facet<F>(1)` only for facet `F` of types `numpunct<charT>` and `ctype<charT>`, and for locale `l` the value obtained by calling member `getloc()` on the `ios_base&` argument to these functions.
- <sup>6</sup> In declarations of facets, a template parameter with name `InputIterator` or `OutputIterator` indicates the set of all possible specializations on parameters that meet the `Cpp17InputIterator` requirements or `Cpp17OutputIterator` requirements, respectively ([25.3](#)). A template parameter with name `C` represents the set of types containing `char`, `wchar_t`, and any other implementation-defined character types that meet the

Table 105: Required specializations [tab:locale.spec]

| Category | Includes facets                                                                                                                                                                                                                                                                                                  |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| collate  | collate_byname<char>, collate_byname<wchar_t>                                                                                                                                                                                                                                                                    |

| monetary | moneypunct_byname<char, International><br>moneypunct_byname<wchar_t, International><br>money_get<C, InputIterator><br>money_put<C, OutputIterator>                                                                                                                                                               |
| numeric  | numpunct_byname<char>, numpunct_byname<wchar_t><br>num_get<C, InputIterator>, num_put<C, OutputIterator>                                                                                                                                                                                                         |
| time     | time_get<char, InputIterator><br>time_get_byname<char, InputIterator><br>time_get<wchar_t, InputIterator><br>time_get_byname<wchar_t, InputIterator><br>time_put<char, OutputIterator><br>time_put_byname<char, OutputIterator><br>time_put<wchar_t, OutputIterator><br>time_put_byname<wchar_t, OutputIterator> |
| messages | messages_byname<char>, messages_byname<wchar_t>                                                                                                                                                                                                                                                                  |

requirements for a character on which any of the iostream components can be instantiated. A template parameter with name `International` represents the set of all possible specializations on a `bool` parameter.

### 30.3.1.2.2 Class `locale::facet`

[`locale.facet`]

```
namespace std {
 class locale::facet {
protected:
 explicit facet(size_t refs = 0);
 virtual ~facet();
 facet(const facet&) = delete;
 void operator=(const facet&) = delete;
};
}
```

- <sup>1</sup> Class `facet` is the base class for locale feature sets. A class is a *facet* if it is publicly derived from another facet, or if it is a class derived from `locale::facet` and contains a publicly accessible declaration as follows:<sup>243</sup>

```
static ::std::locale::id id;
```
- <sup>2</sup> Template parameters in this Clause which are required to be facets are those named `Facet` in declarations. A program that passes a type that is *not* a facet, or a type that refers to a volatile-qualified facet, as an (explicit or deduced) template parameter to a locale function expecting a facet, is ill-formed. A const-qualified facet is a valid template argument to any locale function that expects a `Facet` template parameter.
- <sup>3</sup> The `refs` argument to the constructor is used for lifetime management. For `refs == 0`, the implementation performs `delete static_cast<locale::facet*>(f)` (where `f` is a pointer to the facet) when the last `locale` object containing the facet is destroyed; for `refs == 1`, the implementation never destroys the facet.
- <sup>4</sup> Constructors of all facets defined in this Clause take such an argument and pass it along to their `facet` base class constructor. All one-argument constructors defined in this Clause are *explicit*, preventing their participation in implicit conversions.
- <sup>5</sup> For some standard facets a standard “...\_byname” class, derived from it, implements the virtual function semantics equivalent to that facet of the locale constructed by `locale(const char*)` with the same name.

<sup>243)</sup> This is a complete list of requirements; there are no other requirements. Thus, a facet class need not have a public copy constructor, assignment, default constructor, destructor, etc.

Each such facet provides a constructor that takes a `const char*` argument, which names the locale, and a `refs` argument, which is passed to the base class constructor. Each such facet also provides a constructor that takes a `string` argument `str` and a `refs` argument, which has the same effect as calling the first constructor with the two arguments `str.c_str()` and `refs`. If there is no “`..._byname`” version of a facet, the base class implements named locale semantics itself by reference to other facets.

### 30.3.1.2.3 Class `locale::id`

[`locale.id`]

```
namespace std {
 class locale::id {
 public:
 id();
 void operator=(const id&) = delete;
 id(const id&) = delete;
 };
}
```

- 1 The class `locale::id` provides identification of a locale facet interface, used as an index for lookup and to encapsulate initialization.
- 2 NOTE: Because facets are used by iostreams, potentially while static constructors are running, their initialization cannot depend on programmed static initialization. One initialization strategy is for `locale` to initialize each facet's `id` member the first time an instance of the facet is installed into a locale. This depends only on static storage being zero before constructors run (6.9.3.2).

### 30.3.1.3 Constructors and destructor

[`locale.cons`]

```
locale() noexcept;
```

- 1 *Effects:* Constructs a copy of the argument last passed to `locale::global(locale&)`, if it has been called; else, the resulting facets have virtual function semantics identical to those of `locale::classic()`.  
NOTE: This constructor yields a copy of the current global locale. It is commonly used as a default argument for function parameters of type `const locale&`.

```
explicit locale(const char* std_name);
```

- 2 *Effects:* Constructs a locale using standard C locale names, e.g., "POSIX". The resulting locale implements semantics defined to be associated with that name.

- 3 *Throws:* `runtime_error` if the argument is not valid, or is null.

- 4 *Remarks:* The set of valid string argument values is "C", "", and any implementation-defined values.

```
explicit locale(const string& std_name);
```

- 5 *Effects:* Equivalent to `locale(std_name.c_str())`.

```
locale(const locale& other, const char* std_name, category cats);
```

- 6 *Preconditions:* `cats` is a valid `category` value (30.3.1.2.1).

- 7 *Effects:* Constructs a locale as a copy of `other` except for the facets identified by the `category` argument, which instead implement the same semantics as `locale(std_name)`.

- 8 *Throws:* `runtime_error` if the second argument is not valid, or is null.

- 9 *Remarks:* The locale has a name if and only if `other` has a name.

```
locale(const locale& other, const string& std_name, category cats);
```

- 10 *Effects:* Equivalent to `locale(other, std_name.c_str(), cats)`.

```
template<class Facet> locale(const locale& other, Facet* f);
```

- 11 *Effects:* Constructs a locale incorporating all facets from the first argument except that of type `Facet`, and installs the second argument as the remaining facet. If `f` is null, the resulting object is a copy of `other`.

- 12 *Remarks:* If `f` is null, the resulting locale has the same name as `other`. Otherwise, the resulting locale has no name.

```
locale(const locale& other, const locale& one, category cats);
13 Preconditions: cats is a valid category value.
14 Effects: Constructs a locale incorporating all facets from the first argument except those that implement cats, which are instead incorporated from the second argument.
15 Remarks: If cats is equal to locale::none, the resulting locale has a name if and only if the first argument has a name. Otherwise, the resulting locale has a name if and only if the first two arguments both have names.

const locale& operator=(const locale& other) noexcept;
16 Effects: Creates a copy of other, replacing the current value.
17 Returns: *this.
```

### 30.3.1.4 Members

[**locale.members**]

```
template<class Facet> locale combine(const locale& other) const;
1 Effects: Constructs a locale incorporating all facets from *this except for that one facet of other that is identified by Facet.
2 Returns: The newly created locale.
3 Throws: runtime_error if has_facet<Facet>(other) is false.
4 Remarks: The resulting locale has no name.

string name() const;
5 Returns: The name of *this, if it has one; otherwise, the string "*".
```

### 30.3.1.5 Operators

[**locale.operators**]

```
bool operator==(const locale& other) const;
1 Returns: true if both arguments are the same locale, or one is a copy of the other, or each has a name and the names are identical; false otherwise.

template<class charT, class traits, class Allocator>
 bool operator()(const basic_string<charT, traits, Allocator>& s1,
 const basic_string<charT, traits, Allocator>& s2) const;
2 Effects: Compares two strings according to the collate<charT> facet.
3 Returns:
 use_facet<collate<charT>>(*this).compare(s1.data(), s1.data() + s1.size(),
 s2.data(), s2.data() + s2.size()) < 0
4 Remarks: This member operator template (and therefore locale itself) meets the requirements for a comparator predicate template argument (Clause 27) applied to strings.
5 EXAMPLE: A vector of strings v can be collated according to collation rules in locale loc simply by (27.8.2, 24.3.11):
 std::sort(v.begin(), v.end(), loc);
```

### 30.3.1.6 Static members

[**locale.statics**]

```
static locale global(const locale& loc);
1 Effects: Sets the global locale to its argument. Causes future calls to the constructor locale() to return a copy of the argument. If the argument has a name, does
 setlocale(LC_ALL, loc.name().c_str());
 otherwise, the effect on the C locale, if any, is implementation-defined.
2 Returns: The previous value of locale().
3 Remarks: No library function other than locale::global() affects the value returned by locale().
 NOTE: See 30.5 for data race considerations when setlocale is invoked.
```

```
static const locale& classic();
```

4     The "C" locale.  
 5     >Returns: A locale that implements the classic "C" locale semantics, equivalent to the value `locale("C")`.  
 6     >Remarks: This locale, its facets, and their member functions, do not change with time.

### 30.3.2 locale globals

[`locale.global.templates`]

```
template<class Facet> const Facet& use_facet(const locale& loc);
```

1     >Mandates: `Facet` is a facet class whose definition contains the public static member `id` as defined in [30.3.1.2.2](#).  
 2     >Returns: A reference to the corresponding facet of `loc`, if present.  
 3     >Throws: `bad_cast` if `has_facet<Facet>(loc)` is `false`.  
 4     >Remarks: The reference returned remains valid at least as long as any copy of `loc` exists.

```
template<class Facet> bool has_facet(const locale& loc) noexcept;
```

5     >Returns: `true` if the facet requested is present in `loc`; otherwise `false`.

### 30.3.3 Convenience interfaces

[`locale.convenience`]

#### 30.3.3.1 Character classification

[`classification`]

```
template<class charT> bool isspace (charT c, const locale& loc);
template<class charT> bool isprint (charT c, const locale& loc);
template<class charT> bool iscntrl (charT c, const locale& loc);
template<class charT> bool isupper (charT c, const locale& loc);
template<class charT> bool islower (charT c, const locale& loc);
template<class charT> bool isalpha (charT c, const locale& loc);
template<class charT> bool isdigit (charT c, const locale& loc);
template<class charT> bool ispunct (charT c, const locale& loc);
template<class charT> bool isxdigit(charT c, const locale& loc);
template<class charT> bool isalnum (charT c, const locale& loc);
template<class charT> bool isgraph (charT c, const locale& loc);
template<class charT> bool isblank (charT c, const locale& loc);
```

- 1 Each of these functions `isF` returns the result of the expression:

```
use_facet<ctype<charT>>(loc).is(ctype_base::F, c)
```

where `F` is the `ctype_base::mask` value corresponding to that function ([30.4.2](#)).<sup>244</sup>

#### 30.3.3.2 Character conversions

[`conversions.character`]

```
template<class charT> charT toupper(charT c, const locale& loc);
```

- 1     >Returns: `use_facet<ctype<charT>>(loc).toupper(c)`.

```
template<class charT> charT tolower(charT c, const locale& loc);
```

- 2     >Returns: `use_facet<ctype<charT>>(loc).tolower(c)`.

### 30.4 Standard locale categories

[`locale.categories`]

#### 30.4.1 General

[`locale.categories.general`]

- 1 Each of the standard categories includes a family of facets. Some of these implement formatting or parsing of a datum, for use by standard or users' iostream operators `<<` and `>>`, as members `put()` and `get()`, respectively. Each such member function takes an `ios_base&` argument whose members `flags()`, `precision()`, and `width()`, specify the format of the corresponding datum ([31.5.2](#)). Those functions which need to use other facets call its member `getloc()` to retrieve the locale imbued there. Formatting facets use the character argument `fill` to fill out the specified width where necessary.  
 2 The `put()` members make no provision for error reporting. (Any failures of the `OutputIterator` argument can be extracted from the returned iterator.) The `get()` members take an `ios_base::iostate&` argument whose value they ignore, but set to `ios_base::failbit` in case of a parse error.

<sup>244</sup>) When used in a loop, it is faster to cache the `ctype<>` facet and use it directly, or use the vector form of `ctype<>>::is`.

- <sup>3</sup> Within subclause 30.4 it is unspecified whether one virtual function calls another virtual function.

### 30.4.2 The ctype category

[category.ctype]

#### 30.4.2.1 General

[category.ctype.general]

```
namespace std {
 class ctype_base {
public:
 using mask = see below;

 // numeric values are for exposition only.
 static const mask space = 1 << 0;
 static const mask print = 1 << 1;
 static const mask cntrl = 1 << 2;
 static const mask upper = 1 << 3;
 static const mask lower = 1 << 4;
 static const mask alpha = 1 << 5;
 static const mask digit = 1 << 6;
 static const mask punct = 1 << 7;
 static const mask xdigit = 1 << 8;
 static const mask blank = 1 << 9;
 static const mask alnum = alpha | digit;
 static const mask graph = alnum | punct;
};

}
```

- <sup>1</sup> The type mask is a bitmask type (16.3.3.3).

#### 30.4.2.2 Class template ctype

[locale.ctype]

##### 30.4.2.2.1 General

[locale.ctype.general]

```
namespace std {
 template<class charT>
 class ctype : public locale::facet, public ctype_base {
public:
 using char_type = charT;

 explicit ctype(size_t refs = 0);

 bool is(mask m, charT c) const;
 const charT* is(const charT* low, const charT* high, mask* vec) const;
 const charT* scan_is(mask m, const charT* low, const charT* high) const;
 const charT* scan_not(mask m, const charT* low, const charT* high) const;
 charT toupper(charT c) const;
 const charT* toupper(charT* low, const charT* high) const;
 charT tolower(charT c) const;
 const charT* tolower(charT* low, const charT* high) const;

 charT widen(char c) const;
 const char* widen(const char* low, const char* high, charT* to) const;
 char narrow(charT c, char dfault) const;
 const charT* narrow(const charT* low, const charT* high, char dfault, char* to) const;

 static locale::id id;

protected:
 ~ctype();
 virtual bool do_is(mask m, charT c) const;
 virtual const charT* do_is(const charT* low, const charT* high, mask* vec) const;
 virtual const charT* do_scan_is(mask m, const charT* low, const charT* high) const;
 virtual const charT* do_scan_not(mask m, const charT* low, const charT* high) const;
 virtual charT do_toupper(charT) const;
 virtual const charT* do_toupper(charT* low, const charT* high) const;
 virtual charT do_tolower(charT) const;
 virtual const charT* do_tolower(charT* low, const charT* high) const;
}
```

```

 virtual charT do_widen(char) const;
 virtual const char* do_widen(const char* low, const char* high, charT* dest) const;
 virtual char do_narrow(charT, char default) const;
 virtual const charT* do_narrow(const charT* low, const charT* high,
 char default, char* dest) const;
}
}

```

- <sup>1</sup> Class `ctype` encapsulates the C library <cctype> features. `istream` members are required to use `ctype<>` for character classing during input parsing.
- <sup>2</sup> The specializations required in [Table 104 \(30.3.1.2.1\)](#), namely `ctype<char>` and `ctype<wchar_t>`, implement character classing appropriate to the implementation's native character set.

### 30.4.2.2.2 ctype members

[`locale.ctype.members`]

```

bool is(mask m, charT c) const;
const charT* is(const charT* low, const charT* high, mask* vec) const;
1 Returns: do_is(m, c) or do_is(low, high, vec).

const charT* scan_is(mask m, const charT* low, const charT* high) const;
2 Returns: do_scan_is(m, low, high).

const charT* scan_not(mask m, const charT* low, const charT* high) const;
3 Returns: do_scan_not(m, low, high).

charT toupper(charT) const;
const charT* toupper(charT* low, const charT* high) const;
4 Returns: do_toupper(c) or do_toupper(low, high).

charT tolower(charT c) const;
const charT* tolower(charT* low, const charT* high) const;
5 Returns: do_tolower(c) or do_tolower(low, high).

charT widen(char c) const;
const char* widen(const char* low, const char* high, charT* to) const;
6 Returns: do_widen(c) or do_widen(low, high, to).

char narrow(charT c, char default) const;
const charT* narrow(const charT* low, const charT* high, char default, char* to) const;
7 Returns: do_narrow(c, default) or do_narrow(low, high, default, to).

```

### 30.4.2.2.3 ctype virtual functions

[`locale.ctype.virtuals`]

```

bool do_is(mask m, charT c) const;
const charT* do_is(const charT* low, const charT* high, mask* vec) const;
1 Effects: Classifies a character or sequence of characters. For each argument character, identifies a value M of type ctype_base::mask. The second form identifies a value M of type ctype_base::mask for each *p where (low <= p && p < high), and places it into vec[p - low].
2 Returns: The first form returns the result of the expression (M & m) != 0; i.e., true if the character has the characteristics specified. The second form returns high.

const charT* do_scan_is(mask m, const charT* low, const charT* high) const;
3 Effects: Locates a character in a buffer that conforms to a classification m.
4 Returns: The smallest pointer p in the range [low,high) such that is(m, *p) would return true; otherwise, returns high.

const charT* do_scan_not(mask m, const charT* low, const charT* high) const;
5 Effects: Locates a character in a buffer that fails to conform to a classification m.
6 Returns: The smallest pointer p, if any, in the range [low,high) such that is(m, *p) would return false; otherwise, returns high.

```

charT do\_toupper(charT c) const;  
 const charT\* do\_toupper(charT\* low, const charT\* high) const;

7     *Effects*: Converts a character or characters to upper case. The second form replaces each character \*p in the range [low,high) for which a corresponding upper-case character exists, with that character.

8     *Returns*: The first form returns the corresponding upper-case character if it is known to exist, or its argument if not. The second form returns high.

charT do\_tolower(charT c) const;  
 const charT\* do\_tolower(charT\* low, const charT\* high) const;

9     *Effects*: Converts a character or characters to lower case. The second form replaces each character \*p in the range [low,high) and for which a corresponding lower-case character exists, with that character.

10    *Returns*: The first form returns the corresponding lower-case character if it is known to exist, or its argument if not. The second form returns high.

charT do\_widen(char c) const;  
 const char\* do\_widen(const char\* low, const char\* high, charT\* dest) const;

11    *Effects*: Applies the simplest reasonable transformation from a `char` value or sequence of `char` values to the corresponding `charT` value or values.<sup>245</sup> The only characters for which unique transformations are required are those in the basic character set (5.3).

For any named `ctype` category with a `ctype<charT>` facet `ctc` and valid `ctype_base::mask` value `M`,  
`(ctc.is(M, c) || !is(M, do_widen(c)) )` is true.<sup>246</sup>

The second form transforms each character \*p in the range [low,high), placing the result in `dest[p - low]`.

12    *Returns*: The first form returns the transformed value. The second form returns high.

char do\_narrow(charT c, char default) const;  
 const charT\* do\_narrow(const charT\* low, const charT\* high, char default, char\* dest) const;

13    *Effects*: Applies the simplest reasonable transformation from a `charT` value or sequence of `charT` values to the corresponding `char` value or values.

For any character `c` in the basic character set (5.3) the transformation is such that  
`do_widen(do_narrow(c, 0)) == c`

For any named `ctype` category with a `ctype<char>` facet `ctc` however, and `ctype_base::mask` value `M`,  
`(is(M, c) || !ctc.is(M, do_narrow(c, default)) )`

is true (unless `do_narrow` returns `default`). In addition, for any digit character `c`, the expression `(do_narrow(c, default) - '0')` evaluates to the digit value of the character. The second form transforms each character \*p in the range [low,high), placing the result (or `default` if no simple transformation is readily available) in `dest[p - low]`.

14    *Returns*: The first form returns the transformed value; or `default` if no mapping is readily available. The second form returns high.

### 30.4.2.3 Class template `ctype_byname`

[`locale.ctype.byname`]

```
namespace std {
 template<class charT>
 class ctype_byname : public ctype<charT> {
public:
 using mask = typename ctype<charT>::mask;
 explicit ctype_byname(const char*, size_t refs = 0);
 explicit ctype_byname(const string&, size_t refs = 0);

protected:
 ~ctype_byname();
```

<sup>245</sup>) The parameter `c` of `do_widen` is intended to accept values derived from *character-literals* for conversion to the locale's encoding.

<sup>246</sup>) In other words, the transformed character is not a member of any character classification that `c` is not also a member of.

```
 };
}
```

### 30.4.2.4 ctype<char> specialization

[facet.ctype.special]

#### 30.4.2.4.1 General

[facet.ctype.special.general]

```
namespace std {
 template<>
 class ctype<char> : public locale::facet, public ctype_base {
 public:
 using char_type = char;

 explicit ctype(const mask* tab = nullptr, bool del = false, size_t refs = 0);

 bool is(mask m, char c) const;
 const char* is(const char* low, const char* high, mask* vec) const;
 const char* scan_is(mask m, const char* low, const char* high) const;
 const char* scan_not(mask m, const char* low, const char* high) const;

 char toupper(char c) const;
 const char* toupper(char* low, const char* high) const;
 char tolower(char c) const;
 const char* tolower(char* low, const char* high) const;

 char widen(char c) const;
 const char* widen(const char* low, const char* high, char* to) const;
 char narrow(char c, char default) const;
 const char* narrow(const char* low, const char* high, char default, char* to) const;

 static locale::id id;
 static const size_t table_size = implementation-defined;

 const mask* table() const noexcept;
 static const mask* classic_table() noexcept;

 protected:
 ~ctype();
 virtual char do_toupper(char c) const;
 virtual const char* do_toupper(char* low, const char* high) const;
 virtual char do_tolower(char c) const;
 virtual const char* do_tolower(char* low, const char* high) const;

 virtual char do_widen(char c) const;
 virtual const char* do_widen(const char* low, const char* high, char* to) const;
 virtual char do_narrow(char c, char default) const;
 virtual const char* do_narrow(const char* low, const char* high,
 char default, char* to) const;
 };
}
```

<sup>1</sup> A specialization `ctype<char>` is provided so that the member functions on type `char` can be implemented inline.<sup>247</sup> The implementation-defined value of member `table_size` is at least 256.

#### 30.4.2.4.2 Destructor

[facet.ctype.char.dtor]

```
~ctype();
```

<sup>1</sup> *Effects:* If the constructor's first argument was nonzero, and its second argument was `true`, does `delete [] table()`.

---

<sup>247</sup>) Only the `char` (not `unsigned char` and `signed char`) form is provided. The specialization is specified in the standard, and not left as an implementation detail, because it affects the derivation interface for `ctype<char>`.

**30.4.2.4.3 Members**

[facet.ctype.char.members]

- <sup>1</sup> In the following member descriptions, for `unsigned char` values `v` where `v >= table_size`, `table() [v]` is assumed to have an implementation-specific value (possibly different for each such value `v`) without performing the array lookup.

```
explicit ctype(const mask* tbl = nullptr, bool del = false, size_t refs = 0);
```

- <sup>2</sup> *Preconditions:* Either `tbl == nullptr` is true or `[tbl, tbl+table_size)` is a valid range.

- <sup>3</sup> *Effects:* Passes its `refs` argument to its base class constructor.

```
bool is(mask m, char c) const;
const char* is(const char* low, const char* high, mask* vec) const;
```

- <sup>4</sup> *Effects:* The second form, for all `*p` in the range `[low, high)`, assigns into `vec[p - low]` the value `table() [(unsigned char)*p]`.

- <sup>5</sup> *Returns:* The first form returns `table() [(unsigned char)c] & m`; the second form returns `high`.

```
const char* scan_is(mask m, const char* low, const char* high) const;
```

- <sup>6</sup> *Returns:* The smallest `p` in the range `[low, high)` such that

```
table() [(unsigned char) *p] & m
```

is true.

```
const char* scan_not(mask m, const char* low, const char* high) const;
```

- <sup>7</sup> *Returns:* The smallest `p` in the range `[low, high)` such that

```
table() [(unsigned char) *p] & m
```

is false.

```
char toupper(char c) const;
const char* toupper(char* low, const char* high) const;
```

- <sup>8</sup> *Returns:* `do_toupper(c)` or `do_toupper(low, high)`, respectively.

```
char tolower(char c) const;
const char* tolower(char* low, const char* high) const;
```

- <sup>9</sup> *Returns:* `do_tolower(c)` or `do_tolower(low, high)`, respectively.

```
char widen(char c) const;
const char* widen(const char* low, const char* high, char* to) const;
```

- <sup>10</sup> *Returns:* `do_widen(c)` or `do_widen(low, high, to)`, respectively.

```
char narrow(char c, char dfault) const;
const char* narrow(const char* low, const char* high, char dfault, char* to) const;
```

- <sup>11</sup> *Returns:* `do_narrow(c, dfault)` or `do_narrow(low, high, dfault, to)`, respectively.

```
const mask* table() const noexcept;
```

- <sup>12</sup> *Returns:* The first constructor argument, if it was nonzero, otherwise `classic_table()`.

**30.4.2.4.4 Static members**

[facet.ctype.char.statics]

```
static const mask* classic_table() noexcept;
```

- <sup>1</sup> *Returns:* A pointer to the initial element of an array of size `table_size` which represents the classifications of characters in the "C" locale.

**30.4.2.4.5 Virtual functions**

[facet.ctype.char.virtuals]

```
char do_toupper(char) const;
const char* do_toupper(char* low, const char* high) const;
char do_tolower(char) const;
const char* do_tolower(char* low, const char* high) const;
```

```

virtual char do_widen(char c) const;
virtual const char* do_widen(const char* low, const char* high, char* to) const;
virtual char do_narrow(char c, char default) const;
virtual const char* do_narrow(const char* low, const char* high,
 char default, char* to) const;

```

- <sup>1</sup> These functions are described identically as those members of the same name in the `ctype` class template (30.4.2.2.2).

### 30.4.2.5 Class template `codecvt`

[`locale.codecvt`]

#### 30.4.2.5.1 General

[`locale.codecvt.general`]

```

namespace std {
 class codecvt_base {
public:
 enum result { ok, partial, error, noconv };
};

template<class internT, class externT, class stateT>
 class codecvt : public locale::facet, public codecvt_base {
public:
 using intern_type = internT;
 using extern_type = externT;
 using state_type = stateT;

 explicit codecvt(size_t refs = 0);

 result out(
 stateT& state,
 const internT* from, const internT* from_end, const internT*& from_next,
 externT* to, externT* to_end, externT*& to_next) const;

 result unshift(
 stateT& state,
 externT* to, externT* to_end, externT*& to_next) const;

 result in(
 stateT& state,
 const externT* from, const externT* from_end, const externT*& from_next,
 internT* to, internT* to_end, internT*& to_next) const;

 int encoding() const noexcept;
 bool always_noconv() const noexcept;
 int length(stateT&, const externT* from, const externT* end, size_t max) const;
 int max_length() const noexcept;

 static locale::id id;
};

protected:
 ~codecvt();
 virtual result do_out(
 stateT& state,
 const internT* from, const internT* from_end, const internT*& from_next,
 externT* to, externT* to_end, externT*& to_next) const;
 virtual result do_in(
 stateT& state,
 const externT* from, const externT* from_end, const externT*& from_next,
 internT* to, internT* to_end, internT*& to_next) const;
 virtual result do_unshift(
 stateT& state,
 externT* to, externT* to_end, externT*& to_next) const;

 virtual int do_encoding() const noexcept;
 virtual bool do_always_noconv() const noexcept;
 virtual int do_length(stateT&, const externT* from, const externT* end, size_t max) const;

```

```

 virtual int do_max_length() const noexcept;
 };
}

```

- <sup>1</sup> The class `codecvt<internT, externT, stateT>` is for use when converting from one character encoding to another, such as from wide characters to multibyte characters or between wide character encodings such as UTF-32 and EUC.
- <sup>2</sup> The `stateT` argument selects the pair of character encodings being mapped between.
- <sup>3</sup> The specializations required in [Table 104 \(30.3.1.2.1\)](#) convert the implementation-defined native character set. `codecvt<char, char, mbstate_t>` implements a degenerate conversion; it does not convert at all. The specialization `codecvt<char16_t, char8_t, mbstate_t>` converts between the UTF-16 and UTF-8 encoding forms, and the specialization `codecvt<char32_t, char8_t, mbstate_t>` converts between the UTF-32 and UTF-8 encoding forms. `codecvt<wchar_t, char, mbstate_t>` converts between the native character sets for ordinary and wide characters. Specializations on `mbstate_t` perform conversion between encodings known to the library implementer. Other encodings can be converted by specializing on a program-defined `stateT` type. Objects of type `stateT` can contain any state that is useful to communicate to or from the specialized `do_in` or `do_out` members.

#### 30.4.2.5.2 Members

[`locale.codecvt.members`]

```

result out(
 stateT& state,
 const internT* from, const internT* from_end, const internT*& from_next,
 externT* to, externT* to_end, externT*& to_next) const;

1 Returns: do_out(state, from, from_end, from_next, to, to_end, to_next).

result unshift(stateT& state, externT* to, externT* to_end, externT*& to_next) const;

2 Returns: do_unshift(state, to, to_end, to_next).

result in(
 stateT& state,
 const externT* from, const externT* from_end, const externT*& from_next,
 internT* to, internT* to_end, internT*& to_next) const;

3 Returns: do_in(state, from, from_end, from_next, to, to_end, to_next).

int encoding() const noexcept;
4 Returns: do_encoding().

bool always_noconv() const noexcept;
5 Returns: do_always_noconv().

int length(stateT& state, const externT* from, const externT* from_end, size_t max) const;
6 Returns: do_length(state, from, from_end, max).

int max_length() const noexcept;
7 Returns: do_max_length().

```

#### 30.4.2.5.3 Virtual functions

[`locale.codecvt.virtuals`]

```

result do_out(
 stateT& state,
 const internT* from, const internT* from_end, const internT*& from_next,
 externT* to, externT* to_end, externT*& to_next) const;

result do_in(
 stateT& state,
 const externT* from, const externT* from_end, const externT*& from_next,
 internT* to, internT* to_end, internT*& to_next) const;

1 Preconditions: (from <= from_end && to <= to_end) is well-defined and true; state is initialized, if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in the sequence.

```

- 2    *Effects:* Translates characters in the source range [`from`, `from_end`), placing the results in sequential positions starting at destination `to`. Converts no more than (`from_end - from`) source elements, and stores no more than (`to_end - to`) destination elements.
- 3    Stops if it encounters a character it cannot convert. It always leaves the `from_next` and `to_next` pointers pointing one beyond the last element successfully converted. If `returns` `noconv`, `internT` and `externT` are the same type and the converted sequence is identical to the input sequence [`from`, `from_next`). `to_next` is set equal to `to`, the value of `state` is unchanged, and there are no changes to the values in [`to`, `to_end`].
- 4    A `codecvt` facet that is used by `basic_filebuf` (31.10) shall have the property that if  
`do_out(state, from, from_end, from_next, to, to_end, to_next)`  
would return `ok`, where `from != from_end`, then  
`do_out(state, from, from + 1, from_next, to, to_end, to_next)`  
shall also return `ok`, and that if  
`do_in(state, from, from_end, from_next, to, to_end, to_next)`  
would return `ok`, where `to != to_end`, then  
`do_in(state, from, from_end, from_next, to, to + 1, to_next)`  
shall also return `ok`.<sup>248</sup>
- NOTE 1: As a result of operations on `state`, it can return `ok` or `partial` and set `from_next == from` and `to_next != to`.
- 5    *Returns:* An enumeration value, as summarized in Table 106.

Table 106: `do_in/do_out` result values [tab:locale.codecvt.inout]

| Value                | Meaning                                                                                                                |
|----------------------|------------------------------------------------------------------------------------------------------------------------|
| <code>ok</code>      | completed the conversion                                                                                               |
| <code>partial</code> | not all source characters converted                                                                                    |
| <code>error</code>   | encountered a character in [ <code>from</code> , <code>from_end</code> ) that cannot be converted                      |
| <code>noconv</code>  | <code>internT</code> and <code>externT</code> are the same type, and input sequence is identical to converted sequence |

A return value of `partial`, if (`from_next == from_end`), indicates that either the destination sequence has not absorbed all the available destination elements, or that additional source elements are needed before another destination element can be produced.

- 6    *Remarks:* Its operations on `state` are unspecified.
- NOTE 2: This argument can be used, for example, to maintain shift state, to specify conversion options (such as count only), or to identify a cache of seek offsets.
- ```
result do_unshift(stateT& state, externT* to, externT* to_end, externT*& to_next) const;
```
- 7 *Preconditions:* (`to <= to_end`) is well-defined and `true`; `state` is initialized, if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in the sequence.
- 8 *Effects:* Places characters starting at `to` that should be appended to terminate a sequence when the current `stateT` is given by `state`.²⁴⁹ Stores no more than (`to_end - to`) destination elements, and leaves the `to_next` pointer pointing one beyond the last element successfully stored.
- 9 *Returns:* An enumeration value, as summarized in Table 107.

²⁴⁸) Informally, this means that `basic_filebuf` assumes that the mappings from internal to external characters is 1 to N: that a `codecvt` facet that is used by `basic_filebuf` can translate characters one internal character at a time.

²⁴⁹) Typically these will be characters to return the state to `stateT()`.

Table 107: do_unshift result values [tab:locale.codecvt.unshift]

Value	Meaning
ok	completed the sequence
partial	space for more than <code>to_end</code> – <code>to</code> destination elements was needed to terminate a sequence given the value of <code>state</code>
error	an unspecified error has occurred
noconv	no termination is needed for this <code>state_type</code>

```

int do_encoding() const noexcept;
10   Returns: -1 if the encoding of the externT sequence is state-dependent; else the constant number of
           externT characters needed to produce an internal character; or 0 if this number is not a constant.250

bool do_always_noconv() const noexcept;
11   Returns: true if do_in() and do_out() return noconv for all valid argument values. codecvt<char,
           char, mbstate_t> returns true.

int do_length(stateT& state, const externT* from, const externT* from_end, size_t max) const;
12   Preconditions: (from <= from_end) is well-defined and true; state is initialized, if at the beginning
                   of a sequence, or else is equal to the result of converting the preceding characters in the sequence.

13   Effects: The effect on the state argument is as if it called do_in(state, from, from_end, from,
             to, to+max, to) for to pointing to a buffer of at least max elements.

14   Returns: (from_next-from) where from_next is the largest value in the range [from, from_end] such
             that the sequence of values in the range [from, from_next] represents max or fewer valid complete
             characters of type internT. The specialization codecvt<char, char, mbstate_t>, returns the lesser
             of max and (from_end-from).

int do_max_length() const noexcept;
15   Returns: The maximum value that do_length(state, from, from_end, 1) can return for any valid
             range [from, from_end] and stateT value state. The specialization codecvt<char, char, mbstate_t>::do_max_length() returns 1.

```

30.4.2.6 Class template `codecvt_byname`

[locale.codecvtbyname]

```

namespace std {
    template<class internT, class externT, class stateT>
    class codecvt_byname : public codecvt<internT, externT, stateT> {
        public:
            explicit codecvt_byname(const char*, size_t refs = 0);
            explicit codecvt_byname(const string&, size_t refs = 0);

        protected:
            ~codecvt_byname();
    };
}

```

30.4.3 The numeric category

[category.numeric]

30.4.3.1 General

[category.numeric.general]

- ¹ The classes `num_get<>` and `num_put<>` handle numeric formatting and parsing. Virtual functions are provided for several numeric types. Implementations may (but are not required to) delegate extraction of smaller types to extractors for larger types.²⁵¹

²⁵⁰ If `encoding()` yields -1, then more than `max_length()` `externT` elements can be consumed when producing a single `internT` character, and additional `externT` elements can appear at the end of a sequence after those that yield the final `internT` character.

²⁵¹ Parsing "-1" correctly into, e.g., an `unsigned short` requires that the corresponding member `get()` at least extract the sign before delegating.

- ² All specifications of member functions for `num_put` and `num_get` in the subclauses of 30.4.3 only apply to the specializations required in Tables 104 and 105 (30.3.1.2.1), namely `num_get<char>`, `num_get<wchar_t>`, `num_get<C, InputIterator>`, `num_put<char>`, `num_put<wchar_t>`, and `num_put<C, OutputIterator>`. These specializations refer to the `ios_base&` argument for formatting specifications (30.4), and to its imbued locale for the `numpunct<>` facet to identify all numeric punctuation preferences, and also for the `ctype<>` facet to perform character classification.
- ³ Extractor and inserter members of the standard iostreams use `num_get<>` and `num_put<>` member functions for formatting and parsing numeric values (31.7.5.3.1, 31.7.6.3.1).

30.4.3.2 Class template `num_get`

[`locale.num.get`]

30.4.3.2.1 General

[`locale.num.get.general`]

```
namespace std {
    template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class num_get : public locale::facet {
public:
    using char_type = charT;
    using iter_type = InputIterator;

    explicit num_get(size_t refs = 0);

    iter_type get(iter_type in, iter_type end, ios_base&,
                  ios_base::iostate& err, bool& v) const;
    iter_type get(iter_type in, iter_type end, ios_base&,
                  ios_base::iostate& err, long& v) const;
    iter_type get(iter_type in, iter_type end, ios_base&,
                  ios_base::iostate& err, long long& v) const;
    iter_type get(iter_type in, iter_type end, ios_base&,
                  ios_base::iostate& err, unsigned short& v) const;
    iter_type get(iter_type in, iter_type end, ios_base&,
                  ios_base::iostate& err, unsigned int& v) const;
    iter_type get(iter_type in, iter_type end, ios_base&,
                  ios_base::iostate& err, unsigned long& v) const;
    iter_type get(iter_type in, iter_type end, ios_base&,
                  ios_base::iostate& err, unsigned long long& v) const;
    iter_type get(iter_type in, iter_type end, ios_base&,
                  ios_base::iostate& err, float& v) const;
    iter_type get(iter_type in, iter_type end, ios_base&,
                  ios_base::iostate& err, double& v) const;
    iter_type get(iter_type in, iter_type end, ios_base&,
                  ios_base::iostate& err, long double& v) const;
    iter_type get(iter_type in, iter_type end, ios_base&,
                  ios_base::iostate& err, void*& v) const;

    static locale::id id;

protected:
    ~num_get();
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                            ios_base::iostate& err, bool& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,

              ios_base::iostate& err, void*& val) const;

```

- ¹ *Returns:* `do_get(in, end, str, err, val)`.

30.4.3.2.3 Virtual functions

[facet.num.get.virtuals]

```

iter_type do_get(iter_type in, iter_type end, ios_base& str,
                  ios_base::iostate& err, long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                  ios_base::iostate& err, long long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                  ios_base::iostate& err, unsigned short& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                  ios_base::iostate& err, unsigned int& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                  ios_base::iostate& err, unsigned long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                  ios_base::iostate& err, unsigned long long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                  ios_base::iostate& err, float& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                  ios_base::iostate& err, double& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                  ios_base::iostate& err, long double& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                  ios_base::iostate& err, void*& val) const;

```

- ¹ *Effects:* Reads characters from `in`, interpreting them according to `str.flags()`, `use_facet<ctype<charT>>(loc)`, and `use_facet<numpunct<charT>>(loc)`, where `loc` is `str.getloc()`.
² The details of this operation occur in three stages

- (2.1) — Stage 1: Determine a conversion specifier
 (2.2) — Stage 2: Extract characters from `in` and determine a corresponding `char` value for the format expected by the conversion specification determined in stage 1.
 (2.3) — Stage 3: Store results
- 3 The details of the stages are presented below.

Stage 1: The function initializes local variables via

```
fmtflags flags = str.flags();
fmtflags basefield = (flags & ios_base::basefield);
fmtflags uppercase = (flags & ios_base::uppercase);
fmtflags boolalpha = (flags & ios_base::boolalpha);
```

For conversion to an integral type, the function determines the integral conversion specifier as indicated in [Table 108](#). The table is ordered. That is, the first line whose condition is true applies.

Table 108: Integer conversions [tab:facet.num.get.int]

State	stdio equivalent
<code>basefield == oct</code>	<code>%o</code>
<code>basefield == hex</code>	<code>%X</code>
<code>basefield == 0</code>	<code>%i</code>
<code>signed integral type</code>	<code>%d</code>
<code>unsigned integral type</code>	<code>%u</code>

For conversions to a floating-point type the specifier is `%g`.

For conversions to `void*` the specifier is `%p`.

A length modifier is added to the conversion specification, if needed, as indicated in [Table 109](#).

Table 109: Length modifier [tab:facet.num.get.length]

Type	Length modifier
<code>short</code>	<code>h</code>
<code>unsigned short</code>	<code>h</code>
<code>long</code>	<code>l</code>
<code>unsigned long</code>	<code>l</code>
<code>long long</code>	<code>ll</code>
<code>unsigned long long</code>	<code>ll</code>
<code>double</code>	<code>l</code>
<code>long double</code>	<code>L</code>

Stage 2: If `in == end` then stage 2 terminates. Otherwise a `charT` is taken from `in` and local variables are initialized as if by

```
char_type ct = *in;
char c = src[find(atoms, atoms + sizeof(src) - 1, ct) - atoms];
if (ct == use_facet<numpunct<charT>>(loc).decimal_point())
    c = '.';
bool discard =
    ct == use_facet<numpunct<charT>>(loc).thousands_sep()
    && use_facet<numpunct<charT>>(loc).grouping().length() != 0;
```

where the values `src` and `atoms` are defined as if by

```
static const char src[] = "0123456789abcdefpxABCDEFpx+-";
char_type atoms[sizeof(src)];
use_facet<ctype<charT>>(loc).widen(src, src + sizeof(src), atoms);
```

for this value of `loc`.

If `discard` is `true`, then if `'.'` has not yet been accumulated, then the position of the character is remembered, but the character is otherwise ignored. Otherwise, if `'.'` has already been accumulated, the character is discarded and Stage 2 terminates. If it is not discarded, then a

check is made to determine if `c` is allowed as the next character of an input field of the conversion specifier returned by Stage 1. If so, it is accumulated.

If the character is either discarded or accumulated then `in` is advanced by `++in` and processing returns to the beginning of stage 2.

EXAMPLE 1: Given an input sequence of "0x1a.bp+07p",

- (3.1) — if the conversion specifier returned by Stage 1 is `%d`, "0" is accumulated;
- (3.2) — if the conversion specifier returned by Stage 1 is `%i`, "0x1a" are accumulated;
- (3.3) — if the conversion specifier returned by Stage 1 is `%g`, "0x1a.bp+07" are accumulated.

In all cases, the remainder is left in the input.

Stage 3: The sequence of `chars` accumulated in stage 2 (the field) is converted to a numeric value by the rules of one of the functions declared in the header `<cstdlib>`:

- (3.4) — For a signed integer value, the function `strtoll`.
- (3.5) — For an unsigned integer value, the function `strtoull`.
- (3.6) — For a `float` value, the function `strtod`.
- (3.7) — For a `double` value, the function `strtod`.
- (3.8) — For a `long double` value, the function `strtold`.

The numeric value to be stored can be one of:

- (3.9) — zero, if the conversion function does not convert the entire field.
- (3.10) — the most positive (or negative) representable value, if the field to be converted to a signed integer type represents a value too large positive (or negative) to be represented in `val`.
- (3.11) — the most positive representable value, if the field to be converted to an unsigned integer type represents a value that cannot be represented in `val`.
- (3.12) — the converted value, otherwise.

The resultant numeric value is stored in `val`. If the conversion function does not convert the entire field, or if the field represents a value outside the range of representable values, `ios_base::failbit` is assigned to `err`.

4 Digit grouping is checked. That is, the positions of discarded separators are examined for consistency with `use_facet<numpunct<charT>>(loc).grouping()`. If they are not consistent then `ios_base::failbit` is assigned to `err`.

5 In any case, if stage 2 processing was terminated by the test for `in == end` then `err |= ios_base::eofbit` is performed.

```
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, bool& val) const;
```

6 *Effects:* If `(str.flags()&ios_base::boolalpha) == 0` then input proceeds as it would for a `long` except that if a value is being stored into `val`, the value is determined according to the following: If the value to be stored is 0 then `false` is stored. If the value is 1 then `true` is stored. Otherwise `true` is stored and `ios_base::failbit` is assigned to `err`.

7 Otherwise target sequences are determined “as if” by calling the members `falsename()` and `truename()` of the facet obtained by `use_facet<numpunct<charT>>(str.getloc())`. Successive characters in the range `[in, end)` (see 24.2.4) are obtained and matched against corresponding positions in the target sequences only as necessary to identify a unique match. The input iterator `in` is compared to `end` only when necessary to obtain a character. If a target sequence is uniquely matched, `val` is set to the corresponding value. Otherwise `false` is stored and `ios_base::failbit` is assigned to `err`.

8 The `in` iterator is always left pointing one position beyond the last character successfully matched. If `val` is set, then `err` is set to `str.goodbit`; or to `str.eofbit` if, when seeking another character to match, it is found that `(in == end)`. If `val` is not set, then `err` is set to `str.failbit`; or to `(str.failbit|str.eofbit)` if the reason for the failure was that `(in == end)`.

EXAMPLE 2: For targets `true: "a"` and `false: "abb"`, the input sequence "a" yields `val == true` and `err == str.eofbit`; the input sequence "abc" yields `err = str.failbit`, with `in` ending at the 'c' element. For targets `true: "1"` and `false: "0"`, the input sequence "1" yields `val == true` and `err == str.goodbit`. For empty targets (""), any input sequence yields `err == str.failbit`.

9 *Returns:* `in`.

30.4.3.3 Class template num_put

[locale.nm.put]

30.4.3.3.1 General

[locale.nm.put.general]

```

namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class num_put : public locale::facet {
public:
    using char_type = charT;
    using iter_type = OutputIterator;

    explicit num_put(size_t refs = 0);

    iter_type put(iter_type s, ios_base& f, char_type fill, bool v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, long v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, long long v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, unsigned long v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, unsigned long long v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, double v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, long double v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, const void* v) const;

    static locale::id id;

protected:
    ~num_put();
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, bool v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, long v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, long long v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, unsigned long) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, unsigned long long) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, double v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, long double v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, const void* v) const;
};

}

```

- ¹ The facet num_put is used to format numeric values to a character sequence such as an ostream.

30.4.3.3.2 Members

[facet.num.put.members]

```

iter_type put(iter_type out, ios_base& str, char_type fill, bool val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, unsigned long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, unsigned long long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, double val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long double val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, const void* val) const;

```

- ¹ Returns: do_put(out, str, fill, val).

30.4.3.3.3 Virtual functions

[facet.num.put.virtuals]

```

iter_type do_put(iter_type out, ios_base& str, char_type fill, long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, long long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, unsigned long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, unsigned long long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, double val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, long double val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, const void* val) const;

```

- ¹ Effects: Writes characters to the sequence out, formatting val as desired. In the following description, loc names a local variable initialized as

```
locale loc = str.getloc();
```

- ² The details of this operation occur in several stages:

- (2.1) — Stage 1: Determine a printf conversion specifier `spec` and determine the characters that would be printed by `printf` (31.13) given this conversion specifier for

```
printf(spec, val)
```

assuming that the current locale is the "C" locale.

- (2.2) — Stage 2: Adjust the representation by converting each `char` determined by stage 1 to a `charT` using a conversion and values returned by members of `use_facet<numpunct<charT>>(loc)`.

- (2.3) — Stage 3: Determine where padding is required.

- (2.4) — Stage 4: Insert the sequence into the `out`.

3 Detailed descriptions of each stage follow.

4 *Returns:* `out`.

Stage 1: The first action of stage 1 is to determine a conversion specifier. The tables that describe this determination use the following local variables

```
fmtflags flags = str.flags();
fmtflags basefield = (flags & (ios_base::basefield));
fmtflags uppercase = (flags & (ios_base::uppercase));
fmtflags floatfield = (flags & (ios_base::floatfield));
fmtflags showpos = (flags & (ios_base::showpos));
fmtflags showbase = (flags & (ios_base::showbase));
fmtflags showpoint = (flags & (ios_base::showpoint));
```

All tables used in describing stage 1 are ordered. That is, the first line whose condition is true applies. A line without a condition is the default behavior when none of the earlier lines apply.

For conversion from an integral type other than a character type, the function determines the integral conversion specifier as indicated in Table 110.

Table 110: Integer conversions [tab:facet.num.put.int]

State	stdio equivalent
<code>basefield == ios_base::oct</code>	<code>%o</code>
<code>(basefield == ios_base::hex) && !uppercase</code>	<code>%x</code>
<code>(basefield == ios_base::hex)</code>	<code>%X</code>
for a signed integral type	<code>%d</code>
for an unsigned integral type	<code>%u</code>

For conversion from a floating-point type, the function determines the floating-point conversion specifier as indicated in Table 111.

Table 111: Floating-point conversions [tab:facet.num.put.fp]

State	stdio equivalent
<code>floatfield == ios_base::fixed</code>	<code>%f</code>
<code>floatfield == ios_base::scientific && !uppercase</code>	<code>%e</code>
<code>floatfield == ios_base::scientific</code>	<code>%E</code>
<code>floatfield == (ios_base::fixed ios_base::scientific) && !uppercase</code>	<code>%a</code>
<code>floatfield == (ios_base::fixed ios_base::scientific)</code>	<code>%A</code>
<code>!uppercase</code>	<code>%g</code>
<code>otherwise</code>	<code>%G</code>

For conversions from an integral or floating-point type a length modifier is added to the conversion specifier as indicated in Table 112.

The conversion specifier has the following optional additional qualifiers prepended as indicated in Table 113.

For conversion from a floating-point type, if `floatfield != (ios_base::fixed | ios_base::scientific)`, `str.precision()` is specified as precision in the conversion specification. Otherwise, no precision is specified.

Table 112: Length modifier [tab:facet.num.put.length]

Type	Length modifier
long	1
long long	11
unsigned long	1
unsigned long long	11
long double	L
otherwise	none

Table 113: Numeric conversions [tab:facet.num.put.conv]

Type(s)	State	stdio equivalent
an integral type	showpos	+
	showbase	#
a floating-point type	showpos	+
	showpoint	#

For conversion from `void*` the specifier is `%p`.

The representations at the end of stage 1 consists of the `char`'s that would be printed by a call of `printf(s, val)` where `s` is the conversion specifier determined above.

Stage 2: Any character `c` other than a decimal point(.) is converted to a `charT` via

```
use_facet<ctype<charT>>(loc).widen(c)
```

A local variable `punct` is initialized via

```
const numpunct<charT>& punct = use_facet<numpunct<charT>>(loc);
```

For arithmetic types, `punct.thousands_sep()` characters are inserted into the sequence as determined by the value returned by `punct.do_grouping()` using the method described in 30.4.4.1.3. Decimal point characters(.) are replaced by `punct.decimal_point()`.

Stage 3: A local variable is initialized as

```
fmtflags adjustfield = (flags & (ios_base::adjustfield));
```

The location of any padding²⁵² is determined according to Table 114.

Table 114: Fill padding [tab:facet.num.put.fill]

State	Location
<code>adjustfield == ios_base::left</code>	pad after
<code>adjustfield == ios_base::right</code>	pad before
<code>adjustfield == internal</code> and a sign occurs in the representation	pad after the sign
<code>adjustfield == internal</code> and representation after stage 1 began with 0x or 0X	pad after x or X
<i>otherwise</i>	pad before

If `str.width()` is nonzero and the number of `charT`'s in the sequence after stage 2 is less than `str.width()`, then enough `fill` characters are added to the sequence at the position indicated for padding to bring the length of the sequence to `str.width()`.

`str.width(0)` is called.

Stage 4: The sequence of `charT`'s at the end of stage 3 are output via

```
*out++ = c
```

²⁵²) The conversion specification `#o` generates a leading 0 which is *not* a padding character.

`iter_type do_put(iter_type out, ios_base& str, char_type fill, bool val) const;`

5 *Returns:* If (`str.flags() & ios_base::boolalpha`) == 0 returns `do_put(out, str, fill, (int)val)`, otherwise obtains a string `s` as if by

```
    string_type s =
        val ? use_facet<numpunct<charT>>(loc).truename()
            : use_facet<numpunct<charT>>(loc).falsename();
```

and then inserts each character `c` of `s` into `out` via `*out++ = c` and returns `out`.

30.4.4 The numeric punctuation facet

[facet.numpunct]

30.4.4.1 Class template numpunct

[locale.numpunct]

30.4.4.1.1 General

[locale.numpunct.general]

```
namespace std {
    template<class charT>
    class numpunct : public locale::facet {
public:
    using char_type = charT;
    using string_type = basic_string<charT>;

    explicit numpunct(size_t refs = 0);

    char_type decimal_point() const;
    char_type thousands_sep() const;
    string grouping() const;
    string_type truename() const;
    string_type falsename() const;

    static locale::id id;

protected:
    ~numpunct(); // virtual
    virtual char_type do_decimal_point() const;
    virtual char_type do_thousands_sep() const;
    virtual string do_grouping() const;
    virtual string_type do_truename() const; // for bool
    virtual string_type do_falsename() const; // for bool
};

}
```

¹ `numpunct<>` specifies numeric punctuation. The specializations required in [Table 104 \(30.3.1.2.1\)](#), namely `numpunct<wchar_t>` and `numpunct<char>`, provide classic "C" numeric formats, i.e., they contain information equivalent to that contained in the "C" locale or their wide character counterparts as if obtained by a call to `widen`.

² The syntax for number formats is as follows, where *digit* represents the radix set specified by the `fmtflags` argument value, and *thousands-sep* and *decimal-point* are the results of corresponding `numpunct<charT>` members. Integer values have the format:

```
intval:
    signopt units

sign:
    +
    -
    units:
        digits
        digits thousands-sep units

digits:
    digit digitsopt
```

and floating-point values have:

```
floatval:
    signopt units fractionalopt exponentopt
    signopt decimal-point digits exponentopt
```

```

fractional:
    decimal-point digitsopt

exponent:
    e signopt digits

e:
e
E

```

where the number of digits between *thousands-seps* is as specified by `do_grouping()`. For parsing, if the *digits* portion contains no thousands-separators, no grouping constraint is applied.

30.4.4.1.2 Members

[facet.numpunct.members]

```

char_type decimal_point() const;
1   Returns: do_decimal_point().

char_type thousands_sep() const;
2   Returns: do_thousands_sep().

string grouping() const;
3   Returns: do_grouping().

string_type truename() const;
string_type falsename() const;
4   Returns: do_truename() or do_falsename(), respectively.

```

30.4.4.1.3 Virtual functions

[facet.numpunct.virtuals]

```

char_type do_decimal_point() const;
1   Returns: A character for use as the decimal radix separator. The required specializations return '.' or
L'.'.

char_type do_thousands_sep() const;
2   Returns: A character for use as the digit group separator. The required specializations return ',' or
L','.

string do_grouping() const;
3   Returns: A string vec used as a vector of integer values, in which each element vec[i] represents
the number of digits253 in the group at position i, starting with position 0 as the rightmost group. If
vec.size() <= i, the number is the same as group (i - 1); if (i < 0 || vec[i] <= 0 || vec[i]
== CHAR_MAX), the size of the digit group is unlimited.

4   The required specializations return the empty string, indicating no grouping.

```

```

string_type do_truename() const;
string_type do_falsename() const;
5   Returns: A string representing the name of the boolean value true or false, respectively.
6   In the base class implementation these names are "true" and "false", or L"true" and L"false".

```

30.4.4.2 Class template numpunct_byname

[locale.numpunctbyname]

```

namespace std {
    template<class charT>
    class numpunct_byname : public numpunct<charT> {
        // this class is specialized for char and wchar_t.
        public:
            using char_type = charT;
            using string_type = basic_string<charT>;
}

```

²⁵³) Thus, the string "\003" specifies groups of 3 digits each, and "3" probably indicates groups of 51 (!) digits each, because 51 is the ASCII value of "3".

```

    explicit numpunct_byname(const char*, size_t refs = 0);
    explicit numpunct_byname(const string&, size_t refs = 0);

protected:
    ~numpunct_byname();
};

}

```

30.4.5 The collate category

[category.collate]

30.4.5.1 Class template collate

[locale.collate]

30.4.5.1.1 General

[locale.collate.general]

```

namespace std {
    template<class charT>
    class collate : public locale::facet {
public:
    using char_type    = charT;
    using string_type = basic_string<charT>

    explicit collate(size_t refs = 0);

    int compare(const charT* low1, const charT* high1,
                const charT* low2, const charT* high2) const;
    string_type transform(const charT* low, const charT* high) const;
    long hash(const charT* low, const charT* high) const;

    static locale::id id;
};

protected:
    ~collate();
    virtual int do_compare(const charT* low1, const charT* high1,
                           const charT* low2, const charT* high2) const;
    virtual string_type do_transform(const charT* low, const charT* high) const;
    virtual long do_hash (const charT* low, const charT* high) const;
};
}

```

- The class `collate<charT>` provides features for use in the collation (comparison) and hashing of strings. A locale member function template, `operator()`, uses the collate facet to allow a locale to act directly as the predicate argument for standard algorithms ([Clause 27](#)) and containers operating on strings. The specializations required in [Table 104 \(30.3.1.2.1\)](#), namely `collate<char>` and `collate<wchar_t>`, apply lexicographical ordering ([27.8.11](#)).

- Each function compares a string of characters `*p` in the range `[low, high]`.

30.4.5.1.2 Members

[locale.collate.members]

```

int compare(const charT* low1, const charT* high1,
            const charT* low2, const charT* high2) const;
1   Returns: do_compare(low1, high1, low2, high2).

string_type transform(const charT* low, const charT* high) const;
2   Returns: do_transform(low, high).

long hash(const charT* low, const charT* high) const;
3   Returns: do_hash(low, high).

```

30.4.5.1.3 Virtual functions

[locale.collate.virtuals]

```

int do_compare(const charT* low1, const charT* high1,
               const charT* low2, const charT* high2) const;

```

- Returns: 1 if the first string is greater than the second, -1 if less, zero otherwise. The specializations required in [Table 104 \(30.3.1.2.1\)](#), namely `collate<char>` and `collate<wchar_t>`, implement a lexicographical comparison ([27.8.11](#)).

`string_type do_transform(const charT* low, const charT* high) const;`

2 *Returns:* A `basic_string<charT>` value that, compared lexicographically with the result of calling `transform()` on another string, yields the same result as calling `do_compare()` on the same two strings.²⁵⁴

`long do_hash(const charT* low, const charT* high) const;`

3 *Returns:* An integer value equal to the result of calling `hash()` on any other string for which `do_compare()` returns 0 (equal) when passed the two strings.

4 *Recommended practice:* The probability that the result equals that for another string which does not compare equal should be very small, approaching `(1.0/numeric_limits<unsigned long>::max())`.

30.4.5.2 Class template `collate_byname`

[`locale.collatebyname`]

```
namespace std {
    template<class charT>
    class collate_byname : public collate<charT> {
public:
    using string_type = basic_string<charT>;

    explicit collate_byname(const char*, size_t refs = 0);
    explicit collate_byname(const string&, size_t refs = 0);

protected:
    ~collate_byname();
};

}
```

30.4.6 The time category

[`category.time`]

30.4.6.1 General

[`category.time.general`]

- 1 Templates `time_get<charT, InputIterator>` and `time_put<charT, OutputIterator>` provide date and time formatting and parsing. All specifications of member functions for `time_put` and `time_get` in the subclauses of 30.4.6 only apply to the specializations required in Tables 104 and 105 (30.3.1.2.1). Their members use their `ios_base&`, `ios_base::iostate&`, and `fill` arguments as described in 30.4, and the `ctype<>` facet, to determine formatting details.

30.4.6.2 Class template `time_get`

[`locale.time.get`]

30.4.6.2.1 General

[`locale.time.get.general`]

```
namespace std {
    class time_base {
public:
    enum dateorder { no_order, dmy, mdy, ymd, ydm };
};

template<class charT, class InputIterator = istreambuf_iterator<charT>>
class time_get : public locale::facet, public time_base {
public:
    using char_type = charT;
    using iter_type = InputIterator;

    explicit time_get(size_t refs = 0);

    dateorder date_order() const { return do_date_order(); }
    iter_type get_time(iter_type s, iter_type end, ios_base& f,
                       ios_base::iostate& err, tm* t) const;
    iter_type get_date(iter_type s, iter_type end, ios_base& f,
                       ios_base::iostate& err, tm* t) const;
    iter_type get_weekday(iter_type s, iter_type end, ios_base& f,
                         ios_base::iostate& err, tm* t) const;
    iter_type get_monthname(iter_type s, iter_type end, ios_base& f,
                           ios_base::iostate& err, tm* t) const;
};

}
```

²⁵⁴⁾ This function is useful when one string is being compared to many other strings.

```

    iter_type get_year(iter_type s, iter_type end, ios_base& f,
                       ios_base::iostate& err, tm* t) const;
    iter_type get(iter_type s, iter_type end, ios_base& f,
                  ios_base::iostate& err, tm* t, char format, char modifier = 0) const;
    iter_type get(iter_type s, iter_type end, ios_base& f,
                  ios_base::iostate& err, tm* t, const char_type* fmt,
                  const char_type* fmtend) const;

    static locale::id id;

protected:
    ~time_get();
    virtual dateorder do_date_order() const;
    virtual iter_type do_get_time(iter_type s, iter_type end, ios_base&,
                                  ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get_date(iter_type s, iter_type end, ios_base&,
                                 ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get_weekday(iter_type s, iter_type end, ios_base&,
                                    ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get_monthname(iter_type s, iter_type end, ios_base&,
                                       ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get_year(iter_type s, iter_type end, ios_base&,
                                 ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get(iter_type s, iter_type end, ios_base& f,
                            ios_base::iostate& err, tm* t, char format, char modifier) const;
};

}

```

- ¹ time_get is used to parse a character sequence, extracting components of a time or date into a tm object. Each get member parses a format as produced by a corresponding format specifier to time_put<>::put. If the sequence being parsed matches the correct format, the corresponding members of the tm argument are set to the values used to produce the sequence; otherwise either an error is reported or unspecified values are assigned.²⁵⁵

- ² If the end iterator is reached during parsing by any of the get() member functions, the member sets ios_base::eofbit in err.

30.4.6.2.2 Members

[locale.time.get.members]

- ```

dateorder date_order() const;

1 Returns: do_date_order();

iter_type get_time(iter_type s, iter_type end, ios_base& str,
 ios_base::iostate& err, tm* t) const;

2 Returns: do_get_time(s, end, str, err, t);

iter_type get_date(iter_type s, iter_type end, ios_base& str,
 ios_base::iostate& err, tm* t) const;

3 Returns: do_get_date(s, end, str, err, t);

iter_type get_weekday(iter_type s, iter_type end, ios_base& str,
 ios_base::iostate& err, tm* t) const;
iter_type get_monthname(iter_type s, iter_type end, ios_base& str,
 ios_base::iostate& err, tm* t) const;

4 Returns: do_get_weekday(s, end, str, err, t) or do_get_monthname(s, end, str, err, t);

iter_type get_year(iter_type s, iter_type end, ios_base& str,
 ios_base::iostate& err, tm* t) const;

5 Returns: do_get_year(s, end, str, err, t).

```

<sup>255</sup>) In other words, user confirmation is required for reliable parsing of user-entered dates and times, but machine-generated formats can be parsed reliably. This allows parsers to be aggressive about interpreting user variations on standard formats.

`iter_type get(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err,  
tm* t, char format, char modifier = 0) const;`

6     *Returns:* `do_get(s, end, f, err, t, format, modifier).`

`iter_type get(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err,  
tm* t, const char_type* fmt, const char_type* fmtend) const;`

7     *Preconditions:* `[fmt,fmtend)` is a valid range.

8     *Effects:* The function starts by evaluating `err = ios_base::goodbit`. It then enters a loop, reading zero or more characters from `s` at each iteration. Unless otherwise specified below, the loop terminates when the first of the following conditions holds:

- (8.1) — The expression `fmt == fmtend` evaluates to `true`.
- (8.2) — The expression `err == ios_base::goodbit` evaluates to `false`.
- (8.3) — The expression `s == end` evaluates to `true`, in which case the function evaluates `err = ios_base::eofbit | ios_base::failbit`.
- (8.4) — The next element of `fmt` is equal to `'%'`, optionally followed by a modifier character, followed by a conversion specifier character, `format`, together forming a conversion specification valid for the POSIX function `strftime`. If the number of elements in the range `[fmt,fmtend)` is not sufficient to unambiguously determine whether the conversion specification is complete and valid, the function evaluates `err = ios_base::failbit`. Otherwise, the function evaluates `s = do_get(s, end, f, err, t, format, modifier)`, where the value of `modifier` is `'\0'` when the optional modifier is absent from the conversion specification. If `err == ios_base::goodbit` holds after the evaluation of the expression, the function increments `fmt` to point just past the end of the conversion specification and continues looping.
- (8.5) — The expression `isspace(*fmt, f.getloc())` evaluates to `true`, in which case the function first increments `fmt` until `fmt == fmtend || !isspace(*fmt, f.getloc())` evaluates to `true`, then advances `s` until `s == end || !isspace(*s, f.getloc())` is `true`, and finally resumes looping.
- (8.6) — The next character read from `s` matches the element pointed to by `fmt` in a case-insensitive comparison, in which case the function evaluates `++fmt, ++s` and continues looping. Otherwise, the function evaluates `err = ios_base::failbit`.

9     NOTE: The function uses the `ctype<charT>` facet installed in `f`'s locale to determine valid whitespace characters. It is unspecified by what means the function performs case-insensitive comparison or whether multi-character sequences are considered while doing so.

10    *Returns:* `s`.

### 30.4.6.2.3 Virtual functions

**[locale.time.get.virtuals]**

`dateorder do_date_order() const;`

1     *Returns:* An enumeration value indicating the preferred order of components for those date formats that are composed of day, month, and year.<sup>256</sup> Returns `no_order` if the date format specified by `'x'` contains other variable components (e.g., Julian day, week number, week day).

`iter_type do_get_time(iter_type s, iter_type end, ios_base& str,  
ios_base::iostate& err, tm* t) const;`

2     *Effects:* Reads characters starting at `s` until it has extracted those `tm` members, and remaining format characters, used by `time_put<>::put` to produce the format specified by `"%H:%M:%S"`, or until it encounters an error or end of sequence.

3     *Returns:* An iterator pointing immediately beyond the last character recognized as possibly part of a valid time.

`iter_type do_get_date(iter_type s, iter_type end, ios_base& str,  
ios_base::iostate& err, tm* t) const;`

4     *Effects:* Reads characters starting at `s` until it has extracted those `tm` members and remaining format characters used by `time_put<>::put` to produce one of the following formats, or until it encounters an error. The format depends on the value returned by `date_order()` as shown in [Table 115](#).

<sup>256</sup>) This function is intended as a convenience only, for common formats, and can return `no_order` in valid locales.

Table 115: `do_get_date` effects [tab:locale.time.get.dogetdate]

| <code>date_order()</code> | <code>Format</code> |
|---------------------------|---------------------|
| <code>no_order</code>     | "%m%d%y"            |
| <code>dmy</code>          | "%d%m%y"            |
| <code>mdy</code>          | "%m%d%y"            |
| <code>ymd</code>          | "%y%m%d"            |
| <code>ydm</code>          | "%y%d%m"            |

5 An implementation may also accept additional implementation-defined formats.

6 *Returns:* An iterator pointing immediately beyond the last character recognized as possibly part of a valid date.

```
iter_type do_get_weekday(iter_type s, iter_type end, ios_base& str,
 ios_base::iostate& err, tm* t) const;
iter_type do_get_monthname(iter_type s, iter_type end, ios_base& str,
 ios_base::iostate& err, tm* t) const;
```

7 *Effects:* Reads characters starting at `s` until it has extracted the (perhaps abbreviated) name of a weekday or month. If it finds an abbreviation that is followed by characters that can match a full name, it continues reading until it matches the full name or fails. It sets the appropriate `tm` member accordingly.

8 *Returns:* An iterator pointing immediately beyond the last character recognized as part of a valid name.

```
iter_type do_get_year(iter_type s, iter_type end, ios_base& str,
 ios_base::iostate& err, tm* t) const;
```

9 *Effects:* Reads characters starting at `s` until it has extracted an unambiguous year identifier. It is implementation-defined whether two-digit year numbers are accepted, and (if so) what century they are assumed to lie in. Sets the `t->tm_year` member accordingly.

10 *Returns:* An iterator pointing immediately beyond the last character recognized as part of a valid year identifier.

```
iter_type do_get(iter_type s, iter_type end, ios_base& f,
 ios_base::iostate& err, tm* t, char format, char modifier) const;
```

11 *Preconditions:* `t` points to an object.

12 *Effects:* The function starts by evaluating `err = ios_base::goodbit`. It then reads characters starting at `s` until it encounters an error, or until it has extracted and assigned those `tm` members, and any remaining format characters, corresponding to a conversion specification appropriate for the POSIX function `strptime`, formed by concatenating '`%`', the `modifier` character, when non-NUL, and the `format` character. When the concatenation fails to yield a complete valid directive the function leaves the object pointed to by `t` unchanged and evaluates `err |= ios_base::failbit`. When `s == end` evaluates to `true` after reading a character the function evaluates `err |= ios_base::eofbit`.

13 For complex conversion specifications such as `%c`, `%x`, or `%X`, or conversion specifications that involve the optional modifiers `E` or `O`, when the function is unable to unambiguously determine some or all `tm` members from the input sequence `[s, end)`, it evaluates `err |= ios_base::eofbit`. In such cases the values of those `tm` members are unspecified and may be outside their valid range.

14 *Returns:* An iterator pointing immediately beyond the last character recognized as possibly part of a valid input sequence for the given `format` and `modifier`.

15 *Remarks:* It is unspecified whether multiple calls to `do_get()` with the address of the same `tm` object will update the current contents of the object or simply overwrite its members. Portable programs should zero out the object before invoking the function.

### 30.4.6.3 Class template `time_get_byname`

[`locale.time.getbyname`]

```
namespace std {
template<class charT, class InputIterator = istreambuf_iterator<charT>>
class time_get_byname : public time_get<charT, InputIterator> {
```

```

public:
 using dateorder = time_base::dateorder;
 using iter_type = InputIterator;

 explicit time_get_byname(const char*, size_t refs = 0);
 explicit time_get_byname(const string&, size_t refs = 0);

protected:
 ~time_get_byname();
};

}

```

#### 30.4.6.4 Class template time\_put

[locale.time.put]

```

namespace std {
 template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
 class time_put : public locale::facet {
public:
 using char_type = charT;
 using iter_type = OutputIterator;

 explicit time_put(size_t refs = 0);

 // the following is implemented in terms of other member functions.
 iter_type put(iter_type s, ios_base& f, char_type fill, const tm* tmb,
 const charT* pattern, const charT* pat_end) const;
 iter_type put(iter_type s, ios_base& f, char_type fill,
 const tm* tmb, char format, char modifier = 0) const;

 static locale::id id;

protected:
 ~time_put();
 virtual iter_type do_put(iter_type s, ios_base&, char_type, const tm* t,
 char format, char modifier) const;
};

}

```

##### 30.4.6.4.1 Members

[locale.time.put.members]

```

iter_type put(iter_type s, ios_base& str, char_type fill, const tm* t,
 const charT* pattern, const charT* pat_end) const;
iter_type put(iter_type s, ios_base& str, char_type fill, const tm* t,
 char format, char modifier = 0) const;

```

<sup>1</sup> *Effects:* The first form steps through the sequence from *pattern* to *pat\_end*, identifying characters that are part of a format sequence. Each character that is not part of a format sequence is written to *s* immediately, and each format sequence, as it is identified, results in a call to *do\_put*; thus, format elements and other characters are interleaved in the output in the order in which they appear in the pattern. Format sequences are identified by converting each character *c* to a *char* value as if by *ct.narrow(c, 0)*, where *ct* is a reference to *ctype<charT>* obtained from *str.getloc()*. The first character of each sequence is equal to ‘%’, followed by an optional modifier character *mod*<sup>257</sup> and a format specifier character *spec* as defined for the function *strftime*. If no modifier character is present, *mod* is zero. For each valid format sequence identified, calls *do\_put(s, str, fill, t, spec, mod)*.

<sup>2</sup> The second form calls *do\_put(s, str, fill, t, format, modifier)*.

<sup>3</sup> NOTE: The *fill* argument can be used in the implementation-defined formats or by derivations. A space character is a reasonable default for this argument.

<sup>4</sup> *Returns:* An iterator pointing immediately after the last character produced.

---

<sup>257</sup>) Although the C programming language defines no modifiers, most vendors do.

**30.4.6.4.2 Virtual functions**

[locale.time.put.virtuals]

```
iter_type do_put(iter_type s, ios_base&, char_type fill, const tm* t,
 char format, char modifier) const;
```

- <sup>1</sup> *Effects:* Formats the contents of the parameter *t* into characters placed on the output sequence *s*. Formatting is controlled by the parameters *format* and *modifier*, interpreted identically as the format specifiers in the string argument to the standard library function `strftime()`, except that the sequence of characters produced for those specifiers that are described as depending on the C locale are instead implementation-defined.

NOTE 1: Interpretation of the *modifier* argument is implementation-defined.

- <sup>2</sup> *Returns:* An iterator pointing immediately after the last character produced.

NOTE 2: The *fill* argument can be used in the implementation-defined formats or by derivations. A space character is a reasonable default for this argument.

- <sup>3</sup> *Recommended practice:* Interpretation of the *modifier* should follow POSIX conventions. Implementations should refer to other standards such as POSIX for a specification of the character sequences produced for those specifiers described as depending on the C locale.

**30.4.6.5 Class template time\_put\_byname**

[locale.time.putbyname]

```
namespace std {
 template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
 class time_put_byname : public time_put<charT, OutputIterator> {
 public:
 using char_type = charT;
 using iter_type = OutputIterator;

 explicit time_put_byname(const char*, size_t refs = 0);
 explicit time_put_byname(const string&, size_t refs = 0);

 protected:
 ~time_put_byname();
 };
}
```

**30.4.7 The monetary category**

[category.monetary]

**30.4.7.1 General**

[category.monetary.general]

- <sup>1</sup> These templates handle monetary formats. A template parameter indicates whether local or international monetary formats are to be used.
- <sup>2</sup> All specifications of member functions for `money_put` and `money_get` in the subclauses of [30.4.7](#) only apply to the specializations required in Tables 104 and 105 ([30.3.1.2.1](#)). Their members use their *ios\_base&*, *ios\_base::iostate&*, and *fill* arguments as described in [30.4](#), and the `moneypunct<>` and `ctype<>` facets, to determine formatting details.

**30.4.7.2 Class template money\_get**

[locale.money.get]

```
namespace std {
 template<class charT, class InputIterator = istreambuf_iterator<charT>>
 class money_get : public locale::facet {
 public:
 using char_type = charT;
 using iter_type = InputIterator;
 using string_type = basic_string<charT>;

 explicit money_get(size_t refs = 0);

 iter_type get(iter_type s, iter_type end, bool intl,
 ios_base& f, ios_base::iostate& err,
 long double& units) const;
 iter_type get(iter_type s, iter_type end, bool intl,
 ios_base& f, ios_base::iostate& err,
 string_type& digits) const;
}
```

```

 static locale::id id;

protected:
 ~money_get();
 virtual iter_type do_get(iter_type, iter_type, bool, ios_base&,
 ios_base::iostate& err, long double& units) const;
 virtual iter_type do_get(iter_type, iter_type, bool, ios_base&,
 ios_base::iostate& err, string_type& digits) const;
};

}

```

#### 30.4.7.2.1 Members

[locale.money.get.members]

```

iter_type get(iter_type s, iter_type end, bool intl, ios_base& f,
 ios_base::iostate& err, long double& quant) const;
iter_type get(iter_type s, iter_type end, bool intl, ios_base& f,
 ios_base::iostate& err, string_type& quant) const;

```

1     *Returns:* do\_get(s, end, intl, f, err, quant).

#### 30.4.7.2.2 Virtual functions

[locale.money.get.virtuals]

```

iter_type do_get(iter_type s, iter_type end, bool intl, ios_base& str,
 ios_base::iostate& err, long double& units) const;
iter_type do_get(iter_type s, iter_type end, bool intl, ios_base& str,
 ios_base::iostate& err, string_type& digits) const;

```

1     *Effects:* Reads characters from s to parse and construct a monetary value according to the format specified by a `moneypunct<charT, Intl>` facet reference mp and the character mapping specified by a `ctype<charT>` facet reference ct obtained from the locale returned by `str.getloc()`, and `str.flags()`. If a valid sequence is recognized, does not change err; otherwise, sets err to (`err|str.failbit`), or (`err|str.failbit|str.eofbit`) if no more characters are available, and does not change units or digits. Uses the pattern returned by `mp.neg_format()` to parse all values. The result is returned as an integral value stored in units or as a sequence of digits possibly preceded by a minus sign (as produced by `ct.widen(c)` where c is '-' or in the range from '0' through '9' (inclusive)) stored in digits.

EXAMPLE 1: The sequence \$1,056.23 in a common United States locale would yield, for units, 105623, or, for digits, "105623".

If `mp.grouping()` indicates that no thousands separators are permitted, any such characters are not read, and parsing is terminated at the point where they first appear. Otherwise, thousands separators are optional; if present, they are checked for correct placement only after all format components have been read.

2     Where `money_base::space` or `money_base::none` appears as the last element in the format pattern, no whitespace is consumed. Otherwise, where `money_base::space` appears in any of the initial elements of the format pattern, at least one whitespace character is required. Where `money_base::none` appears in any of the initial elements of the format pattern, whitespace is allowed but not required. If (`str.flags() & str.showbase`) is false, the currency symbol is optional and is consumed only if other characters are needed to complete the format; otherwise, the currency symbol is required.

3     If the first character (if any) in the string pos returned by `mp.positive_sign()` or the string neg returned by `mp.negative_sign()` is recognized in the position indicated by sign in the format pattern, it is consumed and any remaining characters in the string are required after all the other format components.

EXAMPLE 2: If `showbase` is off, then for a neg value of "()" and a currency symbol of "L", in "(100 L)" the "L" is consumed; but if neg is "-", the "L" in "-100 L" is not consumed.

If pos or neg is empty, the sign component is optional, and if no sign is detected, the result is given the sign that corresponds to the source of the empty string. Otherwise, the character in the indicated position must match the first character of pos or neg, and the result is given the corresponding sign. If the first character of pos is equal to the first character of neg, or if both strings are empty, the result is given a positive sign.

- 4 Digits in the numeric monetary component are extracted and placed in `digits`, or into a character buffer `buf1` for conversion to produce a value for `units`, in the order in which they appear, preceded by a minus sign if and only if the result is negative. The value `units` is produced as if by<sup>258</sup>

```
for (int i = 0; i < n; ++i)
 buf2[i] = src[find(atoms, atoms+sizeof(src), buf1[i]) - atoms];
buf2[n] = 0;
sscanf(buf2, "%Lf", &units);
```

where `n` is the number of characters placed in `buf1`, `buf2` is a character buffer, and the values `src` and `atoms` are defined as if by

```
static const char src[] = "0123456789-";
charT atoms[sizeof(src)];
ct.widen(src, src + sizeof(src) - 1, atoms);
```

- 5 *Returns*: An iterator pointing immediately beyond the last character recognized as part of a valid monetary quantity.

### 30.4.7.3 Class template `money_put`

[`locale.money.put`]

```
namespace std {
 template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
 class money_put : public locale::facet {
public:
 using char_type = charT;
 using iter_type = OutputIterator;
 using string_type = basic_string<charT>;

 explicit money_put(size_t refs = 0);

 iter_type put(iter_type s, bool intl, ios_base& f,
 char_type fill, long double units) const;
 iter_type put(iter_type s, bool intl, ios_base& f,
 char_type fill, const string_type& digits) const;

 static locale::id id;

protected:
 ~money_put();
 virtual iter_type do_put(iter_type, bool, ios_base&, char_type fill,
 long double units) const;
 virtual iter_type do_put(iter_type, bool, ios_base&, char_type fill,
 const string_type& digits) const;
};

}
```

#### 30.4.7.3.1 Members

[`locale.money.put.members`]

```
iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, long double quant) const;
iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, const string_type& quant) const;
```

- 1 *Returns*: `do_put(s, intl, f, loc, quant)`.

#### 30.4.7.3.2 Virtual functions

[`locale.money.put.virtuals`]

```
iter_type do_put(iter_type s, bool intl, ios_base& str,
 char_type fill, long double units) const;
iter_type do_put(iter_type s, bool intl, ios_base& str,
 char_type fill, const string_type& digits) const;
```

- 1 *Effects*: Writes characters to `s` according to the format specified by a `moneypunct<charT, Int1>` facet reference `mp` and the character mapping specified by a `ctype<charT>` facet reference `ct` obtained from the locale returned by `str.getloc()`, and `str.flags()`. The argument `units` is transformed into a sequence of wide characters as if by

```
ct.widen(buf1, buf1 + sprintf(buf1, "%..0Lf", units), buf2)
```

---

<sup>258</sup>) The semantics here are different from `ct.narrow`.

for character buffers `buf1` and `buf2`. If the first character in `digits` or `buf2` is equal to `ct.widen(' - ')`, then the pattern used for formatting is the result of `mp.neg_format()`; otherwise the pattern is the result of `mp.pos_format()`. Digit characters are written, interspersed with any thousands separators and decimal point specified by the format, in the order they appear (after the optional leading minus sign) in `digits` or `buf2`. In `digits`, only the optional leading minus sign and the immediately subsequent digit characters (as classified according to `ct`) are used; any trailing characters (including digits appearing after a non-digit character) are ignored. Calls `str.width(0)`.

<sup>2</sup> *Returns:* An iterator pointing immediately after the last character produced.

<sup>3</sup> *Remarks:* The currency symbol is generated if and only if `(str.flags() & str.showbase)` is nonzero. If the number of characters generated for the specified format is less than the value returned by `str.width()` on entry to the function, then copies of `fill` are inserted as necessary to pad to the specified width. For the value `af` equal to `(str.flags() & str.adjustfield)`, if `(af == str.internal)` is true, the fill characters are placed where `none` or `space` appears in the formatting pattern; otherwise if `(af == str.left)` is true, they are placed after the other characters; otherwise, they are placed before the other characters.

NOTE: It is possible, with some combinations of format patterns and flag values, to produce output that cannot be parsed using `num_get<>::get`.

### 30.4.7.4 Class template `moneypunct`

[`locale.moneypunct`]

#### 30.4.7.4.1 General

[`locale.moneypunct.general`]

```
namespace std {
 class money_base {
public:
 enum part { none, space, symbol, sign, value };
 struct pattern { char field[4]; };
};

template<class charT, bool International = false>
 class moneypunct : public locale::facet, public money_base {
public:
 using char_type = charT;
 using string_type = basic_string<charT>

 explicit moneypunct(size_t refs = 0);

 charT decimal_point() const;
 charT thousands_sep() const;
 string grouping() const;
 string_type curr_symbol() const;
 string_type positive_sign() const;
 string_type negative_sign() const;
 int frac_digits() const;
 pattern pos_format() const;
 pattern neg_format() const;

 static locale::id id;
 static const bool intl = International;

protected:
 ~moneypunct();
 virtual charT do_decimal_point() const;
 virtual charT do_thousands_sep() const;
 virtual string do_grouping() const;
 virtual string_type do_curr_symbol() const;
 virtual string_type do_positive_sign() const;
 virtual string_type do_negative_sign() const;
 virtual int do_frac_digits() const;
 virtual pattern do_pos_format() const;
 virtual pattern do_neg_format() const;
};

}
```

- <sup>1</sup> The `moneypunct`<> facet defines monetary formatting parameters used by `money_get`<> and `money_put`<>. A monetary format is a sequence of four components, specified by a `pattern` value `p`, such that the `part` value `static_cast<part>(p.field[i])` determines the `ith` component of the format<sup>259</sup>. In the `field` member of a `pattern` object, each value `symbol`, `sign`, `value`, and either `space` or `none` appears exactly once. The value `none`, if present, is not first; the value `space`, if present, is neither first nor last.
- <sup>2</sup> Where `none` or `space` appears, whitespace is permitted in the format, except where `none` appears at the end, in which case no whitespace is permitted. The value `space` indicates that at least one space is required at that position. Where `symbol` appears, the sequence of characters returned by `curr_symbol()` is permitted, and can be required. Where `sign` appears, the first (if any) of the sequence of characters returned by `positive_sign()` or `negative_sign()` (respectively as the monetary value is non-negative or negative) is required. Any remaining characters of the sign sequence are required after all other format components. Where `value` appears, the absolute numeric monetary value is required.
- <sup>3</sup> The format of the numeric monetary value is a decimal number:

*value*:  
*units* *fractional<sub>opt</sub>*  
*decimal-point digits*

*fractional*:  
*decimal-point digits<sub>opt</sub>*

if `frac_digits()` returns a positive value, or

*value*:  
*units*

otherwise. The symbol `decimal-point` indicates the character returned by `decimal_point()`. The other symbols are defined as follows:

*units*:  
*digits*  
*digits thousands-sep units*

*digits*:  
*adigit digits<sub>opt</sub>*

In the syntax specification, the symbol `adigit` is any of the values `ct.widen(c)` for `c` in the range '0' through '9' (inclusive) and `ct` is a reference of type `const ctype<charT>&` obtained as described in the definitions of `money_get`<> and `money_put`<>. The symbol `thousands-sep` is the character returned by `thousands_sep()`. The space character used is the value `ct.widen(' ')`. Whitespace characters are those characters `c` for which `ci.is(space, c)` returns `true`. The number of digits required after the decimal point (if any) is exactly the value returned by `frac_digits()`.

- <sup>4</sup> The placement of thousands-separator characters (if any) is determined by the value returned by `grouping()`, defined identically as the member `numpunct<>::do_grouping()`.

#### 30.4.7.4.2 Members

[`locale.moneypunct.members`]

```
charT decimal_point() const;
charT thousands_sep() const;
string grouping() const;
string_type curr_symbol() const;
string_type positive_sign() const;
string_type negative_sign() const;
int frac_digits() const;
pattern pos_format() const;
pattern neg_format() const;
```

- <sup>1</sup> Each of these functions `F` returns the result of calling the corresponding virtual member function `do_F()`.

#### 30.4.7.4.3 Virtual functions

[`locale.moneypunct.virtuals`]

```
charT do_decimal_point() const;
```

- <sup>1</sup> *Returns*: The radix separator to use in case `do_frac_digits()` is greater than zero.<sup>260</sup>

<sup>259</sup>) An array of `char`, rather than an array of `part`, is specified for `pattern::field` purely for efficiency.

<sup>260</sup>) In common U.S. locales this is '.'

```

charT do_thousands_sep() const;
2 Returns: The digit group separator to use in case do_grouping() specifies a digit grouping pattern.261

string do_grouping() const;
3 Returns: A pattern defined identically as, but not necessarily equal to, the result of numpunct<charT>::do_grouping().262

string_type do_curr_symbol() const;
4 Returns: A string to use as the currency identifier symbol.

NOTE: For specializations where the second template parameter is true, this is typically four characters long: a three-letter code as specified by ISO 4217 followed by a space.

string_type do_positive_sign() const;
string_type do_negative_sign() const;
5 Returns: do_positive_sign() returns the string to use to indicate a positive monetary value;263 do_negative_sign() returns the string to use to indicate a negative value.

int do_frac_digits() const;
6 Returns: The number of digits after the decimal radix separator, if any.264

pattern do_pos_format() const;
pattern do_neg_format() const;
7 Returns: The specializations required in Table 105 \(30.3.1.2.1\), namely
(7.1) — moneypunct<char>,
(7.2) — moneypunct<wchar_t>,
(7.3) — moneypunct<char, true>, and
(7.4) — moneypunct<wchar_t, true>,
return an object of type pattern initialized to { symbol, sign, none, value }.265

```

### 30.4.7.5 Class template `moneypunct_byname`

[`locale.moneypunctbyname`]

```

namespace std {
 template<class charT, bool Intl = false>
 class moneypunct_byname : public moneypunct<charT, Intl> {
 public:
 using pattern = money_base::pattern;
 using string_type = basic_string<charT>

 explicit moneypunct_byname(const char*, size_t refs = 0);
 explicit moneypunct_byname(const string&, size_t refs = 0);

 protected:
 ~moneypunct_byname();
 };
}

```

### 30.4.8 The message retrieval category

[`category.messages`]

#### 30.4.8.1 General

[`category.messages.general`]

- 1 Class `messages<charT>` implements retrieval of strings from message catalogs.

<sup>261</sup>) In common U.S. locales this is ','.

<sup>262</sup>) To specify grouping by 3s, the value is "\003" *not* "3".

<sup>263</sup>) This is usually the empty string.

<sup>264</sup>) In common U.S. locales, this is 2.

<sup>265</sup>) Note that the international symbol returned by `do_curr_symbol()` usually contains a space, itself; for example, "USD ".

**30.4.8.2 Class template messages**

[locale.messages]

**30.4.8.2.1 General**

[locale.messages.general]

```

namespace std {
 class messages_base {
public:
 using catalog = unspecified signed integer type;
};

template<class charT>
class messages : public locale::facet, public messages_base {
public:
 using char_type = charT;
 using string_type = basic_string<charT>

 explicit messages(size_t refs = 0);

 catalog open(const string& fn, const locale&) const;
 string_type get(catalog c, int set, int msgid,
 const string_type& dfault) const;
 void close(catalog c) const;

 static locale::id id;

protected:
 ~messages();
 virtual catalog do_open(const string&, const locale&) const;
 virtual string_type do_get(catalog, int set, int msgid,
 const string_type& dfault) const;
 virtual void do_close(catalog) const;
};
}

```

- <sup>1</sup> Values of type `messages_base::catalog` usable as arguments to members `get` and `close` can be obtained only by calling member `open`.

**30.4.8.2.2 Members**

[locale.messages.members]

```

catalog open(const string& name, const locale& loc) const;
1 Returns: do_open(name, loc).

string_type get(catalog cat, int set, int msgid, const string_type& dfault) const;
2 Returns: do_get(cat, set, msgid, dfault).

void close(catalog cat) const;
3 Effects: Calls do_close(cat).

```

**30.4.8.2.3 Virtual functions**

[locale.messages.virtuals]

```

catalog do_open(const string& name, const locale& loc) const;
1 Returns: A value that may be passed to get() to retrieve a message from the message catalog identified by the string name according to an implementation-defined mapping. The result can be used until it is passed to close().
2 Returns a value less than 0 if no such catalog can be opened.
3 Remarks: The locale argument loc is used for character set code conversion when retrieving messages, if needed.

string_type do_get(catalog cat, int set, int msgid, const string_type& dfault) const;
4 Preconditions: cat is a catalog obtained from open() and not yet closed.
5 Returns: A message identified by arguments set, msgid, and dfault, according to an implementation-defined mapping. If no such message can be found, returns dfault.

```

```
void do_close(catalog cat) const;
6 Preconditions: cat is a catalog obtained from open() and not yet closed.
7 Effects: Releases unspecified resources associated with cat.
8 Remarks: The limit on such resources, if any, is implementation-defined.
```

### 30.4.8.3 Class template messages\_byname

[locale.messagesbyname]

```
namespace std {
 template<class charT>
 class messages_byname : public messages<charT> {
public:
 using catalog = messages_base::catalog;
 using string_type = basic_string<charT>

 explicit messages_byname(const char*, size_t refs = 0);
 explicit messages_byname(const string&, size_t refs = 0);

protected:
 ~messages_byname();
};

}
```

## 30.5 C library locales

[c.locales]

### 30.5.1 Header <clocale> synopsis

[clocale.syn]

```
namespace std {
 struct lconv;

 char* setlocale(int category, const char* locale);
 lconv* localeconv();
}

#define NULL see 17.2.3
#define LC_ALL see below
#define LC_COLLATE see below
#define LC_CTYPE see below
#define LC_MONETARY see below
#define LC_NUMERIC see below
#define LC_TIME see below
```

<sup>1</sup> The contents and meaning of the header <clocale> are the same as the C standard library header <locale.h>.

### 30.5.2 Data races

[clocale.data.races]

<sup>1</sup> Calls to the function setlocale may introduce a data race (16.4.6.10) with other calls to setlocale or with calls to the functions listed in Table 116.

SEE ALSO: ISO C 7.11

Table 116: Potential setlocale data races [tab:setlocale.data.races]

|         |          |           |            |          |
|---------|----------|-----------|------------|----------|
| fprintf | isprint  | iswdigit  | localeconv | tolower  |
| fscanf  | ispunct  | iswgraph  | mblen      | toupper  |
| isalnum | isspace  | iswlower  | mbstowcs   | towlower |
| isalpha | isupper  | iswprint  | mbtowc     | towupper |
| isblank | iswalnum | iswpunct  | setlocale  | wcscoll  |
| iscntrl | iswalpha | iswspace  | strcoll    | wcstod   |
| isdigit | iswblank | iswupper  | strerror   | wcstombs |
| isgraph | iswcntrl | iswxdigit | strtod     | wcsxfrm  |
| islower | iswctype | isxdigit  | strxfrm    | wctomb   |

# 31 Input/output library [input.output]

## 31.1 General

[input.output.general]

- <sup>1</sup> This Clause describes components that C++ programs may use to perform input/output operations.
- <sup>2</sup> The following subclauses describe requirements for stream parameters, and components for forward declarations of iostreams, predefined iostreams objects, base iostreams classes, stream buffering, stream formatting and manipulators, string streams, and file streams, as summarized in [Table 117](#).

Table 117: Input/output library summary [tab:iostreams.summary]

| Subclause                                         | Header                                                                         |
|---------------------------------------------------|--------------------------------------------------------------------------------|
| <a href="#">31.2</a> Requirements                 |                                                                                |
| <a href="#">31.3</a> Forward declarations         | <code>&lt;iostreamfwd&gt;</code>                                               |
| <a href="#">31.4</a> Standard iostream objects    | <code>&lt;iostream&gt;</code>                                                  |
| <a href="#">31.5</a> Iostreams base classes       | <code>&lt;ios&gt;</code>                                                       |
| <a href="#">31.6</a> Stream buffers               | <code>&lt;streambuf&gt;</code>                                                 |
| <a href="#">31.7</a> Formatting and manipulators  | <code>&lt;iostream&gt;, &lt;ostream&gt;, &lt;iomanip&gt;, &lt;print&gt;</code> |
| <a href="#">31.8</a> String streams               | <code>&lt;sstream&gt;</code>                                                   |
| <a href="#">31.9</a> Span-based streams           | <code>&lt;spanstream&gt;</code>                                                |
| <a href="#">31.10</a> File streams                | <code>&lt;fstream&gt;</code>                                                   |
| <a href="#">31.11</a> Synchronized output streams | <code>&lt;syncstream&gt;</code>                                                |
| <a href="#">31.12</a> File systems                | <code>&lt;filesystem&gt;</code>                                                |
| <a href="#">31.13</a> C library files             | <code>&lt;cstdio&gt;, &lt;cinttypes&gt;</code>                                 |

## 31.2 Iostreams requirements

[iostreams.requirements]

### 31.2.1 Imbue limitations

[iostream.limits.imbue]

- <sup>1</sup> No function described in [Clause 31](#) except for `ios_base::imbue` and `basic_filebuf::pubimbue` causes any instance of `basic_ios::imbue` or `basic_streambuf::imbue` to be called. If any user function called from a function declared in [Clause 31](#) or as an overriding virtual function of any class declared in [Clause 31](#) calls `imbue`, the behavior is undefined.

### 31.2.2 Types

[stream.types]

`using streamoff = implementation-defined;`

- <sup>1</sup> The type `streamoff` is a synonym for one of the signed basic integral types of sufficient size to represent the maximum possible file size for the operating system.<sup>266</sup>

`using streamsize = implementation-defined;`

- <sup>2</sup> The type `streamsize` is a synonym for one of the signed basic integral types. It is used to represent the number of characters transferred in an I/O operation, or the size of I/O buffers.<sup>267</sup>

### 31.2.3 Positioning type limitations

[iostreams.limits.pos]

- <sup>1</sup> The classes of [Clause 31](#) with template arguments `charT` and `traits` behave as described if `traits::pos_type` and `traits::off_type` are `streampos` and `streamoff` respectively. Except as noted explicitly below, their behavior when `traits::pos_type` and `traits::off_type` are other types is implementation-defined.
- <sup>2</sup> NOTE: For each of the specializations of `char_traits` defined in [23.2.4](#), `state_type` denotes `mbstate_t`, `pos_type` denotes `fpos<mbstate_t>`, and `off_type` denotes `streamoff`.
- <sup>3</sup> In the classes of [Clause 31](#), a template parameter with name `charT` represents a member of the set of types containing `char`, `wchar_t`, and any other implementation-defined character types that meet the requirements for a character on which any of the iostream components can be instantiated.

<sup>266</sup>) Typically `long long`.

<sup>267</sup>) Most places where `streamsize` is used would use `size_t` in ISO C, or `ssize_t` in POSIX.

### 31.2.4 Thread safety

[**iostreams.threadsafety**]

- <sup>1</sup> Concurrent access to a stream object (31.8, 31.10), stream buffer object (31.6), or C Library stream (31.13) by multiple threads may result in a data race (6.9.2) unless otherwise specified (31.4).

NOTE: Data races result in undefined behavior (6.9.2).

- <sup>2</sup> If one thread makes a library call *a* that writes a value to a stream and, as a result, another thread reads this value from the stream through a library call *b* such that this does not result in a data race, then *a*'s write synchronizes with *b*'s read.

### 31.3 Forward declarations

[**iostream.forward**]

#### 31.3.1 Header <iosfwd> synopsis

[**iosfwd.syn**]

```
namespace std {
 template<class charT> struct char_traits;

}

```

- <sup>1</sup> Default template arguments are described as appearing both in `<iostreamfwd>` and in the synopsis of other headers but it is well-formed to include both `<iostreamfwd>` and one or more of the other headers.<sup>268</sup>

### 31.3.2 Overview

[`iostream.forward.overview`]

- <sup>1</sup> The class template specialization `basic_ios<charT, traits>` serves as a virtual base class for the class templates `basic_istream`, `basic_ostream`, and class templates derived from them. `basic_iostream` is a class template derived from both `basic_istream<charT, traits>` and `basic_ostream<charT, traits>`.
- <sup>2</sup> The class template specialization `basic_streambuf<charT, traits>` serves as a base class for class templates `basic_stringbuf`, `basic_filebuf`, and `basic_syncbuf`.
- <sup>3</sup> The class template specialization `basic_istream<charT, traits>` serves as a base class for class templates `basic_isstream` and `basic_ifstream`.
- <sup>4</sup> The class template specialization `basic_ostream<charT, traits>` serves as a base class for class templates `basic_ostringstream`, `basic_ofstream`, and `basic_osyncstream`.
- <sup>5</sup> The class template specialization `basic_iostream<charT, traits>` serves as a base class for class templates `basic_stringstream` and `basic_fstream`.
- <sup>6</sup> NOTE 1: For each of the class templates above, the program is ill-formed if `traits::char_type` is not the same type as `charT` (23.2).
- <sup>7</sup> Other *typedef-names* define instances of class templates specialized for `char` or `wchar_t` types.
- <sup>8</sup> Specializations of the class template `fpos` are used for specifying file position information.
- EXAMPLE: The types `streampos` and `wstreampos` are used for positioning streams specialized on `char` and `wchar_t` respectively.
- <sup>9</sup> NOTE 2: This synopsis suggests a circularity between `streampos` and `char_traits<char>`. An implementation can avoid this circularity by substituting equivalent types.

## 31.4 Standard iostream objects

[`iostream.objects`]

### 31.4.1 Header `<iostream>` synopsis

[`iostream.syn`]

```

#include <ios> // see 31.5.1
#include <streambuf> // see 31.6.1
#include <iostream> // see 31.7.1
#include <ostream> // see 31.7.2

namespace std {
 extern istream cin;
 extern ostream cout;
 extern ostream cerr;
 extern ostream clog;

 extern wistream wcin;
 extern wostream wcout;
 extern wostream wcerr;
 extern wostream wclog;
}

```

### 31.4.2 Overview

[`iostream.objects.overview`]

- <sup>1</sup> In this Clause, the type name `FILE` refers to the type `FILE` declared in `<cstdio>` (31.13.1).
- <sup>2</sup> The header `<iostream>` declares objects that associate objects with the standard C streams provided for by the functions declared in `<cstdio>`, and includes all the headers necessary to use these objects.

---

<sup>268</sup>) It is the implementation's responsibility to implement headers so that including `<iostreamfwd>` and other headers does not violate the rules about multiple occurrences of default arguments.

- <sup>3</sup> The objects are constructed and the associations are established at some time prior to or during the first time an object of class `ios_base::Init` is constructed, and in any case before the body of `main` (6.9.3.1) begins execution. The objects are not destroyed during program execution.<sup>269</sup>
- <sup>4</sup> *Recommended practice:* If it is possible for them to do so, implementations should initialize the objects earlier than required.
- <sup>5</sup> The results of including `<iostream>` in a translation unit shall be as if `<iostream>` defined an instance of `ios_base::Init` with static storage duration. Each C++ library module (16.4.2.4) in a hosted implementation shall behave as if it contains an interface unit that defines an unexported `ios_base::Init` variable with ordered initialization (6.9.3.3).

NOTE 1: As a result, the definition of that variable is appearance-ordered before any declaration following the point of importation of a C++ library module. Whether such a definition exists is unobservable by a program that does not reference any of the standard iostream objects.

- <sup>6</sup> Mixing operations on corresponding wide- and narrow-character streams follows the same semantics as mixing such operations on FILEs, as specified in the C standard library.
- <sup>7</sup> Concurrent access to a synchronized (31.5.2.5) standard iostream object's formatted and unformatted input (31.7.5.2) and output (31.7.6.2) functions or a standard C stream by multiple threads does not result in a data race (6.9.2).

NOTE 2: Unynchronized concurrent use of these objects and streams by multiple threads can result in interleaved characters.

SEE ALSO: ISO C 7.21.2

### 31.4.3 Narrow stream objects

[narrow.stream.objects]

`istream cin;`

- <sup>1</sup> The object `cin` controls input from a stream buffer associated with the object `stdin`, declared in `<cstdio>` (31.13.1).
- <sup>2</sup> After the object `cin` is initialized, `cin.tie()` returns `&cout`. Its state is otherwise the same as required for `basic_ios<char>::init` (31.5.4.2).

`ostream cout;`

- <sup>3</sup> The object `cout` controls output to a stream buffer associated with the object `stdout`, declared in `<cstdio>` (31.13.1).

`ostream cerr;`

- <sup>4</sup> The object `cerr` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).
- <sup>5</sup> After the object `cerr` is initialized, `cerr.flags() & unitbuf` is nonzero and `cerr.tie()` returns `&cout`. Its state is otherwise the same as required for `basic_ios<char>::init` (31.5.4.2).

`ostream clog;`

- <sup>6</sup> The object `clog` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

### 31.4.4 Wide stream objects

[wide.stream.objects]

`wistream wcin;`

- <sup>1</sup> The object `wcin` controls input from a stream buffer associated with the object `stdin`, declared in `<cstdio>` (31.13.1).
- <sup>2</sup> After the object `wcin` is initialized, `wcin.tie()` returns `&wcout`. Its state is otherwise the same as required for `basic_ios<wchar_t>::init` (31.5.4.2).

`wostream wcout;`

- <sup>3</sup> The object `wcout` controls output to a stream buffer associated with the object `stdout`, declared in `<cstdio>` (31.13.1).

<sup>269</sup>) Constructors and destructors for objects with static storage duration can access these objects to read input from `stdin` or write output to `stdout` or `stderr`.

```
wostream wcerr;
4 The object wcerr controls output to a stream buffer associated with the object stderr, declared in
<cstdio> (31.13.1).
5 After the object wcerr is initialized, wcerr.flags() & unitbuf is nonzero and wcerr.tie() returns
&wcout. Its state is otherwise the same as required for basic_ios<wchar_t>::init (31.5.4.2).

wostream wclog;
6 The object wclog controls output to a stream buffer associated with the object stderr, declared in
<cstdio> (31.13.1).
```

### 31.5 Iostreams base classes

[**iostreams.base**]

#### 31.5.1 Header <iostream> synopsis

[**ios.syn**]

```
#include <iostream> // see 31.3.1

namespace std {
 using streamoff = implementation-defined;
 using streamsize = implementation-defined;
 template<class stateT> class fpos;

 class ios_base;
 template<class charT, class traits = char_traits<charT>>
 class basic_ios;

 // 31.5.5, manipulators
 ios_base& boolalpha (ios_base& str);
 ios_base& noboolalpha(ios_base& str);

 ios_base& showbase (ios_base& str);
 ios_base& noshowbase (ios_base& str);

 ios_base& showpoint (ios_base& str);
 ios_base& noshowpoint(ios_base& str);

 ios_base& showpos (ios_base& str);
 ios_base& noshowpos (ios_base& str);

 ios_base& skipws (ios_base& str);
 ios_base& noskipws (ios_base& str);

 ios_base& uppercase (ios_base& str);
 ios_base& nouppercase(ios_base& str);

 ios_base& unitbuf (ios_base& str);
 ios_base& nounitbuf (ios_base& str);

 // 31.5.5.2, adjustfield
 ios_base& internal (ios_base& str);
 ios_base& left (ios_base& str);
 ios_base& right (ios_base& str);

 // 31.5.5.3, basefield
 ios_base& dec (ios_base& str);
 ios_base& hex (ios_base& str);
 ios_base& oct (ios_base& str);

 // 31.5.5.4, floatfield
 ios_base& fixed (ios_base& str);
 ios_base& scientific (ios_base& str);
 ios_base& hexfloat (ios_base& str);
 ios_base& defaultfloat(ios_base& str);
```

```
// 31.5.6, error reporting
enum class io_errc {
 stream = 1
};

template<> struct is_error_code_enum<io_errc> : public true_type { };
error_code make_error_code(io_errc e) noexcept;
error_condition make_error_condition(io_errc e) noexcept;
const error_category& iostream_category() noexcept;
}
```

### 31.5.2 Class ios\_base

[ios.base]

#### 31.5.2.1 General

[ios.base.general]

```
namespace std {
 class ios_base {
 public:
 class failure; // see below

 // 31.5.2.2, fmtflags
 using fmtflags = T1;
 static constexpr fmtflags boolalpha = unspecified;
 static constexpr fmtflags dec = unspecified;
 static constexpr fmtflags fixed = unspecified;
 static constexpr fmtflags hex = unspecified;
 static constexpr fmtflags internal = unspecified;
 static constexpr fmtflags left = unspecified;
 static constexpr fmtflags oct = unspecified;
 static constexpr fmtflags right = unspecified;
 static constexpr fmtflags scientific = unspecified;
 static constexpr fmtflags showbase = unspecified;
 static constexpr fmtflags showpoint = unspecified;
 static constexpr fmtflags showpos = unspecified;
 static constexpr fmtflags skipws = unspecified;
 static constexpr fmtflags unitbuf = unspecified;
 static constexpr fmtflags uppercase = unspecified;
 static constexpr fmtflags adjustfield = see below;
 static constexpr fmtflags basefield = see below;
 static constexpr fmtflags floatfield = see below;

 // 31.5.2.3, iostate
 using iostate = T2;
 static constexpr iostate badbit = unspecified;
 static constexpr iostate eofbit = unspecified;
 static constexpr iostate failbit = unspecified;
 static constexpr iostate goodbit = see below;

 // 31.5.2.4, openmode
 using openmode = T3;
 static constexpr openmode app = unspecified;
 static constexpr openmode ate = unspecified;
 static constexpr openmode binary = unspecified;
 static constexpr openmode in = unspecified;
 static constexpr openmode noreplace = unspecified;
 static constexpr openmode out = unspecified;
 static constexpr openmode trunc = unspecified;

 // 31.5.2.5, seekdir
 using seekdir = T4;
 static constexpr seekdir beg = unspecified;
 static constexpr seekdir cur = unspecified;
 static constexpr seekdir end = unspecified;

 class Init;
```

```

// 31.5.2.3, fmtflags state
fmtflags flags() const;
fmtflags flags(fmtflags fmtfl);
fmtflags setf(fmtflags fmtfl);
fmtflags setf(fmtflags fmtfl, fmtflags mask);
void unsetf(fmtflags mask);

streamsize precision() const;
streamsize precision(streamsize prec);
streamsize width() const;
streamsize width(streamsize wide);

// 31.5.2.4, locales
locale imbue(const locale& loc);
locale getloc() const;

// 31.5.2.6, storage
static int xalloc();
long& iword(int idx);
void*& pword(int idx);

// destructor
virtual ~ios_base();

// 31.5.2.7, callbacks
enum event { erase_event, imbue_event, copyfmt_event };
using event_callback = void (*)(event, ios_base&, int idx);
void register_callback(event_callback fn, int idx);

ios_base(const ios_base&) = delete;
ios_base& operator=(const ios_base&) = delete;

static bool sync_with_stdio(bool sync = true);

protected:
 ios_base();

private:
 static int index; // exposition only
 long* iarray; // exposition only
 void** parray; // exposition only
};

}

```

<sup>1</sup> `ios_base` defines several member types:

- (1.1) — a type `failure`, defined as either a class derived from `system_error` or a synonym for a class derived from `system_error`;
- (1.2) — a class `Init`;
- (1.3) — three bitmask types, `fmtflags`, `iostate`, and `openmode`;
- (1.4) — an enumerated type, `seekdir`.

<sup>2</sup> It maintains several kinds of data:

- (2.1) — state information that reflects the integrity of the stream buffer;
- (2.2) — control information that influences how to interpret (format) input sequences and how to generate (format) output sequences;
- (2.3) — additional information that is stored by the program for its private use.

<sup>3</sup> NOTE: For the sake of exposition, the maintained data is presented here as:

- (3.1) — `static int index`, specifies the next available unique index for the integer or pointer arrays maintained for the private use of the program, initialized to an unspecified value;

- (3.2) — `long* iarray`, points to the first element of an arbitrary-length `long` array maintained for the private use of the program;
- (3.3) — `void** parray`, points to the first element of an arbitrary-length pointer array maintained for the private use of the program.

### 31.5.2.2 Types

[ios.types]

#### 31.5.2.2.1 Class `ios_base::failure`

[ios.failure]

```
namespace std {
 class ios_base::failure : public system_error {
 public:
 explicit failure(const string& msg, const error_code& ec = io_errc::stream);
 explicit failure(const char* msg, const error_code& ec = io_errc::stream);
 };
}
```

- <sup>1</sup> An implementation is permitted to define `ios_base::failure` as a synonym for a class with equivalent functionality to class `ios_base::failure` shown in this subclause.

NOTE 1: When `ios_base::failure` is a synonym for another type, that type is required to provide a nested type `failure` to emulate the injected-class-name.

The class `failure` defines the base class for the types of all objects thrown as exceptions, by functions in the `iostreams` library, to report errors detected during stream buffer operations.

- <sup>2</sup> When throwing `ios_base::failure` exceptions, implementations should provide values of `ec` that identify the specific reason for the failure.

NOTE 2: Errors arising from the operating system would typically be reported as `system_category()` errors with an error value of the error number reported by the operating system. Errors arising from within the stream library would typically be reported as `error_code(io_errc::stream, iostream_category())`.

```
explicit failure(const string& msg, const error_code& ec = io_errc::stream);
```

- <sup>3</sup> *Effects*: Constructs the base class with `msg` and `ec`.

```
explicit failure(const char* msg, const error_code& ec = io_errc::stream);
```

- <sup>4</sup> *Effects*: Constructs the base class with `msg` and `ec`.

#### 31.5.2.2.2 Type `ios_base::fmtflags`

[ios.fmtflags]

```
using fmtflags = T1;
```

- <sup>1</sup> The type `fmtflags` is a bitmask type (16.3.3.3). Setting its elements has the effects indicated in Table 118.
- <sup>2</sup> Type `fmtflags` also defines the constants indicated in Table 119.

#### 31.5.2.2.3 Type `ios_base::iostate`

[ios.iostate]

```
using iostate = T2;
```

- <sup>1</sup> The type `iostate` is a bitmask type (16.3.3.3) that contains the elements indicated in Table 120.
- <sup>2</sup> Type `iostate` also defines the constant:
- (2.1) — `goodbit`, the value zero.

#### 31.5.2.2.4 Type `ios_base::openmode`

[ios.openmode]

```
using openmode = T3;
```

- <sup>1</sup> The type `openmode` is a bitmask type (16.3.3.3). It contains the elements indicated in Table 121.

#### 31.5.2.2.5 Type `ios_base::seekdir`

[ios.seekdir]

```
using seekdir = T4;
```

- <sup>1</sup> The type `seekdir` is an enumerated type (16.3.3.3.2) that contains the elements indicated in Table 122.

Table 118: `fmtflags` effects [tab:ios.fmtflags]

| Element                 | Effect(s) if set                                                                                                                                   |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>boolalpha</code>  | insert and extract <code>bool</code> type in alphabetic format                                                                                     |
| <code>dec</code>        | converts integer input or generates integer output in decimal base                                                                                 |
| <code>fixed</code>      | generate floating-point output in fixed-point notation                                                                                             |
| <code>hex</code>        | converts integer input or generates integer output in hexadecimal base                                                                             |
| <code>internal</code>   | adds fill characters at a designated internal point in certain generated output, or identical to <code>right</code> if no such point is designated |
| <code>left</code>       | adds fill characters on the right (final positions) of certain generated output                                                                    |
| <code>oct</code>        | converts integer input or generates integer output in octal base                                                                                   |
| <code>right</code>      | adds fill characters on the left (initial positions) of certain generated output                                                                   |
| <code>scientific</code> | generates floating-point output in scientific notation                                                                                             |
| <code>showbase</code>   | generates a prefix indicating the numeric base of generated integer output                                                                         |
| <code>showpoint</code>  | generates a decimal-point character unconditionally in generated floating-point output                                                             |
| <code>showpos</code>    | generates a + sign in non-negative generated numeric output                                                                                        |
| <code>skipws</code>     | skips leading whitespace before certain input operations                                                                                           |
| <code>unitbuf</code>    | flushes output after each output operation                                                                                                         |
| <code>uppercase</code>  | replaces certain lowercase letters with their uppercase equivalents in generated output                                                            |

Table 119: `fmtflags` constants [tab:ios.fmtflags.const]

| Constant                 | Allowable values                                               |
|--------------------------|----------------------------------------------------------------|
| <code>adjustfield</code> | <code>left</code>   <code>right</code>   <code>internal</code> |
| <code>basefield</code>   | <code>dec</code>   <code>oct</code>   <code>hex</code>         |
| <code>floatfield</code>  | <code>scientific</code>   <code>fixed</code>                   |

Table 120: `iostate` effects [tab:ios.iostate]

| Element              | Effect(s) if set                                                                                                                                 |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>badbit</code>  | indicates a loss of integrity in an input or output sequence (such as an irrecoverable read error from a file);                                  |
| <code>eofbit</code>  | indicates that an input operation reached the end of an input sequence;                                                                          |
| <code>failbit</code> | indicates that an input operation failed to read the expected characters, or that an output operation failed to generate the desired characters. |

Table 121: `openmode` effects [tab:ios.openmode]

| Element                | Effect(s) if set                                                  |
|------------------------|-------------------------------------------------------------------|
| <code>app</code>       | seek to end before each write                                     |
| <code>ate</code>       | open and seek to end immediately after opening                    |
| <code>binary</code>    | perform input and output in binary mode (as opposed to text mode) |
| <code>in</code>        | open for input                                                    |
| <code>noreplace</code> | open in exclusive mode                                            |
| <code>out</code>       | open for output                                                   |
| <code>trunc</code>     | truncate an existing stream when opening                          |

Table 122: `seekdir` effects [tab:ios.seekdir]

| Element          | Meaning                                                                                 |
|------------------|-----------------------------------------------------------------------------------------|
| <code>beg</code> | request a seek (for subsequent input or output) relative to the beginning of the stream |
| <code>cur</code> | request a seek relative to the current position within the sequence                     |
| <code>end</code> | request a seek relative to the current end of the sequence                              |

31.5.2.2.6 Class `ios_base::Init`[`ios.init`]

```
namespace std {
 class ios_base::Init {
 public:
 Init();
 Init(const Init&) = default;
 ~Init();
 Init& operator=(const Init&) = default;

 private:
 static int init_cnt; // exposition only
 };
}
```

<sup>1</sup> The class `Init` describes an object whose construction ensures the construction of the eight objects declared in `<iostream>` (31.4) that associate file stream buffers with the standard C streams provided for by the functions declared in `<cstdio>` (31.13.1).

<sup>2</sup> For the sake of exposition, the maintained data is presented here as:

(2.1) — `static int init_cnt`, counts the number of constructor and destructor calls for class `Init`, initialized to zero.

`Init();`

<sup>3</sup> *Effects*: Constructs and initializes the objects `cin`, `cout`, `cerr`, `clog`, `wcin`, `wcout`, `wcerr`, and `wclog` if they have not already been constructed and initialized.

`~Init();`

<sup>4</sup> *Effects*: If there are no other instances of the class still in existence, calls `cout.flush()`, `cerr.flush()`, `clog.flush()`, `wcout.flush()`, `wcerr.flush()`, `wclog.flush()`.

## 31.5.2.3 State functions

[`fmtflags.state`]

`fmtflags flags() const;`

<sup>1</sup> *Returns*: The format control information for both input and output.

`fmtflags flags(fmtflags fmtfl);`

<sup>2</sup> *Postconditions*: `fmtfl == flags()`.

<sup>3</sup> *Returns*: The previous value of `flags()`.

`fmtflags setf(fmtflags fmtfl);`

<sup>4</sup> *Effects*: Sets `fmtfl` in `flags()`.

<sup>5</sup> *Returns*: The previous value of `flags()`.

`fmtflags setf(fmtflags fmtfl, fmtflags mask);`

<sup>6</sup> *Effects*: Clears `mask` in `flags()`, sets `fmtfl & mask` in `flags()`.

<sup>7</sup> *Returns*: The previous value of `flags()`.

`void unsetf(fmtflags mask);`

<sup>8</sup> *Effects*: Clears `mask` in `flags()`.

`streamsize precision() const;`

<sup>9</sup> *Returns*: The precision to generate on certain output conversions.

`streamsize precision(streamsize prec);`

<sup>10</sup> *Postconditions*: `prec == precision()`.

<sup>11</sup> *Returns*: The previous value of `precision()`.

`streamsize width() const;`

<sup>12</sup> *Returns*: The minimum field width (number of characters) to generate on certain output conversions.

```
streamsize width(streamsize wide);
13 Postconditions: wide == width().
14 Returns: The previous value of width().
```

### 31.5.2.4 Functions

[ios.base.locales]

```
locale imbue(const locale& loc);
```

1    *Effects:* Calls each registered callback pair (*fn*, *idx*) (31.5.2.7) as (\**fn*)(imbue\_event, \*this, *idx*) at such a time that a call to `ios_base::getloc()` from within *fn* returns the new locale value *loc*.

2    *Postconditions:* *loc* == `getloc()`.

3    *Returns:* The previous value of `getloc()`.

```
locale getloc() const;
```

4    *Returns:* If no locale has been imbued, a copy of the global C++ locale, `locale()`, in effect at the time of construction. Otherwise, returns the imbued locale, to be used to perform locale-dependent input and output operations.

### 31.5.2.5 Static members

[ios.members.static]

```
static bool sync_with_stdio(bool sync = true);
```

1    *Effects:* If any input or output operation has occurred using the standard streams prior to the call, the effect is implementation-defined. Otherwise, called with a `false` argument, it allows the standard streams to operate independently of the standard C streams.

2    *Returns:* `true` if the previous state of the standard iostream objects (31.4) was synchronized and otherwise returns `false`. The first time it is called, the function returns `true`.

3    *Remarks:* When a standard iostream object *str* is *synchronized* with a standard stdio stream *f*, the effect of inserting a character *c* by

```
fputc(f, c);
```

is the same as the effect of

```
str.rdbuf()->sputc(c);
```

for any sequences of characters; the effect of extracting a character *c* by

```
c = fgetc(f);
```

is the same as the effect of

```
c = str.rdbuf()->sbumpc();
```

for any sequences of characters; and the effect of pushing back a character *c* by

```
ungetc(c, f);
```

is the same as the effect of

```
str.rdbuf()->sputbackc(c);
```

for any sequence of characters.<sup>270</sup>

### 31.5.2.6 Storage functions

[ios.base.storage]

```
static int xalloc();
```

1    *Returns:* `index`++.

2    *Remarks:* Concurrent access to this function by multiple threads does not result in a data race (6.9.2).

```
long& iword(int idx);
```

3    *Preconditions:* *idx* is a value obtained by a call to `xalloc`.

4    *Effects:* If *iarray* is a null pointer, allocates an array of `long` of unspecified size and stores a pointer to its first element in *iarray*. The function then extends the array pointed at by *iarray* as necessary to

<sup>270)</sup> This implies that operations on a standard iostream object can be mixed arbitrarily with operations on the corresponding stdio stream. In practical terms, synchronization usually means that a standard iostream object and a standard stdio object share a buffer.

include the element `iarray[idx]`. Each newly allocated element of the array is initialized to zero. The reference returned is invalid after any other operation on the object.<sup>271</sup> However, the value of the storage referred to is retained, so that until the next call to `copyfmt`, calling `iword` with the same index yields another reference to the same value. If the function fails<sup>272</sup> and `*this` is a base class subobject of a `basic_ios<>` object or subobject, the effect is equivalent to calling `basic_ios<>::setstate(badbit)` on the derived object (which may throw `failure`).

5     >Returns: On success `iarray[idx]`. On failure, a valid `long&` initialized to 0.

```
void*& pword(int idx);
```

6     `Preconditions:` `idx` is a value obtained by a call to `xalloc`.

7     `Effects:` If `parray` is a null pointer, allocates an array of pointers to `void` of unspecified size and stores a pointer to its first element in `parray`. The function then extends the array pointed at by `parray` as necessary to include the element `parray[idx]`. Each newly allocated element of the array is initialized to a null pointer. The reference returned is invalid after any other operation on the object. However, the value of the storage referred to is retained, so that until the next call to `copyfmt`, calling `pword` with the same index yields another reference to the same value. If the function fails<sup>273</sup> and `*this` is a base class subobject of a `basic_ios<>` object or subobject, the effect is equivalent to calling `basic_ios<>::setstate(badbit)` on the derived object (which may throw `failure`).

8     >Returns: On success `parray[idx]`. On failure a valid `void*&` initialized to 0.

9     `Remarks:` After a subsequent call to `pword(int)` for the same object, the earlier return value may no longer be valid.

### 31.5.2.7 Callbacks

[ios.base.callback]

```
void register_callback(event_callback fn, int idx);
```

1     `Preconditions:` The function `fn` does not throw exceptions.

2     `Effects:` Registers the pair `(fn, idx)` such that during calls to `imbue()` (31.5.2.4), `copyfmt()`, or `~ios_base()` (31.5.2.8), the function `fn` is called with argument `idx`. Functions registered are called when an event occurs, in opposite order of registration. Functions registered while a callback function is active are not called until the next event.

3     `Remarks:` Identical pairs are not merged. A function registered twice will be called twice.

### 31.5.2.8 Constructors and destructor

[ios.base.cons]

```
ios_base();
```

1     `Effects:` Each `ios_base` member has an indeterminate value after construction. The object's members shall be initialized by calling `basic_ios::init` before the object's first use or before it is destroyed, whichever comes first; otherwise the behavior is undefined.

```
~ios_base();
```

2     `Effects:` Calls each registered callback pair `(fn, idx)` (31.5.2.7) as `(*fn)(erase_event, *this, idx)` at such time that any `ios_base` member function called from within `fn` has well-defined results. Then, any memory obtained is deallocated.

### 31.5.3 Class template fpos

[fpos]

```
namespace std {
 template<class stateT> class fpos {
 public:
 // 31.5.3.1, members
 stateT state() const;
 void state(stateT);
```

<sup>271</sup>) An implementation is free to implement both the integer array pointed at by `iarray` and the pointer array pointed at by `parray` as sparse data structures, possibly with a one-element cache for each.

<sup>272</sup>) For example, because it cannot allocate space.

<sup>273</sup>) For example, because it cannot allocate space.

```

private:
 stateT st; // exposition only
};

}

```

### 31.5.3.1 Members

[**fpos.members**]

```

void state(stateT s);

1 Effects: Assigns s to st.

stateT state() const;

2 Returns: Current value of st.

```

### 31.5.3.2 Requirements

[**fpos.operations**]

- <sup>1</sup> An **fpos** type specifies file position information. It holds a state object whose type is equal to the template parameter **stateT**. Type **stateT** shall meet the *Cpp17DefaultConstructible* ([Table 30](#)), *Cpp17CopyConstructible* ([Table 32](#)), *Cpp17CopyAssignable* ([Table 34](#)), and *Cpp17Destructible* ([Table 35](#)) requirements. If *is\_trivially\_copy\_constructible\_v<stateT>* is **true**, then **fpos<stateT>** has a trivial copy constructor. If *is\_trivially\_copy\_assignable\_v<stateT>* is **true**, then **fpos<stateT>** has a trivial copy assignment operator. If *is\_trivially\_destructible\_v<stateT>* is **true**, then **fpos<stateT>** has a trivial destructor. All specializations of **fpos** meet the *Cpp17DefaultConstructible*, *Cpp17CopyConstructible*, *Cpp17CopyAssignable*, *Cpp17Destructible*, and *Cpp17EqualityComparable* ([Table 28](#)) requirements. In addition, the expressions shown in [Table 123](#) are valid and have the indicated semantics. In that table,

- (1.1) — P refers to a specialization of **fpos**,
- (1.2) — p and q refer to values of type P or **const P**,
- (1.3) — p1 and q1 refer to modifiable lvalues of type P,
- (1.4) — O refers to type **streamoff**, and
- (1.5) — o and o2 refer to values of type **streamoff** or **const streamoff**.

Table 123: Position type requirements [tab:**fpos.operations**]

| Expression          | Return type | Operational semantics | Assertion/note pre-/post-condition                                                                                                                                                                                                          |
|---------------------|-------------|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| P(o)                | P           | converts from offset  | <i>Effects:</i> Value-initializes the state object.                                                                                                                                                                                         |
| P p(o);<br>P p = o; |             |                       | <i>Effects:</i> Value-initializes the state object.<br><i>Postconditions:</i> p == P(o) is true.                                                                                                                                            |
| P()                 | P           | P(O)                  |                                                                                                                                                                                                                                             |
| P p;                |             | P p(O);               |                                                                                                                                                                                                                                             |
| O(p)                | streamoff   | converts to offset    | P(O(p)) == p                                                                                                                                                                                                                                |
| p == q              | bool        |                       | <i>Remarks:</i> For any two values o and o2, if p is obtained from o converted to P or from a copy of such P value and if q is obtained from o2 converted to P or from a copy of such P value, then p == q is true only if o == o2 is true. |
| p != q              | bool        | !(p == q)             |                                                                                                                                                                                                                                             |
| p + o               | P           | + offset              | <i>Remarks:</i> With q1 = p + o;, then: q1 - o == p                                                                                                                                                                                         |
| p1 += o             | P&          | += offset             | <i>Remarks:</i> With q1 = p1; before the +=, then: p1 - o == q1                                                                                                                                                                             |
| p - o               | P           | - offset              | <i>Remarks:</i> With q1 = p - o;, then: q1 + o == p                                                                                                                                                                                         |

Table 123: Position type requirements (continued)

| Expression | Return type        | Operational semantics | Assertion/note<br>pre-/post-condition                            |
|------------|--------------------|-----------------------|------------------------------------------------------------------|
| $p1 -= o$  | $P\&$              | $-=$ offset           | Remarks: With $q1 = p1$ ; before the $-=$ , then: $p1 + o == q1$ |
| $o + p$    | convertible to $P$ | $p + o$               | $P(o + p) == p + o$                                              |
| $p - q$    | <b>streamoff</b>   | distance              | $p == q + (p - q)$                                               |

- <sup>2</sup> Stream operations that return a value of type `traits::pos_type` return `P(0(-1))` as an invalid value to signal an error. If this value is used as an argument to any `istream`, `ostream`, or `streambuf` member that accepts a value of type `traits::pos_type` then the behavior of that function is undefined.

### 31.5.4 Class template `basic_ios`

[ios]

#### 31.5.4.1 Overview

[ios.overview]

```

namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_ios : public ios_base {
public:
 using char_type = charT;
 using int_type = typename traits::int_type;
 using pos_type = typename traits::pos_type;
 using off_type = typename traits::off_type;
 using traits_type = traits;

 // 31.5.4.4, flags functions
 explicit operator bool() const;
 bool operator!() const;
 iostate rdstate() const;
 void clear(iostate state = goodbit);
 void setstate(iostate state);
 bool good() const;
 bool eof() const;
 bool fail() const;
 bool bad() const;

 iostate exceptions() const;
 void exceptions(iostate except);

 // 31.5.4.2, constructor/destructor
 explicit basic_ios(basic_streambuf<charT, traits>* sb);
 virtual ~basic_ios();

 // 31.5.4.3, members
 basic_ostream<charT, traits>* tie() const;
 basic_ostream<charT, traits>* tie(basic_ostream<charT, traits>* tiestr);

 basic_streambuf<charT, traits>* rdbuf() const;
 basic_streambuf<charT, traits>* rdbuf(basic_streambuf<charT, traits>* sb);

 basic_ios& copyfmt(const basic_ios& rhs);

 char_type fill() const;
 char_type fill(char_type ch);

 locale imbue(const locale& loc);

 char narrow(char_type c, char dfault) const;
 char_type widen(char c) const;

 basic_ios(const basic_ios&) = delete;
 basic_ios& operator=(const basic_ios&) = delete;
}

```

```

protected:
 basic_ios();
 void init(basic_streambuf<charT, traits>* sb);
 void move(basic_ios& rhs);
 void move(basic_ios&& rhs);
 void swap(basic_ios& rhs) noexcept;
 void set_rdbuf(basic_streambuf<charT, traits>* sb);
};

}

```

### 31.5.4.2 Constructors

[basic.ios.cons]

```
explicit basic_ios(basic_streambuf<charT, traits>* sb);
```

- 1     *Effects:* Assigns initial values to its member objects by calling `init(sb)`.

```
basic_ios();
```

- 2     *Effects:* Leaves its member objects uninitialized. The object shall be initialized by calling `basic_ios::init` before its first use or before it is destroyed, whichever comes first; otherwise the behavior is undefined.

```
~basic_ios();
```

- 3     *Remarks:* The destructor does not destroy `rdbuf()`.

```
void init(basic_streambuf<charT, traits>* sb);
```

- 4     *Postconditions:* The postconditions of this function are indicated in [Table 124](#).

Table 124: `basic_ios::init()` effects [tab:basic.ios.cons]

| Element                   | Value                                                               |
|---------------------------|---------------------------------------------------------------------|
| <code>rdbuf()</code>      | <code>sb</code>                                                     |
| <code>tie()</code>        | 0                                                                   |
| <code>rdstate()</code>    | goodbit if <code>sb</code> is not a null pointer, otherwise badbit. |
| <code>exceptions()</code> | goodbit                                                             |
| <code>flags()</code>      | <code>skipws   dec</code>                                           |
| <code>width()</code>      | 0                                                                   |
| <code>precision()</code>  | 6                                                                   |
| <code>fill()</code>       | <code>widen(' ')</code>                                             |
| <code>getloc()</code>     | a copy of the value returned by <code>locale()</code>               |
| <code>iarray</code>       | a null pointer                                                      |
| <code>parray</code>       | a null pointer                                                      |

### 31.5.4.3 Member functions

[basic.ios.members]

```
basic_ostream<charT, traits>* tie() const;
```

- 1     *Returns:* An output sequence that is tied to (synchronized with) the sequence controlled by the stream buffer.

```
basic_ostream<charT, traits>* tie(basic_ostream<charT, traits>* tiestr);
```

- 2     *Preconditions:* If `tiestr` is not null, `tiestr` is not reachable by traversing the linked list of tied stream objects starting from `tiestr->tie()`.

- 3     *Postconditions:* `tiestr == tie()`.

- 4     *Returns:* The previous value of `tie()`.

```
basic_streambuf<charT, traits>* rdbuf() const;
```

- 5     *Returns:* A pointer to the `streambuf` associated with the stream.

```

basic_streambuf<charT, traits>* rdbuf(basic_streambuf<charT, traits>* sb);
6 Effects: Calls clear().
7 Postconditions: sb == rdbuf().
8 Returns: The previous value of rdbuf().
locale imbue(const locale& loc);
9 Effects: Calls ios_base::imbue(loc) (31.5.2.4) and if rdbuf() != 0 then rdbuf()>pubimbue(loc) (31.6.3.3.1).
10 Returns: The prior value of ios_base::imbue().
char narrow(char_type c, char dfault) const;
11 Returns: use_facet<ctype<char_type>>(getloc()).narrow(c, dfault)
char_type widen(char c) const;
12 Returns: use_facet<ctype<char_type>>(getloc()).widen(c)
char_type fill() const;
13 Returns: The character used to pad (fill) an output conversion to the specified field width.
char_type fill(char_type fillch);
14 Postconditions: traits::eq(fillch, fill()).
15 Returns: The previous value of fill().
basic_ios& copyfmt(const basic_ios& rhs);
16 Effects: If (this == addressof(rhs)) is true does nothing. Otherwise assigns to the member objects of *this the corresponding member objects of rhs as follows:
(16.1) — calls each registered callback pair (fn, idx) as (*fn)(erase_event, *this, idx);
(16.2) — then, assigns to the member objects of *this the corresponding member objects of rhs, except that
(16.2.1) — rdstate(), rdbuf(), and exceptions() are left unchanged;
(16.2.2) — the contents of arrays pointed at by pword and iword are copied, not the pointers themselves;274 and
(16.2.3) — if any newly stored pointer values in *this point at objects stored outside the object rhs and those objects are destroyed when rhs is destroyed, the newly stored pointer values are altered to point at newly constructed copies of the objects;
(16.3) — then, calls each callback pair that was copied from rhs as (*fn)(copyfmt_event, *this, idx);
(16.4) — then, calls exceptions(rhs.exceptions()).
17 NOTE: The second pass through the callback pairs permits a copied pword value to be zeroed, or to have its referent deep copied or reference counted, or to have other special action taken.
18 Postconditions: The postconditions of this function are indicated in Table 125.
19 Returns: *this.
void move(basic_ios& rhs);
void move(basic_ios&& rhs);
20 Postconditions: *this has the state that rhs had before the function call, except that rdbuf() returns nullptr. rhs is in a valid but unspecified state, except that rhs.rdbuf() returns the same value as it returned before the function call, and rhs.tie() returns nullptr.

```

<sup>274)</sup> This suggests an infinite amount of copying, but the implementation can keep track of the maximum element of the arrays that is nonzero.

Table 125: `basic_ios::copyfmt()` effects [tab:basic.ios.copyfmt]

| Element                   | Value                         |
|---------------------------|-------------------------------|
| <code>rdbuf()</code>      | <i>unchanged</i>              |
| <code>tie()</code>        | <code>rhs.tie()</code>        |
| <code>rdstate()</code>    | <i>unchanged</i>              |
| <code>exceptions()</code> | <code>rhs.exceptions()</code> |
| <code>flags()</code>      | <code>rhs.flags()</code>      |
| <code>width()</code>      | <code>rhs.width()</code>      |
| <code>precision()</code>  | <code>rhs.precision()</code>  |
| <code>fill()</code>       | <code>rhs.fill()</code>       |
| <code>getloc()</code>     | <code>rhs.getloc()</code>     |

```

void swap(basic_ios& rhs) noexcept;
21 Effects: The states of *this and rhs are exchanged, except that rdbuf() returns the same value as it
 returned before the function call, and rhs.rdbuf() returns the same value as it returned before the
 function call.

void set_rdbuf(basic_streambuf<charT, traits>* sb);
22 Preconditions: sb != nullptr is true.

23 Effects: Associates the basic_streambuf object pointed to by sb with this stream without calling
 clear().

24 Postconditions: rdbuf() == sb is true.

25 Throws: Nothing.

```

### 31.5.4.4 Flags functions

[iostate.flags]

```
explicit operator bool() const;
```

1     Returns: `!fail()`.

```
bool operator!() const;
```

2     Returns: `fail()`.

```
iostate rdstate() const;
```

3     Returns: The error state of the stream buffer.

```
void clear(iostate state = goodbit);
```

4     Effects: If `((state | (rdbuf() ? goodbit : badbit)) & exceptions()) == 0`, returns. Otherwise, the function throws an object of class `ios_base::failure` (31.5.2.2.1), constructed with implementation-defined argument values.

5     Postconditions: If `rdbuf() != 0` then `state == rdstate()`; otherwise `rdstate() == (state | ios_base::badbit)`.

```
void setstate(iostate state);
```

6     Effects: Calls `clear(rdstate() | state)` (which may throw `ios_base::failure` (31.5.2.2.1)).

```
bool good() const;
```

7     Returns: `rdstate() == 0`

```
bool eof() const;
```

8     Returns: `true` if `eofbit` is set in `rdstate()`.

```
bool fail() const;
```

9     Returns: `true` if `failbit` or `badbit` is set in `rdstate()`.<sup>275</sup>

<sup>275</sup> Checking `badbit` also for `fail()` is historical practice.

```

 bool bad() const;
10 Returns: true if badbit is set in rdstate().

 iostate exceptions() const;
11 Returns: A mask that determines what elements set in rdstate() cause exceptions to be thrown.

 void exceptions(iostate except);
12 Effects: Calls clear(rdstate()).

13 Postconditions: except == exceptions().

```

### 31.5.5 ios\_base manipulators

[std.ios.manip]

#### 31.5.5.1 fmtflags manipulators

[fmtflags.manip]

- <sup>1</sup> Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

```

ios_base& boolalpha(ios_base& str);
2 Effects: Calls str.setf(ios_base::boolalpha).

3 Returns: str.

ios_base& noboolalpha(ios_base& str);
4 Effects: Calls str.unsetf(ios_base::boolalpha).

5 Returns: str.

ios_base& showbase(ios_base& str);
6 Effects: Calls str.setf(ios_base::showbase).

7 Returns: str.

ios_base& noshowbase(ios_base& str);
8 Effects: Calls str.unsetf(ios_base::showbase).

9 Returns: str.

ios_base& showpoint(ios_base& str);
10 Effects: Calls str.setf(ios_base::showpoint).

11 Returns: str.

ios_base& noshowpoint(ios_base& str);
12 Effects: Calls str.unsetf(ios_base::showpoint).

13 Returns: str.

ios_base& showpos(ios_base& str);
14 Effects: Calls str.setf(ios_base::showpos).

15 Returns: str.

ios_base& noshowpos(ios_base& str);
16 Effects: Calls str.unsetf(ios_base::showpos).

17 Returns: str.

ios_base& skipws(ios_base& str);
18 Effects: Calls str.setf(ios_base::skipws).

19 Returns: str.

ios_base& noskipws(ios_base& str);
20 Effects: Calls str.unsetf(ios_base::skipws).

21 Returns: str.

```

```

ios_base& uppercase(ios_base& str);
22 Effects: Calls str.setf(ios_base::uppercase).
23 Returns: str.

ios_base& nouppercase(ios_base& str);
24 Effects: Calls str.unsetf(ios_base::uppercase).
25 Returns: str.

ios_base& unitbuf(ios_base& str);
26 Effects: Calls str.setf(ios_base::unitbuf).
27 Returns: str.

ios_base& nounitbuf(ios_base& str);
28 Effects: Calls str.unsetf(ios_base::unitbuf).
29 Returns: str.

```

**31.5.5.2 adjustfield manipulators****[adjustfield.manip]**

- <sup>1</sup> Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

```

ios_base& internal(ios_base& str);
2 Effects: Calls str.setf(ios_base::internal, ios_base::adjustfield).
3 Returns: str.

ios_base& left(ios_base& str);
4 Effects: Calls str.setf(ios_base::left, ios_base::adjustfield).
5 Returns: str.

ios_base& right(ios_base& str);
6 Effects: Calls str.setf(ios_base::right, ios_base::adjustfield).
7 Returns: str.

```

**31.5.5.3 basefield manipulators****[basefield.manip]**

- <sup>1</sup> Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

```

ios_base& dec(ios_base& str);
2 Effects: Calls str.setf(ios_base::dec, ios_base::basefield).
3 Returns: str.276

ios_base& hex(ios_base& str);
4 Effects: Calls str.setf(ios_base::hex, ios_base::basefield).
5 Returns: str.

ios_base& oct(ios_base& str);
6 Effects: Calls str.setf(ios_base::oct, ios_base::basefield).
7 Returns: str.

```

**31.5.5.4 floatfield manipulators****[floatfield.manip]**

- <sup>1</sup> Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

```

ios_base& fixed(ios_base& str);
2 Effects: Calls str.setf(ios_base::fixed, ios_base::floatfield).
3 Returns: str.

```

<sup>276)</sup> The function signature `dec(ios_base&)` can be called by the function signature `basic_ostream& stream::operator<<(ios_base& (*)(ios_base&))` to permit expressions of the form `cout << dec` to change the format flags stored in `cout`.

```

ios_base& scientific(ios_base& str);
4 Effects: Calls str.setf(ios_base::scientific, ios_base::floatfield).
5 Returns: str.

ios_base& hexfloat(ios_base& str);
6 Effects: Calls str.setf(ios_base::fixed | ios_base::scientific, ios_base::floatfield).
7 Returns: str.

8 NOTE: ios_base::hex cannot be used to specify a hexadecimal floating-point format, because it is not part of
ios_base::floatfield (Table 119).

ios_base& defaultfloat(ios_base& str);
9 Effects: Calls str.unsetf(ios_base::floatfield).
10 Returns: str.

```

**31.5.6 Error reporting**

[error.reporting]

```

error_code make_error_code(io_errc e) noexcept;
1 Returns: error_code(static_cast<int>(e), iostream_category()).

error_condition make_error_condition(io_errc e) noexcept;
2 Returns: error_condition(static_cast<int>(e), iostream_category()).

const error_category& iostream_category() noexcept;
3 Returns: A reference to an object of a type derived from class error_category.

4 The object's default_error_condition and equivalent virtual functions shall behave as specified
for the class error_category. The object's name virtual function shall return a pointer to the string
"iostream".

```

**31.6 Stream buffers**

[stream.buffers]

**31.6.1 Header <streambuf> synopsis**

[streambuf.syn]

```

namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_streambuf;
 using streambuf = basic_streambuf<char>;
 using wstreambuf = basic_streambuf<wchar_t>;
}

```

- 1 The header <streambuf> defines types that control input from and output to *character* sequences.

**31.6.2 Stream buffer requirements**

[streambuf.reqts]

- 1 Stream buffers can impose various constraints on the sequences they control. Some constraints are:
  - (1.1) — The controlled input sequence can be not readable.
  - (1.2) — The controlled output sequence can be not writable.
  - (1.3) — The controlled sequences can be associated with the contents of other representations for character sequences, such as external files.
  - (1.4) — The controlled sequences can support operations *directly* to or from associated sequences.
  - (1.5) — The controlled sequences can impose limitations on how the program can read characters from a sequence, write characters to a sequence, put characters back into an input sequence, or alter the stream position.
- 2 Each sequence is characterized by three pointers which, if non-null, all point into the same **charT** array object. The array object represents, at any moment, a (sub)sequence of characters from the sequence. Operations performed on a sequence alter the values stored in these pointers, perform reads and writes directly to or from associated sequences, and alter “the stream position” and conversion state as needed to maintain this subsequence relationship. The three pointers are:
  - (2.1) — the *beginning pointer*, or lowest element address in the array (called **xbeg** here);

- (2.2) — the *next pointer*, or next element address that is a current candidate for reading or writing (called `xnext` here);
- (2.3) — the *end pointer*, or first element address beyond the end of the array (called `xend` here).
- 3 The following semantic constraints shall always apply for any set of three pointers for a sequence, using the pointer names given immediately above:
- (3.1) — If `xnext` is not a null pointer, then `xbeg` and `xend` shall also be non-null pointers into the same `charT` array, as described above; otherwise, `xbeg` and `xend` shall also be null.
  - (3.2) — If `xnext` is not a null pointer and `xnext < xend` for an output sequence, then a *write position* is available. In this case, `*xnext` shall be assignable as the next element to write (to put, or to store a character value, into the sequence).
  - (3.3) — If `xnext` is not a null pointer and `xbeg < xnext` for an input sequence, then a *putback position* is available. In this case, `xnext[-1]` shall have a defined value and is the next (preceding) element to store a character that is put back into the input sequence.
  - (3.4) — If `xnext` is not a null pointer and `xnext < xend` for an input sequence, then a *read position* is available. In this case, `*xnext` shall have a defined value and is the next element to read (to get, or to obtain a character value, from the sequence).

### 31.6.3 Class template `basic_streambuf`

[`streambuf`  
[`streambuf.general`]]

#### 31.6.3.1 General

```
namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_streambuf {
 public:
 using char_type = charT;
 using int_type = typename traits::int_type;
 using pos_type = typename traits::pos_type;
 using off_type = typename traits::off_type;
 using traits_type = traits;

 virtual ~basic_streambuf();

 // 31.6.3.1, locales
 locale pubimbue(const locale& loc);
 locale getloc() const;

 // 31.6.3.2, buffer and positioning
 basic_streambuf* pubsetbuf(char_type* s, streamsize n);
 pos_type pubseekoff(off_type off, ios_base::seekdir way,
 ios_base::openmode which
 = ios_base::in | ios_base::out);
 pos_type pubseekpos(pos_type sp,
 ios_base::openmode which
 = ios_base::in | ios_base::out);
 int pubsync();

 // get and put areas
 // 31.6.3.3, get area
 streamsize in_avail();
 int_type snextc();
 int_type sbumpc();
 int_type sgetc();
 streamsize sgetn(char_type* s, streamsize n);

 // 31.6.3.4, putback
 int_type sputbackc(char_type c);
 int_type sungetc();

 // 31.6.3.5, put area
 int_type sputc(char_type c);
```

```

 streamsize sputn(const char_type* s, streamsize n);

protected:
 basic_streambuf();
 basic_streambuf(const basic_streambuf& rhs);
 basic_streambuf& operator=(const basic_streambuf& rhs);

 void swap(basic_streambuf& rhs);

 // 31.6.3.4.2, get area access
 char_type* eback() const;
 char_type* gptr() const;
 char_type* egptr() const;
 void gbump(int n);
 void setg(char_type* gbeg, char_type* gnext, char_type* gend);

 // 31.6.3.4.3, put area access
 char_type* pbase() const;
 char_type* pptr() const;
 char_type* eptr() const;
 void pbump(int n);
 void setp(char_type* pbeg, char_type* pend);

 // 31.6.3.5, virtual functions
 // 31.6.3.5.1, locales
 virtual void imbue(const locale& loc);

 // 31.6.3.5.2, buffer management and positioning
 virtual basic_streambuf* setbuf(char_type* s, streamsize n);
 virtual pos_type seekoff(off_type off, ios_base::seekdir way,
 ios_base::openmode which
 = ios_base::in | ios_base::out);
 virtual pos_type seekpos(pos_type sp,
 ios_base::openmode which
 = ios_base::in | ios_base::out);
 virtual int sync();

 // 31.6.3.5.3, get area
 virtual streamsize showmany_c();
 virtual streamsize xsgetn(char_type* s, streamsize n);
 virtual int_type underflow();
 virtual int_type uflow();

 // 31.6.3.5.4, putback
 virtual int_type pbackfail(int_type c = traits::eof());

 // 31.6.3.5.5, put area
 virtual streamsize xsputn(const char_type* s, streamsize n);
 virtual int_type overflow(int_type c = traits::eof());
};

}

```

<sup>1</sup> The class template `basic_streambuf` serves as an abstract base class for deriving various *stream buffers* whose objects each control two *character sequences*:

- (1.1) — a character *input sequence*;
- (1.2) — a character *output sequence*.

### 31.6.3.2 Constructors

[**streambuf.cons**]

`basic_streambuf();`

<sup>1</sup> *Effects:* Initializes.<sup>277</sup>

---

<sup>277</sup>) The default constructor is protected for class `basic_streambuf` to assure that only objects for classes derived from this class can be constructed.

- (1.1) — all pointer member objects to null pointers,  
 (1.2) — the `getloc()` member to a copy of the global locale, `locale()`, at the time of construction.
- 2 *Remarks:* Once the `getloc()` member is initialized, results of calling locale member functions, and of members of facets so obtained, can safely be cached until the next time the member `imbue` is called.

```
basic_streambuf(const basic_streambuf& rhs);

3 Postconditions:
(3.1) — eback() == rhs.eback()
(3.2) — gptr() == rhs.gptr()
(3.3) — egptr() == rhs.egptr()
(3.4) — pbase() == rhs.pbase()
(3.5) — pptr() == rhs.pptr()
(3.6) — epptr() == rhs.epptr()
(3.7) — getloc() == rhs.getloc()

~basic_streambuf();
```

4 *Effects:* None.

### 31.6.3.3 Public member functions

[streambuf.members]

#### 31.6.3.3.1 Locales

[streambuf.locales]

```
locale pubimbue(const locale& loc);
```

1 *Effects:* Calls `imbue(loc)`.

2 *Postconditions:* `loc == getloc()`.

3 *Returns:* Previous value of `getloc()`.

```
locale getloc() const;
```

4 *Returns:* If `pubimbue()` has ever been called, then the last value of `loc` supplied, otherwise the current global locale, `locale()`, in effect at the time of construction. If called after `pubimbue()` has been called but before `pubimbue` has returned (i.e., from within the call of `imbue()`) then it returns the previous value.

#### 31.6.3.3.2 Buffer management and positioning

[streambuf.buffer]

```
basic_streambuf* pubsetbuf(char_type* s, streamsize n);
```

1 *Returns:* `setbuf(s, n)`.

```
pos_type pubseekoff(off_type off, ios_base::seekdir way,
 ios_base::openmode which
 = ios_base::in | ios_base::out);
```

2 *Returns:* `seekoff(off, way, which)`.

```
pos_type pubseekpos(pos_type sp,
 ios_base::openmode which
 = ios_base::in | ios_base::out);
```

3 *Returns:* `seekpos(sp, which)`.

```
int pubsync();
```

4 *Returns:* `sync()`.

#### 31.6.3.3.3 Get area

[streambuf.pub.get]

```
streamsize in_avail();
```

1 *Returns:* If a read position is available, returns `egptr() - gptr()`. Otherwise returns `showmany()` ([31.6.3.5.3](#)).

```
int_type snextc();
2 Effects: Calls sumpc().
3 Returns: If that function returns traits::eof(), returns traits::eof(). Otherwise, returns sgetc().
int_type sumpc();
4 Effects: If the input sequence read position is not available, returns uflow(). Otherwise, returns traits::to_int_type(*gptr()) and increments the next pointer for the input sequence.
int_type sgetc();
5 Returns: If the input sequence read position is not available, returns underflow(). Otherwise, returns traits::to_int_type(*gptr()).
streamsize sgetn(char_type* s, streamsize n);
6 Returns: xsgetn(s, n).
```

**31.6.3.3.4 Putback**

[streambuf.pub.pback]

```
int_type sputbackc(char_type c);
1 Effects: If the input sequence putback position is not available, or if traits::eq(c, gptr()[-1]) is false, returns pbackfail(traits::to_int_type(c)). Otherwise, decrements the next pointer for the input sequence and returns traits::to_int_type(*gptr()).
int_type sungetc();
2 Effects: If the input sequence putback position is not available, returns pbackfail(). Otherwise, decrements the next pointer for the input sequence and returns traits::to_int_type(*gptr()).
```

**31.6.3.3.5 Put area**

[streambuf.pub.put]

```
int_type sputc(char_type c);
1 Effects: If the output sequence write position is not available, returns overflow(traits::to_int_type(c)). Otherwise, stores c at the next pointer for the output sequence, increments the pointer, and returns traits::to_int_type(c).
streamsize sputn(const char_type* s, streamsize n);
2 Returns: xsputn(s, n).
```

**31.6.3.4 Protected member functions**

[streambuf.protected]

**31.6.3.4.1 Assignment**

[streambuf.assign]

```
basic_streambuf& operator=(const basic_streambuf& rhs);
1 Postconditions:
(1.1) — eback() == rhs.eback()
(1.2) — gptr() == rhs.gptr()
(1.3) — egptr() == rhs.egptr()
(1.4) — pbase() == rhs.pbase()
(1.5) — pptr() == rhs.ptr()
(1.6) — epptr() == rhs.epptr()
(1.7) — getloc() == rhs.getloc()
2 Returns: *this.
```

```
void swap(basic_streambuf& rhs);
3 Effects: Swaps the data members of rhs and *this.
```

**31.6.3.4.2 Get area access**

[streambuf.get.area]

```
char_type* eback() const;
1 Returns: The beginning pointer for the input sequence.

char_type* gptr() const;
2 Returns: The next pointer for the input sequence.

char_type* egptr() const;
3 Returns: The end pointer for the input sequence.

void gbump(int n);
4 Effects: Adds n to the next pointer for the input sequence.

void setg(char_type* gbeg, char_type* gnex, char_type* gend);
5 Postconditions: gbeg == eback(), gnex == gptr(), and gend == egptr() are all true.
```

**31.6.3.4.3 Put area access**

[streambuf.put.area]

```
char_type* pbase() const;
1 Returns: The beginning pointer for the output sequence.

char_type* pptr() const;
2 Returns: The next pointer for the output sequence.

char_type* eptr() const;
3 Returns: The end pointer for the output sequence.

void pbump(int n);
4 Effects: Adds n to the next pointer for the output sequence.

void setp(char_type* pbeg, char_type* pend);
5 Postconditions: pbeg == pbase(), pbeg == pptr(), and pend == eptr() are all true.
```

**31.6.3.5 Virtual functions**

[streambuf.virtuals]

**31.6.3.5.1 Locales**

[streambuf.virt.locales]

```
void imbue(const locale&);

1 Effects: Change any translations based on locale.

2 Remarks: Allows the derived class to be informed of changes in locale at the time they occur. Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.

3 Default behavior: Does nothing.
```

**31.6.3.5.2 Buffer management and positioning**

[streambuf.virt.buffer]

```
basic_streambuf* setbuf(char_type* s, streamsize n);

1 Effects: Influences stream buffering in a way that is defined separately for each class derived from basic_streambuf in this Clause (31.8.2.5, 31.10.2.5).

2 Default behavior: Does nothing. Returns this.

pos_type seekoff(off_type off, ios_base::seekdir way,
 ios_base::openmode which
 = ios_base::in | ios_base::out);

3 Effects: Alters the stream positions within one or more of the controlled sequences in a way that is defined separately for each class derived from basic_streambuf in this Clause (31.8.2.5, 31.10.2.5).

4 Default behavior: Returns pos_type(off_type(-1)).
```

```
pos_type seekpos(pos_type sp,
 ios_base::openmode which
 = ios_base::in | ios_base::out);
```

5     *Effects:* Alters the stream positions within one or more of the controlled sequences in a way that is defined separately for each class derived from `basic_streampbuf` in this Clause (31.8.2, 31.10.2).

6     *Default behavior:* Returns `pos_type(off_type(-1))`.

```
int sync();
```

7     *Effects:* Synchronizes the controlled sequences with the arrays. That is, if `pbase()` is non-null the characters between `pbase()` and `pptr()` are written to the controlled sequence. The pointers may then be reset as appropriate.

8     *Returns:* -1 on failure. What constitutes failure is determined by each derived class (31.10.2.5).

9     *Default behavior:* Returns zero.

### 31.6.3.5.3 Get area

[`streampbuf.virt.get`]

```
streamsize showmanyC();278
```

1     *Returns:* An estimate of the number of characters available in the sequence, or -1. If it returns a positive value, then successive calls to `underflow()` will not return `traits::eof()` until at least that number of characters have been extracted from the stream. If `showmanyC()` returns -1, then calls to `underflow()` or `uflow()` will fail.<sup>279</sup>

2     *Default behavior:* Returns zero.

3     *Remarks:* Uses `traits::eof()`.

```
streamsize xsgetn(char_type* s, streamsize n);
```

4     *Effects:* Assigns up to `n` characters to successive elements of the array whose first element is designated by `s`. The characters assigned are read from the input sequence as if by repeated calls to `sbumpc()`. Assigning stops when either `n` characters have been assigned or a call to `sbumpc()` would return `traits::eof()`.

5     *Returns:* The number of characters assigned.<sup>280</sup>

6     *Remarks:* Uses `traits::eof()`.

```
int_type underflow();
```

7     The *pending sequence* of characters is defined as the concatenation of

- (7.1) — the empty sequence if `gptr()` is null, otherwise the characters in `[gptr(), egptr()]`, followed by
- (7.2) — some (possibly empty) sequence of characters read from the input sequence.

8     The *result character* is the first character of the pending sequence if it is non-empty, otherwise the next character that would be read from the input sequence.

9     The *backup sequence* is the empty sequence if `eback()` is null, otherwise the characters in `[eback(), gptr()]`.

10    *Effects:* The function sets up the `gptr()` and `egptr()` such that if the pending sequence is non-empty, then `egptr()` is non-null and the characters in `[gptr(), egptr()]` are the characters in the pending sequence, otherwise either `gptr()` is null or `gptr() == egptr()`.

11    If `eback()` and `gptr()` are non-null then the function is not constrained as to their contents, but the “usual backup condition” is that either

- (11.1) — the backup sequence contains at least `gptr() - eback()` characters, in which case the characters in `[eback(), gptr()]` agree with the last `gptr() - eback()` characters of the backup sequence, or
- (11.2) — the characters in `[gptr() - n, gptr()]` agree with the backup sequence (where `n` is the length of the backup sequence).

<sup>278</sup>) The morphemes of `showmanyC` are “es-how-many-see”, not “show-manic”.

<sup>279</sup>) `underflow` or `uflow` can fail by throwing an exception prematurely. The intention is not only that the calls will not return `eof()` but that they will return “immediately”.

<sup>280</sup>) Classes derived from `basic_streampbuf` can provide more efficient ways to implement `xsgetn()` and `xspoutn()` by overriding these definitions from the base class.

12     *Returns:* traits::to\_int\_type(c), where c is the first character of the pending sequence, without moving the input sequence position past it. If the pending sequence is null then the function returns traits::eof() to indicate failure.

13     *Default behavior:* Returns traits::eof().

14     *Remarks:* The public members of basic\_streambuf call this virtual function only if gptr() is null or gptr() >= egptr().

```
int_type uflow();
```

15     *Preconditions:* The constraints are the same as for underflow(), except that the result character is transferred from the pending sequence to the backup sequence, and the pending sequence is not empty before the transfer.

16     *Default behavior:* Calls underflow(). If underflow() returns traits::eof(), returns traits::eof(). Otherwise, returns the value of traits::to\_int\_type(\*gptr()) and increments the value of the next pointer for the input sequence.

17     *Returns:* traits::eof() to indicate failure.

### 31.6.3.5.4 Putback

[streambuf.virt.pback]

```
int_type pbackfail(int_type c = traits::eof());
```

1     The pending sequence is defined as for underflow(), with the modifications that

- (1.1) — If traits::eq\_int\_type(c, traits::eof()) returns true, then the input sequence is backed up one character before the pending sequence is determined.
- (1.2) — If traits::eq\_int\_type(c, traits::eof()) returns false, then c is prepended. Whether the input sequence is backed up or modified in any other way is unspecified.

2     *Postconditions:* On return, the constraints of gptr(), eback(), and pptr() are the same as for underflow().

3     *Returns:* traits::eof() to indicate failure. Failure may occur because the input sequence cannot be backed up, or if for some other reason the pointers cannot be set consistent with the constraints. pbackfail() is called only when put back has really failed.

4     Returns some value other than traits::eof() to indicate success.

5     *Default behavior:* Returns traits::eof().

6     *Remarks:* The public functions of basic\_streambuf call this virtual function only when gptr() is null, gptr() == eback(), or traits::eq(traits::to\_char\_type(c), gptr()[-1]) returns false. Other calls shall also satisfy that constraint.

### 31.6.3.5.5 Put area

[streambuf.virt.put]

```
streamsize xsputn(const char_type* s, streamsize n);
```

1     *Effects:* Writes up to n characters to the output sequence as if by repeated calls to sputc(c). The characters written are obtained from successive elements of the array whose first element is designated by s. Writing stops when either n characters have been written or a call to sputc(c) would return traits::eof(). It is unspecified whether the function calls overflow() when pptr() == eptr() becomes true or whether it achieves the same effects by other means.

2     *Returns:* The number of characters written.

```
int_type overflow(int_type c = traits::eof());
```

3     *Effects:* Consumes some initial subsequence of the characters of the pending sequence. The pending sequence is defined as the concatenation of

- (3.1) — the empty sequence if pbase() is null, otherwise the pptr() - pbase() characters beginning at pbase(), followed by
- (3.2) — the empty sequence if traits::eq\_int\_type(c, traits::eof()) returns true, otherwise the sequence consisting of c.

- 4     *Preconditions:* Every overriding definition of this virtual function obeys the following constraints:
- (4.1)   — The effect of consuming a character on the associated output sequence is specified.<sup>281</sup>
- (4.2)   — Let  $r$  be the number of characters in the pending sequence not consumed. If  $r$  is nonzero then `pbase()` and `pptr()` are set so that: `pptr() - pbase() == r` and the  $r$  characters starting at `pbase()` are the associated output stream. In case  $r$  is zero (all characters of the pending sequence have been consumed) then either `pbase()` is set to `nullptr`, or `pbase()` and `pptr()` are both set to the same non-null value.
- (4.3)   — The function may fail if either appending some character to the associated output stream fails or if it is unable to establish `pbase()` and `pptr()` according to the above rules.
- 5     *Returns:* `traits::eof()` or throws an exception if the function fails.
- Otherwise, returns some value other than `traits::eof()` to indicate success.<sup>282</sup>
- 6     *Default behavior:* Returns `traits::eof()`.
- 7     *Remarks:* The member functions `sputc()` and `sputn()` call this function in case that no room can be found in the put buffer enough to accommodate the argument character sequence.

## 31.7 Formatting and manipulators

[**iostream.format**]

### 31.7.1 Header <iostream> synopsis

[**istream.syn**]

```
namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_istream;

 using istream = basic_istream<char>;
 using wistream = basic_istream<wchar_t>;

 template<class charT, class traits = char_traits<charT>>
 class basic_iostream;

 using iostream = basic_iostream<char>;
 using wiostream = basic_iostream<wchar_t>;

 template<class charT, class traits>
 basic_istream<charT, traits>& ws(basic_istream<charT, traits>& is);

 template<class Istream, class T>
 Istream&& operator>>(Istream&& is, T&& x);
}
```

### 31.7.2 Header <ostream> synopsis

[**ostream.syn**]

```
namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_ostream;

 using ostream = basic_ostream<char>;
 using wostream = basic_ostream<wchar_t>;

 template<class charT, class traits>
 basic_ostream<charT, traits>& endl(basic_ostream<charT, traits>& os);
 template<class charT, class traits>
 basic_ostream<charT, traits>& ends(basic_ostream<charT, traits>& os);
 template<class charT, class traits>
 basic_ostream<charT, traits>& flush(basic_ostream<charT, traits>& os);
```

<sup>281</sup>) That is, for each class derived from a specialization of `basic_streambuf` in this Clause (31.8.2, 31.10.2), a specification of how consuming a character effects the associated output sequence is given. There is no requirement on a program-defined class.

<sup>282</sup>) Typically, `overflow` returns `c` to indicate success, except when `traits::eq_int_type(c, traits::eof())` returns `true`, in which case it returns `traits::not_eof(c)`.

```

template<class charT, class traits>
 basic_ostream<charT, traits>& emit_on_flush(basic_ostream<charT, traits>& os);
template<class charT, class traits>
 basic_ostream<charT, traits>& noemit_on_flush(basic_ostream<charT, traits>& os);
template<class charT, class traits>
 basic_ostream<charT, traits>& flush_emit(basic_ostream<charT, traits>& os);

template<class Ostream, class T>
 Ostream&& operator<<(Ostream&& os, const T& x);

// 31.7.6.3.5, print functions
template<class... Args>
 void print(ostream& os, format_string<Args...> fmt, Args&&... args);
template<class... Args>
 void println(ostream& os, format_string<Args...> fmt, Args&&... args);

void vprint_unicode(ostream& os, string_view fmt, format_args args);
void vprint_nonunicode(ostream& os, string_view fmt, format_args args);
}

```

### 31.7.3 Header <iomanip> synopsis

[iomanip.syn]

```

namespace std {
 unspecified resetiosflags(ios_base::fmtflags mask);
 unspecified setiosflags (ios_base::fmtflags mask);
 unspecified setbase(int base);
 template<class charT> unspecified setfill(charT c);
 unspecified setprecision(int n);
 unspecified setw(int n);
 template<class moneyT> unspecified get_money(moneyT& mon, bool intl = false);
 template<class moneyT> unspecified put_money(const moneyT& mon, bool intl = false);
 template<class charT> unspecified get_time(tm* tmb, const charT* fmt);
 template<class charT> unspecified put_time(const tm* tmb, const charT* fmt);

 template<class charT>
 unspecified quoted(const charT* s, charT delim = charT('\"'), charT escape = charT('\\'));

 template<class charT, class traits, class Allocator>
 unspecified quoted(const basic_string<charT, traits, Allocator>& s,

```

void vprint_unicode(string_view fmt, format_args args);
void vprint_unicode(FILE* stream, string_view fmt, format_args args);

void vprint_nonunicode(string_view fmt, format_args args);
void vprint_nonunicode(FILE* stream, string_view fmt, format_args args);
}

```

### 31.7.5 Input streams

[input.streams]

#### 31.7.5.1 General

[input.streams.general]

- 1 The header <iostream> defines two class templates and a function template that control input from a stream buffer, along with a function template that extracts from stream rvalues.

#### 31.7.5.2 Class template basic\_istream

[istream]

##### 31.7.5.2.1 General

[istream.general]

- 1 When a function is specified with a type placeholder of *extended-floating-point-type*, the implementation provides overloads for all cv-unqualified extended floating-point types (6.8.2) in lieu of *extended-floating-point-type*.

```

namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_istream : virtual public basic_ios<charT, traits> {
 public:
 // types (inherited from basic_ios (31.5.4))
 using char_type = charT;
 using int_type = typename traits::int_type;
 using pos_type = typename traits::pos_type;
 using off_type = typename traits::off_type;
 using traits_type = traits;

 // 31.7.5.2.2, constructor/destructor
 explicit basic_istream(basic_streambuf<charT, traits>* sb);
 virtual ~basic_istream();

 // 31.7.5.2.4, prefix/suffix
 class sentry;

 // 31.7.5.3, formatted input
 basic_istream& operator>>(basic_istream& (*pf)(basic_istream&));
 basic_istream& operator>>(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
 basic_istream& operator>>(ios_base& (*pf)(ios_base&));

 basic_istream& operator>>(bool& n);
 basic_istream& operator>>(short& n);
 basic_istream& operator>>(unsigned short& n);
 basic_istream& operator>>(int& n);
 basic_istream& operator>>(unsigned int& n);
 basic_istream& operator>>(long& n);
 basic_istream& operator>>(unsigned long& n);
 basic_istream& operator>>(long long& n);
 basic_istream& operator>>(unsigned long long& n);
 basic_istream& operator>>(float& f);
 basic_istream& operator>>(double& f);
 basic_istream& operator>>(long double& f);
 basic_istream& operator>>(extended-floating-point-type& f);

 basic_istream& operator>>(void*& p);
 basic_istream& operator>>(basic_streambuf<char_type, traits>* sb);

 // 31.7.5.4, unformatted input
 streamsize gcount() const;
 int_type get();
 basic_istream& get(char_type& c);
 basic_istream& get(char_type* s, streamsize n);

```

```

basic_istream& get(char_type* s, streamsize n, char_type delim);
basic_istream& get(basic_streambuf<char_type, traits>& sb);
basic_istream& get(basic_streambuf<char_type, traits>& sb, char_type delim);

basic_istream& getline(char_type* s, streamsize n);
basic_istream& getline(char_type* s, streamsize n, char_type delim);

basic_istream& ignore(streamsize n = 1, int_type delim = traits::eof());
int_type peek();
basic_istream& read (char_type* s, streamsize n);
streamsize readsome(char_type* s, streamsize n);

basic_istream& putback(char_type c);
basic_istream& unget();
int sync();

pos_type tellg();
basic_istream& seekg(pos_type);
basic_istream& seekg(off_type, ios_base::seekdir);

protected:
// 31.7.5.2.2, copy/move constructor
basic_istream(const basic_istream&) = delete;
basic_istream(basic_istream&& rhs);

// 31.7.5.2.3, assignment and swap
basic_istream& operator=(const basic_istream&) = delete;
basic_istream& operator=(basic_istream&& rhs);
void swap(basic_istream& rhs);
};

// 31.7.5.3.3, character extraction templates
template<class charT, class traits>
basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>&, charT&);
template<class traits>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, unsigned char&);
template<class traits>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, signed char&);

template<class charT, class traits, size_t N>
basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>&, charT(&)[N]);
template<class traits, size_t N>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, unsigned char(&)[N]);
template<class traits, size_t N>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, signed char(&)[N]);
}

```

- <sup>2</sup> The class template `basic_istream` defines a number of member function signatures that assist in reading and interpreting input from sequences controlled by a stream buffer.
- <sup>3</sup> Two groups of member function signatures share common properties: the *formatted input functions* (or *extractors*) and the *unformatted input functions*. Both groups of input functions are described as if they obtain (or *extract*) input *characters* by calling `rdbuf()>sbumpc()` or `rdbuf()>sgetc()`. They may use other public members of `istream`.

### 31.7.5.2.2 Constructors

[istream.cons]

```
explicit basic_istream(basic_streambuf<charT, traits>* sb);
```

- <sup>1</sup> *Effects:* Initializes the base class subobject with `basic_ios::init(sb)` (31.5.4.2).

- <sup>2</sup> *Postconditions:* `gcount() == 0`.

```
basic_istream(basic_istream&& rhs);
```

- <sup>3</sup> *Effects:* Default constructs the base class, copies the `gcount()` from `rhs`, calls `basic_ios<charT, traits>::move(rhs)` to initialize the base class, and sets the `gcount()` for `rhs` to 0.

```
virtual ~basic_istream();
```

4     *Remarks:* Does not perform any operations of `rdbuf()`.

### 31.7.5.2.3 Assignment and swap

[`istream.assign`]

```
basic_istream& operator=(basic_istream&& rhs);
```

1     *Effects:* Equivalent to: `swap(rhs)`.

2     *Returns:* `*this`.

```
void swap(basic_istream& rhs);
```

3     *Effects:* Calls `basic_ios<charT, traits>::swap(rhs)`. Exchanges the values returned by `gcount()` and `rhs.gcount()`.

### 31.7.5.2.4 Class `basic_istream::sentry`

[`istream.sentry`]

```
namespace std {
 template<class charT, class traits>
 class basic_istream<charT, traits>::sentry {
 bool ok_; // exposition only

 public:
 explicit sentry(basic_istream& is, bool noskipws = false);
 ~sentry();
 explicit operator bool() const { return ok_; }
 sentry(const sentry&) = delete;
 sentry& operator=(const sentry&) = delete;
 };
}
```

1     The class `sentry` defines a class that is responsible for doing exception safe prefix and suffix operations.

```
explicit sentry(basic_istream& is, bool noskipws = false);
```

2     *Effects:* If `is.good()` is `false`, calls `is.setstate(failbit)`. Otherwise, prepares for formatted or unformatted input. First, if `is.tie()` is not a null pointer, the function calls `is.tie()->flush()` to synchronize the output sequence with any associated external C stream. Except that this call can be suppressed if the put area of `is.tie()` is empty. Further an implementation is allowed to defer the call to `flush` until a call of `is.rdbuf()->underflow()` occurs. If no such call occurs before the `sentry` object is destroyed, the call to `flush` may be eliminated entirely.<sup>283</sup> If `noskipws` is zero and `is.flags() & ios_base::skipws` is nonzero, the function extracts and discards each character as long as the next available input character `c` is a whitespace character. If `is.rdbuf()->smpc()` or `is.rdbuf()->sgetc()` returns `traits::eof()`, the function calls `setstate(failbit | eofbit)` (which may throw `ios_base::failure`).

3     *Remarks:* The constructor

```
explicit sentry(basic_istream& is, bool noskipws = false)
```

uses the currently imbued locale in `is`, to determine whether the next input character is whitespace or not.

4     To decide if the character `c` is a whitespace character, the constructor performs as if it executes the following code fragment:

```
const ctype<charT>& ctype = use_facet<ctype<charT>>(is.getloc());
if (ctype.is(ctype.space, c) != 0)
 // c is a whitespace character.
```

5     If, after any preparation is completed, `is.good()` is `true`, `ok_ != false` otherwise, `ok_ == false`. During preparation, the constructor may call `setstate(failbit)` (which may throw `ios_base::failure` (31.5.4.4)).<sup>284</sup>

<sup>283</sup>) This will be possible only in functions that are part of the library. The semantics of the constructor used in user code is as specified.

<sup>284</sup>) The `sentry` constructor and destructor can also perform additional implementation-dependent operations.

```

~sentry();
6 Effects: None.

explicit operator bool() const;
7 Returns: ok_.

```

### 31.7.5.3 Formatted input functions

[istream.formatted]

#### 31.7.5.3.1 Common requirements

[istream.formatted.reqmts]

- 1 Each formatted input function begins execution by constructing an object of type `ios_base::iostate`, termed the local error state, and initializing it to `ios_base::goodbit`. It then creates an object of class `sentry` with the `noskipws` (second) argument `false`. If the `sentry` object returns `true`, when converted to a value of type `bool`, the function endeavors to obtain the requested input. Otherwise, if the `sentry` constructor exits by throwing an exception or if the `sentry` object produces `false` when converted to a value of type `bool`, the function returns without attempting to obtain any input. If `rdbuf() ->sbumpc()` or `rdbuf() ->sgetc()` returns `traits::eof()`, then `ios_base::eofbit` is set in the local error state and the input function stops trying to obtain the requested input. If an exception is thrown during input then `ios_base::badbit` is set in the local error state, `*this`'s error state is set to the local error state, and the exception is rethrown if `(exceptions() & badbit) != 0`. After extraction is done, the input function calls `setstate`, which sets `*this`'s error state to the local error state, and may throw an exception. In any case, the formatted input function destroys the `sentry` object. If no exception has been thrown, it returns `*this`.

#### 31.7.5.3.2 Arithmetic extractors

[istream.formatted.arithmetic]

```

basic_istream& operator>>(unsigned short& val);
basic_istream& operator>>(unsigned int& val);
basic_istream& operator>>(long& val);
basic_istream& operator>>(unsigned long& val);
basic_istream& operator>>(long long& val);
basic_istream& operator>>(unsigned long long& val);
basic_istream& operator>>(float& val);
basic_istream& operator>>(double& val);
basic_istream& operator>>(long double& val);
basic_istream& operator>>(bool& val);
basic_istream& operator>>(void*& val);

```

- 1 As in the case of the inserters, these extractors depend on the locale's `num_get<>` (30.4.3.2) object to perform parsing the input stream data. These extractors behave as formatted input functions (as described in 31.7.5.3.1). After a `sentry` object is constructed, the conversion occurs as if performed by the following code fragment, where `state` represents the input function's local error state:

```

using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
use_facet<numget>(loc).get(*this, 0, *this, state, val);

```

In the above fragment, `loc` stands for the private member of the `basic_ios` class.

NOTE 1: The first argument provides an object of the `istreambuf_iterator` class which is an iterator pointed to an input stream. It bypasses istreams and uses streambufs directly.

Class `locale` relies on this type as its interface to `istream`, so that it does not need to depend directly on `istream`.

```
basic_istream& operator>>(short& val);
```

- 2 The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

```

using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
long lval;
use_facet<numget>(loc).get(*this, 0, *this, state, lval);
if (lval < numeric_limits<short>::min()) {
 state |= ios_base::failbit;
 val = numeric_limits<short>::min();
} else if (numeric_limits<short>::max() < lval) {
 state |= ios_base::failbit;
 val = numeric_limits<short>::max();
} else

```

- `val = static_cast<short>(lval);`
- `basic_istream& operator>>(int& val);`
- 3 The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):
- ```
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
long lval;
use_facet<numget>(loc).get(*this, 0, *this, state, lval);
if (lval < numeric_limits<int>::min()) {
    state |= ios_base::failbit;
    val = numeric_limits<int>::min();
} else if (numeric_limits<int>::max() < lval) {
    state |= ios_base::failbit;
    val = numeric_limits<int>::max();
} else
    val = static_cast<int>(lval);
```
- `basic_istream& operator>>(extended-floating-point-type& val);`
- 4 If the floating-point conversion rank of *extended-floating-point-type* is not less than or equal to that of *long double*, then an invocation of the operator function is conditionally supported with implementation-defined semantics.
- 5 Otherwise, let FP be a standard floating-point type:
- (5.1) — if the floating-point conversion rank of *extended-floating-point-type* is less than or equal to that of *float*, then FP is *float*,
 - (5.2) — otherwise, if the floating-point conversion rank of *extended-floating-point-type* is less than or equal to that of *double*, then FP is *double*,
 - (5.3) — otherwise, FP is *long double*.
- 6 The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

```
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
FP fval;
use_facet<numget>(loc).get(*this, 0, *this, state, fval);
if (fval < -numeric_limits<extended-floating-point-type>::max()) {
    state |= ios_base::failbit;
    val = -numeric_limits<extended-floating-point-type>::max();
} else if (numeric_limits<extended-floating-point-type>::max() < fval) {
    state |= ios_base::failbit;
    val = numeric_limits<extended-floating-point-type>::max();
} else {
    val = static_cast<extended-floating-point-type>(fval);
}
```

NOTE 2: When the extended floating-point type has a floating-point conversion rank that is not equal to the rank of any standard floating-point type, then double rounding during the conversion can result in inaccurate results. `from_chars` can be used in situations where maximum accuracy is important.

31.7.5.3.3 basic_istream::operator>>

[istream.extractors]

`basic_istream& operator>>(basic_istream& (*pf)(basic_istream&));`

1 *Effects*: None. This extractor does not behave as a formatted input function (as described in 31.7.5.3.1).

2 *Returns*: `pf(*this)`.²⁸⁵

`basic_istream& operator>>(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));`

3 *Effects*: Calls `pf(*this)`. This extractor does not behave as a formatted input function (as described in 31.7.5.3.1).

4 *Returns*: `*this`.

²⁸⁵ See, for example, the function signature `ws(basic_istream&)` (31.7.5.5).

`basic_istream& operator>>(ios_base& (*pf)(ios_base&));`

5 *Effects:* Calls `pf(*this)`.²⁸⁶ This extractor does not behave as a formatted input function (as described in 31.7.5.3.1).

6 *Returns:* `*this`.

`template<class charT, class traits, size_t N>`
`basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& in, charT (&s)[N]);`
`template<class traits, size_t N>`
`basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, unsigned char (&s)[N]);`
`template<class traits, size_t N>`
`basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, signed char (&s)[N]);`

7 *Effects:* Behaves like a formatted input member (as described in 31.7.5.3.1) of `in`. After a `sentry` object is constructed, `operator>>` extracts characters and stores them into `s`. If `width()` is greater than zero, `n` is `min(size_t(width()), N)`. Otherwise `n` is `N`. `n` is the maximum number of characters stored.

8 Characters are extracted and stored until any of the following occurs:

(8.1) — `n-1` characters are stored;

(8.2) — end of file occurs on the input sequence;

(8.3) — letting `ct` be `use_facet<ctype<charT>>(in.getloc())`, `ct.is(ct.space, c)` is `true`.

9 `operator>>` then stores a null byte (`charT()`) in the next position, which may be the first position if no characters were extracted. `operator>>` then calls `width(0)`.

10 If the function extracted no characters, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

11 *Returns:* `in`.

`template<class charT, class traits>`
`basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& in, charT& c);`
`template<class traits>`
`basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, unsigned char& c);`
`template<class traits>`
`basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, signed char& c);`

12 *Effects:* Behaves like a formatted input member (as described in 31.7.5.3.1) of `in`. A character is extracted from `in`, if one is available, and stored in `c`. Otherwise, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

13 *Returns:* `in`.

`basic_istream& operator>>(basic_streambuf<charT, traits>* sb);`

14 *Effects:* Behaves as an unformatted input function (31.7.5.4). If `sb` is null, calls `setstate(fail-bit)`, which may throw `ios_base::failure` (31.5.4.4). After a `sentry` object is constructed, extracts characters from `*this` and inserts them in the output sequence controlled by `sb`. Characters are extracted and inserted until any of the following occurs:

(14.1) — end-of-file occurs on the input sequence;

(14.2) — inserting in the output sequence fails (in which case the character to be inserted is not extracted);

(14.3) — an exception occurs (in which case the exception is caught).

15 If the function inserts no characters, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

16 *Returns:* `*this`.

31.7.5.4 Unformatted input functions

[istream.unformatted]

- 1 Each unformatted input function begins execution by constructing an object of type `ios_base::iostate`, termed the local error state, and initializing it to `ios_base::goodbit`. It then creates an object of class `sentry` with the default argument `noskipws` (second) argument `true`. If the `sentry` object returns `true`,

²⁸⁶ See, for example, the function signature `dec(ios_base&)` (31.5.5.3).

when converted to a value of type `bool`, the function endeavors to obtain the requested input. Otherwise, if the `sentry` constructor exits by throwing an exception or if the `sentry` object produces `false`, when converted to a value of type `bool`, the function returns without attempting to obtain any input. In either case the number of extracted characters is set to 0; unformatted input functions taking a character array of nonzero size as an argument shall also store a null character (using `charT()`) in the first location of the array. If `rdbuf()>sbumpc()` or `rdbuf()>sgetc()` returns `traits::eof()`, then `ios_base::eofbit` is set in the local error state and the input function stops trying to obtain the requested input. If an exception is thrown during input then `ios_base::badbit` is set in the local error state, `*this`'s error state is set to the local error state, and the exception is rethrown if `(exceptions() & badbit) != 0`. If no exception has been thrown it stores the number of characters extracted in a member object. After extraction is done, the input function calls `setstate`, which sets `*this`'s error state to the local error state, and may throw an exception. In any event the `sentry` object is destroyed before leaving the unformatted input function.

`streamsize gcount() const;`

- 2 *Effects:* None. This member function does not behave as an unformatted input function (as described above).
- 3 *Returns:* The number of characters extracted by the last unformatted input member function called for the object. If the number cannot be represented, returns `numeric_limits<streamsize>::max()`.

`int_type get();`

- 4 *Effects:* Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts a character `c`, if one is available. Otherwise, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.
- 5 *Returns:* `c` if available, otherwise `traits::eof()`.

`basic_istream& get(char_type& c);`

- 6 *Effects:* Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts a character, if one is available, and assigns it to `c`.²⁸⁷ Otherwise, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.
- 7 *Returns:* `*this`.

`basic_istream& get(char_type* s, streamsize n, char_type delim);`

- 8 *Effects:* Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts characters and stores them into successive locations of an array whose first element is designated by `s`.²⁸⁸ Characters are extracted and stored until any of the following occurs:

- (8.1) — `n` is less than one or `n - 1` characters are stored;
- (8.2) — end-of-file occurs on the input sequence;
- (8.3) — `traits::eq(c, delim)` for the next available input character `c` (in which case `c` is not extracted).

- 9 If the function stores no characters, `ios_base::failbit` is set in the input function's local error state before `setstate` is called. In any case, if `n` is greater than zero it then stores a null character into the next successive location of the array.

- 10 *Returns:* `*this`.

`basic_istream& get(char_type* s, streamsize n);`

- 11 *Effects:* Calls `get(s, n, widen('\n'))`.

- 12 *Returns:* Value returned by the call.

`basic_istream& get(basic_streambuf<char_type, traits>& sb, char_type delim);`

- 13 *Effects:* Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts characters and inserts them in the output sequence controlled by `sb`. Characters are extracted and inserted until any of the following occurs:

- (13.1) — end-of-file occurs on the input sequence;

²⁸⁷) Note that this function is not overloaded on types `signed char` and `unsigned char`.

²⁸⁸) Note that this function is not overloaded on types `signed char` and `unsigned char`.

- (13.2) — inserting in the output sequence fails (in which case the character to be inserted is not extracted);
 (13.3) — `traits::eq(c, delim)` for the next available input character `c` (in which case `c` is not extracted);
 (13.4) — an exception occurs (in which case, the exception is caught but not rethrown).

14 If the function inserts no characters, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

15 *Returns:* `*this`.

```
basic_istream& get(basic_streambuf<char_type, traits>& sb);
```

16 *Effects:* Calls `get(sb, widen('\n'))`.

17 *Returns:* Value returned by the call.

```
basic_istream& getline(char_type* s, streamsize n, char_type delim);
```

18 *Effects:* Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts characters and stores them into successive locations of an array whose first element is designated by `s`.²⁸⁹ Characters are extracted and stored until one of the following occurs:

1. end-of-file occurs on the input sequence;
2. `traits::eq(c, delim)` for the next available input character `c` (in which case the input character is extracted but not stored);²⁹⁰
3. `n` is less than one or `n - 1` characters are stored (in which case the function calls `setstate(failbit)`).

19 These conditions are tested in the order shown.²⁹¹

20 If the function extracts no characters, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.²⁹²

21 In any case, if `n` is greater than zero, it then stores a null character (using `charT()`) into the next successive location of the array.

22 *Returns:* `*this`.

23 EXAMPLE:

```
#include <iostream>

int main() {
    using namespace std;
    const int line_buffer_size = 100;

    char buffer[line_buffer_size];
    int line_number = 0;
    while (cin.getline(buffer, line_buffer_size, '\n') || cin.gcount()) {
        int count = cin.gcount();
        if (cin.eof())
            cout << "Partial final line";      // cin.fail() is false
        else if (cin.fail()) {
            cout << "Partial long line";
            cin.clear(cin.rdstate() & ~ios_base::failbit);
        } else {
            count--;
            cout << "Line " << ++line_number;
        }
        cout << " (" << count << " chars): " << buffer << endl;
    }
}
```

²⁸⁹) Note that this function is not overloaded on types `signed char` and `unsigned char`.

²⁹⁰) Since the final input character is “extracted”, it is counted in the `gcount()`, even though it is not stored.

²⁹¹) This allows an input line which exactly fills the buffer, without setting `failbit`. This is different behavior than the historical AT&T implementation.

²⁹²) This implies an empty input line will not cause `failbit` to be set.

```
basic_istream& getline(char_type* s, streamsize n);
24   Returns: getline(s, n, widen('\n'))

basic_istream& ignore(streamsize n = 1, int_type delim = traits::eof());
25   Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, extracts characters and discards them. Characters are extracted until any of the following occurs:
(25.1)   — n != numeric_limits<streamsize>::max() (17.3.5) and n characters have been extracted so far
(25.2)   — end-of-file occurs on the input sequence (in which case the function calls setstate(eofbit), which may throw ios_base::failure (31.5.4.4));
(25.3)   — traits::eq_int_type(traits::to_int_type(c), delim) for the next available input character c (in which case c is extracted).

NOTE 1: The last condition will never occur if traits::eq_int_type(delim, traits::eof()).
```

26 Returns: ***this**.

```
int_type peek();
27   Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, reads but does not extract the current input character.
```

28 Returns: **traits::eof()** if **good()** is **false**. Otherwise, returns **rdbuf()>sgetc()**.

```
basic_istream& read(char_type* s, streamsize n);
29   Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, if !good() calls setstate(failbit) which may throw an exception, and return. Otherwise extracts characters and stores them into successive locations of an array whose first element is designated by s.293 Characters are extracted and stored until either of the following occurs:
(29.1)   — n characters are stored;
(29.2)   — end-of-file occurs on the input sequence (in which case the function calls setstate(failbit | eofbit), which may throw ios_base::failure (31.5.4.4)).
```

30 Returns: ***this**.

```
streamsize readsome(char_type* s, streamsize n);
31   Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, if !good() calls setstate(failbit) which may throw an exception, and return. Otherwise extracts characters and stores them into successive locations of an array whose first element is designated by s. If rdbuf()>in_avail() == -1, calls setstate(eofbit) (which may throw ios_base::failure (31.5.4.4)), and extracts no characters;
(31.1)   — If rdbuf()>in_avail() == 0, extracts no characters
(31.2)   — If rdbuf()>in_avail() > 0, extracts min(rdbuf()>in_avail(), n).
```

32 Returns: The number of characters extracted.

```
basic_istream& putback(char_type c);
33   Effects: Behaves as an unformatted input function (as described above), except that the function first clears eofbit. After constructing a sentry object, if !good() calls setstate(failbit) which may throw an exception, and return. If rdbuf() is not null, calls rdbuf()>sputbackc(c). If rdbuf() is null, or if sputbackc returns traits::eof(), calls setstate(badbit) (which may throw ios_base::failure (31.5.4.4)).
```

NOTE 2: This function extracts no characters, so the value returned by the next call to **gcount()** is 0.

34 Returns: ***this**.

²⁹³ Note that this function is not overloaded on types **signed char** and **unsigned char**.

`basic_istream& unget();`

- 35 *Effects:* Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`. After constructing a `sentry` object, if `!good()` calls `setstate(failbit)` which may throw an exception, and return. If `rdbuf()` is not null, calls `rdbuf() -> sungetc()`. If `rdbuf()` is null, or if `sungetc` returns `traits::eof()`, calls `setstate(badbit)` (which may throw `ios_base::failure` (31.5.4.4)).

NOTE 3: This function extracts no characters, so the value returned by the next call to `gcount()` is 0.

- 36 *Returns:* `*this`.

`int sync();`

- 37 *Effects:* Behaves as an unformatted input function (as described above), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `gcount()`. After constructing a `sentry` object, if `rdbuf()` is a null pointer, returns `-1`. Otherwise, calls `rdbuf() -> pubsync()` and, if that function returns `-1` calls `setstate(badbit)` (which may throw `ios_base::failure` (31.5.4.4)), and returns `-1`. Otherwise, returns zero.

`pos_type tellg();`

- 38 *Effects:* Behaves as an unformatted input function (as described above), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `gcount()`.

- 39 *Returns:* After constructing a `sentry` object, if `fail() != false`, returns `pos_type(-1)` to indicate failure. Otherwise, returns `rdbuf() -> pubseekoff(0, cur, in)`.

`basic_istream& seekg(pos_type pos);`

- 40 *Effects:* Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`, it does not count the number of characters extracted, and it does not affect the value returned by subsequent calls to `gcount()`. After constructing a `sentry` object, if `fail() != true`, executes `rdbuf() -> pubseekpos(pos, ios_base::in)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

- 41 *Returns:* `*this`.

`basic_istream& seekg(off_type off, ios_base::seekdir dir);`

- 42 *Effects:* Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`, does not count the number of characters extracted, and does not affect the value returned by subsequent calls to `gcount()`. After constructing a `sentry` object, if `fail() != true`, executes `rdbuf() -> pubseekoff(off, dir, ios_base::in)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

- 43 *Returns:* `*this`.

31.7.5.5 Standard basic_istream manipulators

[istream.manip]

- 1 Each instantiation of the function template specified in this subclause is a designated addressable function (16.4.5.2.1).

```
template<class charT, class traits>
basic_istream<charT, traits>& ws(basic_istream<charT, traits>& is);
```

- 2 *Effects:* Behaves as an unformatted input function (31.7.5.4), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `is.gcount()`. After constructing a `sentry` object extracts characters as long as the next available character `c` is whitespace or until there are no more characters in the sequence. Whitespace characters are distinguished with the same criterion as used by `sentry::sentry` (31.7.5.2.4). If `ws` stops extracting characters because there are no more available it sets `eofbit`, but not `failbit`.

- 3 *Returns:* `is`.

31.7.5.6 Rvalue stream extraction

[istream.rvalue]

```
template<class Istream, class T>
```

```
Iostream&& operator>>(Iostream&& is, T&& x);
```

¹ *Constraints:* The expression `is >> std::forward<T>(x)` is well-formed when treated as an unevaluated operand ([7.2.3](#)) and `Iostream` is publicly and unambiguously derived from `ios_base`.

² *Effects:* Equivalent to:

```
is >> std::forward<T>(x);
return std::move(is);
```

31.7.5.7 Class template `basic_iostream`

[`iostreamclass`]

31.7.5.7.1 General

[`iostreamclass.general`]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_iostream
        : public basic_istream<charT, traits>,
          public basic_ostream<charT, traits> {
    public:
        using char_type     = charT;
        using int_type      = typename traits::int_type;
        using pos_type      = typename traits::pos_type;
        using off_type      = typename traits::off_type;
        using traits_type   = traits;

        // 31.7.5.7.2, constructor
        explicit basic_iostream(basic_streambuf<charT, traits>* sb);

        // 31.7.5.7.3, destructor
        virtual ~basic_iostream();

    protected:
        // 31.7.5.7.2, constructor
        basic_iostream(const basic_iostream&) = delete;
        basic_iostream(basic_iostream&& rhs);

        // 31.7.5.7.4, assignment and swap
        basic_iostream& operator=(const basic_iostream&) = delete;
        basic_iostream& operator=(basic_iostream&& rhs);
        void swap(basic_iostream& rhs);
    };
}
```

¹ The class template `basic_iostream` inherits a number of functions that allow reading input and writing output to sequences controlled by a stream buffer.

31.7.5.7.2 Constructors

[`iostream.cons`]

```
explicit basic_iostream(basic_streambuf<charT, traits>* sb);
```

¹ *Effects:* Initializes the base class subobjects with `basic_istream<charT, traits>(sb)` ([31.7.5.2](#)) and `basic_ostream<charT, traits>(sb)` ([31.7.6.2](#)).

² *Postconditions:* `rdbuf() == sb` and `gcount() == 0`.

```
basic_iostream(basic_iostream&& rhs);
```

³ *Effects:* Move constructs from the rvalue `rhs` by constructing the `basic_istream` base class with `std::move(rhs)`.

31.7.5.7.3 Destructor

[`iostream.dest`]

```
virtual ~basic_iostream();
```

¹ *Remarks:* Does not perform any operations on `rdbuf()`.

31.7.5.7.4 Assignment and swap

[iostream.assign]

```
basic_iostream& operator=(basic_iostream&& rhs);
1   Effects: Equivalent to: swap(rhs).

void swap(basic_iostream& rhs);
2   Effects: Calls basic_istream<charT, traits>::swap(rhs).
```

31.7.6 Output streams

[output.streams]

31.7.6.1 General

[output.streams.general]

- 1 The header <iostream> defines a class template and several function templates that control output to a stream buffer, along with a function template that inserts into stream rvalues.

31.7.6.2 Class template basic_ostream

[ostream]

31.7.6.2.1 General

[ostream.general]

- 1 When a function has a parameter type *extended-floating-point-type*, the implementation provides overloads for all cv-unqualified extended floating-point types (6.8.2).

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ostream : virtual public basic_ios<charT, traits> {
        public:
            // types (inherited from basic_ios (31.5.4))
            using char_type     = charT;
            using int_type      = typename traits::int_type;
            using pos_type      = typename traits::pos_type;
            using off_type      = typename traits::off_type;
            using traits_type   = traits;

            // 31.7.6.2.2, constructor/destructor
            explicit basic_ostream(basic_streambuf<char_type, traits>* sb);
            virtual ~basic_ostream();

            // 31.7.6.2.4, prefix/suffix
            class sentry;

            // 31.7.6.3, formatted output
            basic_ostream& operator<<(basic_ostream& (*pf)(basic_ostream&));
            basic_ostream& operator<<(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
            basic_ostream& operator<<(ios_base& (*pf)(ios_base&));

            basic_ostream& operator<<(bool n);
            basic_ostream& operator<<(short n);
            basic_ostream& operator<<(unsigned short n);
            basic_ostream& operator<<(int n);
            basic_ostream& operator<<(unsigned int n);
            basic_ostream& operator<<(long n);
            basic_ostream& operator<<(unsigned long n);
            basic_ostream& operator<<(long long n);
            basic_ostream& operator<<(unsigned long long n);
            basic_ostream& operator<<(float f);
            basic_ostream& operator<<(double f);
            basic_ostream& operator<<(long double f);
            basic_ostream& operator<<(extended-floating-point-type f);

            basic_ostream& operator<<(const void* p);
            basic_ostream& operator<<(const volatile void* p);
            basic_ostream& operator<<(nullptr_t);
            basic_ostream& operator<<(basic_streambuf<char_type, traits>* sb);

            // 31.7.6.4, unformatted output
            basic_ostream& put(char_type c);
            basic_ostream& write(const char_type* s, streamsize n);
```

```

basic_ostream& flush();

// 31.7.6.2.5, seeks
pos_type tellp();
basic_ostream& seekp(pos_type);
basic_ostream& seekp(off_type, ios_base::seekdir);

protected:
// 31.7.6.2.2, copy/move constructor
basic_ostream(const basic_ostream&) = delete;
basic_ostream(basic_ostream&& rhs);

// 31.7.6.2.3, assignment and swap
basic_ostream& operator=(const basic_ostream&) = delete;
basic_ostream& operator=(basic_ostream&& rhs);
void swap(basic_ostream& rhs);
};

// 31.7.6.3.4, character inserters
template<class charT, class traits>

}

```

- 2 The class template `basic_ostream` defines a number of member function signatures that assist in formatting and writing output to output sequences controlled by a stream buffer.
- 3 Two groups of member function signatures share common properties: the *formatted output functions* (or *inserters*) and the *unformatted output functions*. Both groups of output functions generate (or *insert*) output *characters* by actions equivalent to calling `rdbuf()>sputc(int_type)`. They may use other public members of `basic_ostream` except that they shall not invoke any virtual members of `rdbuf()` except `overflow()`, `xputn()`, and `sync()`.
- 4 If one of these called functions throws an exception, then unless explicitly noted otherwise the output function sets `badbit` in the error state. If `badbit` is set in `exceptions()`, the output function rethrows the exception without completing its actions, otherwise it does not throw anything and proceeds as if the called function had returned a failure indication.
- 5 NOTE: The deleted overloads of `operator<<` prevent formatting characters as integers and strings as pointers.

31.7.6.2.2 Constructors

[`ostream.cons`]

```

explicit basic_ostream(basic_streambuf<charT, traits>* sb);

1   Effects: Initializes the base class subobject with basic_ios<charT, traits>::init(sb) (31.5.4.2).
2   Postconditions: rdbuf() == sb.

basic_ostream(basic_ostream&& rhs);

3   Effects: Move constructs from the rvalue rhs. This is accomplished by default constructing the base
           class and calling basic_ios<charT, traits>::move(rhs) to initialize the base class.

virtual ~basic_ostream();

4   Remarks: Does not perform any operations on rdbuf().

```

31.7.6.2.3 Assignment and swap

[`ostream.assign`]

```

basic_ostream& operator=(basic_ostream&& rhs);

1   Effects: Equivalent to: swap(rhs).
2   Returns: *this.

void swap(basic_ostream& rhs);

3   Effects: Calls basic_ios<charT, traits>::swap(rhs).

```

31.7.6.2.4 Class `basic_ostream::sentry`

[`ostream.sentry`]

```

namespace std {
    template<class charT, class traits>
    class basic_ostream<charT, traits>::sentry {
        bool ok_;           // exposition only
    }
}
```

```

public:
    explicit sentry(basic_ostream& os);
    ~sentry();
    explicit operator bool() const { return ok_; }

    sentry(const sentry&) = delete;
    sentry& operator=(const sentry&) = delete;
};

}

```

- ¹ The class **sentry** defines a class that is responsible for doing exception safe prefix and suffix operations.

```
explicit sentry(basic_ostream& os);
```

- ² If **os.good()** is nonzero, prepares for formatted or unformatted output. If **os.tie()** is not a null pointer, calls **os.tie()->flush()**.²⁹⁴

- ³ If, after any preparation is completed, **os.good()** is true, **ok_ == true** otherwise, **ok_ == false**. During preparation, the constructor may call **setstate(failbit)** (which may throw **ios_base::failure** (31.5.4.4)).²⁹⁵

```
~sentry();
```

- ⁴ If **(os.flags() & ios_base::unitbuf) && !uncaught_exceptions() && os.good() is true**, calls **os.rdbuf()->pubsync()**. If that function returns -1, sets **badbit** in **os.rdstate()** without propagating an exception.

```
explicit operator bool() const;
```

- ⁵ *Effects:* Returns **ok_**.

31.7.6.2.5 Seek members

[**ostream.seeks**]

- ¹ Each seek member function begins execution by constructing an object of class **sentry**. It returns by destroying the **sentry** object.

```
pos_type tellp();
```

- ² *Returns:* If **fail() != false**, returns **pos_type(-1)** to indicate failure. Otherwise, returns **rdbuf()->pubseekoff(0, cur, out)**.

```
basic_ostream& seekp(pos_type pos);
```

- ³ *Effects:* If **fail() != true**, executes **rdbuf()->pubseekpos(pos, ios_base::out)**. In case of failure, the function calls **setstate(failbit)** (which may throw **ios_base::failure**).

- ⁴ *Returns:* ***this**.

```
basic_ostream& seekp(off_type off, ios_base::seekdir dir);
```

- ⁵ *Effects:* If **fail() != true**, executes **rdbuf()->pubseekoff(off, dir, ios_base::out)**. In case of failure, the function calls **setstate(failbit)** (which may throw **ios_base::failure**).

- ⁶ *Returns:* ***this**.

31.7.6.3 Formatted output functions

[**ostream.formatted**]

31.7.6.3.1 Common requirements

[**ostream.formatted.reqmts**]

- ¹ Each formatted output function begins execution by constructing an object of class **sentry**. If that object returns **true** when converted to a value of type **bool**, the function endeavors to generate the requested output. If the generation fails, then the formatted output function does **setstate(ios_base::failbit)**, which can throw an exception. If an exception is thrown during output, then **ios_base::badbit** is set²⁹⁶ in ***this**'s error state. If **(exceptions()&badbit) != 0** then the exception is rethrown. Whether or not an exception is thrown, the **sentry** object is destroyed before leaving the formatted output function. If no exception is thrown, the result of the formatted output function is ***this**.

²⁹⁴) The call **os.tie()->flush()** does not necessarily occur if the function can determine that no synchronization is necessary.

²⁹⁵) The **sentry** constructor and destructor can also perform additional implementation-dependent operations.

²⁹⁶) This is done without causing an **ios_base::failure** to be thrown.

- ² The descriptions of the individual formatted output functions describe how they perform output and do not mention the `sentry` object.
- ³ If a formatted output function of a stream `os` determines padding, it does so as follows. Given a `charT` character sequence `seq` where `charT` is the character type of the stream, if the length of `seq` is less than `os.width()`, then enough copies of `os.fill()` are added to this sequence as necessary to pad to a width of `os.width()` characters. If `(os.flags() & ios_base::adjustfield) == ios_base::left` is `true`, the fill characters are placed after the character sequence; otherwise, they are placed before the character sequence.

31.7.6.3.2 Arithmetic inserters

[`ostream.inserters.arithmetic`]

```
basic_ostream& operator<<(bool val);
basic_ostream& operator<<(short val);
basic_ostream& operator<<(unsigned short val);
basic_ostream& operator<<(int val);
basic_ostream& operator<<(unsigned int val);
basic_ostream& operator<<(long val);
basic_ostream& operator<<(unsigned long val);
basic_ostream& operator<<(long long val);
basic_ostream& operator<<(unsigned long long val);
basic_ostream& operator<<(float val);
basic_ostream& operator<<(double val);
basic_ostream& operator<<(long double val);
basic_ostream& operator<<(const void* val);
```

- ¹ *Effects:* The classes `num_get<>` and `num_put<>` handle locale-dependent numeric formatting and parsing. These inserter functions use the imbued locale value to perform numeric formatting. When `val` is of type `bool`, `long`, `unsigned long`, `long long`, `unsigned long long`, `double`, `long double`, or `const void*`, the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(), val).failed();
```

When `val` is of type `short` the formatting conversion occurs as if it performed the following code fragment:

```
ios_base::fmtflags baseflags = ios_base::flags() & ios_base::basefield;
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(),
        baseflags == ios_base::oct || baseflags == ios_base::hex
        ? static_cast<long>(static_cast<unsigned short>(val))
        : static_cast<long>(val)).failed();
```

When `val` is of type `int` the formatting conversion occurs as if it performed the following code fragment:

```
ios_base::fmtflags baseflags = ios_base::flags() & ios_base::basefield;
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(),
        baseflags == ios_base::oct || baseflags == ios_base::hex
        ? static_cast<long>(static_cast<unsigned int>(val))
        : static_cast<long>(val)).failed();
```

When `val` is of type `unsigned short` or `unsigned int` the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(),
        static_cast<unsigned long>(val)).failed();
```

When `val` is of type `float` the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(),
```

`static_cast<double>(val)).failed();`

2 The first argument provides an object of the `ostreambuf_iterator<>` class which is an iterator for class `basic_ostream<>`. It bypasses `ostreams` and uses `streambufs` directly. Class `locale` relies on these types as its interface to `iostreams`, since for flexibility it has been abstracted away from direct dependence on `ostream`. The second parameter is a reference to the base class subobject of type `ios_base`. It provides formatting specifications such as field width, and a locale from which to obtain other facets. If `failed` is `true` then does `setstate(badbit)`, which may throw an exception, and returns.

3 *Returns:* `*this`.

`basic_ostream& operator<<(const volatile void* p);`

4 *Effects:* Equivalent to: `return operator<<(const_cast<const void*>(p));`

`basic_ostream& operator<<(extended-floating-point-type val);`

5 *Effects:* If the floating-point conversion rank of `extended-floating-point-type` is less than or equal to that of `double`, the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(),
        static_cast<double>(val)).failed();
```

Otherwise, if the floating-point conversion rank of `extended-floating-point-type` is less than or equal to that of `long double`, the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(),
        static_cast<long double>(val)).failed();
```

Otherwise, an invocation of the operator function is conditionally supported with implementation-defined semantics.

If `failed` is `true` then does `setstate(badbit)`, which may throw an exception, and returns.

6 *Returns:* `*this`.

31.7.6.3.3 `basic_ostream::operator<<`

[`ostream.inserters`]

`basic_ostream& operator<<(basic_ostream& (*pf)(basic_ostream&));`

1 *Effects:* None. Does not behave as a formatted output function (as described in [31.7.6.3.1](#)).

2 *Returns:* `pf(*this)`.²⁹⁷

`basic_ostream& operator<<(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));`

3 *Effects:* Calls `pf(*this)`. This inserter does not behave as a formatted output function (as described in [31.7.6.3.1](#)).

4 *Returns:* `*this`.²⁹⁸

`basic_ostream& operator<<(ios_base& (*pf)(ios_base&));`

5 *Effects:* Calls `pf(*this)`. This inserter does not behave as a formatted output function (as described in [31.7.6.3.1](#)).

6 *Returns:* `*this`.

`basic_ostream& operator<<(basic_streambuf<charT, traits>* sb);`

7 *Effects:* Behaves as an unformatted output function ([31.7.6.4](#)). After the `sentry` object is constructed, if `sb` is null calls `setstate(badbit)` (which may throw `ios_base::failure`).

8 Gets characters from `sb` and inserts them in `*this`. Characters are read from `sb` and inserted until any of the following occurs:

²⁹⁷) See, for example, the function signature `endl(basic_ostream&)` ([31.7.6.5](#)).

²⁹⁸) See, for example, the function signature `dec(ios_base&)` ([31.5.5.3](#)).

- (8.1) — end-of-file occurs on the input sequence;
 (8.2) — inserting in the output sequence fails (in which case the character to be inserted is not extracted);
 (8.3) — an exception occurs while getting a character from `sb`.

9 If the function inserts no characters, it calls `setstate(failbit)` (which may throw `ios_base::failure` (31.5.4.4)). If an exception was thrown while extracting a character, the function sets `failbit` in the error state, and if `failbit` is set in `exceptions()` the caught exception is rethrown.

10 *Returns:* `*this`.

```
basic_ostream& operator<<(nullptr_t);
```

11 *Effects:* Equivalent to:

```
return *this << s;
```

where `s` is an implementation-defined NTCTS (3.36).

31.7.6.3.4 Character inserter function templates

[ostream.inserters.character]

```
template<class charT, class traits>
  basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, charT c);
template<class charT, class traits>
  basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, char c);
// specialization
template<class traits>
  basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, char c);
// signed and unsigned
template<class traits>
  basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, signed char c);
template<class traits>
  basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, unsigned char c);
```

1 *Effects:* Behaves as a formatted output function (31.7.6.3.1) of `out`. Constructs a character sequence `seq`. If `c` has type `char` and the character type of the stream is not `char`, then `seq` consists of `out.widen(c)`; otherwise `seq` consists of `c`. Determines padding for `seq` as described in 31.7.6.3.1. Inserts `seq` into `out`. Calls `os.width(0)`.

2 *Returns:* `out`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, const charT* s);
template<class charT, class traits>
  basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, const char* s);
template<class traits>
  basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, const char* s);
template<class traits>
  basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, const signed char* s);
template<class traits>
  basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out,
                                              const unsigned char* s);
```

3 *Preconditions:* `s` is not a null pointer.

4 *Effects:* Behaves like a formatted inserter (as described in 31.7.6.3.1) of `out`. Creates a character sequence `seq` of `n` characters starting at `s`, each widened using `out.widen()` (31.5.4.3), where `n` is the number that would be computed as if by:

(4.1) — `traits::length(s)` for the overload where the first argument is of type `basic_ostream<charT, traits>&` and the second is of type `const charT*`, and also for the overload where the first argument is of type `basic_ostream<char, traits>&` and the second is of type `const char*`,

(4.2) — `char_traits<char>::length(s)` for the overload where the first argument is of type `basic_ostream<charT, traits>&` and the second is of type `const char*`,

(4.3) — `traits::length(reinterpret_cast<const char*>(s))` for the other two overloads.

Determines padding for `seq` as described in 31.7.6.3.1. Inserts `seq` into `out`. Calls `width(0)`.

5 *Returns:* `out`.

31.7.6.3.5 Print**[ostream.formatted.print]**

```
template<class... Args>
void print(ostream& os, format_string<Args...> fmt, Args&&... args);
1   Effects: If the ordinary literal encoding (5.3) is UTF-8, equivalent to:
           vprint_unicode(os, fmt.str, make_format_args(std::forward<Args>(args)...));
Otherwise, equivalent to:
           vprint_nonunicode(os, fmt.str, make_format_args(std::forward<Args>(args)...));
```

```
template<class... Args>
void println(ostream& os, format_string<Args...> fmt, Args&&... args);
```

2 Effects: Equivalent to:

```
print(os, "{}\n", format(fmt, std::forward<Args>(args)...));
```

```
void vprint_unicode(ostream& os, string_view fmt, format_args args);
void vprint_nonunicode(ostream& os, string_view fmt, format_args args);
```

3 Effects: Behaves as a formatted output function (31.7.6.3.1) of os, except that:

- (3.1) — failure to generate output is reported as specified below, and
- (3.2) — any exception thrown by the call to vformat is propagated without regard to the value of os.exceptions() and without turning on ios_base::badbit in the error state of os.

After constructing a **sentry** object, the function initializes an automatic variable via

```
string out = vformat(os.getloc(), fmt, args);
```

If the function is **vprint_unicode** and os is a stream that refers to a terminal capable of displaying Unicode which is determined in an implementation-defined manner, writes out to the terminal using the native Unicode API; if out contains invalid code units, the behavior is undefined and implementations are encouraged to diagnose it. If the native Unicode API is used, the function flushes os before writing out. Otherwise (if os is not such a stream or the function is **vprint_nonunicode**), inserts the character sequence [out.begin(), out.end()) into os. If writing to the terminal or inserting into os fails, calls os.setstate(ios_base::badbit) (which may throw ios_base::failure).

- 4 Recommended practice: For **vprint_unicode**, if invoking the native Unicode API requires transcoding, implementations should substitute invalid code units with U+FFFD REPLACEMENT CHARACTER per the Unicode Standard, Chapter 3.9 U+FFFD Substitution in Conversion.

31.7.6.4 Unformatted output functions**[ostream.unformatted]**

- 1 Each unformatted output function begins execution by constructing an object of class **sentry**. If that object returns **true**, while converting to a value of type **bool**, the function endeavors to generate the requested output. If an exception is thrown during output, then **ios_base::badbit** is set²⁹⁹ in *this's error state. If (exceptions() & badbit) != 0 then the exception is rethrown. In any case, the unformatted output function ends by destroying the **sentry** object, then, if no exception was thrown, returning the value specified for the unformatted output function.

```
basic_ostream& put(char_type c);
```

- 2 Effects: Behaves as an unformatted output function (as described above). After constructing a **sentry** object, inserts the character c, if possible.³⁰⁰

- 3 Otherwise, calls **setstate(badbit)** (which may throw **ios_base::failure** (31.5.4.4)).

- 4 Returns: *this.

```
basic_ostream& write(const char_type* s, streamsize n);
```

- 5 Effects: Behaves as an unformatted output function (as described above). After constructing a **sentry** object, obtains characters to insert from successive locations of an array whose first element is designated by s.³⁰¹ Characters are inserted until either of the following occurs:

- (5.1) — n characters are inserted;

²⁹⁹ This is done without causing an **ios_base::failure** to be thrown.

³⁰⁰ Note that this function is not overloaded on types **signed char** and **unsigned char**.

³⁰¹ Note that this function is not overloaded on types **signed char** and **unsigned char**.

(5.2) — inserting in the output sequence fails (in which case the function calls `setstate(badbit)`, which may throw `ios_base::failure` (31.5.4.4)).

6 >Returns: `*this`.

`basic_ostream& flush();`

7 *Effects:* Behaves as an unformatted output function (as described above). If `rdbuf()` is not a null pointer, constructs a `sentry` object. If that object returns `true` when converted to a value of type `bool` the function calls `rdbuf()>pubsync()`. If that function returns `-1` calls `setstate(badbit)` (which may throw `ios_base::failure` (31.5.4.4)). Otherwise, if the `sentry` object returns `false`, does nothing.

8 >Returns: `*this`.

31.7.6.5 Standard manipulators

[`ostream.manip`]

1 Each instantiation of any of the function templates specified in this subclause is a designated addressable function (16.4.5.2.1).

```
template<class charT, class traits>
    basic_ostream<charT, traits>& endl(basic_ostream<charT, traits>& os);
```

2 *Effects:* Calls `os.put(os.widen('\n'))`, then `os.flush()`.

3 >Returns: `os`.

```
template<class charT, class traits>
    basic_ostream<charT, traits>& ends(basic_ostream<charT, traits>& os);
```

4 *Effects:* Inserts a null character into the output sequence: calls `os.put(charT())`.

5 >Returns: `os`.

```
template<class charT, class traits>
    basic_ostream<charT, traits>& flush(basic_ostream<charT, traits>& os);
```

6 *Effects:* Calls `os.flush()`.

7 >Returns: `os`.

```
template<class charT, class traits>
    basic_ostream<charT, traits>& emit_on_flush(basic_ostream<charT, traits>& os);
```

8 *Effects:* If `os.rdbuf()` is a `basic_syncbuf<charT, traits, Allocator>*`, called `buf` for the purpose of exposition, calls `buf->set_emit_on_sync(true)`. Otherwise this manipulator has no effect.

NOTE: To work around the issue that the `Allocator` template argument cannot be deduced, implementations can introduce an intermediate base class to `basic_syncbuf` that manages its `emit_on_sync` flag.

9 >Returns: `os`.

```
template<class charT, class traits>
    basic_ostream<charT, traits>& noemit_on_flush(basic_ostream<charT, traits>& os);
```

10 *Effects:* If `os.rdbuf()` is a `basic_syncbuf<charT, traits, Allocator>*`, called `buf` for the purpose of exposition, calls `buf->set_emit_on_sync(false)`. Otherwise this manipulator has no effect.

11 >Returns: `os`.

```
template<class charT, class traits>
    basic_ostream<charT, traits>& flush_emit(basic_ostream<charT, traits>& os);
```

12 *Effects:* Calls `os.flush()`. Then, if `os.rdbuf()` is a `basic_syncbuf<charT, traits, Allocator>*`, called `buf` for the purpose of exposition, behaves as an unformatted output function (31.7.6.4) of `os`. After constructing a `sentry` object, calls `buf->emit()`. If that call returns `false`, calls `os.setstate(ios_base::badbit)`.

13 >Returns: `os`.

31.7.6.6 Rvalue stream insertion

[`ostream.rvalue`]

```
template<class Ostream, class T>
```

```
Ostream&& operator<<(Ostream&& os, const T& x);
```

¹ *Constraints:* The expression `os << x` is well-formed when treated as an unevaluated operand and `Ostream` is publicly and unambiguously derived from `ios_base`.

² *Effects:* As if by: `os << x;`

³ *Returns:* `std::move(os)`.

31.7.7 Standard manipulators

[**std.manip**]

¹ The header `<iomanip>` defines several functions that support extractors and inserters that alter information maintained by class `ios_base` and its derived classes.

```
unspecified resetiosflags(ios_base::fmtflags mask);
```

² *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << resetiosflags(mask)` behaves as if it called `f(out, mask)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> resetiosflags(mask)` behaves as if it called `f(in, mask)`, where the function `f` is defined as:³⁰²

```
void f(ios_base& str, ios_base::fmtflags mask) {
    // reset specified flags
    str.setf(ios_base::fmtflags(0), mask);
}
```

The expression `out << resetiosflags(mask)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> resetiosflags(mask)` has type `basic_istream<charT, traits>&` and value `in`.

```
unspecified setiosflags(ios_base::fmtflags mask);
```

³ *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setiosflags(mask)` behaves as if it called `f(out, mask)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setiosflags(mask)` behaves as if it called `f(in, mask)`, where the function `f` is defined as:

```
void f(ios_base& str, ios_base::fmtflags mask) {
    // set specified flags
    str.setf(mask);
}
```

The expression `out << setiosflags(mask)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setiosflags(mask)` has type `basic_istream<charT, traits>&` and value `in`.

```
unspecified setbase(int base);
```

⁴ *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setbase(base)` behaves as if it called `f(out, base)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setbase(base)` behaves as if it called `f(in, base)`, where the function `f` is defined as:

```
void f(ios_base& str, int base) {
    // set basefield
    str.setf(base == 8 ? ios_base::oct :
        base == 10 ? ios_base::dec :
        base == 16 ? ios_base::hex :
        ios_base::fmtflags(0), ios_base::basefield);
}
```

The expression `out << setbase(base)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setbase(base)` has type `basic_istream<charT, traits>&` and value `in`.

³⁰²) The expression `cin >> resetiosflags(ios_base::skipws)` clears `ios_base::skipws` in the format flags stored in the `basic_istream<charT, traits>` object `cin` (the same as `cin >> noskipws`), and the expression `cout << resetiosflags(ios_base::showbase)` clears `ios_base::showbase` in the format flags stored in the `basic_ostream<charT, traits>` object `cout` (the same as `cout << noshowbase`).

unspecified `setfill(char_type c);`

- 5 *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` and `c` has type `charT` then the expression `out << setfill(c)` behaves as if it called `f(out, c)`, where the function `f` is defined as:

```
template<class charT, class traits>
void f(basic_ios<charT, traits>& str, charT c) {
    // set fill character
    str.fill(c);
}
```

The expression `out << setfill(c)` has type `basic_ostream<charT, traits>&` and value `out`.

unspecified `setprecision(int n);`

- 6 *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setprecision(n)` behaves as if it called `f(out, n)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setprecision(n)` behaves as if it called `f(in, n)`, where the function `f` is defined as:

```
void f(ios_base& str, int n) {
    // set precision
    str.precision(n);
}
```

The expression `out << setprecision(n)` has type `basic_ostream<charT, traits>&` and value `out`.
The expression `in >> setprecision(n)` has type `basic_istream<charT, traits>&` and value `in`.

unspecified `setw(int n);`

- 7 *Returns:* An object of unspecified type such that if `out` is an instance of `basic_ostream<charT, traits>` then the expression `out << setw(n)` behaves as if it called `f(out, n)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setw(n)` behaves as if it called `f(in, n)`, where the function `f` is defined as:

```
void f(ios_base& str, int n) {
    // set width
    str.width(n);
}
```

The expression `out << setw(n)` has type `basic_ostream<charT, traits>&` and value `out`.
The expression `in >> setw(n)` has type `basic_istream<charT, traits>&` and value `in`.

31.7.8 Extended manipulators

[ext.manip]

- 1 The header `<iomanip>` defines several functions that support extractors and inserters that allow for the parsing and formatting of sequences and values for money and time.

`template<class moneyT> unspecified get_money(moneyT& mon, bool intl = false);`

- 2 *Mandates:* The type `moneyT` is either `long double` or a specialization of the `basic_string` template ([Clause 23](#)).

- 3 *Effects:* The expression `in >> get_money(mon, intl)` described below behaves as a formatted input function ([31.7.5.3.1](#)).

- 4 *Returns:* An object of unspecified type such that if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> get_money(mon, intl)` behaves as if it called `f(in, mon, intl)`, where the function `f` is defined as:

```
template<class charT, class traits, class moneyT>
void f(basic_ios<charT, traits>& str, moneyT& mon, bool intl) {
    using Iter      = istreambuf_iterator<charT, traits>;
    using MoneyGet = money_get<charT, Iter>;

    ios_base::iostate err = ios_base::goodbit;
    const MoneyGet& mg = use_facet<MoneyGet>(str.getloc());

    mg.get(Iter(str.rdbuf()), Iter(), intl, str, err, mon);
```

```

    if (ios_base::goodbit != err)
        str.setstate(err);
}

```

The expression `in >> get_money(mon, intl)` has type `basic_istream<charT, traits>&` and value `in`.

```
template<class moneyT> unspecified put_money(const moneyT& mon, bool intl = false);
```

5 *Mandates*: The type `moneyT` is either `long double` or a specialization of the `basic_string` template ([Clause 23](#)).

6 *Returns*: An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << put_money(mon, intl)` behaves as a formatted output function ([31.7.6.3.1](#)) that calls `f(out, mon, intl)`, where the function `f` is defined as:

```

template<class charT, class traits, class moneyT>
void f(basic_ios<charT, traits>& str, const moneyT& mon, bool intl) {
    using Iter      = ostreambuf_iterator<charT, traits>;
    using MoneyPut = money_put<charT, Iter>;

    const MoneyPut& mp = use_facet<MoneyPut>(str.getloc());
    const Iter end = mp.put(Iter(str.rdbuf()), intl, str, str.fill(), mon);

    if (end.failed())
        str.setstate(ios_base::badbit);
}

```

The expression `out << put_money(mon, intl)` has type `basic_ostream<charT, traits>&` and value `out`.

```
template<class charT> unspecified get_time(tm* tmb, const charT* fmt);
```

7 *Preconditions*: The argument `tmb` is a valid pointer to an object of type `tm`, and `[fmt, fmt + char_traits<charT>::length(fmt)]` is a valid range.

8 *Returns*: An object of unspecified type such that if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> get_time(tmb, fmt)` behaves as if it called `f(in, tmb, fmt)`, where the function `f` is defined as:

```

template<class charT, class traits>
void f(basic_ios<charT, traits>& str, tm* tmb, const charT* fmt) {
    using Iter      = istreambuf_iterator<charT, traits>;
    using TimeGet = time_get<charT, Iter>;

    ios_base::iostate err = ios_base::goodbit;
    const TimeGet& tg = use_facet<TimeGet>(str.getloc());

    tg.get(Iter(str.rdbuf()), Iter(), str, err, tmb,
           fmt, fmt + traits::length(fmt));

    if (err != ios_base::goodbit)
        str.setstate(err);
}

```

The expression `in >> get_time(tmb, fmt)` has type `basic_istream<charT, traits>&` and value `in`.

```
template<class charT> unspecified put_time(const tm* tmb, const charT* fmt);
```

9 *Preconditions*: The argument `tmb` is a valid pointer to an object of type `tm`, and `[fmt, fmt + char_traits<charT>::length(fmt)]` is a valid range.

10 *Returns*: An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << put_time(tmb, fmt)` behaves as if it called `f(out, tmb, fmt)`, where the function `f` is defined as:

```

template<class charT, class traits>
void f(basic_ios<charT, traits>& str, const tm* tmb, const charT* fmt) {
    using Iter      = ostreambuf_iterator<charT, traits>;

```

```

using TimePut = time_put<charT, Iter>;
const TimePut& tp = use_facet<TimePut>(str.getloc());
const Iter end = tp.put(Iter(str.rdbuf()), str, str.fill(), tmb,
    fmt, fmt + traits::length(fmt));
if (end.failed())
    str.setstate(ios_base::badbit);
}

```

The expression `out << put_time(tmb, fmt)` has type `basic_ostream<charT, traits>&` and value `out`.

31.7.9 Quoted manipulators

[quoted.manip]

- ¹ NOTE: Quoted manipulators provide string insertion and extraction of quoted strings (for example, XML and CSV formats). Quoted manipulators are useful in ensuring that the content of a string with embedded spaces remains unchanged if inserted and then extracted via stream I/O.

```

template<class charT>
unspecified quoted(const charT* s, charT delim = charT('\"'), charT escape = charT('\\'));
template<class charT, class traits, class Allocator>
unspecified quoted(const basic_string<charT, traits, Allocator>& s,
    charT delim = charT('\"'), charT escape = charT('\\'));
template<class charT, class traits>
unspecified quoted(basic_string_view<charT, traits> s,
    charT delim = charT('\"'), charT escape = charT('\\'));

```

- ² Returns: An object of unspecified type such that if `out` is an instance of `basic_ostream` with member type `char_type` the same as `charT` and with member type `traits_type`, which in the second and third forms is the same as `traits`, then the expression `out << quoted(s, delim, escape)` behaves as a formatted output function (31.7.6.3.1) of `out`. This forms a character sequence `seq`, initially consisting of the following elements:

- (2.1) — `delim`.
- (2.2) — Each character in `s`. If the character to be output is equal to `escape` or `delim`, as determined by `traits_type::eq`, first output `escape`.
- (2.3) — `delim`.

Let `x` be the number of elements initially in `seq`. Then padding is determined for `seq` as described in 31.7.6.3.1, `seq` is inserted as if by calling `out.rdbuf()>-sputn(seq, n)`, where `n` is the larger of `out.width()` and `x`, and `out.width(0)` is called. The expression `out << quoted(s, delim, escape)` has type `basic_ostream<charT, traits>&` and value `out`.

```

template<class charT, class traits, class Allocator>
unspecified quoted(basic_string<charT, traits, Allocator>& s,
    charT delim = charT('\"'), charT escape = charT('\\'));

```

- ³ Returns: An object of unspecified type such that:

- (3.1) — If `in` is an instance of `basic_istream` with member types `char_type` and `traits_type` the same as `charT` and `traits`, respectively, then the expression `in >> quoted(s, delim, escape)` behaves as if it extracts the following characters from `in` using operator`>>(basic_istream<charT, traits>&, charT&)` (31.7.5.3.3) which may throw `ios_base::failure` (31.5.2.2.1):
 - (3.1.1) — If the first character extracted is equal to `delim`, as determined by `traits_type::eq`, then:
 - (3.1.1.1) — Turn off the `skipws` flag.
 - (3.1.1.2) — `s.clear()`
 - (3.1.1.3) — Until an unescaped `delim` character is reached or `!in`, extract characters from `in` and append them to `s`, except that if an `escape` is reached, ignore it and append the next character to `s`.
 - (3.1.1.4) — Discard the final `delim` character.
 - (3.1.1.5) — Restore the `skipws` flag to its original value.

- (3.1.2) — Otherwise, `in >> s.`
- (3.2) — If `out` is an instance of `basic_ostream` with member types `char_type` and `traits_type` the same as `charT` and `traits`, respectively, then the expression `out << quoted(s, delim, escape)` behaves as specified for the const `basic_string<charT, traits, Allocator>&` overload of the `quoted` function.
- (3.3) — The expression `in >> quoted(s, delim, escape)` has type `basic_istream<charT, traits>&` and value `in`.
- (3.4) — The expression `out << quoted(s, delim, escape)` has type `basic_ostream<charT, traits>&` and value `out`.

31.7.10 Print functions

[print.fun]

```
template<class... Args>
void print(format_string<Args...> fmt, Args&&... args);
```

1 *Effects:* Equivalent to:

```
print(stdout, fmt, std::forward<Args>(args)...);
```

```
template<class... Args>
void print(FILE* stream, format_string<Args...> fmt, Args&&... args);
```

2 *Effects:* If the ordinary literal encoding (5.3) is UTF-8, equivalent to:

```
vprint_unicode(stream, fmt.str, make_format_args(std::forward<Args>(args)...));
```

Otherwise, equivalent to:

```
vprint_nonunicode(stream, fmt.str, make_format_args(std::forward<Args>(args)...));
```

```
template<class... Args>
void println(format_string<Args...> fmt, Args&&... args);
```

3 *Effects:* Equivalent to:

```
println(stdout, fmt, std::forward<Args>(args)...);
```

```
template<class... Args>
void println(FILE* stream, format_string<Args...> fmt, Args&&... args);
```

4 *Effects:* Equivalent to:

```
print(stream, "{}\n", format(fmt, std::forward<Args>(args)...));
```

```
void vprint_unicode(string_view fmt, format_args args);
```

5 *Effects:* Equivalent to:

```
vprint_unicode(stdout, fmt, args);
```

```
void vprint_unicode(FILE* stream, string_view fmt, format_args args);
```

6 *Preconditions:* `stream` is a valid pointer to an output C stream.

7 *Effects:* The function initializes an automatic variable via

```
string out = vformat(fmt, args);
```

If `stream` refers to a terminal capable of displaying Unicode, writes `out` to the terminal using the native Unicode API; if `out` contains invalid code units, the behavior is undefined and implementations are encouraged to diagnose it. Otherwise writes `out` to `stream` unchanged. If the native Unicode API is used, the function flushes `stream` before writing `out`.

NOTE 1: On POSIX and Windows, `stream` referring to a terminal means that, respectively, `isatty(fileno(stream))` and `GetConsoleMode(_get_osfhandle(_fileno(stream)), ...)` return nonzero.

NOTE 2: On Windows, the native Unicode API is `WriteConsoleW`.

8 *Throws:* Any exception thrown by the call to `vformat` (22.14.3). `system_error` if writing to the terminal or `stream` fails. May throw `bad_alloc`.

9 *Recommended practice:* If invoking the native Unicode API requires transcoding, implementations should substitute invalid code units with U+FFFD REPLACEMENT CHARACTER per the Unicode Standard, Chapter 3.9 U+FFFD Substitution in Conversion.

```

void vprint_nonunicode(string_view fmt, format_args args);
10   Effects: Equivalent to:
      vprint_nonunicode(stdout, fmt, args);

void vprint_nonunicode(FILE* stream, string_view fmt, format_args args);
11   Preconditions: stream is a valid pointer to an output C stream.
12   Effects: Writes the result of vformat(fmt, args) to stream.
13   Throws: Any exception thrown by the call to vformat (22.14.3). system_error if writing to stream
fails. May throw bad_alloc.

```

31.8 String-based streams

[string.streams]

31.8.1 Header <sstream> synopsis

[sstream.syn]

```

namespace std {
    template<class charT, class traits = char_traits<charT>,
              class Allocator = allocator<charT>>
    class basic_stringbuf;

    template<class charT, class traits, class Allocator>
    void swap(basic_stringbuf<charT, traits, Allocator>& x,
              basic_stringbuf<charT, traits, Allocator>& y) noexcept(noexcept(x.swap(y)));

    using stringbuf = basic_stringbuf<char>;
    using wstringbuf = basic_stringbuf<wchar_t>;

    template<class charT, class traits = char_traits<charT>,
              class Allocator = allocator<charT>>
    class basic_istringstream;

    template<class charT, class traits, class Allocator>
    void swap(basic_istringstream<charT, traits, Allocator>& x,
              basic_istringstream<charT, traits, Allocator>& y);

    using istringstream = basic_istringstream<char>;
    using wistringstream = basic_istringstream<wchar_t>;

    template<class charT, class traits = char_traits<charT>,
              class Allocator = allocator<charT>>
    class basic_ostringstream;

    template<class charT, class traits, class Allocator>
    void swap(basic_ostringstream<charT, traits, Allocator>& x,
              basic_ostringstream<charT, traits, Allocator>& y);

    using ostringstream = basic_ostringstream<char>;
    using wostringstream = basic_ostringstream<wchar_t>;

    template<class charT, class traits = char_traits<charT>,
              class Allocator = allocator<charT>>
    class basic_stringstream;

    template<class charT, class traits, class Allocator>
    void swap(basic_stringstream<charT, traits, Allocator>& x,
              basic_stringstream<charT, traits, Allocator>& y);

    using stringstream = basic_stringstream<char>;
    using wstringstream = basic_stringstream<wchar_t>;
}

```

¹ The header <sstream> defines four class templates and eight types that associate stream buffers with objects of class `basic_string`, as described in 23.4.

31.8.2 Class template `basic_stringbuf`

31.8.2.1 General

[`stringbuf`
[`stringbuf.general`]]

```

namespace std {
    template<class charT, class traits = char_traits<charT>,
              class Allocator = allocator<charT>>
    class basic_stringbuf : public basic_streambuf<charT, traits> {
public:
    using char_type      = charT;
    using int_type       = typename traits::int_type;
    using pos_type        = typename traits::pos_type;
    using off_type        = typename traits::off_type;
    using traits_type     = traits;
    using allocator_type  = Allocator;

    // 31.8.2.2, constructors
    basic_stringbuf() : basic_stringbuf(ios_base::in | ios_base::out) {}
    explicit basic_stringbuf(ios_base::openmode which);
    explicit basic_stringbuf(
        const basic_string<charT, traits, Allocator>& s,
        ios_base::openmode which = ios_base::in | ios_base::out);
    explicit basic_stringbuf(const Allocator& a)
        : basic_stringbuf(ios_base::in | ios_base::out, a){}
    basic_stringbuf(ios_base::openmode which, const Allocator& a);
    explicit basic_stringbuf(
        basic_string<charT, traits, Allocator>&& s,
        ios_base::openmode which = ios_base::in | ios_base::out);
    template<class SAlloc>
    basic_stringbuf(
        const basic_string<charT, traits, SAlloc>& s, const Allocator& a)
        : basic_stringbuf(s, ios_base::in | ios_base::out, a){}
    template<class SAlloc>
    basic_stringbuf(
        const basic_string<charT, traits, SAlloc>& s,
        ios_base::openmode which, const Allocator& a);
    template<class SAlloc>
    explicit basic_stringbuf(
        const basic_string<charT, traits, SAlloc>& s,
        ios_base::openmode which = ios_base::in | ios_base::out);
    basic_stringbuf(const basic_stringbuf&) = delete;
    basic_stringbuf(basic_stringbuf&& rhs);
    basic_stringbuf(basic_stringbuf&& rhs, const Allocator& a);

    // 31.8.2.3, assignment and swap
    basic_stringbuf& operator=(const basic_stringbuf&) = delete;
    basic_stringbuf& operator=(basic_stringbuf&& rhs);
    void swap(basic_stringbuf& rhs) noexcept(see below);

    // 31.8.2.4, getters and setters
    allocator_type get_allocator() const noexcept;

    basic_string<charT, traits, Allocator> str() const &;
    template<class SAlloc>
        basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
    basic_string<charT, traits, Allocator> str() &&;
    basic_string_view<charT, traits> view() const noexcept;

    void str(const basic_string<charT, traits, Allocator>& s);
    template<class SAlloc>
        void str(const basic_string<charT, traits, SAlloc>& s);
    void str(basic_string<charT, traits, Allocator>&& s);
}

```

```

protected:
// 31.8.2.5, overridden virtual functions
int_type underflow() override;
int_type pbackfail(int_type c = traits::eof()) override;
int_type overflow (int_type c = traits::eof()) override;
basic_streambuf<charT, traits>* setbuf(charT*, streamsize) override;

pos_type seekoff(off_type off, ios_base::seekdir way,
ios_base::openmode which
= ios_base::in | ios_base::out) override;

ios_base::openmode which
= ios_base::in | ios_base::out) override;

private:
ios_base::openmode mode; // exposition only
basic_string<charT, traits, Allocator> buf; // exposition only
void init_buf_ptrs(); // exposition only
};

}
}

```

- 1 The class **basic_stringbuf** is derived from **basic_streambuf** to associate possibly the input sequence and possibly the output sequence with a sequence of arbitrary *characters*. The sequence can be initialized from, or made available as, an object of class **basic_string**.
- 2 For the sake of exposition, the maintained data and internal pointer initialization is presented here as:
 - (2.1) — **ios_base::openmode mode**, has **in** set if the input sequence can be read, and **out** set if the output sequence can be written.
 - (2.2) — **basic_string<charT, traits, Allocator> buf** contains the underlying character sequence.
 - (2.3) — **init_buf_ptrs()** sets the base class' get area (31.6.3.4.2) and put area (31.6.3.4.3) pointers after initializing, moving from, or assigning to **buf** accordingly.

31.8.2.2 Constructors

[stringbuf.cons]

```
explicit basic_stringbuf(ios_base::openmode which);
```

- 1 *Effects*: Initializes the base class with **basic_streambuf()** (31.6.3.2), and **mode** with **which**. It is implementation-defined whether the sequence pointers (**eback()**, **gptr()**, **egptr()**, **pbase()**, **pptr()**, **epptr()**) are initialized to null pointers.
- 2 *Postconditions*: **str().empty()** is true.

```
explicit basic_stringbuf(
const basic_string<charT, traits, Allocator>& s,
ios_base::openmode which = ios_base::in | ios_base::out);
```

- 3 *Effects*: Initializes the base class with **basic_streambuf()** (31.6.3.2), **mode** with **which**, and **buf** with **s**, then calls **init_buf_ptrs()**.

```
basic_stringbuf(ios_base::openmode which, const Allocator &a);
```

- 4 *Effects*: Initializes the base class with **basic_streambuf()** (31.6.3.2), **mode** with **which**, and **buf** with **a**, then calls **init_buf_ptrs()**.

- 5 *Postconditions*: **str().empty()** is true.

```
explicit basic_stringbuf(
basic_string<charT, traits, Allocator>&& s,
ios_base::openmode which = ios_base::in | ios_base::out);
```

- 6 *Effects*: Initializes the base class with **basic_streambuf()** (31.6.3.2), **mode** with **which**, and **buf** with **std::move(s)**, then calls **init_buf_ptrs()**.

```
template<class SAlloc>
basic_stringbuf(
const basic_string<charT, traits, SAlloc>& s,
```

ios_base::openmode which, const Allocator &a);

7 *Effects:* Initializes the base class with basic_streambuf() (31.6.3.2), mode with which, and buf with {s,a}, then calls init_buf_ptrs().

```
template<class SAlloc>
explicit basic_stringbuf(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::in | ios_base::out);
```

8 *Constraints:* is_same_v<SAlloc, Allocator> is false.

9 *Effects:* Initializes the base class with basic_streambuf() (31.6.3.2), mode with which, and buf with s, then calls init_buf_ptrs().

```
basic_stringbuf(basic_stringbuf&& rhs);
basic_stringbuf(basic_stringbuf&& rhs, const Allocator& a);
```

10 *Effects:* Copy constructs the base class from rhs and initializes mode with rhs.mode. In the first form buf is initialized from std::move(rhs).str(). In the second form buf is initialized from {std::move(rhs).str(), a}. It is implementation-defined whether the sequence pointers in *this (eback(), gptr(), egptr(), pbase(), pptr(), epptr()) obtain the values which rhs had.

11 *Postconditions:* Let rhs_p refer to the state of rhs just prior to this construction and let rhs_a refer to the state of rhs just after this construction.

(11.1) — str() == rhs_p.str()
 (11.2) — gptr() - eback() == rhs_p.gptr() - rhs_p.eback()
 (11.3) — egptr() - eback() == rhs_p.egptr() - rhs_p.eback()
 (11.4) — pptr() - pbase() == rhs_p.pptr() - rhs_p.pbase()
 (11.5) — epptr() - pbase() == rhs_p.epptr() - rhs_p.pbase()
 (11.6) — if (eback()) eback() != rhs_a.eback()
 (11.7) — if (gptr()) gptr() != rhs_a.gptr()
 (11.8) — if (egptr()) egptr() != rhs_a.egptr()
 (11.9) — if (pbase()) pbase() != rhs_a.pbase()
 (11.10) — if (pptr()) pptr() != rhs_a.pptr()
 (11.11) — if (epptr()) epptr() != rhs_a.epptr()
 (11.12) — getloc() == rhs_p.getloc()
 (11.13) — rhs is empty but usable, as if std::move(rhs).str() was called.

31.8.2.3 Assignment and swap

[stringbuf.assign]

```
basic_stringbuf& operator=(basic_stringbuf&& rhs);
```

1 *Effects:* After the move assignment *this has the observable state it would have had if it had been move constructed from rhs (see 31.8.2.2).

2 *Returns:* *this.

```
void swap(basic_stringbuf& rhs) noexcept(see below);
```

3 *Preconditions:* allocator_traits<Allocator>::propagate_on_container_swap::value is true or get_allocator() == rhs.get_allocator() is true.

4 *Effects:* Exchanges the state of *this and rhs.

5 *Remarks:* The exception specification is equivalent to:

```
allocator_traits<Allocator>::propagate_on_container_swap::value ||
allocator_traits<Allocator>::is_always_equal::value.
```

```
template<class charT, class traits, class Allocator>
void swap(basic_stringbuf<charT, traits, Allocator>& x,
          basic_stringbuf<charT, traits, Allocator>& y) noexcept(noexcept(x.swap(y)));
```

6 *Effects:* Equivalent to: x.swap(y).

31.8.2.4 Member functions

[**stringbuf.members**]

- ¹ The member functions getting the underlying character sequence all refer to a `high_mark` value, where `high_mark` represents the position one past the highest initialized character in the buffer. Characters can be initialized by writing to the stream, by constructing the `basic_stringbuf` passing a `basic_string` argument, or by calling one of the `str` member functions passing a `basic_string` as an argument. In the latter case, all characters initialized prior to the call are now considered uninitialized (except for those characters re-initialized by the new `basic_string`).

```
void init_buf_ptrs(); // exposition only
```

- ² *Effects:* Initializes the input and output sequences from `buf` according to `mode`.

³ *Postconditions:*

- (3.1) — If `ios_base::out` is set in `mode`, `pbase()` points to `buf.front()` and `epptr() >= pbase() + buf.size()` is true;
- (3.1.1) — in addition, if `ios_base::ate` is set in `mode`, `pptr() == pbase() + buf.size()` is true,
- (3.1.2) — otherwise `pptr() == pbase()` is true.
- (3.2) — If `ios_base::in` is set in `mode`, `eback()` points to `buf.front()`, and `(gptr() == eback() && egptr() == eback() + buf.size())` is true.

- ⁴ NOTE 1: For efficiency reasons, stream buffer operations can violate invariants of `buf` while it is held encapsulated in the `basic_stringbuf`, e.g., by writing to characters in the range `[buf.data() + buf.size(), buf.data() + buf.capacity()]`. All operations retrieving a `basic_string` from `buf` ensure that the `basic_string` invariants hold on the returned value.

```
allocator_type get_allocator() const noexcept;
```

- ⁵ *Returns:* `buf.get_allocator()`.

```
basic_string<charT, traits, Allocator> str() const &;
```

- ⁶ *Effects:* Equivalent to:

```
return basic_string<charT, traits, Allocator>(view(), get_allocator());
```

```
template<class SAlloc>
basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
```

- ⁷ *Constraints:* `SAlloc` is a type that qualifies as an allocator ([24.2.2.1](#)).

- ⁸ *Effects:* Equivalent to:

```
return basic_string<charT, traits, SAlloc>(view(), sa);
```

```
basic_string<charT, traits, Allocator> str() &&;
```

- ⁹ *Postconditions:* The underlying character sequence `buf` is empty and `pbase()`, `pptr()`, `epptr()`, `eback()`, `gptr()`, and `egptr()` are initialized as if by calling `init_buf_ptrs()` with an empty `buf`.

- ¹⁰ *Returns:* A `basic_string<charT, traits, Allocator>` object move constructed from the `basic_stringbuf`'s underlying character sequence in `buf`. This can be achieved by first adjusting `buf` to have the same content as `view()`.

```
basic_string_view<charT, traits> view() const noexcept;
```

- ¹¹ Let `sv` be `basic_string_view<charT, traits>`.

- ¹² *Returns:* A `sv` object referring to the `basic_stringbuf`'s underlying character sequence in `buf`:

- (12.1) — If `ios_base::out` is set in `mode`, then `sv(pbase(), high_mark-pbase())` is returned.
- (12.2) — Otherwise, if `ios_base::in` is set in `mode`, then `sv(eback(), egptr()-eback())` is returned.
- (12.3) — Otherwise, `sv()` is returned.

- ¹³ NOTE 2: Using the returned `sv` object after destruction or invalidation of the character sequence underlying `*this` is undefined behavior, unless `sv.empty()` is true.

```
void str(const basic_string<charT, traits, Allocator>& s);
```

- ¹⁴ *Effects:* Equivalent to:

```

    buf = s;
    init_buf_ptrs();

template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);

15   Constraints: is_same_v<SAlloc, Allocator> is false.
16   Effects: Equivalent to:
    buf = s;
    init_buf_ptrs();

void str(basic_string<charT, traits, Allocator>&& s);

17   Effects: Equivalent to:
    buf = std::move(s);
    init_buf_ptrs();

```

31.8.2.5 Overridden virtual functions

[stringbuf.virtuals]

```
int_type underflow() override;
```

1 *Returns:* If the input sequence has a read position available, returns `traits::to_int_type(*gptr())`. Otherwise, returns `traits::eof()`. Any character in the underlying buffer which has been initialized is considered to be part of the input sequence.

```
int_type pbackfail(int_type c = traits::eof()) override;
```

2 *Effects:* Puts back the character designated by `c` to the input sequence, if possible, in one of three ways:

(2.1) — If `traits::eq_int_type(c, traits::eof())` returns `false` and if the input sequence has a putback position available, and if `traits::eq(to_char_type(c), gptr()[-1])` returns `true`, assigns `gptr() - 1` to `gptr()`.

Returns: `c`.

(2.2) — If `traits::eq_int_type(c, traits::eof())` returns `false` and if the input sequence has a putback position available, and if `mode & ios_base::out` is nonzero, assigns `c` to `*--gptr()`.

Returns: `c`.

(2.3) — If `traits::eq_int_type(c, traits::eof())` returns `true` and if the input sequence has a putback position available, assigns `gptr() - 1` to `gptr()`.

Returns: `traits::not_eof(c)`.

3 *Returns:* As specified above, or `traits::eof()` to indicate failure.

4 *Remarks:* If the function can succeed in more than one of these ways, it is unspecified which way is chosen.

```
int_type overflow(int_type c = traits::eof()) override;
```

5 *Effects:* Appends the character designated by `c` to the output sequence, if possible, in one of two ways:

(5.1) — If `traits::eq_int_type(c, traits::eof())` returns `false` and if either the output sequence has a write position available or the function makes a write position available (as described below), the function calls `sputc(c)`.

Signals success by returning `c`.

(5.2) — If `traits::eq_int_type(c, traits::eof())` returns `true`, there is no character to append.

Signals success by returning a value other than `traits::eof()`.

6 *Returns:* As specified above, or `traits::eof()` to indicate failure.

7 *Remarks:* The function can alter the number of write positions available as a result of any call.

8 The function can make a write position available only if `ios_base::out` is set in `mode`. To make a write position available, the function reallocates (or initially allocates) an array object with a sufficient number of elements to hold the current array object (if any), plus at least one additional write position. If `ios_base::in` is set in `mode`, the function alters the read end pointer `egptr()` to point just past the new write position.

```
pos_type seekoff(off_type off, ios_base::seekdir way,
    ios_base::openmode which
    = ios_base::in | ios_base::out) override;
```

- 9 *Effects:* Alters the stream position within one of the controlled sequences, if possible, as indicated in [Table 126](#).

Table 126: `seekoff` positioning [tab:stringbuf.seekoff.pos]

Conditions	Result
<code>ios_base::in</code> is set in <code>which</code>	positions the input sequence
<code>ios_base::out</code> is set in <code>which</code>	positions the output sequence
both <code>ios_base::in</code> and <code>ios_base::out</code> are set in <code>which</code> and either <code>way == ios_base::beg</code> or <code>way == ios_base::end</code>	positions both the input and the output sequences
Otherwise	the positioning operation fails.

- 10 For a sequence to be positioned, the function determines `newoff` as indicated in [Table 127](#). If the sequence's next pointer (either `gptr()` or `pptr()`) is a null pointer and `newoff` is nonzero, the positioning operation fails.

Table 127: `newoff` values [tab:stringbuf.seekoff.newoff]

Condition	<code>newoff</code> Value
<code>way == ios_base::beg</code>	0
<code>way == ios_base::cur</code>	the next pointer minus the beginning pointer (<code>xnext - xbeg</code>).
<code>way == ios_base::end</code>	the high mark pointer minus the beginning pointer (<code>high_mark - xbeg</code>).

- 11 If $(\text{newoff} + \text{off}) < 0$, or if `newoff + off` refers to an uninitialized character ([31.8.2.4](#)), the positioning operation fails. Otherwise, the function assigns `xbeg + newoff + off` to the next pointer `xnext`.
- 12 *Returns:* `pos_type(newoff)`, constructed from the resultant offset `newoff` (of type `off_type`), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is `pos_type(off_type(-1))`.

```
pos_type seekpos(pos_type sp,
    ios_base::openmode which
    = ios_base::in | ios_base::out) override;
```

- 13 *Effects:* Equivalent to `seekoff(off_type(sp), ios_base::beg, which)`.

- 14 *Returns:* `sp` to indicate success, or `pos_type(off_type(-1))` to indicate failure.

```
basic_streambuf<charT, traits>* setbuf(charT* s, streamsize n) override;
```

- 15 *Effects:* implementation-defined, except that `setbuf(0, 0)` has no effect.

- 16 *Returns:* `this`.

31.8.3 Class template `basic_istringstream`

[`istringstream`]

31.8.3.1 General

[`istringstream.general`]

```
namespace std {
    template<class charT, class traits = char_traits<charT>,
              class Allocator = allocator<charT>>
    class basic_istringstream : public basic_istream<charT, traits> {
        public:
            using char_type      = charT;
```

```

using int_type      = typename traits::int_type;
using pos_type      = typename traits::pos_type;
using off_type      = typename traits::off_type;
using traits_type   = traits;
using allocator_type = Allocator;

// 31.8.3.2, constructors
basic_istringstream() : basic_istringstream(ios_base::in) {}
explicit basic_istringstream(ios_base::openmode which);
explicit basic_istringstream(
    const basic_string<charT, traits, Allocator>& s,
    ios_base::openmode which = ios_base::in);
basic_istringstream(ios_base::openmode which, const Allocator& a);
explicit basic_istringstream(
    basic_string<charT, traits, Allocator>&& s,
    ios_base::openmode which = ios_base::in);
template<class SAlloc>
basic_istringstream(
    const basic_string<charT, traits, SAlloc>& s, const Allocator& a)
: basic_istringstream(s, ios_base::in, a) {}
template<class SAlloc>
basic_istringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which, const Allocator& a);
template<class SAlloc>
explicit basic_istringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::in);
basic_istringstream(const basic_istringstream&) = delete;
basic_istringstream(basic_istringstream&& rhs);

basic_istringstream& operator=(const basic_istringstream&) = delete;
basic_istringstream& operator=(basic_istringstream&& rhs);

// 31.8.3.3, swap
void swap(basic_istringstream& rhs);

// 31.8.3.4, members
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
basic_string<charT, traits, Allocator> str() const &;
template<class SAlloc>
    basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
basic_string<charT, traits, Allocator> str() &&;
basic_string_view<charT, traits> view() const noexcept;

void str(const basic_string<charT, traits, Allocator>& s);
template<class SAlloc>
    void str(const basic_string<charT, traits, SAlloc>& s);
    void str(basic_string<charT, traits, Allocator>&& s);

private:
    basic_stringbuf<charT, traits, Allocator> sb; // exposition only
};

}

1 The class basic_istringstream<charT, traits, Allocator> supports reading objects of class basic_string<charT, traits, Allocator>. It uses a basic_stringbuf<charT, traits, Allocator> object to control the associated storage. For the sake of exposition, the maintained data is presented here as:
(1.1) — sb, the stringbuf object.

```

31.8.3.2 Constructors

[istringstream.cons]

```

explicit basic_istringstream(ios_base::openmode which);

1   Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (31.7.5.2)
           and sb with basic_stringbuf<charT, traits, Allocator>(which | ios_base::in) (31.8.2.2).

explicit basic_istringstream(
    const basic_string<charT, traits, Allocator>& s,
    ios_base::openmode which = ios_base::in);

2   Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (31.7.5.2)
           and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::in) (31.8.2.2).

basic_istringstream(ios_base::openmode which, const Allocator& a);

3   Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (31.7.5.2)
           and sb with basic_stringbuf<charT, traits, Allocator>(which | ios_base::in, a) (31.8.2.2).

explicit basic_istringstream(
    basic_string<charT, traits, Allocator>&& s,
    ios_base::openmode which = ios_base::in);

4   Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (31.7.5.2)
           and sb with basic_stringbuf<charT, traits, Allocator>(std::move(s), which | ios_base::in) (31.8.2.2).

template<class SAlloc>
basic_istringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which, const Allocator& a);

5   Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (31.7.5.2)
           and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::in, a) (31.8.2.2).

template<class SAlloc>
explicit basic_istringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::in);

6   Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (31.7.5.2)
           and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::in) (31.8.2.2).

basic_istringstream(basic_istringstream&& rhs);

7   Effects: Move constructs from the rvalue rhs. This is accomplished by move constructing the
           base class, and the contained basic_stringbuf. Then calls basic_istream<charT, traits>::set-
           rdbuf(addressof(sb)) to install the contained basic_stringbuf.

```

31.8.3.3 Swap

[iostream.swap]

```

void swap(basic_istringstream& rhs);

1   Effects: Equivalent to:
            basic_istream<charT, traits>::swap(rhs);
            sb.swap(rhs.sb);

template<class charT, class traits, class Allocator>
void swap(basic_istringstream<charT, traits, Allocator>& x,
          basic_istringstream<charT, traits, Allocator>& y);

```

2 Effects: Equivalent to: x.swap(y).

31.8.3.4 Member functions

[iostream.members]

```

basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

1   Returns: const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(sb)).

```

```

basic_string<charT, traits, Allocator> str() const &;
2   Effects: Equivalent to: return rdbuf()->str();

template<class SAlloc>
basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
3   Effects: Equivalent to: return rdbuf()->str(sa);

basic_string<charT, traits, Allocator> str() &&;
4   Effects: Equivalent to: return std::move(*rdbuf()).str();

basic_string_view<charT, traits> view() const noexcept;
5   Effects: Equivalent to: return rdbuf()->view();

void str(const basic_string<charT, traits, Allocator>& s);
6   Effects: Equivalent to: rdbuf()->str(s);

template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);
7   Effects: Equivalent to: rdbuf()->str(s);

void str(basic_string<charT, traits, Allocator>&& s);
8   Effects: Equivalent to: rdbuf()->str(std::move(s));

```

31.8.4 Class template basic_ostringstream

[ostringstream]

31.8.4.1 General

[ostringstream.general]

```

namespace std {
    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_ostringstream : public basic_ostream<charT, traits> {
public:
    using char_type      = charT;
    using int_type       = typename traits::int_type;
    using pos_type       = typename traits::pos_type;
    using off_type       = typename traits::off_type;
    using traits_type    = traits;
    using allocator_type = Allocator;

// 31.8.4.2, constructors
basic_ostringstream() : basic_ostringstream(ios_base::out) {}
explicit basic_ostringstream(ios_base::openmode which);
explicit basic_ostringstream(
    const basic_string<charT, traits, Allocator>& s,
    ios_base::openmode which = ios_base::out);

    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::out);
basic_ostringstream(const basic_ostringstream&) = delete;
basic_ostringstream(basic_ostringstream&& rhs);

```

```

basic_ostringstream& operator=(const basic_ostringstream&) = delete;
basic_ostringstream& operator=(basic_ostringstream&& rhs);

// 31.8.4.3, swap
void swap(basic_ostringstream& rhs);

// 31.8.4.4, members
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

basic_string<charT, traits, Allocator> str() const &;
template<class SAlloc>
basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
basic_string<charT, traits, Allocator> str() &&;
basic_string_view<charT, traits> view() const noexcept;

void str(const basic_string<charT, traits, Allocator>& s);
template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);
void str(basic_string<charT, traits, Allocator>&& s);

private:
    basic_stringbuf<charT, traits, Allocator> sb; // exposition only
};

}

1 The class basic_ostringstream<charT, traits, Allocator> supports writing objects of class basic_string<charT, traits, Allocator>. It uses a basic_stringbuf object to control the associated storage. For the sake of exposition, the maintained data is presented here as:
(1.1) — sb, the stringbuf object.

```

31.8.4.2 Constructors

[`ostringstream.cons`]

```

explicit basic_ostringstream(ios_base::openmode which);

1 Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (31.7.6.2) and sb with basic_stringbuf<charT, traits, Allocator>(which | ios_base::out) (31.8.2.2).

explicit basic_ostringstream(
    const basic_string<charT, traits, Allocator>& s,
    ios_base::openmode which = ios_base::out);

2 Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (31.7.6.2) and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out) (31.8.2.2).

basic_ostringstream(ios_base::openmode which, const Allocator& a);

3 Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (31.7.6.2) and sb with basic_stringbuf<charT, traits, Allocator>(which | ios_base::out, a) (31.8.2.2).

explicit basic_ostringstream(
    basic_string<charT, traits, Allocator>&& s,
    ios_base::openmode which = ios_base::out);

4 Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (31.7.6.2) and sb with basic_stringbuf<charT, traits, Allocator>(std::move(s), which | ios_base::out) (31.8.2.2).

template<class SAlloc>
basic_ostringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which, const Allocator& a);

5 Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (31.7.6.2) and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out, a) (31.8.2.2).

```

```

template<class SAlloc>
explicit basic_ostringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::out);

6   Constraints: is_same_v<SAlloc, Allocator> is false.

7   Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (31.7.6.2)
        and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out)
        (31.8.2.2).

    basic_ostringstream(basic_ostringstream&& rhs);

8   Effects: Move constructs from the rvalue rhs. This is accomplished by move constructing the
        base class, and the contained basic_stringbuf. Then calls basic_ostream<charT, traits>::set_-_
        rdbuf(addressof(sb)) to install the contained basic_stringbuf.

```

31.8.4.3 Swap[`ostringstream.swap`]

```

void swap(basic_ostringstream& rhs);

1   Effects: Equivalent to:
    basic_ostream<charT, traits>::swap(rhs);
    sb.swap(rhs.sb);

template<class charT, class traits, class Allocator>
void swap(basic_ostringstream<charT, traits, Allocator>& x,
          basic_ostringstream<charT, traits, Allocator>& y);

2   Effects: Equivalent to: x.swap(y).

```

31.8.4.4 Member functions[`ostringstream.members`]

```

basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
1   Returns: const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(sb)).

    basic_string<charT, traits, Allocator> str() &&;
    basic_string_view<charT, traits> view() const noexcept;

    void str(const basic_string<charT, traits, Allocator>& s);
    template<class SAlloc>
    void str(const basic_string<charT, traits, SAlloc>& s);
    void str(basic_string<charT, traits, Allocator>&& s);

private:
    basic_stringbuf<charT, traits> sb; // exposition only
};

}

1 The class template basic_stringstream<charT, traits> supports reading and writing from objects of class basic_string<charT, traits, Allocator>. It uses a basic_stringbuf<charT, traits, Allocator> object to control the associated sequence. For the sake of exposition, the maintained data is presented here as
(1.1) — sb, the stringbuf object.

```

31.8.5.2 Constructors

[stringstream.cons]

```

explicit basic_stringstream(ios_base::openmode which);

1   Effects: Initializes the base class with basic_iostream<charT, traits>(addressof(sb)) (31.7.5.7.2)
            and sb with basic_stringbuf<charT, traits, Allocator>(which).

explicit basic_stringstream(
    const basic_string<charT, traits, Allocator>& s,
    ios_base::openmode which = ios_base::out | ios_base::in);

2   Effects: Initializes the base class with basic_iostream<charT, traits>(addressof(sb)) (31.7.5.7.2)
            and sb with basic_stringbuf<charT, traits, Allocator>(s, which).

basic_stringstream(ios_base::openmode which, const Allocator& a);

3   Effects: Initializes the base class with basic_iostream<charT, traits>(addressof(sb)) (31.7.5.7.2)
            and sb with basic_stringbuf<charT, traits, Allocator>(which, a) (31.8.2.2).

explicit basic_stringstream(
    basic_string<charT, traits, Allocator>&& s,
    ios_base::openmode which = ios_base::out | ios_base::in);

4   Effects: Initializes the base class with basic_iostream<charT, traits>(addressof(sb)) (31.7.5.7.2)
            and sb with basic_stringbuf<charT, traits, Allocator>(std::move(s), which) (31.8.2.2).

template<class SAlloc>
basic_stringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which, const Allocator& a);

5   Effects: Initializes the base class with basic_iostream<charT, traits>(addressof(sb)) (31.7.5.7.2)
            and sb with basic_stringbuf<charT, traits, Allocator>(s, which, a) (31.8.2.2).

template<class SAlloc>
explicit basic_stringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::out | ios_base::in);

6   Constraints: is_same_v<SAlloc, Allocator> is false.

7   Effects: Initializes the base class with basic_iostream<charT, traits>(addressof(sb)) (31.7.5.7.2)
            and sb with basic_stringbuf<charT, traits, Allocator>(s, which) (31.8.2.2).

basic_stringstream(basic_stringstream&& rhs);

8   Effects: Move constructs from the rvalue rhs. This is accomplished by move constructing the
            base class, and the contained basic_stringbuf. Then calls basic_istream<charT, traits>::set_
            rdbuf(addressof(sb)) to install the contained basic_stringbuf.

```

31.8.5.3 Swap

[stringstream.swap]

```

void swap(basic_stringstream& rhs);

1   Effects: Equivalent to:
            basic_iostream<charT, traits>::swap(rhs);
            sb.swap(rhs.sb);

template<class charT, class traits, class Allocator>
void swap(basic_stringstream<charT, traits, Allocator>& x,
          basic_stringstream<charT, traits, Allocator>& y);

2   Effects: Equivalent to: x.swap(y).

```

31.8.5.4 Member functions

[stringstream.members]

```

basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

1   Returns: const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(sb)).

```

```

basic_string<charT, traits, Allocator> str() const &;
2   Effects: Equivalent to: return rdbuf()->str();

template<class SAlloc>
basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
3   Effects: Equivalent to: return rdbuf()->str(sa);

basic_string<charT, traits, Allocator> str() &&;
4   Effects: Equivalent to: return std::move(*rdbuf()).str();

basic_string_view<charT, traits> view() const noexcept;
5   Effects: Equivalent to: return rdbuf()->view();

void str(const basic_string<charT, traits, Allocator>& s);
6   Effects: Equivalent to: rdbuf()->str(s);

template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);
7   Effects: Equivalent to: rdbuf()->str(s);

void str(basic_string<charT, traits, Allocator>&& s);
8   Effects: Equivalent to: rdbuf()->str(std::move(s));

```

31.9 Span-based streams

[span.streams]

31.9.1 Overview

[span.streams.overview]

- ¹ The header `<spanstream>` defines class templates and types that associate stream buffers with objects whose types are specializations of `span` as described in [24.7.2.2](#).

NOTE: A user of these classes is responsible for ensuring that the character sequence represented by the given `span` outlives the use of the sequence by objects of the classes in subclause [31.9](#). Using multiple `basic_spanbuf` objects referring to overlapping underlying sequences from different threads, where at least one `basic_spanbuf` object is used for writing to the sequence, results in a data race.

31.9.2 Header `<spanstream>` synopsis

[spanstream.syn]

```

namespace std {
    template<class charT, class traits = char_traits<charT>>
        class basic_spanbuf;

    template<class charT, class traits>
        void swap(basic_spanbuf<charT, traits>& x, basic_spanbuf<charT, traits>& y);

    using spanbuf = basic_spanbuf<char>;
    using wspanbuf = basic_spanbuf<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
        class basic_ispanstream;

    template<class charT, class traits>
        void swap(basic_ispanstream<charT, traits>& x, basic_ispanstream<charT, traits>& y);

    using ispanstream = basic_ispanstream<char>;
    using wispanstream = basic_ispanstream<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
        class basic_ospanstream;

    template<class charT, class traits>
        void swap(basic_ospanstream<charT, traits>& x, basic_ospanstream<charT, traits>& y);

    using ospanstream = basic_ospanstream<char>;
    using wospanstream = basic_ospanstream<wchar_t>;

```

```

template<class charT, class traits = char_traits<charT>>
class basic_spanstream;

template<class charT, class traits>
void swap(basic_spanstream<charT, traits>& x, basic_spanstream<charT, traits>& y);

using spanstream = basic_spanstream<char>;
using wspanstream = basic_spanstream<wchar_t>;
}

```

31.9.3 Class template basic_spanbuf

[spanbuf]

31.9.3.1 General

[spanbuf.general]

```

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_spanbuf
        : public basic_streambuf<charT, traits> {
    public:
        using char_type     = charT;
        using int_type      = typename traits::int_type;
        using pos_type       = typename traits::pos_type;
        using off_type       = typename traits::off_type;
        using traits_type   = traits;

        // 31.9.3.2, constructors
        basic_spanbuf() : basic_spanbuf(ios_base::in | ios_base::out) {}
        explicit basic_spanbuf(ios_base::openmode which)
            : basic_spanbuf(std::span<charT>(), which) {}
        explicit basic_spanbuf(std::span<charT> s,
                               ios_base::openmode which = ios_base::in | ios_base::out);
        basic_spanbuf(const basic_spanbuf&) = delete;
        basic_spanbuf(basic_spanbuf&& rhs);

        // 31.9.3.3, assignment and swap
        basic_spanbuf& operator=(const basic_spanbuf&) = delete;
        basic_spanbuf& operator=(basic_spanbuf&& rhs);
        void swap(basic_spanbuf& rhs);

        // 31.9.3.4, member functions
        std::span<charT> span() const noexcept;
        void span(std::span<charT> s) noexcept;

    protected:
        // 31.9.3.5, overridden virtual functions
        basic_streambuf<charT, traits>* setbuf(charT*, streamsize) override;
        pos_type seekoff(off_type off, ios_base::seekdir way,
                         ios_base::openmode which = ios_base::in | ios_base::out) override;
        pos_type seekpos(pos_type sp,
                         ios_base::openmode which = ios_base::in | ios_base::out) override;

    private:
        ios_base::openmode mode;           // exposition only
        std::span<charT> buf;             // exposition only
    };
}

```

- ¹ The class template **basic_spanbuf** is derived from **basic_streambuf** to associate possibly the input sequence and possibly the output sequence with a sequence of arbitrary characters. The sequence is provided by an object of class **span<charT>**.
- ² For the sake of exposition, the maintained data is presented here as:
 - (2.1) — **ios_base::openmode mode**, has **in** set if the input sequence can be read, and **out** set if the output sequence can be written.
 - (2.2) — **std::span<charT> buf** is the view to the underlying character sequence.

31.9.3.2 Constructors

[spanbuf.cons]

```
explicit basic_spanbuf(std::span<charT> s,
                      ios_base::openmode which = ios_base::in | ios_base::out);
```

1 *Effects:* Initializes the base class with `basic_streambuf()` (31.6.3.2), and `mode` with `which`. Initializes the internal pointers as if calling `span(s)`.

```
basic_spanbuf(basic_spanbuf&& rhs);
```

2 *Effects:* Initializes the base class with `std::move(rhs)` and `mode` with `std::move(rhs.mode)` and `buf` with `std::move(rhs.buf)`. The sequence pointers in `*this` (`eback()`, `gptr()`, `egptr()`, `pbase()`, `pptr()`, `epptr()`) obtain the values which `rhs` had. It is implementation-defined whether `rhs.buf.empty()` returns `true` after the move.

3 *Postconditions:* Let `rhs_p` refer to the state of `rhs` just prior to this construction.

- (3.1) — `span().data() == rhs_p.span().data()`
- (3.2) — `span().size() == rhs_p.span().size()`
- (3.3) — `eback() == rhs_p.eback()`
- (3.4) — `gptr() == rhs_p.gptr()`
- (3.5) — `egptr() == rhs_p.egptr()`
- (3.6) — `pbase() == rhs_p.pbase()`
- (3.7) — `pptr() == rhs_p.pptr()`
- (3.8) — `epptr() == rhs_p.epptr()`
- (3.9) — `getloc() == rhs_p.getloc()`

31.9.3.3 Assignment and swap

[spanbuf.assign]

```
basic_spanbuf& operator=(basic_spanbuf&& rhs);
```

1 *Effects:* Equivalent to:

```
basic_spanbuf tmp{std::move(rhs)};
this->swap(tmp);
return *this;
```

```
void swap(basic_spanbuf& rhs);
```

2 *Effects:* Equivalent to:

```
basic_streambuf<charT, traits>::swap(rhs);
std::swap(mode, rhs.mode);
std::swap(buf, rhs.buf);
```

```
template<class charT, class traits>
void swap(basic_spanbuf<charT, traits>& x, basic_spanbuf<charT, traits>& y);
```

3 *Effects:* Equivalent to `x.swap(y)`.

31.9.3.4 Member functions

[spanbuf.members]

```
std::span<charT> span() const noexcept;
```

1 *Returns:* If `ios_base::out` is set in `mode`, returns `std::span<charT>(pbase(), pptr())`, otherwise returns `buf`.

NOTE: In contrast to `basic_stringbuf`, the underlying sequence never grows and is not owned. An owning copy can be obtained by converting the result to `basic_string<charT>`.

```
void span(std::span<charT> s) noexcept;
```

2 *Effects:* `buf = s`. Initializes the input and output sequences according to `mode`.

3 *Postconditions:*

- (3.1) — If `ios_base::out` is set in `mode`, `pbase() == s.data() && epptr() == pbase() + s.size()` is true;
- (3.1.1) — in addition, if `ios_base::ate` is set in `mode`, `pptr() == pbase() + s.size()` is true,

- (3.1.2) — otherwise `pptr() == pbase()` is true.
- (3.2) — If `ios_base::in` is set in `mode`, `eback() == s.data() && gptr() == eback() && egptr() == eback() + s.size()` is true.

31.9.3.5 Overridden virtual functions

[`spanbuf.virtuals`]

- ¹ NOTE: Because the underlying buffer is of fixed size, neither `overflow`, `underflow`, nor `pbackfail` can provide useful behavior.

```
pos_type seekoff(off_type off, ios_base::seekdir way,
                 ios_base::openmode which = ios_base::in | ios_base::out) override;
```

- ² *Effects:* Alters the stream position within one or both of the controlled sequences, if possible, as follows:

- (2.1) — If `ios_base::in` is set in `which`, positions the input sequence; `xnext` is `gptr()`, `xbeg` is `eback()`.
- (2.2) — If `ios_base::out` is set in `which`, positions the output sequence; `xnext` is `pptr()`, `xbeg` is `pbase()`.

- ³ If both `ios_base::in` and `ios_base::out` are set in `which` and `way` is `ios_base::cur`, the positioning operation fails.

- ⁴ For a sequence to be positioned, if its next pointer `xnext` (either `gptr()` or `pptr()`) is a null pointer and the new offset `newoff` as computed below is nonzero, the positioning operation fails. Otherwise, the function determines `baseoff` as a value of type `off_type` as follows:

- (4.1) — 0 when `way` is `ios_base::beg`;
- (4.2) — `(pptr() - pbase())` for the output sequence, or `(gptr() - eback())` for the input sequence when `way` is `ios_base::cur`;
- (4.3) — when `way` is `ios_base::end` :
- (4.3.1) — `(pptr() - pbase())` if `ios_base::out` is set in `mode` and `ios_base::in` is not set in `mode`,
- (4.3.2) — `buf.size()` otherwise.

- ⁵ If `baseoff + off` would overflow, or if `baseoff + off` is less than zero, or if `baseoff + off` is greater than `buf.size()`, the positioning operation fails. Otherwise, the function computes

```
off_type newoff = baseoff + off;
```

and assigns `xbeg + newoff` to the next pointer `xnext`.

- ⁶ *Returns:* `pos_type(off_type(-1))` if the positioning operation fails; `pos_type(newoff)` otherwise.

```
pos_type seekpos(pos_type sp, ios_base::openmode which = ios_base::in | ios_base::out) override;
```

- ⁷ *Effects:* Equivalent to:

```
return seekoff(off_type(sp), ios_base::beg, which);
```

```
basic_streambuf<charT, traits>* setbuf(charT* s, streamsize n) override;
```

- ⁸ *Effects:* Equivalent to:

```
this->span(std::span<charT>(s, n));
return this;
```

31.9.4 Class template `basic_ispanstream`

[`ispanstream`]

31.9.4.1 General

[`ispanstream.general`]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ispanstream
        : public basic_istream<charT, traits> {
    public:
        using char_type    = charT;
        using int_type     = typename traits::int_type;
        using pos_type     = typename traits::pos_type;
        using off_type     = typename traits::off_type;
        using traits_type  = traits;
```

```

// 31.9.4.2, constructors
explicit basic_ispanstream(std::span<charT> s,
                           ios_base::openmode which = ios_base::in);
basic_ispanstream(const basic_ispanstream&) = delete;
basic_ispanstream(basic_ispanstream&& rhs);
template<class ROS> explicit basic_ispanstream(ROS&& s);

basic_ispanstream& operator=(const basic_ispanstream&) = delete;
basic_ispanstream& operator=(basic_ispanstream&& rhs);

// 31.9.4.3, swap
void swap(basic_ispanstream& rhs);

// 31.9.4.4, member functions
basic_spanbuf<charT, traits>* rdbuf() const noexcept;

std::span<const charT> span() const noexcept;
void span(std::span<charT> s) noexcept;
template<class ROS> void span(ROS&& s) noexcept;

private:
    basic_spanbuf<charT, traits> sb; // exposition only
};

}

1 NOTE: Constructing an ispanstream from a string-literal includes the termination character '\0' in the underlying spanbuf.

```

31.9.4.2 Constructors

[`ispanstream.cons`]

```

explicit basic_ispanstream(std::span<charT> s, ios_base::openmode which = ios_base::in);

1   Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) and sb with basic_spanbuf<charT, traits>(s, which | ios_base::in) (31.9.3.2).

basic_ispanstream(basic_ispanstream&& rhs);

2   Effects: Initializes the base class with std::move(rhs) and sb with std::move(rhs.sb). Next, basic_istream<charT, traits>::set_rdbuf(addressof(sb)) is called to install the contained basic_spanbuf.

template<class ROS> explicit basic_ispanstream(ROS&& s)

3   Constraints: ROS models ranges::borrowed_range. !convertible_to<ROS, std::span<charT>> && convertible_to<ROS, std::span<charT const>> is true.

4   Effects: Let sp be std::span<const charT>(std::forward<ROS>(s)). Equivalent to
            basic_ispanstream(std::span<charT>(const_cast<charT*>(sp.data()), sp.size()))

```

31.9.4.3 Swap

[`ispanstream.swap`]

```

void swap(basic_ispanstream& rhs);

1   Effects: Equivalent to:
            basic_istream<charT, traits>::swap(rhs);
            sb.swap(rhs.sb);

template<class charT, class traits>
void swap(basic_ispanstream<charT, traits>& x, basic_ispanstream<charT, traits>& y);

2   Effects: Equivalent to x.swap(y).

```

31.9.4.4 Member functions

[`ispanstream.members`]

```

basic_spanbuf<charT, traits>* rdbuf() const noexcept;

1   Effects: Equivalent to:
            return const_cast<basic_spanbuf<charT, traits>*>(addressof(sb));

```

```

    std::span<const charT> span() const noexcept;
2     Effects: Equivalent to: return rdbuf()->span();
    void span(std::span<charT> s) noexcept;
3     Effects: Equivalent to rdbuf()->span(s).

    template<class ROS> void span(ROS&& s) noexcept;
4     Constraints: ROS models ranges::borrowed_range. (!convertible_to<ROS, std::span<charT>>)
&& convertible_to<ROS, std::span<const charT>> is true.
5     Effects: Let sp be std::span<const charT>(std::forward<ROS>(s)). Equivalent to:
        this->span(std::span<charT>(const_cast<charT*>(sp.data()), sp.size()))

```

31.9.5 Class template basic_ostream

[ospanstream]

31.9.5.1 General

[ospanstream.general]

```

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ostream
        : public basic_ostream<charT, traits> {
    public:
        using char_type    = charT;
        using int_type     = typename traits::int_type;
        using pos_type     = typename traits::pos_type;
        using off_type     = typename traits::off_type;
        using traits_type = traits;

        // 31.9.5.2, constructors
        explicit basic_ostream(std::span<charT> s,
                               ios_base::openmode which = ios_base::out);
        basic_ostream(const basic_ostream&) = delete;
        basic_ostream(basic_ostream&& rhs);

        basic_ostream& operator=(const basic_ostream&) = delete;
        basic_ostream& operator=(basic_ostream&& rhs);

        // 31.9.5.3, swap
        void swap(basic_ostream& rhs);

        // 31.9.5.4, member functions
        basic_spanbuf<charT, traits>* rdbuf() const noexcept;

        std::span<charT> span() const noexcept;
        void span(std::span<charT> s) noexcept;

    private:
        basic_spanbuf<charT, traits> sb;      // exposition only
    };
}

```

31.9.5.2 Constructors

[ospanstream.cons]

```

explicit basic_ostream(std::span<charT> s,
                       ios_base::openmode which = ios_base::out);

```

- 1 Effects: Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` and `sb` with `basic_spanbuf<charT, traits>(s, which | ios_base::out)` (31.9.3.2).

```

basic_ostream(basic_ostream&& rhs) noexcept;

```

- 2 Effects: Initializes the base class with `std::move(rhs)` and `sb` with `std::move(rhs.sb)`. Next, `basic_ostream<charT, traits>::set_rdbuf(addressof(sb))` is called to install the contained `basic_spanbuf`.

31.9.5.3 Swap

[ospanstream.swap]

```
void swap(basic_ospanstream& rhs);
1   Effects: Equivalent to:
        basic_ostream<charT, traits>::swap(rhs);
        sb.swap(rhs.sb);

template<class charT, class traits>
void swap(basic_ospanstream<charT, traits>& x, basic_ospanstream<charT, traits>& y);
2   Effects: Equivalent to x.swap(y).
```

31.9.5.4 Member functions

[ospanstream.members]

```
basic_spanbuf<charT, traits>* rdbuf() const noexcept;
1   Effects: Equivalent to:
        return const_cast<basic_spanbuf<charT, traits>*>(addressof(sb));

std::span<charT> span() const noexcept;
2   Effects: Equivalent to: return rdbuf()->span();

void span(std::span<charT> s) noexcept;
3   Effects: Equivalent to rdbuf()->span(s).
```

31.9.6 Class template basic_ospanstream

[spanstream]

31.9.6.1 General

[spanstream.general]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ospanstream
        : public basic_iostream<charT, traits> {
    public:
        using char_type     = charT;
        using int_type      = typename traits::int_type;
        using pos_type      = typename traits::pos_type;
        using off_type      = typename traits::off_type;
        using traits_type   = traits;

        // 31.9.6.2, constructors
        explicit basic_ospanstream(std::span<charT> s,
                                    ios_base::openmode which = ios_base::out | ios_base::in);
        basic_ospanstream(const basic_ospanstream&) = delete;
        basic_ospanstream(basic_ospanstream&& rhs);

        basic_ospanstream& operator=(const basic_ospanstream&) = delete;
        basic_ospanstream& operator=(basic_ospanstream&& rhs);

        // 31.9.6.3, swap
        void swap(basic_ospanstream& rhs);

        // 31.9.6.4, members
        basic_spanbuf<charT, traits>* rdbuf() const noexcept;

        std::span<charT> span() const noexcept;
        void span(std::span<charT> s) noexcept;

    private:
        basic_spanbuf<charT, traits> sb;      // exposition only
    };
}
```

31.9.6.2 Constructors

[spanstream.cons]

```
explicit basic_spanstream(std::span<charT> s,
                           ios_base::openmode which = ios_base::out | ios_base::in);
1   Effects: Initializes the base class with basic_iostream<charT, traits>(addressof(sb)) and sb with basic_spanbuf<charT, traits>(s, which) (31.9.3.2).

basic_spanstream(basic_spanstream&& rhs);
```

2 Effects: Initializes the base class with std::move(rhs) and sb with std::move(rhs.sb). Next, basic_iostream<charT, traits>::set_rdbuf(addressof(sb)) is called to install the contained basic_spanbuf.

31.9.6.3 Swap

[spanstream.swap]

```
void swap(basic_spanstream& rhs);
```

1 Effects: Equivalent to:

```
basic_iostream<charT, traits>::swap(rhs);
sb.swap(rhs.sb);

template<class charT, class traits>
void swap(basic_spanstream<charT, traits>& x, basic_spanstream<charT, traits>& y);
```

2 Effects: Equivalent to x.swap(y).

31.9.6.4 Member functions

[spanstream.members]

```
basic_spanbuf<charT, traits>* rdbuf() const noexcept;
```

1 Effects: Equivalent to:

```
return const_cast<basic_spanbuf<charT, traits>*>(addressof(sb));
```

std::span<charT> span() const noexcept;

2 Effects: Equivalent to: return rdbuf()->span();

```
void span(std::span<charT> s) noexcept;
```

3 Effects: Equivalent to rdbuf()->span(s).

31.10 File-based streams

[file.streams]

31.10.1 Header <fstream> synopsis

[fstream.syn]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
        class basic_filebuf;

    template<class charT, class traits>
        void swap(basic_filebuf<charT, traits>& x, basic_filebuf<charT, traits>& y);

    using filebuf = basic_filebuf<char>;
    using wfilebuf = basic_filebuf<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
        class basic_ifstream;

    template<class charT, class traits>
        void swap(basic_ifstream<charT, traits>& x, basic_ifstream<charT, traits>& y);

    using ifstream = basic_ifstream<char>;
    using wifstream = basic_ifstream<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
        class basic_ofstream;

    template<class charT, class traits>
        void swap(basic_ofstream<charT, traits>& x, basic_ofstream<charT, traits>& y);
```

```

using ofstream = basic_ofstream<char>;
using wofstream = basic_ofstream<wchar_t>;

template<class charT, class traits = char_traits<charT>>
class basic_fstream;

template<class charT, class traits>
void swap(basic_fstream<charT, traits>& x, basic_fstream<charT, traits>& y);

using fstream = basic_fstream<char>;
using wfstream = basic_fstream<wchar_t>;
}

```

- ¹ The header <fstream> defines four class templates and eight types that associate stream buffers with files and assist reading and writing files.
- ² NOTE 1: The class template `basic_filebuf` treats a file as a source or sink of bytes. In an environment that uses a large character set, the file typically holds multibyte character sequences and the `basic_filebuf` object converts those multibyte sequences into wide character sequences.
- ³ In subclause 31.10, member functions taking arguments of `const filesystem::path::value_type*` are only provided on systems where `filesystem::path::value_type` (31.12.6) is not `char`.

NOTE 2: These functions enable class path support for systems with a wide native path character type, such as `wchar_t`.

31.10.2 Class template `basic_filebuf`

[filebuf]

31.10.2.1 General

[filebuf.general]

```

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_filebuf : public basic_streambuf<charT, traits> {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;

            // 31.10.2.2, constructors/destructor
            basic_filebuf();
            basic_filebuf(const basic_filebuf&) = delete;
            basic_filebuf(basic_filebuf&& rhs);
            virtual ~basic_filebuf();

            // 31.10.2.3, assignment and swap
            basic_filebuf& operator=(const basic_filebuf&) = delete;
            basic_filebuf& operator=(basic_filebuf&& rhs);
            void swap(basic_filebuf& rhs);

            // 31.10.2.4, members
            bool is_open() const;
            basic_filebuf* open(const char* s, ios_base::openmode mode);
            basic_filebuf* open(const filesystem::path::value_type* s,
                                ios_base::openmode mode); // wide systems only; see 31.10.1
            basic_filebuf* open(const string& s,
                                ios_base::openmode mode);
            basic_filebuf* open(const filesystem::path& s,
                                ios_base::openmode mode);
            basic_filebuf* close();

        protected:
            // 31.10.2.5, overridden virtual functions
            streamsize showmany() override;
            int_type underflow() override;
            int_type uflow() override;
    };
}

```

```

    int_type pbackfail(int_type c = traits::eof()) override;
    int_type overflow (int_type c = traits::eof()) override;

    basic_streambuf<charT, traits>* setbuf(char_type* s,
                                             streamsize n) override;
    pos_type seekoff(off_type off, ios_base::seekdir way,
                     ios_base::openmode which
                     = ios_base::in | ios_base::out) override;
    pos_type seekpos(pos_type sp,
                     ios_base::openmode which
                     = ios_base::in | ios_base::out) override;
    int sync() override;
    void imbue(const locale& loc) override;
};

}

```

- ¹ The class **basic_filebuf**<charT, traits> associates both the input sequence and the output sequence with a file.
- ² The restrictions on reading and writing a sequence controlled by an object of class **basic_filebuf**<charT, traits> are the same as for reading and writing with the C standard library FILEs.
- ³ In particular:
 - (3.1) — If the file is not open for reading the input sequence cannot be read.
 - (3.2) — If the file is not open for writing the output sequence cannot be written.
 - (3.3) — A joint file position is maintained for both the input sequence and the output sequence.
- ⁴ An instance of **basic_filebuf** behaves as described in [31.10.2](#) provided traits::pos_type is fpos<traits::state_type>. Otherwise the behavior is undefined.
- ⁵ In order to support file I/O and multibyte/wide character conversion, conversions are performed using members of a facet, referred to as **a_codecvt** in following subclauses, obtained as if by

```
const codecvt<charT, char, typename traits::state_type>& a_codecvt =
    use_facet<codecvt<charT, char, typename traits::state_type>>(getloc());
```

31.10.2.2 Constructors

[filebuf.cons]

```
basic_filebuf();
```

- ¹ *Effects:* Initializes the base class with **basic_streambuf**<charT, traits>(). ([31.6.3.2](#)).

- ² *Postconditions:* **is_open()** == false.

```
basic_filebuf(basic_filebuf&& rhs);
```

- ³ *Effects:* It is implementation-defined whether the sequence pointers in *this (**eback()**, **gptr()**, **egptr()**, **pbase()**, **pptr()**, **epptr()**) obtain the values which **rhs** had. Whether they do or not, *this and **rhs** reference separate buffers (if any at all) after the construction. Additionally *this references the file which **rhs** did before the construction, and **rhs** references no file after the construction. The openmode, locale and any other state of **rhs** is also copied.

- ⁴ *Postconditions:* Let **rhs_p** refer to the state of **rhs** just prior to this construction and let **rhs_a** refer to the state of **rhs** just after this construction.

- (4.1) — **is_open()** == **rhs_p.is_open()**
- (4.2) — **rhs_a.is_open()** == false
- (4.3) — **gptr()** - **eback()** == **rhs_p.gptr()** - **rhs_p.eback()**
- (4.4) — **egptr()** - **eback()** == **rhs_p.egptr()** - **rhs_p.eback()**
- (4.5) — **pptr()** - **pbase()** == **rhs_p.pptr()** - **rhs_p.pbase()**
- (4.6) — **epptr()** - **pbase()** == **rhs_p.epptr()** - **rhs_p.pbase()**
- (4.7) — **if** (**eback()**) **eback()** != **rhs_a.eback()**
- (4.8) — **if** (**gptr()**) **gptr()** != **rhs_a.gptr()**
- (4.9) — **if** (**egptr()**) **egptr()** != **rhs_a.egptr()**

```
(4.10)    — if (pbase()) pbase() != rhs_a.pbase()
(4.11)    — if (pptr()) pptr() != rhs_a.pptr()
(4.12)    — if (epptr()) epptr() != rhs_a.epptr()

    virtual ~basic_filebuf();
```

5 *Effects:* Calls `close()`. If an exception occurs during the destruction of the object, including the call to `close()`, the exception is caught but not rethrown (see [16.4.6.13](#)).

31.10.2.3 Assignment and swap

[`filebuf.assign`]

```
basic_filebuf& operator=(basic_filebuf&& rhs);
```

1 *Effects:* Calls `close()` then move assigns from `rhs`. After the move assignment `*this` has the observable state it would have had if it had been move constructed from `rhs` (see [31.10.2.2](#)).

2 *Returns:* `*this`.

```
void swap(basic_filebuf& rhs);
```

3 *Effects:* Exchanges the state of `*this` and `rhs`.

```
template<class charT, class traits>
void swap(basic_filebuf<charT, traits>& x, basic_filebuf<charT, traits>& y);
```

4 *Effects:* Equivalent to: `x.swap(y)`.

31.10.2.4 Member functions

[`filebuf.members`]

```
bool is_open() const;
```

1 *Returns:* `true` if a previous call to `open` succeeded (returned a non-null value) and there has been no intervening call to `close`.

```
basic_filebuf* open(const char* s, ios_base::openmode mode);
basic_filebuf* open(const filesystem::path::value_type* s,
                   ios_base::openmode mode); // wide systems only; see 31.10.1
```

2 *Preconditions:* `s` points to a NTCTS ([3.36](#)).

3 *Effects:* If `is_open() != false`, returns a null pointer. Otherwise, initializes the `filebuf` as required. It then opens the file to which `s` resolves, if possible, as if by a call to `fopen` with the second argument determined from `mode & ~ios_base::ate` as indicated in [Table 128](#). If `mode` is not some combination of flags shown in the table then the `open` fails.

4 If the `open` operation succeeds and `ios_base::ate` is set in `mode`, positions the file to the end (as if by calling `fseek(file, 0, SEEK_END)`, where `file` is the pointer returned by calling `fopen`).³⁰³

5 If the repositioning operation fails, calls `close()` and returns a null pointer to indicate failure.

6 *Returns:* `this` if successful, a null pointer otherwise.

```
basic_filebuf* open(const string& s, ios_base::openmode mode);
basic_filebuf* open(const filesystem::path& s, ios_base::openmode mode);
```

7 *Returns:* `open(s.c_str(), mode)`;

```
basic_filebuf* close();
```

8 *Effects:* If `is_open() == false`, returns a null pointer. If a put area exists, calls `overflow(traits::eof())` to flush characters. If the last virtual member function called on `*this` (between `underflow`, `overflow`, `seekoff`, and `seekpos`) was `overflow` then calls `a_codecvt.unshift` (possibly several times) to determine a termination sequence, inserts those characters and calls `overflow(traits::eof())` again. Finally, regardless of whether any of the preceding calls fails or throws an exception, the function closes the file (as if by calling `fclose(file)`). If any of the calls made by the function, including `fclose`, fails, `close` fails by returning a null pointer. If one of these calls throws an exception, the exception is caught and rethrown after closing the file.

³⁰³ The macro `SEEK_END` is defined, and the function signatures `fopen(const char*, const char*)` and `fseek(FILE*, long, int)` are declared, in `<cstdio>` ([31.13.1](#)).

Table 128: File open modes [tab:filebuf.open.modes]

ios_base binary	in	out	trunc	app	noreplace	stdio equivalent
	+					"w"
	+				+	"wx"
	+	+				"w"
	+	+			+	"wx"
	+		+			"a"
				+		"a"
	+					"r"
	+	+				"r+"
	+	+	+			"w+"
	+	+	+		+	"w+x"
	+	+		+		"a+"
	+			+		"a+"
	+	+				"wb"
	+	+			+	"wbx"
	+	+	+			"wb"
	+	+	+		+	"wbx"
	+	+		+		"ab"
	+			+		"ab"
	+	+				"rb"
	+	+	+			"r+b"
	+	+	+	+		"w+b"
	+	+	+		+	"w+bx"
	+	+		+		"a+b"
	+	+			+	"a+b"

9 *Postconditions:* `is_open() == false`.

10 *Returns:* `this` on success, a null pointer otherwise.

31.10.2.5 Overridden virtual functions

[filebuf.virtuals]

`streamsize showmany()` `override`;

1 *Effects:* Behaves the same as `basic_streambuf::showmany()` (31.6.3.5).

2 *Remarks:* An implementation may provide an overriding definition for this function signature if it can determine whether more characters can be read from the input sequence.

`int_type underflow()` `override`;

3 *Effects:* Behaves according to the description of `basic_streambuf<charT, traits>::underflow()`, with the specialization that a sequence of characters is read from the input sequence as if by reading from the associated file into an internal buffer (`extern_buf`) and then as if by doing:

```
char    extern_buf[XSIZE];
char*  extern_end;
charT   intern_buf[ISIZE];
charT*  intern_end;
codecvt_base::result r =
  a_codecvt.in(state, extern_buf, extern_buf+XSIZE, extern_end,
               intern_buf, intern_buf+ISIZE, intern_end);
```

This shall be done in such a way that the class can recover the position (`fpos_t`) corresponding to each character between `intern_buf` and `intern_end`. If the value of `r` indicates that `a_codecvt.in()` ran out of space in `intern_buf`, retry with a larger `intern_buf`.

```
int_type uflow() override;
```

- 4 *Effects:* Behaves according to the description of `basic_streambuf<charT, traits>::uflow()`, with the specialization that a sequence of characters is read from the input with the same method as used by `underflow`.

```
int_type pbackfail(int_type c = traits::eof()) override;
```

- 5 *Effects:* Puts back the character designated by `c` to the input sequence, if possible, in one of three ways:

- (5.1) — If `traits::eq_int_type(c, traits::eof())` returns `false` and if the function makes a putback position available and if `traits::eq(to_char_type(c), gptr()[-1])` returns `true`, decrements the next pointer for the input sequence, `gptr()`.

 Returns: `c`.

- (5.2) — If `traits::eq_int_type(c, traits::eof())` returns `false` and if the function makes a putback position available and if the function is permitted to assign to the putback position, decrements the next pointer for the input sequence, and stores `c` there.

 Returns: `c`.

- (5.3) — If `traits::eq_int_type(c, traits::eof())` returns `true`, and if either the input sequence has a putback position available or the function makes a putback position available, decrements the next pointer for the input sequence, `gptr()`.

 Returns: `traits::not_eof(c)`.

- 6 *Returns:* As specified above, or `traits::eof()` to indicate failure.

- 7 *Remarks:* If `is_open() == false`, the function always fails.

8 The function does not put back a character directly to the input sequence.

9 If the function can succeed in more than one of these ways, it is unspecified which way is chosen. The function can alter the number of putback positions available as a result of any call.

```
int_type overflow(int_type c = traits::eof()) override;
```

- 10 *Effects:* Behaves according to the description of `basic_streambuf<charT, traits>::overflow(c)`, except that the behavior of “consuming characters” is performed by first converting as if by:

```
charT* b = pbase();
charT* p = pptr();
charT* end;
char xbuf[XSIZE];
char* xbuf_end;
codecvt_base::result r =
    a_codecvt.out(state, b, p, end, xbuf, xbuf+XSIZE, xbuf_end);
```

and then

- (10.1) — If `r == codecvt_base::error` then fail.
- (10.2) — If `r == codecvt_base::noconv` then output characters from `b` up to (and not including) `p`.
- (10.3) — If `r == codecvt_base::partial` then output to the file characters from `xbuf` up to `xbuf_end`, and repeat using characters from `end` to `p`. If output fails, fail (without repeating).
- (10.4) — Otherwise output from `xbuf` to `xbuf_end`, and fail if output fails. At this point if `b != p` and `b == end` (`xbuf` isn't large enough) then increase `XSIZE` and repeat from the beginning.

- 11 *Returns:* `traits::not_eof(c)` to indicate success, and `traits::eof()` to indicate failure. If `is_open() == false`, the function always fails.

```
basic_streambuf* setbuf(char_type* s, streamsize n) override;
```

- 12 *Effects:* If `setbuf(0, 0)` is called on a stream before any I/O has occurred on that stream, the stream becomes unbuffered. Otherwise the results are implementation-defined. “Unbuffered” means that `pbase()` and `pptr()` always return null and output to the file should appear as soon as possible.

```
pos_type seekoff(off_type off, ios_base::seekdir way,
                 ios_base::openmode which
```

- = ios_base::in | ios_base::out) override;
- 13 *Effects:* Let `width` denote `a_codecvt.encoding()`. If `is_open() == false`, or `off != 0 && width <= 0`, then the positioning operation fails. Otherwise, if `way != basic_ios::cur` or `off != 0`, and if the last operation was output, then update the output sequence and write any unshift sequence. Next, seek to the new position: if `width > 0`, call `fseek(file, width * off, whence)`, otherwise call `fseek(file, 0, whence)`.
- 14 *Returns:* A newly constructed `pos_type` object that stores the resultant stream position, if possible. If the positioning operation fails, or if the object cannot represent the resultant stream position, returns `pos_type(off_type(-1))`.
- 15 *Remarks:* “The last operation was output” means either the last virtual operation was overflow or the put buffer is non-empty. “Write any unshift sequence” means, if `width` is less than zero then call `a_codecvt.unshift(state, xbuf, xbuf+XSIZE, xbuf_end)` and output the resulting unshift sequence. The function determines one of three values for the argument `whence`, of type `int`, as indicated in [Table 129](#).

Table 129: `seekoff` effects [tab:filebuf.seekoff]

<code>way</code>	<code>Value</code>	<code>stdio</code> Equivalent
<code>basic_ios::beg</code>		SEEK_SET
<code>basic_ios::cur</code>		SEEK_CUR
<code>basic_ios::end</code>		SEEK_END

- ```
pos_type seekpos(pos_type sp,
 ios_base::openmode which
 = ios_base::in | ios_base::out) override;
```
- 16     Alters the file position, if possible, to correspond to the position stored in `sp` (as described below). Altering the file position performs as follows:
1. if `(om & ios_base::out) != 0`, then update the output sequence and write any unshift sequence;
  2. set the file position to `sp` as if by a call to `fsetpos`;
  3. if `(om & ios_base::in) != 0`, then update the input sequence;
- where `om` is the open mode passed to the last call to `open()`. The operation fails if `is_open()` returns `false`.
- 17     If `sp` is an invalid stream position, or if the function positions neither sequence, the positioning operation fails. If `sp` has not been obtained by a previous successful call to one of the positioning functions (`seekoff` or `seekpos`) on the same file the effects are undefined.
- 18     *Returns:* `sp` on success. Otherwise returns `pos_type(off_type(-1))`.
- ```
int sync() override;
```
- 19 *Effects:* If a put area exists, calls `filebuf::overflow` to write the characters to the file, then flushes the file as if by calling `fflush(file)`. If a get area exists, the effect is implementation-defined.
- ```
void imbue(const locale& loc) override;
```
- 20     *Preconditions:* If the file is not positioned at its beginning and the encoding of the current locale as determined by `a_codecvt.encoding()` is state-dependent ([30.4.2.5.3](#)) then that facet is the same as the corresponding facet of `loc`.
- 21     *Effects:* Causes characters inserted or extracted after this call to be converted according to `loc` until another call of `imbue`.
- 22     *Remarks:* This may require reconversion of previously converted characters. This in turn may require the implementation to be able to reconstruct the original contents of the file.

### 31.10.3 Class template `basic_ifstream`

[`ifstream`]

#### 31.10.3.1 General

[`ifstream.general`]

```
namespace std {
```

```

template<class charT, class traits = char_traits<charT>>
class basic_ifstream : public basic_istream<charT, traits> {
public:
 using char_type = charT;
 using int_type = typename traits::int_type;
 using pos_type = typename traits::pos_type;
 using off_type = typename traits::off_type;
 using traits_type = traits;

 // 31.10.3.2, constructors
 basic_ifstream();
 explicit basic_ifstream(const char* s,
 ios_base::openmode mode = ios_base::in);
 explicit basic_ifstream(const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::in); // wide systems only; see 31.10.1
 explicit basic_ifstream(const string& s,
 ios_base::openmode mode = ios_base::in);
 template<class T>
 explicit basic_ifstream(const T& s, ios_base::openmode mode = ios_base::in);
 basic_ifstream(const basic_ifstream&) = delete;
 basic_ifstream(basic_ifstream&& rhs);

 basic_ifstream& operator=(const basic_ifstream&) = delete;
 basic_ifstream& operator=(basic_ifstream&& rhs);

 // 31.10.3.3, swap
 void swap(basic_ifstream& rhs);

 // 31.10.3.4, members
 basic_filebuf<charT, traits>* rdbuf() const;

 bool is_open() const;
 void open(const char* s, ios_base::openmode mode = ios_base::in);
 void open(const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::in); // wide systems only; see 31.10.1
 void open(const string& s, ios_base::openmode mode = ios_base::in);
 void open(const filesystem::path& s, ios_base::openmode mode = ios_base::in);
 void close();

private:
 basic_filebuf<charT, traits> sb; // exposition only
};

}

1 The class basic_ifstream<charT, traits> supports reading from named files. It uses a basic_filebuf<charT, traits> object to control the associated sequence. For the sake of exposition, the maintained data is presented here as:
(1.1) — sb, the filebuf object.

```

### 31.10.3.2 Constructors

[ifstream.cons]

`basic_ifstream();`

- 1 *Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.2.2) and `sb` with `basic_filebuf<charT, traits>()` (31.10.2.2).

```

explicit basic_ifstream(const char* s,
 ios_base::openmode mode = ios_base::in);
explicit basic_ifstream(const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::in); // wide systems only; see 31.10.1

```

- 2 *Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.2.2) and `sb` with `basic_filebuf<charT, traits>()` (31.10.2.2), then calls `rdbuf()->open(s, mode | ios_base::in)`. If that function returns a null pointer, calls `setstate(failbit)`.

```

explicit basic_ifstream(const string& s,
 ios_base::openmode mode = ios_base::in);
3 Effects: Equivalent to: basic_ifstream(s.c_str(), mode).

template<class T>
explicit basic_ifstream(const T& s, ios_base::openmode mode = ios_base::in);
4 Constraints: is_same_v<T, filesystem::path> is true.
5 Effects: Equivalent to: basic_ifstream(s.c_str(), mode).

basic_ifstream(basic_ifstream&& rhs);
6 Effects: Move constructs the base class, and the contained basic_filebuf. Then calls basic_istream<charT, traits>::set_rdbuf(addressof(sb)) to install the contained basic_filebuf.

```

**31.10.3.3 Swap**

[ifstream.swap]

```

void swap(basic_ifstream& rhs);
1 Effects: Exchanges the state of *this and rhs by calling basic_istream<charT, traits>::swap(rhs) and sb.swap(rhs.sb).

template<class charT, class traits>
void swap(basic_ifstream<charT, traits>& x, basic_ifstream<charT, traits>& y);
2 Effects: Equivalent to: x.swap(y).

```

**31.10.3.4 Member functions**

[ifstream.members]

```

basic_filebuf<charT, traits>* rdbuf() const;
1 Returns: const_cast<basic_filebuf<charT, traits>*>(addressof(sb)).

bool is_open() const;
2 Returns: rdbuf()->is_open().

void open(const char* s, ios_base::openmode mode = ios_base::in);
void open(const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::in); // wide systems only; see 31.10.1
3 Effects: Calls rdbuf()->open(s, mode | ios_base::in). If that function does not return a null pointer calls clear(), otherwise calls setstate(failbit) (which may throw ios_base::failure) (31.5.4.4).

void open(const string& s, ios_base::openmode mode = ios_base::in);
void open(const filesystem::path& s, ios_base::openmode mode = ios_base::in);
4 Effects: Calls open(s.c_str(), mode).

void close();
5 Effects: Calls rdbuf()->close() and, if that function returns a null pointer, calls setstate(failbit) (which may throw ios_base::failure) (31.5.4.4).

```

**31.10.4 Class template basic\_ofstream**

[ofstream]

**31.10.4.1 General**

[ofstream.general]

```

namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_ofstream : public basic_ostream<charT, traits> {
 public:
 using char_type = charT;
 using int_type = typename traits::int_type;
 using pos_type = typename traits::pos_type;
 using off_type = typename traits::off_type;
 using traits_type = traits;

```

```

// 31.10.4.2, constructors
basic_ofstream();
explicit basic_ofstream(const char* s,
 ios_base::openmode mode = ios_base::out);
explicit basic_ofstream(const filesystem::path::value_type* s, // wide systems only; see 31.10.1
 ios_base::openmode mode = ios_base::out);
explicit basic_ofstream(const string& s,
 ios_base::openmode mode = ios_base::out);
template<class T>
explicit basic_ofstream(const T& s, ios_base::openmode mode = ios_base::out);
basic_ofstream(const basic_ofstream&) = delete;
basic_ofstream(basic_ofstream&& rhs);

basic_ofstream& operator=(const basic_ofstream&) = delete;
basic_ofstream& operator=(basic_ofstream&& rhs);

// 31.10.4.3, swap
void swap(basic_ofstream& rhs);

// 31.10.4.4, members
basic_filebuf<charT, traits>* rdbuf() const;

bool is_open() const;
void open(const char* s, ios_base::openmode mode = ios_base::out);
void open(const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::out); // wide systems only; see 31.10.1
void open(const string& s, ios_base::openmode mode = ios_base::out);
void open(const filesystem::path& s, ios_base::openmode mode = ios_base::out);
void close();

private:
 basic_filebuf<charT, traits> sb; // exposition only
};

}

1 The class basic_ofstream<charT, traits> supports writing to named files. It uses a basic_filebuf<charT, traits> object to control the associated sequence. For the sake of exposition, the maintained data is presented here as:

```

- (1.1) — `sb`, the `filebuf` object.

### 31.10.4.2 Constructors

[`ofstream.cons`]

`basic_ofstream();`

- 1 *Effects:* Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.6.2.2) and `sb` with `basic_filebuf<charT, traits>()` (31.10.2.2).

```

explicit basic_ofstream(const char* s,
 ios_base::openmode mode = ios_base::out);
explicit basic_ofstream(const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::out); // wide systems only; see 31.10.1

```

- 2 *Effects:* Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.6.2.2) and `sb` with `basic_filebuf<charT, traits>()` (31.10.2.2), then calls `rdbuf()->open(s, mode | ios_base::out)`. If that function returns a null pointer, calls `setstate(failbit)`.

```

explicit basic_ofstream(const string& s,
 ios_base::openmode mode = ios_base::out);

```

- 3 *Effects:* Equivalent to: `basic_ofstream(s.c_str(), mode)`.

```

template<class T>
explicit basic_ofstream(const T& s, ios_base::openmode mode = ios_base::out);

```

- 4 *Constraints:* `is_same_v<T, filesystem::path>` is true.

- 5 *Effects:* Equivalent to: `basic_ofstream(s.c_str(), mode)`.

```
basic_ofstream(basic_ofstream&& rhs);
6 Effects: Move constructs the base class, and the contained basic_filebuf. Then calls basic_ostream<charT, traits>::set_rdbuf(addressof(sb)) to install the contained basic_filebuf.
```

### 31.10.4.3 Swap [ofstream.swap]

```
void swap(basic_ofstream& rhs);
1 Effects: Exchanges the state of *this and rhs by calling basic_ostream<charT, traits>::swap(rhs) and sb.swap(rhs.sb).
```

```
template<class charT, class traits>
void swap(basic_ofstream<charT, traits>& x, basic_ofstream<charT, traits>& y);
```

2 Effects: Equivalent to: x.swap(y).

### 31.10.4.4 Member functions [ofstream.members]

```
basic_filebuf<charT, traits>* rdbuf() const;
```

1 Returns: const\_cast<basic\_filebuf<charT, traits>\*>(addressof(sb)).

```
bool is_open() const;
```

2 Returns: rdbuf()->is\_open().

```
void open(const char* s, ios_base::openmode mode = ios_base::out);
```

```
void open(const filesystem::path::value_type* s,
ios_base::openmode mode = ios_base::out); // wide systems only; see 31.10.1
```

3 Effects: Calls rdbuf()->open(s, mode | ios\_base::out). If that function does not return a null pointer calls clear(), otherwise calls setstate(failbit) (which may throw ios\_base::failure) (31.5.4.4).

```
void close();
```

4 Effects: Calls rdbuf()->close() and, if that function fails (returns a null pointer), calls setstate(failbit) (which may throw ios\_base::failure) (31.5.4.4).

```
void open(const string& s, ios_base::openmode mode = ios_base::out);
```

```
void open(const filesystem::path& s, ios_base::openmode mode = ios_base::out);
```

5 Effects: Calls open(s.c\_str(), mode).

## 31.10.5 Class template basic\_fstream [fstream]

### 31.10.5.1 General [fstream.general]

```
namespace std {
template<class charT, class traits = char_traits<charT>>
class basic_fstream : public basic_iostream<charT, traits> {
public:
 using char_type = charT;
 using int_type = typename traits::int_type;
 using pos_type = typename traits::pos_type;
 using off_type = typename traits::off_type;
 using traits_type = traits;

 // 31.10.5.2, constructors
 basic_fstream();
 explicit basic_fstream(
 const char* s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
 explicit basic_fstream(
 const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::in|ios_base::out); // wide systems only; see 31.10.1
 explicit basic_fstream(
 const string& s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
```

```

template<class T>
 explicit basic_fstream(const T& s, ios_base::openmode mode = ios_base::in | ios_base::out);
basic_fstream(const basic_fstream&) = delete;
basic_fstream(basic_fstream&& rhs);

basic_fstream& operator=(const basic_fstream&) = delete;
basic_fstream& operator=(basic_fstream&& rhs);

// 31.10.5.3, swap
void swap(basic_fstream& rhs);

// 31.10.5.4, members
basic_filebuf<charT, traits>* rdbuf() const;
bool is_open() const;
void open(
 const char* s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
void open(
 const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::in | ios_base::out); // wide systems only; see 31.10.1
void open(
 const string& s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
void open(
 const filesystem::path& s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
void close();

private:
 basic_filebuf<charT, traits> sb; // exposition only
};

}

}

```

- <sup>1</sup> The class template `basic_fstream<charT, traits>` supports reading and writing from named files. It uses a `basic_filebuf<charT, traits>` object to control the associated sequences. For the sake of exposition, the maintained data is presented here as:

(1.1) — `sb`, the `basic_filebuf` object.

### 31.10.5.2 Constructors

[`fstream.cons`]

`basic_fstream();`

- <sup>1</sup> *Effects*: Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_filebuf<charT, traits>()`.

```

explicit basic_fstream(
 const char* s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
explicit basic_fstream(
 const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::in | ios_base::out); // wide systems only; see 31.10.1

```

- <sup>2</sup> *Effects*: Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_filebuf<charT, traits>()`. Then calls `rdbuf()>open(s, mode)`. If that function returns a null pointer, calls `setstate(failbit)`.

```

explicit basic_fstream(
 const string& s,
 ios_base::openmode mode = ios_base::in | ios_base::out);

```

- <sup>3</sup> *Effects*: Equivalent to: `basic_fstream(s.c_str(), mode)`.

```

template<class T>
 explicit basic_fstream(const T& s, ios_base::openmode mode = ios_base::in | ios_base::out);

```

- <sup>4</sup> *Constraints*: `is_same_v<T, filesystem::path>` is true.

5       *Effects:* Equivalent to: `basic_fstream(s.c_str(), mode).`

```
basic_fstream(basic_fstream&& rhs);
```

6       *Effects:* Move constructs the base class, and the contained `basic_filebuf`. Then calls `basic_istream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_filebuf`.

**31.10.5.3 Swap**[`fstream.swap`]

```
void swap(basic_fstream& rhs);
```

1       *Effects:* Exchanges the state of `*this` and `rhs` by calling `basic_iostream<charT, traits>::swap(rhs)` and `sb.swap(rhs.sb)`.

```
template<class charT, class traits>
void swap(basic_fstream<charT, traits>& x,
 basic_fstream<charT, traits>& y);
```

2       *Effects:* Equivalent to: `x.swap(y)`.

**31.10.5.4 Member functions**[`fstream.members`]

```
basic_filebuf<charT, traits>* rdbuf() const;
```

1       *Returns:* `const_cast<basic_filebuf<charT, traits>*>(addressof(sb))`.

```
bool is_open() const;
```

2       *Returns:* `rdbuf()>is_open()`.

```
void open(
 const char* s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
void open(
 const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::in | ios_base::out); // wide systems only; see 31.10.1
```

3       *Effects:* Calls `rdbuf()>open(s, mode)`. If that function does not return a null pointer calls `clear()`, otherwise calls `setstate(failbit)` (which may throw `ios_base::failure`) (31.5.4.4).

```
void open(
 const string& s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
void open(
 const filesystem::path& s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
```

4       *Effects:* Calls `open(s.c_str(), mode)`.

```
void close();
```

5       *Effects:* Calls `rdbuf()>close()` and, if that function returns a null pointer, calls `setstate(failbit)` (which may throw `ios_base::failure`) (31.5.4.4).

**31.11 Synchronized output streams**[`syncstream`]**31.11.1 Header <syncstream> synopsis**[`syncstream.syn`]

```
#include <ostream> // see 31.7.2
```

```
namespace std {
 template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
 class basic_syncbuf;

 // 31.11.2.6, specialized algorithms
 template<class charT, class traits, class Allocator>
 void swap(basic_syncbuf<charT, traits, Allocator>&,
 basic_syncbuf<charT, traits, Allocator>&);

 using syncbuf = basic_syncbuf<char>;
 using wsyncbuf = basic_syncbuf<wchar_t>;
```

```

template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
class basic_osyncstream;

using osyncstream = basic_osyncstream<char>;
using wosyncstream = basic_osyncstream<wchar_t>;
}

```

- <sup>1</sup> The header <syncstream> provides a mechanism to synchronize execution agents writing to the same stream.

### 31.11.2 Class template basic\_syncbuf

[syncstream.syncbuf]

#### 31.11.2.1 Overview

[syncstream.syncbuf.overview]

```

namespace std {
 template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
 class basic_syncbuf : public basic_streambuf<charT, traits> {
 public:
 using char_type = charT;
 using int_type = typename traits::int_type;
 using pos_type = typename traits::pos_type;
 using off_type = typename traits::off_type;
 using traits_type = traits;
 using allocator_type = Allocator;

 using streambuf_type = basic_streambuf<charT, traits>;

 // 31.11.2.2, construction and destruction
 basic_syncbuf()
 : basic_syncbuf(nullptr) {}
 explicit basic_syncbuf(streambuf_type* obuf)
 : basic_syncbuf(obuf, Allocator()) {}
 basic_syncbuf(streambuf_type*, const Allocator&);
 basic_syncbuf(basic_syncbuf&&);
 ~basic_syncbuf();

 // 31.11.2.3, assignment and swap
 basic_syncbuf& operator=(basic_syncbuf&&);
 void swap(basic_syncbuf&);

 // 31.11.2.4, member functions
 bool emit();
 streambuf_type* get_wrapped() const noexcept;
 allocator_type get_allocator() const noexcept;
 void set_emit_on_sync(bool) noexcept;

 protected:
 // 31.11.2.5, overridden virtual functions
 int sync() override;

 private:
 streambuf_type* wrapped; // exposition only
 bool emit_on_sync{}; // exposition only
 };
}

```

- <sup>1</sup> Class template **basic\_syncbuf** stores character data written to it, known as the associated output, into internal buffers allocated using the object's allocator. The associated output is transferred to the wrapped stream buffer object \*wrapped when **emit()** is called or when the **basic\_syncbuf** object is destroyed. Such transfers are atomic with respect to transfers by other **basic\_syncbuf** objects with the same wrapped stream buffer object.

#### 31.11.2.2 Construction and destruction

[syncstream.syncbuf.cons]

```
basic_syncbuf(streambuf_type* obuf, const Allocator& allocator);
```

- <sup>1</sup> *Effects:* Sets wrapped to obuf.

2     *Postconditions:* `get_wrapped() == obuf` and `get_allocator() == allocator` are true.  
 3     *Throws:* Nothing unless an exception is thrown by the construction of a mutex or by memory allocation.  
 4     *Remarks:* A copy of `allocator` is used to allocate memory for internal buffers holding the associated output.

```
basic_syncbuf(basic_syncbuf&& other);
```

5     *Postconditions:* The value returned by `this->get_wrapped()` is the value returned by `other.get_wrapped()` prior to calling this constructor. Output stored in `other` prior to calling this constructor will be stored in `*this` afterwards. `other.pbase() == other.pptr()` and `other.get_wrapped() == nullptr` are true.  
 6     *Remarks:* This constructor disassociates `other` from its wrapped stream buffer, ensuring destruction of `other` produces no output.

```
~basic_syncbuf();
```

7     *Effects:* Calls `emit()`.  
 8     *Throws:* Nothing. If an exception is thrown from `emit()`, the destructor catches and ignores that exception.

### 31.11.2.3 Assignment and swap

[syncstream.syncbuf.assign]

```
basic_syncbuf& operator=(basic_syncbuf&& rhs);
```

1     *Effects:* Calls `emit()` then move assigns from `rhs`. After the move assignment `*this` has the observable state it would have had if it had been move constructed from `rhs` (31.11.2.2).

2     *Postconditions:*

- (2.1)     — `rhs.get_wrapped() == nullptr` is true.
- (2.2)     — `this->get_allocator() == rhs.get_allocator()` is true when  
`allocator_traits<Allocator>::propagate_on_container_move_assignment::value`  
           is true; otherwise, the allocator is unchanged.

3     *Returns:* `*this`.

4     *Remarks:* This assignment operator disassociates `rhs` from its wrapped stream buffer, ensuring destruction of `rhs` produces no output.

```
void swap(basic_syncbuf& other);
```

5     *Preconditions:* Either `allocator_traits<Allocator>::propagate_on_container_swap::value` is true or `this->get_allocator() == other.get_allocator()` is true.

6     *Effects:* Exchanges the state of `*this` and `other`.

### 31.11.2.4 Member functions

[syncstream.syncbuf.members]

```
bool emit();
```

1     *Effects:* Atomically transfers the associated output of `*this` to the stream buffer `*wrapped`, so that it appears in the output stream as a contiguous sequence of characters. `wrapped->pubsync()` is called if and only if a call was made to `sync()` since the most recent call to `emit()`, if any.

2     *Synchronization:* All `emit()` calls transferring characters to the same stream buffer object appear to execute in a total order consistent with the “happens before” relation (6.9.2.2), where each `emit()` call synchronizes with subsequent `emit()` calls in that total order.

3     *Postconditions:* On success, the associated output is empty.

4     *Returns:* `true` if all of the following conditions hold; otherwise `false`:

- (4.1)     — `wrapped == nullptr` is false.
- (4.2)     — All of the characters in the associated output were successfully transferred.
- (4.3)     — The call to `wrapped->pubsync()` (if any) succeeded.

5     *Remarks:* May call member functions of `wrapped` while holding a lock uniquely associated with `wrapped`.

`streambuf_type* get_wrapped() const noexcept;`

6     *Returns:* wrapped.

`allocator_type get_allocator() const noexcept;`

7     *Returns:* A copy of the allocator that was set in the constructor or assignment operator.

`void set_emit_on_sync(bool b) noexcept;`

8     *Effects:* `emit_on_sync = b`.

**31.11.2.5 Overridden virtual functions** [syncstream.syncbuf.virtuals]

`int sync() override;`

1     *Effects:* Records that the wrapped stream buffer is to be flushed. Then, if `emit_on_sync` is `true`, calls `emit()`.  
NOTE: If `emit_on_sync` is `false`, the actual flush is delayed until a call to `emit()`.

2     *Returns:* If `emit()` was called and returned `false`, returns `-1`; otherwise `0`.

**31.11.2.6 Specialized algorithms** [syncstream.syncbuf.special]

`template<class charT, class traits, class Allocator>`  
`void swap(basic_syncbuf<charT, traits, Allocator>& a,`  
`basic_syncbuf<charT, traits, Allocator>& b);`

1     *Effects:* Equivalent to `a.swap(b)`.

**31.11.3 Class template basic\_osyncstream** [syncstream.osyncstream]

**31.11.3.1 Overview** [syncstream.osyncstream.overview]

```
namespace std {
 template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
 class basic_osyncstream : public basic_ostream<charT, traits> {
public:
 using char_type = charT;
 using int_type = typename traits::int_type;
 using pos_type = typename traits::pos_type;
 using off_type = typename traits::off_type;
 using traits_type = traits;

 using allocator_type = Allocator;
 using streambuf_type = basic_streambuf<charT, traits>;
 using syncbuf_type = basic_syncbuf<charT, traits, Allocator>;

 // 31.11.3.2, construction and destruction
 basic_osyncstream(streambuf_type*, const Allocator&);
 explicit basic_osyncstream(streambuf_type* obuf)
 : basic_osyncstream(obuf, Allocator{}) {}
 basic_osyncstream(basic_ostream<charT, traits>& os, const Allocator& allocator)
 : basic_osyncstream(os.rdbuf(), allocator) {}
 explicit basic_osyncstream(basic_ostream<charT, traits>& os)
 : basic_osyncstream(os, Allocator{}) {}
 basic_osyncstream(basic_osyncstream&&) noexcept;
 ~basic_osyncstream();

 // assignment
 basic_osyncstream& operator=(basic_osyncstream&&);

 // 31.11.3.3, member functions
 void emit();
 streambuf_type* get_wrapped() const noexcept;
 syncbuf_type* rdbuf() const noexcept { return const_cast<syncbuf_type*>(addressof(sb)); }
}
```

```

 private:
 syncbuf_type sb; // exposition only
 };
}

```

- 1 Allocator shall meet the *Cpp17Allocator* requirements (16.4.4.6.1).  
 2 EXAMPLE 1: A named variable can be used within a block statement for streaming.

```

{
 osyncstream bout(cout);
 bout << "Hello, ";
 bout << "World!";
 bout << endl; // flush is noted
 bout << "and more!\n";
} // characters are transferred and cout is flushed

```

- 3 EXAMPLE 2: A temporary object can be used for streaming within a single statement.

```
osyncstream(cout) << "Hello, " << "World!" << '\n';
```

In this example, cout is not flushed.

### 31.11.3.2 Construction and destruction

[syncstream.osyncstream.cons]

```
basic_osyncstream(streambuf_type* buf, const Allocator& allocator);
```

- 1 *Effects*: Initializes sb from buf and allocator. Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))`.  
 2 NOTE: The member functions of the provided stream buffer can be called from `emit()` while a lock is held, which can result in a deadlock if used incautiously.  
 3 *Postconditions*: `get_wrapped() == buf` is true.

```
basic_osyncstream(basic_osyncstream&& other) noexcept;
```

- 4 *Effects*: Move constructs the base class and sb from the corresponding subobjects of other, and calls `basic_ostream<charT, traits>::set_rdbuf(addressof(sb))`.  
 5 *Postconditions*: The value returned by `get_wrapped()` is the value returned by `other.get_wrapped()` prior to calling this constructor. `nullptr == other.get_wrapped()` is true.

### 31.11.3.3 Member functions

[syncstream.osyncstream.members]

```
void emit();
```

- 1 *Effects*: Behaves as an unformatted output function (31.7.6.4). After constructing a `sentry` object, calls `sb.emit()`. If that call returns false, calls `setstate(ios_base::badbit)`.  
 2 EXAMPLE 1: A flush on a `basic_osyncstream` does not flush immediately:

```

{
 osyncstream bout(cout);
 bout << "Hello," << '\n'; // no flush
 bout.emit(); // characters transferred; cout not flushed
 bout << "World!" << endl; // flush noted; cout not flushed
 bout.emit(); // characters transferred; cout flushed
 bout << "Greetings." << '\n'; // no flush
} // characters transferred; cout not flushed

```

- 3 EXAMPLE 2: The function `emit()` can be used to handle exceptions from operations on the underlying stream.

```

{
 osyncstream bout(cout);
 bout << "Hello, " << "World!" << '\n';
 try {
 bout.emit();
 } catch (...) {
 // handle exception
 }
}

```

```
streambuf_type* get_wrapped() const noexcept;
```

4     *Returns:* `sb.get_wrapped()`.

5     EXAMPLE 3: Obtaining the wrapped stream buffer with `get_wrapped()` allows wrapping it again with an `osyncstream`. For example,

```
{
 osyncstream bout1(cout);
 bout1 << "Hello, ";
{
 osyncstream(bout1.get_wrapped()) << "Goodbye, " << "Planet!" << '\n';
}
bout1 << "World!" << '\n';
}
```

produces the *uninterleaved* output

```
Goodbye, Planet!
Hello, World!
```

## 31.12 File systems

[filesystems]

### 31.12.1 General

[fs.general]

- 1 Subclause 31.12 describes operations on file systems and their components, such as paths, regular files, and directories.
- 2 A *file system* is a collection of files and their attributes.
- 3 A *file* is an object within a file system that holds user or system data. Files can be written to, or read from, or both. A file has certain attributes, including type. File types include regular files and directories. Other types of files, such as symbolic links, may be supported by the implementation.
- 4 A *directory* is a file within a file system that acts as a container of directory entries that contain information about other files, possibly including other directory files. The *parent directory* of a directory is the directory that both contains a directory entry for the given directory and is represented by the dot-dot filename (31.12.6.2) in the given directory. The *parent directory* of other types of files is a directory containing a directory entry for the file under discussion.
- 5 A *link* is an object that associates a filename with a file. Several links can associate names with the same file. A *hard link* is a link to an existing file. Some file systems support multiple hard links to a file. If the last hard link to a file is removed, the file itself is removed.

NOTE 1: A hard link can be thought of as a shared-ownership smart pointer to a file.

A *symbolic link* is a type of file with the property that when the file is encountered during pathname resolution (31.12.6), a string stored by the file is used to modify the pathname resolution.

NOTE 2: Symbolic links are often called symlinks. A symbolic link can be thought of as a raw pointer to a file. If the file pointed to does not exist, the symbolic link is said to be a “dangling” symbolic link.

### 31.12.2 Conformance

[fs.conformance]

#### 31.12.2.1 General

[fs.conformance.general]

- 1 Conformance is specified in terms of behavior. Ideal behavior is not always implementable, so the conformance subclauses take that into account.

#### 31.12.2.2 POSIX conformance

[fs.conform.9945]

- 1 Some behavior is specified by reference to POSIX. How such behavior is actually implemented is unspecified.  
NOTE 1: This constitutes an “as if” rule allowing implementations to call native operating system or other APIs.
- 2 Implementations should provide such behavior as it is defined by POSIX. Implementations shall document any behavior that differs from the behavior defined by POSIX. Implementations that do not support exact POSIX behavior should provide behavior as close to POSIX behavior as is reasonable given the limitations of actual operating systems and file systems. If an implementation cannot provide any reasonable behavior, the implementation shall report an error as specified in 31.12.5.

NOTE 2: This allows users to rely on an exception being thrown or an error code being set when an implementation cannot provide any reasonable behavior.

- <sup>3</sup> Implementations are not required to provide behavior that is not supported by a particular file system.

EXAMPLE: The FAT file system used by some memory cards, camera memory, and floppy disks does not support hard links, symlinks, and many other features of more capable file systems, so implementations are not required to support those features on the FAT file system but instead are required to report an error as described above.

### 31.12.2.3 Operating system dependent behavior conformance

[fs.conform.os]

- <sup>1</sup> Behavior that is specified as being *operating system dependent* is dependent upon the behavior and characteristics of an operating system. The operating system an implementation is dependent upon is implementation-defined.
- <sup>2</sup> It is permissible for an implementation to be dependent upon an operating system emulator rather than the actual underlying system.

### 31.12.2.4 File system race behavior

[fs.race.behavior]

- <sup>1</sup> A *file system race* is the condition that occurs when multiple threads, processes, or computers interleave access and modification of the same object within a file system. Behavior is undefined if calls to functions provided by subclause 31.12 introduce a file system race.
- <sup>2</sup> If the possibility of a file system race would make it unreliable for a program to test for a precondition before calling a function described herein, *Preconditions*: is not specified for the function.

NOTE: As a design practice, preconditions are not specified when it is unreasonable for a program to detect them prior to calling the function.

## 31.12.3 Requirements

[fs.req]

- <sup>1</sup> Throughout subclause 31.12, `char`, `wchar_t`, `char8_t`, `char16_t`, and `char32_t` are collectively called *encoded character types*.
- <sup>2</sup> Functions with template parameters named `EcharT` shall not participate in overload resolution unless `EcharT` is one of the encoded character types.
- <sup>3</sup> Template parameters named `InputIterator` shall meet the *Cpp17InputIterator* requirements (25.3.5.3) and shall have a value type that is one of the encoded character types.
- <sup>4</sup> NOTE: Use of an encoded character type implies an associated character set and encoding. Since `signed char` and `unsigned char` have no implied character set and encoding, they are not included as permitted types.
- <sup>5</sup> Template parameters named `Allocator` shall meet the *Cpp17Allocator* requirements (16.4.4.6.1).

### 31.12.4 Header <filesystem> synopsis

[fs.filesystem.syn]

```
#include <compare> // see 17.11.1

 template<>
 inline constexpr bool enable_view<filesystem::recursive_directory_iterator> = true;
}

```

- <sup>1</sup> Implementations should ensure that the resolution and range of `file_time_type` reflect the operating system dependent resolution and range of file time values.

### 31.12.5 Error reporting

[`fs.err.report`]

- <sup>1</sup> Filesystem library functions often provide two overloads, one that throws an exception to report file system errors, and another that sets an `error_code`.

NOTE: This supports two common use cases:

- (1.1) — Uses where file system errors are truly exceptional and indicate a serious failure. Throwing an exception is an appropriate response.
- (1.2) — Uses where file system errors are routine and do not necessarily represent failure. Returning an error code is the most appropriate response. This allows application specific error handling, including simply ignoring the error.

- <sup>2</sup> Functions not having an argument of type `error_code&` handle errors as follows, unless otherwise specified:

- (2.1) — When a call by the implementation to an operating system or other underlying API results in an error that prevents the function from meeting its specifications, an exception of type `filesystem_error` shall be thrown. For functions with a single path argument, that argument shall be passed to the `filesystem_error` constructor with a single path argument. For functions with two path arguments, the first of these arguments shall be passed to the `filesystem_error` constructor as the `path1` argument, and the second shall be passed as the `path2` argument. The `filesystem_error` constructor's `error_code` argument is set as appropriate for the specific operating system dependent error.
- (2.2) — Failure to allocate storage is reported by throwing an exception as described in [16.4.6.13](#).
- (2.3) — Destructors throw nothing.

- <sup>3</sup> Functions having an argument of type `error_code&` handle errors as follows, unless otherwise specified:

- (3.1) — If a call by the implementation to an operating system or other underlying API results in an error that prevents the function from meeting its specifications, the `error_code&` argument is set as appropriate for the specific operating system dependent error. Otherwise, `clear()` is called on the `error_code&` argument.

### 31.12.6 Class path

[`fs.class.path`]

#### 31.12.6.1 General

[`fs.class.path.general`]

- <sup>1</sup> An object of class `path` represents a path and contains a pathname. Such an object is concerned only with the lexical and syntactic aspects of a path. The path does not necessarily exist in external storage, and the pathname is not necessarily valid for the current operating system or for a particular file system.
- <sup>2</sup> NOTE 1: Class `path` is used to support the differences between the string types used by different operating systems to represent pathnames, and to perform conversions between encodings when necessary.
- <sup>3</sup> A *path* is a sequence of elements that identify the location of a file within a filesystem. The elements are the *root-name<sub>opt</sub>*, *root-directory<sub>opt</sub>*, and an optional sequence of *filenames* ([31.12.6.2](#)). The maximum number of elements in the sequence is operating system dependent ([31.12.2.3](#)).
- <sup>4</sup> An *absolute path* is a path that unambiguously identifies the location of a file without reference to an additional starting location. The elements of a path that determine if it is absolute are operating system dependent. A *relative path* is a path that is not absolute, and as such, only unambiguously identifies the location of a file when resolved relative to an implied starting location. The elements of a path that determine if it is relative are operating system dependent.

NOTE 2: Pathnames “.” and “..” are relative paths.

- <sup>5</sup> A *pathname* is a character string that represents the name of a path. Pathnames are formatted according to the generic pathname format grammar ([31.12.6.2](#)) or according to an operating system dependent *native pathname format* accepted by the host operating system.
- <sup>6</sup> *Pathname resolution* is the operating system dependent mechanism for resolving a pathname to a particular file in a file hierarchy. There may be multiple pathnames that resolve to the same file.

EXAMPLE 1: POSIX specifies the mechanism in section 4.12, Pathname resolution.

```

namespace std::filesystem {
 class path {
 public:
 using value_type = see below;
 using string_type = basic_string<value_type>;
 static constexpr value_type preferred_separator = see below;

 // 31.12.8.1, enumeration format
 enum format;

 // 31.12.6.5.1, constructors and destructor
 path() noexcept;
 path(const path& p);
 path(path&& p) noexcept;
 path(string_type&& source, format fmt = auto_format);
 template<class Source>
 path(const Source& source, format fmt = auto_format);

 iterator end() const;

 // 31.12.6.7, path inserter and extractor
 template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const path& p);
 template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, path& p);
};

}

```

- <sup>7</sup> `value_type` is a `typedef` for the operating system dependent encoded character type used to represent pathnames.
- <sup>8</sup> The value of the `preferred_separator` member is the operating system dependent *preferred-separator* character (31.12.6.2).
- <sup>9</sup> EXAMPLE 2: For POSIX-based operating systems, `value_type` is `char` and `preferred_separator` is the slash character ('/'). For Windows-based operating systems, `value_type` is `wchar_t` and `preferred_separator` is the backslash character (L'\\').

### 31.12.6.2 Generic pathname format

[fs.path.generic]

*pathname*:

*root-name<sub>opt</sub>* *root-directory<sub>opt</sub>* *relative-path*

*root-name*:

operating system dependent sequences of characters

implementation-defined sequences of characters

*root-directory*:

*directory-separator*

*relative-path*:

*filename*

*filename directory-separator relative-path*

an empty path

*filename*:

non-empty sequence of characters other than *directory-separator* characters

*directory-separator*:

*preferred-separator* *directory-separator<sub>opt</sub>*

*fallback-separator* *directory-separator<sub>opt</sub>*

*preferred-separator*:

operating system dependent directory separator character

*fallback-separator*:

/, if *preferred-separator* is not /

- <sup>1</sup> A *filename* is the name of a file. The *dot* and *dot-dot* filenames, consisting solely of one and two period characters respectively, have special meaning. The following characteristics of filenames are operating system dependent:

- (1.1) — The permitted characters.

EXAMPLE: Some operating systems prohibit the ASCII control characters (0x00 – 0x1F) in filenames.

NOTE 1: Wider portability can be achieved by limiting *filename* characters to the POSIX Portable Filename Character Set:

```
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
a b c d e f g h i j k l m n o p q r s t u v w x y z
0 1 2 3 4 5 6 7 8 9 . _ -
```

- (1.2) — The maximum permitted length.
  - (1.3) — Filenames that are not permitted.
  - (1.4) — Filenames that have special meaning.
  - (1.5) — Case awareness and sensitivity during path resolution.
  - (1.6) — Special rules that may apply to file types other than regular files, such as directories.
- 2 Except in a *root-name*, multiple successive *directory-separator* characters are considered to be the same as one *directory-separator* character.
- 3 The dot filename is treated as a reference to the current directory. The dot-dot filename is treated as a reference to the parent directory. What the dot-dot filename refers to relative to *root-directory* is implementation-defined. Specific filenames may have special meanings for a particular operating system.
- 4 A *root-name* identifies the starting location for pathname resolution (31.12.6). If there are no operating system dependent *root-names*, at least one implementation-defined *root-name* is required.

NOTE 2: Many operating systems define a name beginning with two *directory-separator* characters as a *root-name* that identifies network or other resource locations. Some operating systems define a single letter followed by a colon as a drive specifier — a *root-name* identifying a specific device such as a disk drive.

- 5 If a *root-name* is otherwise ambiguous, the possibility with the longest sequence of characters is chosen.

NOTE 3: On a POSIX-like operating system, it is impossible to have a *root-name* and a *relative-path* without an intervening *root-directory* element.

- 6 *Normalization* of a generic format pathname means:

1. If the path is empty, stop.
2. Replace each slash character in the *root-name* with a *preferred-separator*.
3. Replace each *directory-separator* with a *preferred-separator*.

NOTE 4: The generic pathname grammar defines *directory-separator* as one or more slashes and *preferred-separators*.

4. Remove each dot filename and any immediately following *directory-separator*.
5. As long as any appear, remove a non-dot-dot filename immediately followed by a *directory-separator* and a dot-dot filename, along with any immediately following *directory-separator*.
6. If there is a *root-directory*, remove all dot-dot filenames and any *directory-separators* immediately following them.

NOTE 5: These dot-dot filenames attempt to refer to nonexistent parent directories.

7. If the last filename is dot-dot, remove any trailing *directory-separator*.
8. If the path is empty, add a dot.

The result of normalization is a path in *normal form*, which is said to be *normalized*.

### 31.12.6.3 Conversions

[fs.path.cvt]

#### 31.12.6.3.1 Argument format conversions

[fs.path.fmt.cvt]

- 1 NOTE 1: The format conversions described in this subclause are not applied on POSIX-based operating systems because on these systems:
- (1.1) — The generic format is acceptable as a native path.
  - (1.2) — There is no need to distinguish between native format and generic format in function arguments.
  - (1.3) — Paths for regular files and paths for directories share the same syntax.
- 2 Several functions are defined to accept *detected-format* arguments, which are character sequences. A detected-format argument represents a path using either a pathname in the generic format (31.12.6.2) or a pathname in the native format (31.12.6). Such an argument is taken to be in the generic format if and only if it matches the generic format and is not acceptable to the operating system as a native path.

- <sup>3</sup> NOTE 2: Some operating systems have no unambiguous way to distinguish between native format and generic format arguments. This is by design as it simplifies use for operating systems that do not require disambiguation. An implementation for an operating system where disambiguation is required is permitted to distinguish between the formats.
- <sup>4</sup> Pathnames are converted as needed between the generic and native formats in an operating-system-dependent manner. Let  $G(n)$  and  $N(g)$  in a mathematical sense be the implementation's functions that convert native-to-generic and generic-to-native formats respectively. If  $g=G(n)$  for some  $n$ , then  $G(N(g))=g$ ; if  $n=N(g)$  for some  $g$ , then  $N(G(n))=n$ .
- NOTE 3: Neither  $G$  nor  $N$  need be invertible.
- <sup>5</sup> If the native format requires paths for regular files to be formatted differently from paths for directories, the path shall be treated as a directory path if its last element is a *directory-separator*, otherwise it shall be treated as a path to a regular file.
- <sup>6</sup> NOTE 4: A path stores a native format pathname (31.12.6.5.6) and acts as if it also stores a generic format pathname, related as given below. The implementation can generate the generic format pathname based on the native format pathname (and possibly other information) when requested.
- <sup>7</sup> When a path is constructed from or is assigned a single representation separate from any path, the other representation is selected by the appropriate conversion function ( $G$  or  $N$ ).
- <sup>8</sup> When the (new) value  $p$  of one representation of a path is derived from the representation of that or another path, a value  $q$  is chosen for the other representation. The value  $q$  converts to  $p$  (by  $G$  or  $N$  as appropriate) if any such value does so;  $q$  is otherwise unspecified.

NOTE 5: If  $q$  is the result of converting any path at all, it is the result of converting  $p$ .

### 31.12.6.3.2 Type and encoding conversions

[fs.path.type.cvt]

- <sup>1</sup> The *native encoding* of an ordinary character string is the operating system dependent current encoding for pathnames (31.12.6). The *native encoding* for wide character strings is the implementation-defined execution wide-character set encoding (16.3.3.3.4).
- <sup>2</sup> For member function arguments that take character sequences representing paths and for member functions returning strings, value type and encoding conversion is performed if the value type of the argument or return value differs from `path::value_type`. For the argument or return value, the method of conversion and the encoding to be converted to is determined by its value type:
- (2.1) — `char`: The encoding is the native ordinary encoding. The method of conversion, if any, is operating system dependent.
 

NOTE 1: For POSIX-based operating systems `path::value_type` is `char` so no conversion from `char` value type arguments or to `char` value type return values is performed. For Windows-based operating systems, the native ordinary encoding is determined by calling a Windows API function.

NOTE 2: This results in behavior identical to other C and C++ standard library functions that perform file operations using ordinary character strings to identify paths. Changing this behavior would be surprising and error-prone.
  - (2.2) — `wchar_t`: The encoding is the native wide encoding. The method of conversion is unspecified.
 

NOTE 3: For Windows-based operating systems `path::value_type` is `wchar_t` so no conversion from `wchar_t` value type arguments or to `wchar_t` value type return values is performed.
  - (2.3) — `char8_t`: The encoding is UTF-8. The method of conversion is unspecified.
  - (2.4) — `char16_t`: The encoding is UTF-16. The method of conversion is unspecified.
  - (2.5) — `char32_t`: The encoding is UTF-32. The method of conversion is unspecified.
- <sup>3</sup> If the encoding being converted to has no representation for source characters, the resulting converted characters, if any, are unspecified. Implementations should not modify member function arguments if already of type `path::value_type`.

### 31.12.6.4 Requirements

[fs.path.req]

- <sup>1</sup> In addition to the requirements (31.12.3), function template parameters named `Source` shall be one of:
- (1.1) — `basic_string<EcharT, traits, Allocator>`. A function argument `const Source& source` shall have an effective range `[source.begin(), source.end()]`.

- (1.2) — `basic_string_view<EcharT, traits>`. A function argument `const Source& source` shall have an effective range `[source.begin(), source.end()]`.
- (1.3) — A type meeting the *Cpp17InputIterator* requirements that iterates over a NTCTS. The value type shall be an encoded character type. A function argument `const Source& source` shall have an effective range `[source, end)` where `end` is the first iterator value with an element value equal to `iterator_traits<Source>::value_type()`.
- (1.4) — A character array that after array-to-pointer decay results in a pointer to the start of a NTCTS. The value type shall be an encoded character type. A function argument `const Source& source` shall have an effective range `[source, end)` where `end` is the first iterator value with an element value equal to `iterator_traits<decay_t<Source>>::value_type()`.
- <sup>2</sup> Functions taking template parameters named `Source` shall not participate in overload resolution unless `Source` denotes a type other than `path`, and either
- (2.1) — `Source` is a specialization of `basic_string` or `basic_string_view`, or
- (2.2) — the *qualified-id* `iterator_traits<decay_t<Source>>::value_type` is valid and denotes a possibly `const` encoded character type (13.10.3).
- <sup>3</sup> NOTE: See path conversions (31.12.6.3) for how the value types above and their encodings convert to `path::value_type` and its encoding.
- <sup>4</sup> Arguments of type `Source` shall not be null pointers.

### 31.12.6.5 Members

[fs.path.member]

#### 31.12.6.5.1 Constructors

[fs.path.construct]

- ```
path() noexcept;
1   Postconditions: empty() == true.
```
- ```
path(const path& p);
path(path&& p) noexcept;
```
- 2    *Effects*: Constructs an object of class `path` having the same pathname in the native and generic formats, respectively, as the original value of `p`. In the second form, `p` is left in a valid but unspecified state.
- ```
path(string_type&& source, format fmt = auto_format);
```
- 3 *Effects*: Constructs an object of class `path` for which the pathname in the detected-format of `source` has the original value of `source` (31.12.6.3.1), converting format if required (31.12.6.3.1). `source` is left in a valid but unspecified state.
- ```
template<class Source>
path(const Source& source, format fmt = auto_format);
template<class InputIterator>
path(InputIterator first, InputIterator last, format fmt = auto_format);
```
- 4    *Effects*: Let `s` be the effective range of `source` (31.12.6.4) or the range `[first, last)`, with the encoding converted if required (31.12.6.3). Finds the detected-format of `s` (31.12.6.3.1) and constructs an object of class `path` for which the pathname in that format is `s`.
- ```
template<class Source>
path(const Source& source, const locale& loc, format fmt = auto_format);
template<class InputIterator>
path(InputIterator first, InputIterator last, const locale& loc, format fmt = auto_format);
```
- 5 *Mandates*: The value type of `Source` and `InputIterator` is `char`.
- 6 *Effects*: Let `s` be the effective range of `source` or the range `[first, last)`, after converting the encoding as follows:
- (6.1) — If `value_type` is `wchar_t`, converts to the native wide encoding (31.12.6.3.2) using the `codecvt<wchar_t, char, mbstate_t>` facet of `loc`.
- (6.2) — Otherwise a conversion is performed using the `codecvt<wchar_t, char, mbstate_t>` facet of `loc`, and then a second conversion to the current ordinary encoding.

- 7 Finds the detected-format of `s` (31.12.6.3.1) and constructs an object of class `path` for which the pathname in that format is `s`.

EXAMPLE: A string is to be read from a database that is encoded in ISO/IEC 8859-1, and used to create a directory:

```
namespace fs = std::filesystem;
std::string latin1_string = read_latin1_data();
codecvt_8859_1<wchar_t> latin1_facet;
std::locale latin1_locale(std::locale(), latin1_facet);
fs::create_directory(fs::path(latin1_string, latin1_locale));
```

For POSIX-based operating systems, the path is constructed by first using `latin1_facet` to convert ISO/IEC 8859-1 encoded `latin1_string` to a wide character string in the native wide encoding (31.12.6.3.2). The resulting wide string is then converted to an ordinary character pathname string in the current native ordinary encoding. If the native wide encoding is UTF-16 or UTF-32, and the current native ordinary encoding is UTF-8, all of the characters in the ISO/IEC 8859-1 character set will be converted to their Unicode representation, but for other native ordinary encodings some characters may have no representation.

For Windows-based operating systems, the path is constructed by using `latin1_facet` to convert ISO/IEC 8859-1 encoded `latin1_string` to a UTF-16 encoded wide character pathname string. All of the characters in the ISO/IEC 8859-1 character set will be converted to their Unicode representation.

31.12.6.5.2 Assignments

[fs.path.assign]

```
path& operator=(const path& p);
```

- 1 *Effects*: If `*this` and `p` are the same object, has no effect. Otherwise, sets both respective pathnames of `*this` to the respective pathnames of `p`.

- 2 *Returns*: `*this`.

```
path& operator=(path&& p) noexcept;
```

- 3 *Effects*: If `*this` and `p` are the same object, has no effect. Otherwise, sets both respective pathnames of `*this` to the respective pathnames of `p`. `p` is left in a valid but unspecified state.

NOTE: A valid implementation is `swap(p)`.

- 4 *Returns*: `*this`.

```
path& operator=(string_type&& source);
path& assign(string_type&& source);
```

- 5 *Effects*: Sets the pathname in the detected-format of `source` to the original value of `source`. `source` is left in a valid but unspecified state.

- 6 *Returns*: `*this`.

```
template<class Source>
path& operator=(const Source& source);
template<class Source>
path& assign(const Source& source);
template<class InputIterator>
path& assign(InputIterator first, InputIterator last);
```

- 7 *Effects*: Let `s` be the effective range of `source` (31.12.6.4) or the range `[first, last]`, with the encoding converted if required (31.12.6.3). Finds the detected-format of `s` (31.12.6.3.1) and sets the pathname in that format to `s`.

- 8 *Returns*: `*this`.

31.12.6.5.3 Appends

[fs.path.append]

- 1 The append operations use `operator/=` to denote their semantic effect of appending *preferred-separator* when needed.

```
path& operator/=(const path& p);
```

- 2 *Effects*: If `p.is_absolute() || (p.has_root_name() && p.root_name() != root_name())`, then `operator=(p)`.

- 3 Otherwise, modifies `*this` as if by these steps:

- (3.1) — If `p.has_root_directory()`, then removes any root directory and relative path from the generic format pathname. Otherwise, if `!has_root_directory() && is_absolute()` is true or if `has_filename()` is true, then appends `path::preferred_separator` to the generic format pathname.
- (3.2) — Then appends the native format pathname of `p`, omitting any *root-name* from its generic format pathname, to the native format pathname.

4 EXAMPLE: Even if `//host` is interpreted as a *root-name*, and even if `operator/` appends a backslash as the separator, both of the paths `path("//host")/"foo"` and `path("//host/")/"foo"` equal `"//host/foo"`.

Expression examples:

```
// On POSIX,
path("foo") /= path("");           // yields path("foo/")
path("foo") /= path("/bar");       // yields path("/bar")

// On Windows,
path("foo") /= path("");           // yields path("foo\\")
path("foo") /= path("/bar");        // yields path("/bar")
path("foo") /= path("c:/bar");      // yields path("c:/bar")
path("foo") /= path("c:");          // yields path("c:")
path("c:") /= path("");            // yields path("c:")
path("c:foo") /= path("/bar");     // yields path("c:/bar")
path("c:foo") /= path("c:bar");     // yields path("c:foo\\bar")
```

5 Returns: `*this`.

```
template<class Source>
path& operator/=(const Source& source);
template<class Source>
path& append(const Source& source);

6 Effects: Equivalent to: return operator/=(path(source));

template<class InputIterator>
path& append(InputIterator first, InputIterator last);

7 Effects: Equivalent to: return operator/=(path(first, last));
```

31.12.6.5.4 Concatenation

[`fs.path.concat`]

```
path& operator+=(const path& x);
path& operator+=(const string_type& x);
path& operator+=(basic_string_view<value_type> x);
path& operator+=(const value_type* x);
template<class Source>
path& operator+=(const Source& x);
template<class Source>
path& concat(const Source& x);
```

1 Effects: Appends `path(x).native()` to the pathname in the native format.

NOTE: This directly manipulates the value of `native()`, which is not necessarily portable between operating systems.

2 Returns: `*this`.

```
path& operator+=(value_type x);
template<class EcharT>
path& operator+=(EcharT x);

3 Effects: Equivalent to: return *this += basic_string_view(&x, 1);

template<class InputIterator>
path& concat(InputIterator first, InputIterator last);

4 Effects: Equivalent to: return *this += path(first, last);
```

31.12.6.5.5 Modifiers

[fs.path.modifiers]

```

void clear() noexcept;
1   Postconditions: empty() == true.

path& make_preferred();
2   Effects: Each directory-separator of the pathname in the generic format is converted to preferred-separator.
3   Returns: *this.
4   EXAMPLE 1:
```

```

path p("foo/bar");
std::cout << p << '\n';
p.make_preferred();
std::cout << p << '\n';
```

On an operating system where *preferred-separator* is a slash, the output is:

```
"foo/bar"
"foo/bar"
```

On an operating system where *preferred-separator* is a backslash, the output is:

```
"foo\bar"
"foo\bar"
```

```

path& remove_filename();
5   Effects: Remove the generic format pathname of filename() from the generic format pathname.
```

```
6   Postconditions: !has_filename().
```

```
7   Returns: *this.
```

```
8   EXAMPLE 2:
```

```

path("foo/bar").remove_filename();           // yields "foo/"
path("foo/").remove_filename();              // yields "foo/"
path("//foo").remove_filename();             // yields "/"
path("//").remove_filename();               // yields "/"
```

```

path& replace_filename(const path& replacement);
```

```
9   Effects: Equivalent to:
```

```

remove_filename();
operator/=(replacement);
```

```
10  Returns: *this.
```

```
11  EXAMPLE 3:
```

```

path("/foo").replace_filename("bar");        // yields "/bar" on POSIX
path("//").replace_filename("bar");          // yields "/bar" on POSIX
```

```

path& replace_extension(const path& replacement = path());
```

```
12  Effects:
```

(12.1) — Any existing extension() (31.12.6.5.9) is removed from the pathname in the generic format, then

(12.2) — If replacement is not empty and does not begin with a dot character, a dot character is appended to the pathname in the generic format, then

(12.3) — operator+=(replacement);.

```
13  Returns: *this.
```

```

void swap(path& rhs) noexcept;
```

```
14  Effects: Swaps the contents (in all formats) of the two paths.
```

```
15  Complexity: Constant time.
```

31.12.6.5.6 Native format observers

[fs.path.native.obs]

¹ The string returned by all native format observers is in the native pathname format (31.12.6).

```

const string_type& native() const noexcept;
2   Returns: The pathname in the native format.

const value_type* c_str() const noexcept;
3   Effects: Equivalent to: return native().c_str();

operator string_type() const;
4   Returns: native().

template<class EcharT, class traits = char_traits<EcharT>,
         class Allocator = allocator<EcharT>>
basic_string<EcharT, traits, Allocator>
string(const Allocator& a = Allocator()) const;
5   Returns: native().

6   Remarks: All memory allocation, including for the return value, shall be performed by a. Conversion, if any, is specified by 31.12.6.3.

```

```

std::string string() const;
std::wstring wstring() const;
std::u8string u8string() const;
std::u16string u16string() const;
std::u32string u32string() const;
7   Returns: native().

8   Remarks: Conversion, if any, is performed as specified by 31.12.6.3.

```

31.12.6.5.7 Generic format observers

[fs.path.generic.obs]

- 1 Generic format observer functions return strings formatted according to the generic pathname format ([31.12.6.2](#)). A single slash ('/') character is used as the *directory-separator*.
 - 2 EXAMPLE: On an operating system that uses backslash as its *preferred-separator*,

```

path("foo\\bar").generic_string()
returns "foo/bar".

```
- ```

template<class EcharT, class traits = char_traits<EcharT>,
 class Allocator = allocator<EcharT>>
basic_string<EcharT, traits, Allocator>
generic_string(const Allocator& a = Allocator()) const;
3 Returns: The pathname in the generic format.

4 Remarks: All memory allocation, including for the return value, shall be performed by a. Conversion, if any, is specified by 31.12.6.3.

```

```

std::string generic_string() const;
std::wstring generic_wstring() const;
std::u8string generic_u8string() const;
std::u16string generic_u16string() const;
std::u32string generic_u32string() const;
5 Returns: The pathname in the generic format.

6 Remarks: Conversion, if any, is specified by 31.12.6.3.

```

**31.12.6.5.8 Compare**

[fs.path.compare]

```
int compare(const path& p) const noexcept;
```

- 1 Returns:
  - (1.1) — Let *rootNameComparison* be the result of *this->root\_name().native().compare(p.root\_name().native())*. If *rootNameComparison* is not 0, *rootNameComparison*.
  - (1.2) — Otherwise, if *!this->has\_root\_directory()* and *p.has\_root\_directory()*, a value less than 0.

- (1.3) — Otherwise, if `this->has_root_directory()` and `!p.has_root_directory()`, a value greater than 0.
- (1.4) — Otherwise, if `native()` for the elements of `this->relative_path()` are lexicographically less than `native()` for the elements of `p.relative_path()`, a value less than 0.
- (1.5) — Otherwise, if `native()` for the elements of `this->relative_path()` are lexicographically greater than `native()` for the elements of `p.relative_path()`, a value greater than 0.
- (1.6) — Otherwise, 0.

```
int compare(const string_type& s) const;
int compare(basic_string_view<value_type> s) const;
int compare(const value_type* s) const;
```

2     *Effects:* Equivalent to: `return compare(path(s));`

### 31.12.6.5.9 Decomposition

[`fs.path.decompose`]

`path root_name() const;`

1     *Returns:* `root-name`, if the pathname in the generic format includes `root-name`, otherwise `path()`.

`path root_directory() const;`

2     *Returns:* `root-directory`, if the pathname in the generic format includes `root-directory`, otherwise `path()`.

`path root_path() const;`

3     *Returns:* `root_name() / root_directory()`.

`path relative_path() const;`

4     *Returns:* A path composed from the pathname in the generic format, if `empty()` is `false`, beginning with the first `filename` after `root_path()`. Otherwise, `path()`.

`path parent_path() const;`

5     *Returns:* `*this` if `has_relative_path()` is `false`, otherwise a path whose generic format pathname is the longest prefix of the generic format pathname of `*this` that produces one fewer element in its iteration.

`path filename() const;`

6     *Returns:* `relative_path().empty() ? path() : *--end()`.

7     EXAMPLE 1:

```
path("/foo/bar.txt").filename(); // yields "bar.txt"
path("/foo/bar").filename(); // yields "bar"
path("/foo/bar/").filename(); // yields ""
path("//").filename(); // yields ""
path("//host").filename(); // yields ""
path(".").filename(); // yields "."
path("../").filename(); // yields ".."
```

`path stem() const;`

8     *Returns:* Let `f` be the generic format pathname of `filename()`. Returns a path whose pathname in the generic format is

(8.1) — `f`, if it contains no periods other than a leading period or consists solely of one or two periods;

(8.2) — otherwise, the prefix of `f` ending before its last period.

9     EXAMPLE 2:

```
std::cout << path("/foo/bar.txt").stem(); // outputs "bar"
path p = "foo.bar.baz.tar";
for (; !p.extension().empty(); p = p.stem())
 std::cout << p.extension() << '\n';
// outputs: .tar
// .baz
// .bar
```

`path extension() const;`

10     *Returns:* A path whose pathname in the generic format is the suffix of `filename()` not included in `stem()`.

11     EXAMPLE 3:

```
path("/foo/bar.txt").extension(); // yields ".txt" and stem() is "bar"
 path("/foo/bar"); // yields "" and stem() is "bar"
 path("/foo/.profile").extension(); // yields "" and stem() is ".profile"
 path(".bar").extension(); // yields "" and stem() is ".bar"
 path("..bar").extension(); // yields ".bar" and stem() is ".."
```

12     NOTE 1: The period is included in the return value so that it is possible to distinguish between no extension and an empty extension.

13     NOTE 2: On non-POSIX operating systems, for a path `p`, it is possible that `p.stem() + p.extension() == p.filename()` is `false`, even though the generic format pathnames are the same.

### 31.12.6.5.10 Query

[fs.path.query]

`[[nodiscard]] bool empty() const noexcept;`

1     *Returns:* `true` if the pathname in the generic format is empty, otherwise `false`.

`bool has_root_path() const;`

2     *Returns:* `!root_path().empty()`.

`bool has_root_name() const;`

3     *Returns:* `!root_name().empty()`.

`bool has_root_directory() const;`

4     *Returns:* `!root_directory().empty()`.

`bool has_relative_path() const;`

5     *Returns:* `!relative_path().empty()`.

`bool has_parent_path() const;`

6     *Returns:* `!parent_path().empty()`.

`bool has_filename() const;`

7     *Returns:* `!filename().empty()`.

`bool has_stem() const;`

8     *Returns:* `!stem().empty()`.

`bool has_extension() const;`

9     *Returns:* `!extension().empty()`.

`bool is_absolute() const;`

10     *Returns:* `true` if the pathname in the native format contains an absolute path (31.12.6), otherwise `false`.

11     EXAMPLE: `path("/") .is_absolute()` is `true` for POSIX-based operating systems, and `false` for Windows-based operating systems.

`bool is_relative() const;`

12     *Returns:* `!is_absolute()`.

### 31.12.6.5.11 Generation

[fs.path.gen]

`path lexically_normal() const;`

1     *Returns:* A path whose pathname in the generic format is the normal form (31.12.6.2) of the pathname in the generic format of `*this`.

2     EXAMPLE 1:

```
assert(path("foo./bar/..").lexically_normal() == "foo/");
assert(path("foo///bar/..").lexically_normal() == "foo");
```

The above assertions will succeed. On Windows, the returned path's *directory-separator* characters will be backslashes rather than slashes, but that does not affect `path` equality.

```
path lexically_relative(const path& base) const;
```

3     *Effects:* If:

- (3.1) — `root_name()` != `base.root_name()` is true, or
- (3.2) — `is_absolute()` != `base.is_absolute()` is true, or
- (3.3) — `!has_root_directory()` && `base.has_root_directory()` is true, or
- (3.4) — any *filename* in `relative_path()` or `base.relative_path()` can be interpreted as a *root-name*, returns `path()`.

NOTE 1: On a POSIX implementation, no *filename* in a *relative-path* is acceptable as a *root-name*.

Determines the first mismatched element of `*this` and `base` as if by:

```
auto [a, b] = mismatch(begin(), end(), base.begin(), base.end());
```

Then,

- (3.5) — if `a == end()` and `b == base.end()`, returns `path(".")`; otherwise
- (3.6) — let `n` be the number of *filename* elements in `[b, base.end()]` that are not dot or dot-dot or empty, minus the number that are dot-dot. If `n<0`, returns `path()`; otherwise
- (3.7) — if `n == 0` and (`a == end()` || `a->empty()`), returns `path(".")`; otherwise
- (3.8) — returns an object of class `path` that is default-constructed, followed by
  - application of `operator/=(path(..)) n times`, and then
  - application of `operator/=` for each element in `[a, end()]`.

4     *Returns:* `*this` made relative to `base`. Does not resolve (31.12.6) symlinks. Does not first normalize (31.12.6.2) `*this` or `base`.

5     EXAMPLE 2:

```
assert(path("/a/d").lexically_relative("/a/b/c") == ".../d");
assert(path("/a/b/c").lexically_relative("/a/d") == ".../b/c");
assert(path("a/b/c").lexically_relative("a") == "b/c");
assert(path("a/b/c").lexically_relative("a/b/c/x/y") == "...");
assert(path("a/b/c").lexically_relative("a/b/c") == ".");
assert(path("a/b").lexically_relative("c/d") == ".../a/b");
```

The above assertions will succeed. On Windows, the returned path's *directory-separator* characters will be backslashes rather than slashes, but that does not affect `path` equality.

6     NOTE 2: If symlink following semantics are desired, use the operational function `relative()`.

7     NOTE 3: If normalization (31.12.6.2) is needed to ensure consistent matching of elements, apply `lexically_normal()` to `*this`, `base`, or both.

```
path lexically_proximate(const path& base) const;
```

8     *Returns:* If the value of `lexically_relative(base)` is not an empty path, return it. Otherwise return `*this`.

9     NOTE 4: If symlink following semantics are desired, use the operational function `proximate()`.

10    NOTE 5: If normalization (31.12.6.2) is needed to ensure consistent matching of elements, apply `lexically_normal()` to `*this`, `base`, or both.

### 31.12.6.6 Iterators

[fs.path.itr]

<sup>1</sup> Path iterators iterate over the elements of the pathname in the generic format (31.12.6.2).

<sup>2</sup> A `path::iterator` is a constant iterator meeting all the requirements of a bidirectional iterator (25.3.5.6) except that, for dereferenceable iterators `a` and `b` of type `path::iterator` with `a == b`, there is no requirement that `*a` and `*b` are bound to the same object. Its `value_type` is `path`.

- <sup>3</sup> Calling any non-const member function of a `path` object invalidates all iterators referring to elements of that object.
- <sup>4</sup> For the elements of the pathname in the generic format, the forward traversal order is as follows:
- (4.1) — The *root-name* element, if present.
  - (4.2) — The *root-directory* element, if present.
- NOTE: The generic format is required to ensure lexicographical comparison works correctly.
- (4.3) — Each successive *filename* element, if present.
  - (4.4) — An empty element, if a trailing non-root *directory-separator* is present.

<sup>5</sup> The backward traversal order is the reverse of forward traversal.

`iterator begin() const;`

<sup>6</sup> *Returns*: An iterator for the first present element in the traversal list above. If no elements are present, the end iterator.

`iterator end() const;`

<sup>7</sup> *Returns*: The end iterator.

### 31.12.6.7 Inserter and extractor

[fs.path.io]

```
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const path& p);
```

<sup>1</sup> *Effects*: Equivalent to `os << quoted(p.string<charT, traits>())`.

NOTE: The `quoted` function is described in [31.7.9](#).

<sup>2</sup> *Returns*: `os`.

```
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, path& p);
```

<sup>3</sup> *Effects*: Equivalent to:

```
basic_string<charT, traits> tmp;
is >> quoted(tmp);
p = tmp;
```

<sup>4</sup> *Returns*: `is`.

### 31.12.6.8 Non-member functions

[fs.path.nonmember]

`void swap(path& lhs, path& rhs) noexcept;`

<sup>1</sup> *Effects*: Equivalent to `lhs.swap(rhs)`.

`size_t hash_value(const path& p) noexcept;`

<sup>2</sup> *Returns*: A hash value for the path `p`. If for two paths, `p1 == p2` then `hash_value(p1) == hash_value(p2)`.

`friend bool operator==(const path& lhs, const path& rhs) noexcept;`

<sup>3</sup> *Returns*: `lhs.compare(rhs) == 0`.

<sup>4</sup> NOTE: Path equality and path equivalence have different semantics.

(4.1) — Equality is determined by the path non-member `operator==`, which considers the two paths' lexical representations only.

EXAMPLE 1: `path("foo") == "bar"` is never true.

(4.2) — Equivalence is determined by the `equivalent()` non-member function, which determines if two paths resolve ([31.12.6](#)) to the same file system entity.

EXAMPLE 2: `equivalent("foo", "bar")` will be `true` when both paths resolve to the same file.

```

friend strong_ordering operator<=>(const path& lhs, const path& rhs) noexcept;
5 Returns: lhs.compare(rhs) <=> 0.

friend path operator/(const path& lhs, const path& rhs);
6 Effects: Equivalent to: return path(lhs) /= rhs;

```

### 31.12.6.9 Hash support

[fs.path.hash]

```
template<> struct hash<filesystem::path>;
```

- 1 For an object p of type filesystem::path, hash<filesystem::path>()(p) evaluates to the same result as filesystem::hash\_value(p).

### 31.12.7 Class filesystem\_error

[fs.class.filesystem.error]

#### 31.12.7.1 General

[fs.class.filesystem.error.general]

```

namespace std::filesystem {
 class filesystem_error : public system_error {
 public:
 filesystem_error(const string& what_arg, error_code ec);
 filesystem_error(const string& what_arg,
 const path& p1, error_code ec);
 filesystem_error(const string& what_arg,
 const path& p1, const path& p2, error_code ec);

 const path& path1() const noexcept;
 const path& path2() const noexcept;
 const char* what() const noexcept override;
 };
}

```

- 1 The class filesystem\_error defines the type of objects thrown as exceptions to report file system errors from functions described in subclause 31.12.

#### 31.12.7.2 Members

[fs.filesystem.error.members]

- 1 Constructors are provided that store zero, one, or two paths associated with an error.

```
filesystem_error(const string& what_arg, error_code ec);
```

2 Postconditions:

- (2.1) — code() == ec,
- (2.2) — path1().empty() == true,
- (2.3) — path2().empty() == true, and
- (2.4) — string\_view(what()).find(what\_arg.c\_str()) != string\_view::npos.

```
filesystem_error(const string& what_arg, const path& p1, error_code ec);
```

3 Postconditions:

- (3.1) — code() == ec,
- (3.2) — path1() returns a reference to the stored copy of p1,
- (3.3) — path2().empty() == true, and
- (3.4) — string\_view(what()).find(what\_arg.c\_str()) != string\_view::npos.

```
filesystem_error(const string& what_arg, const path& p1, const path& p2, error_code ec);
```

4 Postconditions:

- (4.1) — code() == ec,
- (4.2) — path1() returns a reference to the stored copy of p1,
- (4.3) — path2() returns a reference to the stored copy of p2, and
- (4.4) — string\_view(what()).find(what\_arg.c\_str()) != string\_view::npos.

```

const path& path1() const noexcept;
5 Returns: A reference to the copy of p1 stored by the constructor, or, if none, an empty path.

const path& path2() const noexcept;
6 Returns: A reference to the copy of p2 stored by the constructor, or, if none, an empty path.

const char* what() const noexcept override;
7 Returns: An NTBS that incorporates the what_arg argument supplied to the constructor. The exact
 format is unspecified. Implementations should include the system_error::what() string and the
 pathnames of path1 and path2 in the native format in the returned string.

```

### 31.12.8 Enumerations

[fs.enum]

#### 31.12.8.1 Enum path::format

[fs.enum.path.format]

- <sup>1</sup> This enum specifies constants used to identify the format of the character sequence, with the meanings listed in [Table 130](#).

Table 130: Enum path::format [tab:fs.enum.path.format]

| Name                        | Meaning                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>native_format</code>  | The native pathname format.                                                                                                                                                                                                                                                                                                                                     |
| <code>generic_format</code> | The generic pathname format.                                                                                                                                                                                                                                                                                                                                    |
| <code>auto_format</code>    | The interpretation of the format of the character sequence is implementation-defined. The implementation may inspect the content of the character sequence to determine the format.<br><i>Recommended practice:</i> For POSIX-based systems, native and generic formats are equivalent and the character sequence should always be interpreted in the same way. |

#### 31.12.8.2 Enum class file\_type

[fs.enum.file.type]

- <sup>1</sup> This enum class specifies constants used to identify file types, with the meanings listed in [Table 131](#). The values of the constants are distinct.

Table 131: Enum class file\_type [tab:fs.enum.file.type]

| Constant                            | Meaning                                                                                                                                                                                                                                           |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>none</code>                   | The type of the file has not been determined or an error occurred while trying to determine the type.                                                                                                                                             |
| <code>not_found</code>              | Pseudo-type indicating the file was not found.<br>NOTE: The file not being found is not considered an error while determining the type of a file.                                                                                                 |
| <code>regular</code>                | Regular file                                                                                                                                                                                                                                      |
| <code>directory</code>              | Directory file                                                                                                                                                                                                                                    |
| <code>symlink</code>                | Symbolic link file                                                                                                                                                                                                                                |
| <code>block</code>                  | Block special file                                                                                                                                                                                                                                |
| <code>character</code>              | Character special file                                                                                                                                                                                                                            |
| <code>fifo</code>                   | FIFO or pipe file                                                                                                                                                                                                                                 |
| <code>socket</code>                 | Socket file                                                                                                                                                                                                                                       |
| <code>implementation-defined</code> | Implementations that support file systems having file types in addition to the above <code>file_type</code> types shall supply implementation-defined <code>file_type</code> constants to separately identify each of those additional file types |
| <code>unknown</code>                | The file exists but the type cannot be determined                                                                                                                                                                                                 |

**31.12.8.3 Enum class copy\_options**

[fs.enum.copy.opts]

- <sup>1</sup> The enum class type `copy_options` is a bitmask type (16.3.3.3) that specifies bitmask constants used to control the semantics of copy operations. The constants are specified in option groups with the meanings listed in Table 132. The constant `none` represents the empty bitmask, and is shown in each option group for purposes of exposition; implementations shall provide only a single definition. Every other constant in the table represents a distinct bitmask element.

Table 132: Enum class `copy_options` [tab:fs.enum.copy.opts]

| Option group controlling <code>copy_file</code> function effects for existing target files   |                                                                                                                                                    |
|----------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Constant                                                                                     | Meaning                                                                                                                                            |
| <code>none</code>                                                                            | (Default) Error; file already exists.                                                                                                              |
| <code>skip_existing</code>                                                                   | Do not overwrite existing file, do not report an error.                                                                                            |
| <code>overwrite_existing</code>                                                              | Overwrite the existing file.                                                                                                                       |
| <code>update_existing</code>                                                                 | Overwrite the existing file if it is older than the replacement file.                                                                              |
| Option group controlling <code>copy</code> function effects for subdirectories               |                                                                                                                                                    |
| Constant                                                                                     | Meaning                                                                                                                                            |
| <code>none</code>                                                                            | (Default) Do not copy subdirectories.                                                                                                              |
| <code>recursive</code>                                                                       | Recursively copy subdirectories and their contents.                                                                                                |

| <code>create_hard_links</code>                                                               | Make hard links instead of copies of files.                                                                                                        |

**31.12.8.4 Enum class perms**

[fs.enum.perms]

- <sup>1</sup> The enum class type `perms` is a bitmask type (16.3.3.3) that specifies bitmask constants used to identify file permissions, with the meanings listed in Table 133.

**31.12.8.5 Enum class perm\_options**

[fs.enum.perm.opts]

- <sup>1</sup> The enum class type `perm_options` is a bitmask type (16.3.3.3) that specifies bitmask constants used to control the semantics of permissions operations, with the meanings listed in Table 134. The bitmask constants are bitmask elements. In Table 134 `perm` denotes a value of type `perms` passed to `permissions`.

**31.12.8.6 Enum class directory\_options**

[fs.enum.dir.opts]

- <sup>1</sup> The enum class type `directory_options` is a bitmask type (16.3.3.3) that specifies bitmask constants used to identify directory traversal options, with the meanings listed in Table 135. The constant `none` represents the empty bitmask; every other constant in the table represents a distinct bitmask element.

**31.12.9 Class file\_status**

[fs.class.file.status]

**31.12.9.1 General**

[fs.class.file.status.general]

```
namespace std::filesystem {
 class file_status {
 public:
 // 31.12.9.2, constructors and destructor
 file_status() noexcept : file_status(file_type::none) {}
```

Table 133: Enum class `perms` [tab:fs.enum.perms]

| Name         | Value<br>(octal) | POSIX<br>macro | Definition or notes                                                                                                         |
|--------------|------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------|
| none         | 0                |                | There are no permissions set for the file.                                                                                  |
| owner_read   | 0400             | S_IRUSR        | Read permission, owner                                                                                                      |
| owner_write  | 0200             | S_IWUSR        | Write permission, owner                                                                                                     |
| owner_exec   | 0100             | S_IXUSR        | Execute/search permission, owner                                                                                            |
| owner_all    | 0700             | S_IRWXU        | Read, write, execute/search by owner;<br><code>owner_read   owner_write   owner_exec</code>                                 |

| unknown      | 0xFFFF           |                | The permissions are not known, such as when a <code>file_status</code> object is created without specifying the permissions |

Table 134: Enum class `perm_options` [tab:fs.enum.perm.opts]

| Name     | Meaning                                                                                                                                                  |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| replace  | permissions shall replace the file's permission bits with <code>perm</code>                                                                              |
| add      | permissions shall replace the file's permission bits with the bitwise OR of <code>perm</code> and the file's current permission bits.                    |
| remove   | permissions shall replace the file's permission bits with the bitwise AND of the complement of <code>perm</code> and the file's current permission bits. |
| nofollow | permissions shall change the permissions of a symbolic link itself rather than the permissions of the file the link resolves to.                         |

Table 135: Enum class `directory_options` [tab:fs.enum.dir.opts]

| Name                     | Meaning                                                            |
|--------------------------|--------------------------------------------------------------------|
| none                     | (Default) Skip directory symlinks, permission denied is an error.  |
| follow_directory_symlink | Follow rather than skip directory symlinks.                        |
| skip_permission_denied   | Skip directories that would otherwise result in permission denied. |

```

explicit file_status(file_type ft,
 perms prms = perms::unknown) noexcept;
file_status(const file_status&) noexcept = default;
file_status(file_status&&) noexcept = default;
~file_status();

// assignments
file_status& operator=(const file_status&) noexcept = default;
file_status& operator=(file_status&&) noexcept = default;

// 31.12.9.4, modifiers
void type(file_type ft) noexcept;
void permissions(perms prms) noexcept;

// 31.12.9.3, observers
file_type type() const noexcept;
perms permissions() const noexcept;

friend bool operator==(const file_status& lhs, const file_status& rhs) noexcept
{ return lhs.type() == rhs.type() && lhs.permissions() == rhs.permissions(); }
};

}

```

- <sup>1</sup> An object of type `file_status` stores information about the type and permissions of a file.

### 31.12.9.2 Constructors

[fs.file.status.cons]

```
explicit file_status(file_type ft, perms prms = perms::unknown) noexcept;
```

<sup>1</sup> *Postconditions:* `type() == ft` and `permissions() == prms`.

### 31.12.9.3 Observers

[fs.file.status.obs]

- ```
file_type type() const noexcept;
```
- ¹ *Returns:* The value of `type()` specified by the postconditions of the most recent call to a constructor, `operator=`, or `type(file_type)` function.
- ```
perms permissions() const noexcept;
```
- <sup>2</sup> *Returns:* The value of `permissions()` specified by the postconditions of the most recent call to a constructor, `operator=`, or `permissions(perms)` function.

### 31.12.9.4 Modifiers

[fs.file.status.mods]

```
void type(file_type ft) noexcept;
```

<sup>1</sup> *Postconditions:* `type() == ft`.

```
void permissions(perms prms) noexcept;
```

<sup>2</sup> *Postconditions:* `permissions() == prms`.

## 31.12.10 Class `directory_entry`

[fs.class.directory.entry]

### 31.12.10.1 General

[fs.class.directory.entry.general]

```
namespace std::filesystem {
 class directory_entry {
 public:
 // 31.12.10.2, constructors and destructor
 directory_entry() noexcept = default;
 directory_entry(const directory_entry&) = default;
 directory_entry(directory_entry&&) noexcept = default;
 explicit directory_entry(const filesystem::path& p);
 directory_entry(const filesystem::path& p, error_code& ec);
 ~directory_entry();
 };
}
```

```

// assignments
directory_entry& operator=(const directory_entry&) = default;
directory_entry& operator=(directory_entry&&) noexcept = default;

// 31.12.10.3, modifiers
void assign(const filesystem::path& p);
void assign(const filesystem::path& p, error_code& ec);
void replace_filename(const filesystem::path& p);
void replace_filename(const filesystem::path& p, error_code& ec);
void refresh();
void refresh(error_code& ec) noexcept;

// 31.12.10.4, observers
const filesystem::path& path() const noexcept;
operator const filesystem::path&() const noexcept;
bool exists() const;
bool exists(error_code& ec) const noexcept;
bool is_block_file() const;
bool is_block_file(error_code& ec) const noexcept;
bool is_character_file() const;
bool is_character_file(error_code& ec) const noexcept;
bool is_directory() const;
bool is_directory(error_code& ec) const noexcept;
bool is_fifo() const;
bool is_fifo(error_code& ec) const noexcept;
bool is_other() const;
bool is_other(error_code& ec) const noexcept;
bool is_regular_file() const;
bool is_regular_file(error_code& ec) const noexcept;
bool is_socket() const;
bool is_socket(error_code& ec) const noexcept;
bool is_symlink() const;
bool is_symlink(error_code& ec) const noexcept;
uintmax_t file_size() const;
uintmax_t file_size(error_code& ec) const noexcept;
uintmax_t hard_link_count() const;
uintmax_t hard_link_count(error_code& ec) const noexcept;
file_time_type last_write_time() const;
file_time_type last_write_time(error_code& ec) const noexcept;
file_status status() const;
file_status status(error_code& ec) const noexcept;
file_status symlink_status() const;
file_status symlink_status(error_code& ec) const noexcept;

bool operator==(const directory_entry& rhs) const noexcept;
strong_ordering operator<=(const directory_entry& rhs) const noexcept;

// 31.12.10.5, inserter
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const directory_entry& d);

private:
 filesystem::path pathobject; // exposition only
 friend class directory_iterator; // exposition only
};

}

```

- <sup>1</sup> A `directory_entry` object stores a `path` object and may store additional objects for file attributes such as hard link count, status, symlink status, file size, and last write time.
- <sup>2</sup> Implementations should store such additional file attributes during directory iteration if their values are available and storing the values would allow the implementation to eliminate file system accesses by `directory_entry` observer functions (31.12.13). Such stored file attribute values are said to be *cached*.

<sup>3</sup> NOTE: For purposes of exposition, class `directory_iterator` (31.12.11) is shown above as a friend of class `directory_entry`. Friendship allows the `directory_iterator` implementation to cache already available attribute values directly into a `directory_entry` object without the cost of an unneeded call to `refresh()`.

<sup>4</sup> EXAMPLE:

```
using namespace std::filesystem;

// use possibly cached last write time to minimize disk accesses
for (auto&& x : directory_iterator(".")) {
 std::cout << x.path() << " " << x.last_write_time() << std::endl;
}

// call refresh() to refresh a stale cache
for (auto&& x : directory_iterator(".")) {
 lengthy_function(x.path()); // cache becomes stale
 x.refresh();
 std::cout << x.path() << " " << x.last_write_time() << std::endl;
}
```

On implementations that do not cache the last write time, both loops will result in a potentially expensive call to the `std::filesystem::last_write_time` function. On implementations that do cache the last write time, the first loop will use the cached value and so will not result in a potentially expensive call to the `std::filesystem::last_write_time` function. The code is portable to any implementation, regardless of whether or not it employs caching.

### 31.12.10.2 Constructors

[fs.dir.entry.cons]

```
explicit directory_entry(const filesystem::path& p);
directory_entry(const filesystem::path& p, error_code& ec);
```

<sup>1</sup> *Effects*: Calls `refresh()` or `refresh(ec)`, respectively.

<sup>2</sup> *Postconditions*: `path() == p` if no error occurs, otherwise `path() == filesystem::path()`.

<sup>3</sup> *Throws*: As specified in 31.12.5.

### 31.12.10.3 Modifiers

[fs.dir.entry.mods]

```
void assign(const filesystem::path& p);
void assign(const filesystem::path& p, error_code& ec);
```

<sup>1</sup> *Effects*: Equivalent to `pathobject = p`, then `refresh()` or `refresh(ec)`, respectively. If an error occurs, the values of any cached attributes are unspecified.

<sup>2</sup> *Throws*: As specified in 31.12.5.

```
void replace_filename(const filesystem::path& p);
void replace_filename(const filesystem::path& p, error_code& ec);
```

<sup>3</sup> *Effects*: Equivalent to `pathobject.replace_filename(p)`, then `refresh()` or `refresh(ec)`, respectively. If an error occurs, the values of any cached attributes are unspecified.

<sup>4</sup> *Throws*: As specified in 31.12.5.

```
void refresh();
void refresh(error_code& ec) noexcept;
```

<sup>5</sup> *Effects*: Stores the current values of any cached attributes of the file `p` resolves to. If an error occurs, an error is reported (31.12.5) and the values of any cached attributes are unspecified.

<sup>6</sup> *Throws*: As specified in 31.12.5.

<sup>7</sup> NOTE: Implementations of `directory_iterator` (31.12.11) are prohibited from directly or indirectly calling the `refresh` function as described in 31.12.11.1.

### 31.12.10.4 Observers

[fs.dir.entry.obs]

<sup>1</sup> Unqualified function names in the *Returns*: elements of the `directory_entry` observers described below refer to members of the `std::filesystem` namespace.

```
const filesystem::path& path() const noexcept;
```

```

operator const filesystem::path&() const noexcept;
2 Returns: pathobject.

bool exists() const;
bool exists(error_code& ec) const noexcept;
3 Returns: exists(this->status()) or exists(this->status(ec)), respectively.
4 Throws: As specified in 31.12.5.

bool is_block_file() const;
bool is_block_file(error_code& ec) const noexcept;
5 Returns: is_block_file(this->status()) or is_block_file(this->status(ec)), respectively.
6 Throws: As specified in 31.12.5.

bool is_character_file() const;
bool is_character_file(error_code& ec) const noexcept;
7 Returns: is_character_file(this->status()) or is_character_file(this->status(ec)), respectively.
8 Throws: As specified in 31.12.5.

bool is_directory() const;
bool is_directory(error_code& ec) const noexcept;
9 Returns: is_directory(this->status()) or is_directory(this->status(ec)), respectively.
10 Throws: As specified in 31.12.5.

bool is_fifo() const;
bool is_fifo(error_code& ec) const noexcept;
11 Returns: is_fifo(this->status()) or is_fifo(this->status(ec)), respectively.
12 Throws: As specified in 31.12.5.

bool is_other() const;
bool is_other(error_code& ec) const noexcept;
13 Returns: is_other(this->status()) or is_other(this->status(ec)), respectively.
14 Throws: As specified in 31.12.5.

bool is_regular_file() const;
bool is_regular_file(error_code& ec) const noexcept;
15 Returns: is_regular_file(this->status()) or is_regular_file(this->status(ec)), respectively.
16 Throws: As specified in 31.12.5.

bool is_socket() const;
bool is_socket(error_code& ec) const noexcept;
17 Returns: is_socket(this->status()) or is_socket(this->status(ec)), respectively.
18 Throws: As specified in 31.12.5.

bool is_symlink() const;
bool is_symlink(error_code& ec) const noexcept;
19 Returns: is_symlink(this->symlink_status()) or is_symlink(this->symlink_status(ec)), respectively.
20 Throws: As specified in 31.12.5.

uintmax_t file_size() const;
uintmax_t file_size(error_code& ec) const noexcept;
21 Returns: If cached, the file size attribute value. Otherwise, file_size(path()) or file_size(path(), ec), respectively.

```

22     *Throws:* As specified in [31.12.5](#).

```
23 uintmax_t hard_link_count() const;
 uintmax_t hard_link_count(error_code& ec) const noexcept;
```

23     *Returns:* If cached, the hard link count attribute value. Otherwise, `hard_link_count(path())` or `hard_link_count(path(), ec)`, respectively.

24     *Throws:* As specified in [31.12.5](#).

```
25 file_time_type last_write_time() const;
 file_time_type last_write_time(error_code& ec) const noexcept;
```

25     *Returns:* If cached, the last write time attribute value. Otherwise, `last_write_time(path())` or `last_write_time(path(), ec)`, respectively.

26     *Throws:* As specified in [31.12.5](#).

```
27 file_status status() const;
 file_status status(error_code& ec) const noexcept;
```

27     *Returns:* If cached, the status attribute value. Otherwise, `status(path())` or `status(path(), ec)`, respectively.

28     *Throws:* As specified in [31.12.5](#).

```
29 file_status symlink_status() const;
 file_status symlink_status(error_code& ec) const noexcept;
```

29     *Returns:* If cached, the symlink status attribute value. Otherwise, `symlink_status(path())` or `symlink_status(path(), ec)`, respectively.

30     *Throws:* As specified in [31.12.5](#).

```
31 bool operator==(const directory_entry& rhs) const noexcept;
```

31     *Returns:* `pathobject == rhs.pathobject`.

```
32 strong_ordering operator<=(const directory_entry& rhs) const noexcept;
```

32     *Returns:* `pathobject <= rhs.pathobject`.

**31.12.10.5 Inserter**

[fs.dir.entry.io]

```
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const directory_entry& d);
```

1     *Effects:* Equivalent to: `return os << d.path();`

**31.12.11 Class directory\_iterator**

[fs.class.directory.iterator]

**31.12.11.1 General**

[fs.class.directory.iterator.general]

1     An object of type `directory_iterator` provides an iterator for a sequence of `directory_entry` elements representing the path and any cached attribute values ([31.12.10](#)) for each file in a directory or in an implementation-defined directory-like file type.

NOTE 1: For iteration into subdirectories, see class `recursive_directory_iterator` ([31.12.12](#)).

```
namespace std::filesystem {
 class directory_iterator {
 public:
 using iterator_category = input_iterator_tag;
 using value_type = directory_entry;
 using difference_type = ptrdiff_t;
 using pointer = const directory_entry*;
 using reference = const directory_entry&;
 // 31.12.11.2, member functions
 directory_iterator() noexcept;
 explicit directory_iterator(const path& p);
 directory_iterator(const path& p, directory_options options);
```

```

directory_iterator(const path& p, error_code& ec);
directory_iterator(const path& p, directory_options options,
 error_code& ec);
directory_iterator(const directory_iterator& rhs);
directory_iterator(directory_iterator&& rhs) noexcept;
~directory_iterator();

directory_iterator& operator=(const directory_iterator& rhs);
directory_iterator& operator=(directory_iterator&& rhs) noexcept;

const directory_entry& operator*() const;
const directory_entry* operator->() const;
directory_iterator& operator++();
directory_iterator& increment(error_code& ec);

bool operator==(default_sentinel_t) const noexcept {
 return *this == directory_iterator();
}

// other members as required by 25.3.5.3, input iterators
};

}

```

- <sup>2</sup> `directory_iterator` meets the `Cpp17InputIterator` requirements (25.3.5.3).
  - <sup>3</sup> If an iterator of type `directory_iterator` reports an error or is advanced past the last directory element, that iterator shall become equal to the end iterator value. The `directory_iterator` default constructor shall create an iterator equal to the end iterator value, and this shall be the only valid iterator for the end condition.
  - <sup>4</sup> The end iterator is not dereferenceable.
  - <sup>5</sup> Two end iterators are always equal. An end iterator shall not be equal to a non-end iterator.
  - <sup>6</sup> The result of calling the `path()` member of the `directory_entry` object obtained by dereferencing a `directory_iterator` is a reference to a `path` object composed of the `directory` argument from which the iterator was constructed with the filename of the directory entry appended as if by `operator/`.
  - <sup>7</sup> Directory iteration shall not yield directory entries for the current (dot) and parent (dot-dot) directories.
  - <sup>8</sup> The order of directory entries obtained by dereferencing successive increments of a `directory_iterator` is unspecified.
  - <sup>9</sup> Constructors and non-const `directory_iterator` member functions store the values of any cached attributes (31.12.10) in the `directory_entry` element returned by `operator*()`. `directory_iterator` member functions shall not directly or indirectly call any `directory_entry refresh` function.
- NOTE 2: The exact mechanism for storing cached attribute values is not exposed to users. For exposition, class `directory_iterator` is shown in 31.12.10 as a friend of class `directory_entry`.
- <sup>10</sup> NOTE 3: It is possible for a path obtained by dereferencing a directory iterator to not actually exist; for example if it is a symbolic link to a non-existent file. Recursively walking directory trees for purposes of removing and renaming entries can invalidate symbolic links that are being followed.
  - <sup>11</sup> NOTE 4: If a file is removed from or added to a directory after the construction of a `directory_iterator` for the directory, it is unspecified whether or not subsequently incrementing the iterator will ever result in an iterator referencing the removed or added directory entry. See POSIX `readdir`.

### 31.12.11.2 Members

[fs.dir.itr.members]

`directory_iterator() noexcept;`

- <sup>1</sup> *Effects:* Constructs the end iterator.

```

explicit directory_iterator(const path& p);
directory_iterator(const path& p, directory_options options);
directory_iterator(const path& p, error_code& ec);

```

```
directory_iterator(const path& p, directory_options options, error_code& ec);
```

- 2    *Effects:* For the directory that `p` resolves to, constructs an iterator for the first element in a sequence of `directory_entry` elements representing the files in the directory, if any; otherwise the end iterator. However, if

```
 (options & directory_options::skip_permission_denied) != directory_options::none
```

and construction encounters an error indicating that permission to access `p` is denied, constructs the end iterator and does not report an error.

- 3    *Throws:* As specified in [31.12.5](#).

4    *NOTE:* To iterate over the current directory, use `directory_iterator(".")` rather than `directory_iterator("")`.

```
directory_iterator(const directory_iterator& rhs);
directory_iterator(directory_iterator&& rhs) noexcept;
```

- 5    *Postconditions:* `*this` has the original value of `rhs`.

```
directory_iterator& operator=(const directory_iterator& rhs);
directory_iterator& operator=(directory_iterator&& rhs) noexcept;
```

- 6    *Effects:* If `*this` and `rhs` are the same object, the member has no effect.

7    *Postconditions:* `*this` has the original value of `rhs`.

8    *Returns:* `*this`.

```
directory_iterator& operator++();
directory_iterator& increment(error_code& ec);
```

- 9    *Effects:* As specified for the prefix increment operation of Input iterators ([25.3.5.3](#)).

10    *Returns:* `*this`.

- 11    *Throws:* As specified in [31.12.5](#).

### 31.12.11.3 Non-member functions

[fs.dir.itr.nonmembers]

- 1    These functions enable range access for `directory_iterator`.

```
directory_iterator begin(directory_iterator iter) noexcept;
```

2    *Returns:* `iter`.

```
directory_iterator end(directory_iterator) noexcept;
```

3    *Returns:* `directory_iterator()`.

## 31.12.12 Class recursive\_directory\_iterator

[fs.class.rec.dir.itr]

### 31.12.12.1 General

[fs.class.rec.dir.itr.general]

- 1    An object of type `recursive_directory_iterator` provides an iterator for a sequence of `directory_entry` elements representing the files in a directory or in an implementation-defined directory-like file type, and its subdirectories.

```
namespace std::filesystem {
 class recursive_directory_iterator {
 public:
 using iterator_category = input_iterator_tag;
 using value_type = directory_entry;
 using difference_type = ptrdiff_t;
 using pointer = const directory_entry*;
 using reference = const directory_entry&

 // 31.12.12.2, constructors and destructor
 recursive_directory_iterator() noexcept;
 explicit recursive_directory_iterator(const path& p);
 recursive_directory_iterator(const path& p, directory_options options);
 recursive_directory_iterator(const path& p, directory_options options,
 error_code& ec);
```

```

recursive_directory_iterator(const path& p, error_code& ec);
recursive_directory_iterator(const recursive_directory_iterator& rhs);
recursive_directory_iterator(recursive_directory_iterator&& rhs) noexcept;
~recursive_directory_iterator();

// 31.12.12.2, observers
directory_options options() const;
int depth() const;
bool recursion_pending() const;

const directory_entry& operator*() const;
const directory_entry* operator->() const;

// 31.12.12.2, modifiers
recursive_directory_iterator&
operator=(const recursive_directory_iterator& rhs);
recursive_directory_iterator&
operator=(recursive_directory_iterator&& rhs) noexcept;

recursive_directory_iterator& operator++();
recursive_directory_iterator& increment(error_code& ec);

void pop();
void pop(error_code& ec);
void disable_recursion_pending();

bool operator==(default_sentinel_t) const noexcept {
 return *this == recursive_directory_iterator();
}

// other members as required by 25.3.5.3, input iterators
};

}

```

- 2 Calling `options`, `depth`, `recursion_pending`, `pop` or `disable_recursion_pending` on an iterator that is not dereferenceable results in undefined behavior.
- 3 The behavior of a `recursive_directory_iterator` is the same as a `directory_iterator` unless otherwise specified.
- 4 NOTE: If the directory structure being iterated over contains cycles then it is possible that the end iterator is unreachable.

### 31.12.12.2 Members

[fs.rec.dir.itr.members]

```
recursive_directory_iterator() noexcept;
```

- 1 *Effects:* Constructs the end iterator.

```
explicit recursive_directory_iterator(const path& p);
recursive_directory_iterator(const path& p, directory_options options);
recursive_directory_iterator(const path& p, directory_options options, error_code& ec);
recursive_directory_iterator(const path& p, error_code& ec);
```

- 2 *Effects:* Constructs an iterator representing the first entry in the directory to which `p` resolves, if any; otherwise, the end iterator. However, if

```
(options & directory_options::skip_permission_denied) != directory_options::none
```

and construction encounters an error indicating that permission to access `p` is denied, constructs the end iterator and does not report an error.

- 3 *Postconditions:* `options() == options` for the signatures with a `directory_options` argument, otherwise `options() == directory_options::none`.

- 4 *Throws:* As specified in 31.12.5.

- 5 NOTE 1: Use `recursive_directory_iterator(".")` rather than `recursive_directory_iterator("")` to iterate over the current directory.

6        NOTE 2: By default, `recursive_directory_iterator` does not follow directory symlinks. To follow directory symlinks, specify `options` as `directory_options::follow_directory_symlink`.

```
recursive_directory_iterator(const recursive_directory_iterator& rhs);
```

7        *Postconditions:*

- (7.1)      — `options() == rhs.options()`
- (7.2)      — `depth() == rhs.depth()`
- (7.3)      — `recursion_pending() == rhs.recursion_pending()`

```
recursive_directory_iterator(recursive_directory_iterator&& rhs) noexcept;
```

8        *Postconditions:* `options()`, `depth()`, and `recursion_pending()` have the values that `rhs.options()`, `rhs.depth()`, and `rhs.recursion_pending()`, respectively, had before the function call.

```
recursive_directory_iterator& operator=(const recursive_directory_iterator& rhs);
```

9        *Effects:* If `*this` and `rhs` are the same object, the member has no effect.

10      *Postconditions:*

- (10.1)     — `options() == rhs.options()`
- (10.2)     — `depth() == rhs.depth()`
- (10.3)     — `recursion_pending() == rhs.recursion_pending()`

11      *Returns:* `*this`.

```
recursive_directory_iterator& operator=(recursive_directory_iterator&& rhs) noexcept;
```

12      *Effects:* If `*this` and `rhs` are the same object, the member has no effect.

13      *Postconditions:* `options()`, `depth()`, and `recursion_pending()` have the values that `rhs.options()`, `rhs.depth()`, and `rhs.recursion_pending()`, respectively, had before the function call.

14      *Returns:* `*this`.

```
directory_options options() const;
```

15      *Returns:* The value of the argument passed to the constructor for the `options` parameter, if present, otherwise `directory_options::none`.

16      *Throws:* Nothing.

```
int depth() const;
```

17      *Returns:* The current depth of the directory tree being traversed.

NOTE 3: The initial directory is depth 0, its immediate subdirectories are depth 1, and so forth.

18      *Throws:* Nothing.

```
bool recursion_pending() const;
```

19      *Returns:* `true` if `disable_recursion_pending()` has not been called subsequent to the prior construction or increment operation, otherwise `false`.

20      *Throws:* Nothing.

```
recursive_directory_iterator& operator++();
```

```
recursive_directory_iterator& increment(error_code& ec);
```

21      *Effects:* As specified for the prefix increment operation of Input iterators (25.3.5.3), except that:

- (21.1)     — If there are no more entries at the current depth, then if `depth() != 0` iteration over the parent directory resumes; otherwise `*this = recursive_directory_iterator()`.
- (21.2)     — Otherwise if  

$$\text{recursion\_pending}() \&\& \text{is\_directory}((\ast\text{this})\rightarrow\text{status}()) \&\& (\text{!is\_symlink}((\ast\text{this})\rightarrow\text{symlink\_status}()) \mid (\text{options}() \& \text{directory\_options::follow\_directory\_symlink}) \neq \text{directory\_options::none})$$
then either directory `(\ast\text{this})\rightarrow\text{path}()` is recursively iterated into or, if

(options() & directory\_options::skip\_permission\_denied) != directory\_options::none  
and an error occurs indicating that permission to access directory (\*this)->path() is denied,  
then directory (\*this)->path() is treated as an empty directory and no error is reported.

22     *Returns:* \*this.

23     *Throws:* As specified in [31.12.5](#).

```
void pop();
void pop(error_code& ec);
```

24     *Effects:* If depth() == 0, set \*this to recursive\_directory\_iterator(). Otherwise, cease iteration  
of the directory currently being iterated over, and continue iteration over the parent directory.

25     *Throws:* As specified in [31.12.5](#).

26     *Remarks:* Any copies of the previous value of \*this are no longer required to be dereferenceable nor to be in  
the domain of ==.

```
void disable_recursion_pending();
```

27     *Postconditions:* recursion\_pending() == false.

28     NOTE 4: disable\_recursion\_pending() is used to prevent unwanted recursion into a directory.

**31.12.12.3 Non-member functions**

[fs.rec.dir.itr.nonmembers]

- 1 These functions enable use of recursive\_directory\_iterator with range-based for statements.

```
recursive_directory_iterator begin(recursive_directory_iterator iter) noexcept;
2 Returns: iter.
```

```
recursive_directory_iterator end(recursive_directory_iterator) noexcept;
3 Returns: recursive_directory_iterator().
```

**31.12.13 Filesystem operation functions**

[fs.op.funcs]

**31.12.13.1 General**

[fs.op.funcs.general]

- 1 Filesystem operation functions query or modify files, including directories, in external storage.
- 2 NOTE: Because hardware failures, network failures, file system races ([31.12.2.4](#)), and many other kinds of errors occur  
frequently in file system operations, any filesystem operation function, no matter how apparently innocuous, can  
encounter an error; see [31.12.5](#).

**31.12.13.2 Absolute**

[fs.op.absolute]

```
path filesystem::absolute(const path& p);
path filesystem::absolute(const path& p, error_code& ec);
```

- 1     *Effects:* Composes an absolute path referencing the same file system location as p according to the  
operating system ([31.12.2.3](#)).
- 2     *Returns:* The composed path. The signature with argument ec returns path() if an error occurs.
- 3     NOTE 1: For the returned path, rp, rp.is\_absolute() is true unless an error occurs.
- 4     *Throws:* As specified in [31.12.5](#).
- 5     NOTE 2: To resolve symlinks or perform other sanitization that can involve queries to secondary storage, such  
as hard disks, consider canonical ([31.12.13.3](#)).
- 6     NOTE 3: Implementations are strongly encouraged to not query secondary storage, and not consider !exists(p)  
an error.
- 7     EXAMPLE: For POSIX-based operating systems, absolute(p) is simply current\_path()/p. For Windows-based  
operating systems, absolute typically has the same semantics as GetFullPathNameW.

**31.12.13.3 Canonical**

[fs.op.canonical]

```
path filesystem::canonical(const path& p);
path filesystem::canonical(const path& p, error_code& ec);
```

- 1     *Effects:* Converts p to an absolute path that has no symbolic link, dot, or dot-dot elements in its  
pathname in the generic format.

- 2     *Returns*: A path that refers to the same file system object as `absolute(p)`. The signature with argument `ec` returns `path()` if an error occurs.
- 3     *Throws*: As specified in [31.12.5](#).
- 4     *Remarks*: `!exists(p)` is an error.

#### 31.12.13.4 Copy

[`fs.op.copy`]

`void filesystem::copy(const path& from, const path& to);`

- 1     *Effects*: Equivalent to `copy(from, to, copy_options::none)`.

`void filesystem::copy(const path& from, const path& to, error_code& ec);`

- 2     *Effects*: Equivalent to `copy(from, to, copy_options::none, ec)`.

`void filesystem::copy(const path& from, const path& to, copy_options options);`

`void filesystem::copy(const path& from, const path& to, copy_options options, error_code& ec);`

- 3     *Preconditions*: At most one element from each option group ([31.12.8.3](#)) is set in `options`.

- 4     *Effects*: Before the first use of `f` and `t`:

(4.1)     — If

(options & `copy_options::create_symlinks`) != `copy_options::none` ||  
           (options & `copy_options::skip_symlinks`) != `copy_options::none`  
           then `auto f = symlink_status(from)` and if needed `auto t = symlink_status(to)`.

(4.2)     — Otherwise, if

(options & `copy_options::copy_symlinks`) != `copy_options::none`  
           then `auto f = symlink_status(from)` and if needed `auto t = status(to)`.

(4.3)     — Otherwise, `auto f = status(from)` and if needed `auto t = status(to)`.

Effects are then as follows:

(4.4)     — If `f.type()` or `t.type()` is an implementation-defined file type ([31.12.8.2](#)), then the effects are implementation-defined.

(4.5)     — Otherwise, an error is reported as specified in [31.12.5](#) if:

— `exists(f)` is `false`, or

— `equivalent(from, to)` is `true`, or

— `is_other(f) || is_other(t)` is `true`, or

— `is_directory(f) && is_regular_file(t)` is `true`.

(4.6)     — Otherwise, if `is_symlink(f)`, then:

— If `(options & copy_options::skip_symlinks) != copy_options::none` then return.

— Otherwise if

!`exists(t) && (options & copy_options::copy_symlinks) != copy_options::none`  
           then `copy_symlink(from, to)`.

— Otherwise report an error as specified in [31.12.5](#).

(4.7)     — Otherwise, if `is_regular_file(f)`, then:

— If `(options & copy_options::directories_only) != copy_options::none`, then return.

— Otherwise, if `(options & copy_options::create_symlinks) != copy_options::none`, then create a symbolic link to the source file.

— Otherwise, if `(options & copy_options::create_hard_links) != copy_options::none`, then create a hard link to the source file.

— Otherwise, if `is_directory(t)`, then `copy_file(from, to/from.filename(), options)`.

— Otherwise, `copy_file(from, to, options)`.

- (4.8) — Otherwise, if  
`is_directory(f) &&`  
`(options & copy_options::create_symlinks) != copy_options::none`  
 then report an error with an `error_code` argument equal to `make_error_code(errc::is_a_directory)`.
- (4.9) — Otherwise, if  
`is_directory(f) &&`  
`((options & copy_options::recursive) != copy_options::none ||`  
`options == copy_options::none)`
- then:
- (4.9.1) — If `exists(t)` is `false`, then `create_directory(to, from)`.
- (4.9.2) — Then, iterate over the files in `from`, as if by  
`for (const directory_entry& x : directory_iterator(from))`  
`copy(x.path(), to/x.path().filename(),`  
`options | copy_options::in-recursive-copy);`
- where `in-recursive-copy` is a bitmask element of `copy_options` that is not one of the elements in [31.12.8.3](#).

(4.10) — Otherwise, for the signature with argument `ec`, `ec.clear()`.

(4.11) — Otherwise, no effects.

5     *Throws*: As specified in [31.12.5](#).

6     *Remarks*: For the signature with argument `ec`, any library functions called by the implementation shall have an `error_code` argument if applicable.

7     EXAMPLE: Given this directory structure:

```
/dir1
 file1
 file2
 dir2
 file3
```

Calling `copy("/dir1", "/dir3")` would result in:

```
/dir1
 file1
 file2
 dir2
 file3
/dir3
 file1
 file2
```

Alternatively, calling `copy("/dir1", "/dir3", copy_options::recursive)` would result in:

```
/dir1
 file1
 file2
 dir2
 file3
/dir3
 file1
 file2
 dir2
 file3
```

### 31.12.13.5 Copy file

[`fs.op.copy.file`]

```
bool filesystem::copy_file(const path& from, const path& to);
bool filesystem::copy_file(const path& from, const path& to, error_code& ec);
```

1     *Returns*: `copy_file(from, to, copy_options::none)` or  
`copy_file(from, to, copy_options::none, ec)`, respectively.

2     *Throws:* As specified in [31.12.5](#).

```
bool filesystem::copy_file(const path& from, const path& to, copy_options options);
bool filesystem::copy_file(const path& from, const path& to, copy_options options,
 error_code& ec);
```

3     *Preconditions:* At most one element from each option group ([31.12.8.3](#)) is set in `options`.

4     *Effects:* As follows:

(4.1)   — Report an error as specified in [31.12.5](#) if:

(4.1.1)   — `is_regular_file(from)` is `false`, or

(4.1.2)   — `exists(to)` is `true` and `is_regular_file(to)` is `false`, or

(4.1.3)   — `exists(to)` is `true` and `equivalent(from, to)` is `true`, or

(4.1.4)   — `exists(to)` is `true` and

```
(options & (copy_options::skip_existing |
 copy_options::overwrite_existing |
 copy_options::update_existing)) == copy_options::none
```

(4.2)   — Otherwise, copy the contents and attributes of the file `from` resolves to, to the file `to` resolves to, if:

(4.2.1)   — `exists(to)` is `false`, or

(4.2.2)   — `(options & copy_options::overwrite_existing) != copy_options::none`, or

(4.2.3)   — `(options & copy_options::update_existing) != copy_options::none` and `from` is more recent than `to`, determined as if by use of the `last_write_time` function ([31.12.13.26](#)).

(4.3)   — Otherwise, no effects.

5     *Returns:* `true` if the `from` file was copied, otherwise `false`. The signature with argument `ec` returns `false` if an error occurs.

6     *Throws:* As specified in [31.12.5](#).

7     *Complexity:* At most one direct or indirect invocation of `status(to)`.

### 31.12.13.6 Copy symlink

[`fs.op.copy.symlink`]

```
void filesystem::copy_symlink(const path& existing_symlink, const path& new_symlink);
void filesystem::copy_symlink(const path& existing_symlink, const path& new_symlink,
 error_code& ec) noexcept;
```

1     *Effects:* Equivalent to `function(read_symlink(existing_symlink), new_symlink)` or `function(read_symlink(existing_symlink, ec), new_symlink, ec)`, respectively, where in each case `function` is `create_symlink` or `create_directory_symlink` as appropriate.

2     *Throws:* As specified in [31.12.5](#).

### 31.12.13.7 Create directories

[`fs.op.create.directories`]

```
bool filesystem::create_directories(const path& p);
bool filesystem::create_directories(const path& p, error_code& ec);
```

1     *Effects:* Calls `create_directory()` for each element of `p` that does not exist.

2     *Returns:* `true` if a new directory was created for the directory `p` resolves to, otherwise `false`.

3     *Throws:* As specified in [31.12.5](#).

4     *Complexity:*  $\mathcal{O}(n)$  where `n` is the number of elements of `p`.

### 31.12.13.8 Create directory

[`fs.op.create.directory`]

```
bool filesystem::create_directory(const path& p);
bool filesystem::create_directory(const path& p, error_code& ec) noexcept;
```

1     *Effects:* Creates the directory `p` resolves to, as if by POSIX `mkdir` with a second argument of `static_cast<int>(perms::all)`. If `mkdir` fails because `p` resolves to an existing directory, no error is reported. Otherwise on failure an error is reported.

- 2     *Returns:* `true` if a new directory was created, otherwise `false`.  
 3     *Throws:* As specified in [31.12.5](#).

```
bool filesystem::create_directory(const path& p, const path& existing_p);
bool filesystem::create_directory(const path& p, const path& existing_p, error_code& ec) noexcept;
```

- 4     *Effects:* Creates the directory `p` resolves to, with attributes copied from directory `existing_p`. The set of attributes copied is operating system dependent. If `mkdir` fails because `p` resolves to an existing directory, no error is reported. Otherwise on failure an error is reported.

NOTE: For POSIX-based operating systems, the attributes are those copied by native API `stat(existing_p.c_str(), &attributes_stat)` followed by `mkdir(p.c_str(), attributes_stat.st_mode)`. For Windows-based operating systems, the attributes are those copied by native API `CreateDirectoryExW(existing_p.c_str(), p.c_str(), 0)`.

- 5     *Returns:* `true` if a new directory was created with attributes copied from directory `existing_p`, otherwise `false`.  
 6     *Throws:* As specified in [31.12.5](#).

### 31.12.13.9 Create directory symlink

[fs.op.create.dir.symlk]

```
void filesystem::create_directory_symlink(const path& to, const path& new_symlink);
void filesystem::create_directory_symlink(const path& to, const path& new_symlink,
 error_code& ec) noexcept;
```

- 1     *Effects:* Establishes the postcondition, as if by POSIX `symlink()`.  
 2     *Postconditions:* `new_symlink` resolves to a symbolic link file that contains an unspecified representation of `to`.  
 3     *Throws:* As specified in [31.12.5](#).  
 4     NOTE 1: Some operating systems require symlink creation to identify that the link is to a directory. Thus, `create_symlink()` (instead of `create_directory_symlink()`) cannot be used reliably to create directory symlinks.  
 5     NOTE 2: Some operating systems do not support symbolic links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support symbolic links regardless of the operating system.

### 31.12.13.10 Create hard link

[fs.op.create.hard.lk]

```
void filesystem::create_hard_link(const path& to, const path& new_hard_link);
void filesystem::create_hard_link(const path& to, const path& new_hard_link,
 error_code& ec) noexcept;
```

- 1     *Effects:* Establishes the postcondition, as if by POSIX `link()`.  
 2     *Postconditions:*  
 (2.1) — `exists(to) && exists(new_hard_link) && equivalent(to, new_hard_link)`  
 (2.2) — The contents of the file or directory `to` resolves to are unchanged.  
 3     *Throws:* As specified in [31.12.5](#).  
 4     NOTE: Some operating systems do not support hard links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support hard links regardless of the operating system. Some file systems limit the number of links per file.

### 31.12.13.11 Create symlink

[fs.op.create.symlink]

```
void filesystem::create_symlink(const path& to, const path& new_symlink);
void filesystem::create_symlink(const path& to, const path& new_symlink,
 error_code& ec) noexcept;
```

- 1     *Effects:* Establishes the postcondition, as if by POSIX `symlink()`.  
 2     *Postconditions:* `new_symlink` resolves to a symbolic link file that contains an unspecified representation of `to`.  
 3     *Throws:* As specified in [31.12.5](#).

4 NOTE: Some operating systems do not support symbolic links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support symbolic links regardless of the operating system.

### 31.12.13.12 Current path

[fs.op.current.path]

```
path filesystem::current_path();
path filesystem::current_path(error_code& ec);
```

1 *Returns*: The absolute path of the current working directory, whose pathname in the native format is obtained as if by POSIX `getcwd()`. The signature with argument `ec` returns `path()` if an error occurs.

2 *Throws*: As specified in [31.12.5](#).

3 *Remarks*: The current working directory is the directory, associated with the process, that is used as the starting location in pathname resolution for relative paths.

4 NOTE 1: The `current_path()` name was chosen to emphasize that the returned value is a path, not just a single directory name.

5 NOTE 2: The current path as returned by many operating systems is a dangerous global variable and can be changed unexpectedly by third-party or system library functions, or by another thread.

```
void filesystem::current_path(const path& p);
void filesystem::current_path(const path& p, error_code& ec) noexcept;
```

6 *Effects*: Establishes the postcondition, as if by POSIX `chdir()`.

7 *Postconditions*: `equivalent(p, current_path())`.

8 *Throws*: As specified in [31.12.5](#).

9 NOTE 3: The current path for many operating systems is a dangerous global state and can be changed unexpectedly by third-party or system library functions, or by another thread.

### 31.12.13.13 Equivalent

[fs.op.equivalent]

```
bool filesystem::equivalent(const path& p1, const path& p2);
bool filesystem::equivalent(const path& p1, const path& p2, error_code& ec) noexcept;
```

1 Two paths are considered to resolve to the same file system entity if two candidate entities reside on the same device at the same location.

NOTE: On POSIX platforms, this is determined as if by the values of the POSIX `stat` class, obtained as if by `stat()` for the two paths, having equal `st_dev` values and equal `st_ino` values.

2 *Returns*: `true`, if `p1` and `p2` resolve to the same file system entity, otherwise `false`. The signature with argument `ec` returns `false` if an error occurs.

3 *Throws*: As specified in [31.12.5](#).

4 *Remarks*: `!exists(p1) || !exists(p2)` is an error.

### 31.12.13.14 Exists

[fs.op.exists]

```
bool filesystem::exists(file_status s) noexcept;
```

1 *Returns*: `status_known(s) && s.type() != file_type::not_found`.

```
bool filesystem::exists(const path& p);
bool filesystem::exists(const path& p, error_code& ec) noexcept;
```

2 Let `s` be a `file_status`, determined as if by `status(p)` or `status(p, ec)`, respectively.

3 *Effects*: The signature with argument `ec` calls `ec.clear()` if `status_known(s)`.

4 *Returns*: `exists(s)`.

5 *Throws*: As specified in [31.12.5](#).

### 31.12.13.15 File size

[fs.op.file.size]

```
uintmax_t filesystem::file_size(const path& p);
uintmax_t filesystem::file_size(const path& p, error_code& ec) noexcept;
```

1 *Effects*: If `exists(p)` is `false`, an error is reported ([31.12.5](#)).

2 *Returns*:

- (2.1) — If `is_regular_file(p)`, the size in bytes of the file `p` resolves to, determined as if by the value of the POSIX `stat` class member `st_size` obtained as if by POSIX `stat()`.
- (2.2) — Otherwise, the result is implementation-defined.

The signature with argument `ec` returns `static_cast<uintmax_t>(-1)` if an error occurs.

- 3     *Throws:* As specified in [31.12.5](#).

### 31.12.13.16 Hard link count

[fs.op.hard.lk.ct]

```
uintmax_t filesystem::hard_link_count(const path& p);
uintmax_t filesystem::hard_link_count(const path& p, error_code& ec) noexcept;
```

- 1     *Returns:* The number of hard links for `p`. The signature with argument `ec` returns `static_cast<uintmax_t>(-1)` if an error occurs.

- 2     *Throws:* As specified in [31.12.5](#).

### 31.12.13.17 Is block file

[fs.op.is.block.file]

```
bool filesystem::is_block_file(file_status s) noexcept;
```

- 1     *Returns:* `s.type() == file_type::block`.

```
bool filesystem::is_block_file(const path& p);
bool filesystem::is_block_file(const path& p, error_code& ec) noexcept;
```

- 2     *Returns:* `is_block_file(status(p))` or `is_block_file(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

- 3     *Throws:* As specified in [31.12.5](#).

### 31.12.13.18 Is character file

[fs.op.is.char.file]

```
bool filesystem::is_character_file(file_status s) noexcept;
```

- 1     *Returns:* `s.type() == file_type::character`.

```
bool filesystem::is_character_file(const path& p);
bool filesystem::is_character_file(const path& p, error_code& ec) noexcept;
```

- 2     *Returns:* `is_character_file(status(p))` or `is_character_file(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

- 3     *Throws:* As specified in [31.12.5](#).

### 31.12.13.19 Is directory

[fs.op.is.directory]

```
bool filesystem::is_directory(file_status s) noexcept;
```

- 1     *Returns:* `s.type() == file_type::directory`.

```
bool filesystem::is_directory(const path& p);
bool filesystem::is_directory(const path& p, error_code& ec) noexcept;
```

- 2     *Returns:* `is_directory(status(p))` or `is_directory(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

- 3     *Throws:* As specified in [31.12.5](#).

### 31.12.13.20 Is empty

[fs.op.is.empty]

```
bool filesystem::is_empty(const path& p);
bool filesystem::is_empty(const path& p, error_code& ec);
```

- 1     *Effects:*

- (1.1) — Determine `file_status s`, as if by `status(p)` or `status(p, ec)`, respectively.

- (1.2) — For the signature with argument `ec`, return `false` if an error occurred.

- (1.3) — Otherwise, if `is_directory(s)`:

- (1.3.1) — Create a variable `itr`, as if by `directory_iterator itr(p)` or `directory_iterator itr(p, ec)`, respectively.

- (1.3.2) — For the signature with argument `ec`, return `false` if an error occurred.
- (1.3.3) — Otherwise, return `itr == directory_iterator()`.
- (1.4) — Otherwise:
- (1.4.1) — Determine `uintmax_t sz`, as if by `file_size(p)` or `file_size(p, ec)`, respectively.
- (1.4.2) — For the signature with argument `ec`, return `false` if an error occurred.
- (1.4.3) — Otherwise, return `sz == 0`.

2     *Throws*: As specified in [31.12.5](#).

### 31.12.13.21 Is fifo

[fs.op.is fifo]

`bool filesystem::is_fifo(file_status s) noexcept;`

1     *Returns*: `s.type() == file_type::fifo`.

`bool filesystem::is_fifo(const path& p);`

`bool filesystem::is_fifo(const path& p, error_code& ec) noexcept;`

2     *Returns*: `is_fifo(status(p))` or `is_fifo(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3     *Throws*: As specified in [31.12.5](#).

### 31.12.13.22 Is other

[fs.op.is.other]

`bool filesystem::is_other(file_status s) noexcept;`

1     *Returns*: `exists(s) && !is_regular_file(s) && !is_directory(s) && !is_symlink(s)`.

`bool filesystem::is_other(const path& p);`

`bool filesystem::is_other(const path& p, error_code& ec) noexcept;`

2     *Returns*: `is_other(status(p))` or `is_other(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3     *Throws*: As specified in [31.12.5](#).

### 31.12.13.23 Is regular file

[fs.op.is.regular.file]

`bool filesystem::is_regular_file(file_status s) noexcept;`

1     *Returns*: `s.type() == file_type::regular`.

`bool filesystem::is_regular_file(const path& p);`

2     *Returns*: `is_regular_file(status(p))`.

3     *Throws*: `filesystem_error` if `status(p)` would throw `filesystem_error`.

`bool filesystem::is_regular_file(const path& p, error_code& ec) noexcept;`

4     *Effects*: Sets `ec` as if by `status(p, ec)`.

NOTE: `file_type::none`, `file_type::not_found` and `file_type::unknown` cases set `ec` to error values. To distinguish between cases, call the `status` function directly.

5     *Returns*: `is_regular_file(status(p, ec))`. Returns `false` if an error occurs.

### 31.12.13.24 Is socket

[fs.op.is.socket]

`bool filesystem::is_socket(file_status s) noexcept;`

1     *Returns*: `s.type() == file_type::socket`.

`bool filesystem::is_socket(const path& p);`

`bool filesystem::is_socket(const path& p, error_code& ec) noexcept;`

2     *Returns*: `is_socket(status(p))` or `is_socket(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3     *Throws*: As specified in [31.12.5](#).

### 31.12.13.25 Is symlink

[fs.op.is.symlink]

```
bool filesystem::is_symlink(file_status s) noexcept;
```

1     >Returns: `s.type() == file_type::symlink`.

```
bool filesystem::is_symlink(const path& p);
```

```
bool filesystem::is_symlink(const path& p, error_code& ec) noexcept;
```

2     >Returns: `is_symlink(symlink_status(p))` or `is_symlink(symlink_status(p, ec))`, respectively.  
The signature with argument `ec` returns `false` if an error occurs.

3     >Throws: As specified in [31.12.5](#).

### 31.12.13.26 Last write time

[fs.op.last.write.time]

```
file_time_type filesystem::last_write_time(const path& p);
```

```
file_time_type filesystem::last_write_time(const path& p, error_code& ec) noexcept;
```

1     >Returns: The time of last data modification of `p`, determined as if by the value of the POSIX `stat` class member `st_mtime` obtained as if by POSIX `stat()`. The signature with argument `ec` returns `file_time_type::min()` if an error occurs.

2     >Throws: As specified in [31.12.5](#).

```
void filesystem::last_write_time(const path& p, file_time_type new_time);
```

```
void filesystem::last_write_time(const path& p, file_time_type new_time,
 error_code& ec) noexcept;
```

3     >Effects: Sets the time of last data modification of the file resolved to by `p` to `new_time`, as if by POSIX `futimens()`.

4     >Throws: As specified in [31.12.5](#).

5     >Note: A postcondition of `last_write_time(p) == new_time` is not specified because it does not necessarily hold for file systems with coarse time granularity.

### 31.12.13.27 Permissions

[fs.op.permissions]

```
void filesystem::permissions(const path& p, perms prms, perm_options opts=perm_options::replace);
```

```
void filesystem::permissions(const path& p, perms prms, error_code& ec) noexcept;
```

```
void filesystem::permissions(const path& p, perms prms, perm_options opts, error_code& ec);
```

1     >Preconditions: Exactly one of the `perm_options` constants `replace`, `add`, or `remove` is present in `opts`.

2     >Effects: Applies the action specified by `opts` to the file `p` resolves to, or to file `p` itself if `p` is a symbolic link and `perm_options::nofollow` is set in `opts`. The action is applied as if by POSIX `fchmodat()`.

3     >Note: Conceptually permissions are viewed as bits, but the actual implementation can use some other mechanism.

4     >Throws: As specified in [31.12.5](#).

5     >Remarks: The second signature behaves as if it had an additional parameter `perm_options opts` with an argument of `perm_options::replace`.

### 31.12.13.28 Proximate

[fs.op.proximate]

```
path filesystem::proximate(const path& p, error_code& ec);
```

1     >Returns: `proximate(p, current_path(), ec)`.

2     >Throws: As specified in [31.12.5](#).

```
path filesystem::proximate(const path& p, const path& base = current_path());
```

```
path filesystem::proximate(const path& p, const path& base, error_code& ec);
```

3     >Returns: For the first form:

```
 weakly_canonical(p).lexically_proximate(weakly_canonical(base));
```

For the second form:

```
 weakly_canonical(p, ec).lexically_proximate(weakly_canonical(base, ec));
```

or `path()` at the first error occurrence, if any.

4     *Throws:* As specified in [31.12.5](#).

### 31.12.13.29 Read symlink

[`fs.op.read.symlink`]

```
path filesystem::read_symlink(const path& p);
path filesystem::read_symlink(const path& p, error_code& ec);
```

1     *Returns:* If `p` resolves to a symbolic link, a `path` object containing the contents of that symbolic link. The signature with argument `ec` returns `path()` if an error occurs.

2     *Throws:* As specified in [31.12.5](#).

NOTE: It is an error if `p` does not resolve to a symbolic link.

### 31.12.13.30 Relative

[`fs.op.relative`]

```
path filesystem::relative(const path& p, error_code& ec);
```

1     *Returns:* `relative(p, current_path(), ec)`.

2     *Throws:* As specified in [31.12.5](#).

```
path filesystem::relative(const path& p, const path& base = current_path());
path filesystem::relative(const path& p, const path& base, error_code& ec);
```

3     *Returns:* For the first form:

```
weakly_canonical(p).lexically_relative(weakly_canonical(base));
```

For the second form:

```
weakly_canonical(p, ec).lexically_relative(weakly_canonical(base, ec));
```

or `path()` at the first error occurrence, if any.

4     *Throws:* As specified in [31.12.5](#).

### 31.12.13.31 Remove

[`fs.op.remove`]

```
bool filesystem::remove(const path& p);
bool filesystem::remove(const path& p, error_code& ec) noexcept;
```

1     *Effects:* If `exists(symlink_status(p, ec))`, the file `p` is removed as if by POSIX `remove()`.

NOTE: A symbolic link is itself removed, rather than the file it resolves to.

2     *Postconditions:* `exists(symlink_status(p))` is `false`.

3     *Returns:* `false` if `p` did not exist, otherwise `true`. The signature with argument `ec` returns `false` if an error occurs.

4     *Throws:* As specified in [31.12.5](#).

### 31.12.13.32 Remove all

[`fs.op.remove.all`]

```
uintmax_t filesystem::remove_all(const path& p);
uintmax_t filesystem::remove_all(const path& p, error_code& ec);
```

1     *Effects:* Recursively deletes the contents of `p` if it exists, then deletes file `p` itself, as if by POSIX `remove()`.

NOTE: A symbolic link is itself removed, rather than the file it resolves to.

2     *Postconditions:* `exists(symlink_status(p))` is `false`.

3     *Returns:* The number of files removed. The signature with argument `ec` returns `static_cast<uintmax_t>(-1)` if an error occurs.

4     *Throws:* As specified in [31.12.5](#).

### 31.12.13.33 Rename

[`fs.op.rename`]

```
void filesystem::rename(const path& old_p, const path& new_p);
void filesystem::rename(const path& old_p, const path& new_p, error_code& ec) noexcept;
```

1     *Effects:* Renames `old_p` to `new_p`, as if by POSIX `rename()`.

## NOTE:

- (1.1) — If `old_p` and `new_p` resolve to the same existing file, no action is taken.
- (1.2) — Otherwise, the rename can include the following effects:
  - (1.2.1) — if `new_p` resolves to an existing non-directory file, `new_p` is removed; otherwise,
  - (1.2.2) — if `new_p` resolves to an existing directory, `new_p` is removed if empty on POSIX compliant operating systems but can be an error on other operating systems.

A symbolic link is itself renamed, rather than the file it resolves to.

- 2     *Throws:* As specified in [31.12.5](#).

**31.12.13.34 Resize file**

[fs.op.resize.file]

```
void filesystem::resize_file(const path& p, uintmax_t new_size);
void filesystem::resize_file(const path& p, uintmax_t new_size, error_code& ec) noexcept;
```

- 1     *Effects:* Causes the size that would be returned by `file_size(p)` to be equal to `new_size`, as if by POSIX `truncate()`.
- 2     *Throws:* As specified in [31.12.5](#).

**31.12.13.35 Space**

[fs.op.space]

```
space_info filesystem::space(const path& p);
space_info filesystem::space(const path& p, error_code& ec) noexcept;
```

- 1     *Returns:* An object of type `space_info`. The value of the `space_info` object is determined as if by using POSIX `statvfs` to obtain a POSIX `struct statvfs`, and then multiplying its `f_blocks`, `f_bfree`, and `f_bavail` members by its `f_frsizze` member, and assigning the results to the `capacity`, `free`, and `available` members respectively. Any members for which the value cannot be determined shall be set to `static_cast<uintmax_t>(-1)`. For the signature with argument `ec`, all members are set to `static_cast<uintmax_t>(-1)` if an error occurs.
- 2     *Throws:* As specified in [31.12.5](#).
- 3     *Remarks:* The value of member `space_info::available` is operating system dependent.

NOTE: `available` can be less than `free`.

**31.12.13.36 Status**

[fs.op.status]

```
file_status filesystem::status(const path& p);
```

- 1     *Effects:* As if:
- ```
error_code ec;
file_status result = status(p, ec);
if (result.type() == file_type::none)
    throw filesystem_error(implementation-supplied-message, p, ec);
return result;
```

- 2 *Returns:* See above.

- 3 *Throws:* `filesystem_error`.

NOTE 1: `result` values of `file_status(file_type::not_found)` and `file_status(file_type::unknown)` are not considered failures and do not cause an exception to be thrown.

```
file_status filesystem::status(const path& p, error_code& ec) noexcept;
```

- 4 *Effects:* If possible, determines the attributes of the file `p` resolves to, as if by using POSIX `stat()` to obtain a POSIX `struct stat`. If, during attribute determination, the underlying file system API reports an error, sets `ec` to indicate the specific error reported. Otherwise, `ec.clear()`.

NOTE 2: This allows users to inspect the specifics of underlying API errors even when the value returned by `status()` is not `file_status(file_type::none)`.

- 5 Let `prms` denote the result of `(m & perms::mask)`, where `m` is determined as if by converting the `st_mode` member of the obtained `struct stat` to the type `perms`.

- 6 *Returns:*

- (6.1) — If `ec != error_code()`:

- (6.1.1) — If the specific error indicates that *p* cannot be resolved because some element of the path does not exist, returns `file_status(file_type::not_found)`.
- (6.1.2) — Otherwise, if the specific error indicates that *p* can be resolved but the attributes cannot be determined, returns `file_status(file_type::unknown)`.
- (6.1.3) — Otherwise, returns `file_status(file_type::none)`.
- NOTE 3: These semantics distinguish between *p* being known not to exist, *p* existing but not being able to determine its attributes, and there being an error that prevents even knowing if *p* exists. These distinctions are important to some use cases.
- (6.2) — Otherwise,
- (6.2.1) — If the attributes indicate a regular file, as if by POSIX `S_ISREG`, returns `file_status(file_type::regular, prms)`.
- NOTE 4: `file_type::regular` implies appropriate `<fstream>` operations would succeed, assuming no hardware, permission, access, or file system race errors. Lack of `file_type::regular` does not necessarily imply `<fstream>` operations would fail on a directory.
- (6.2.2) — Otherwise, if the attributes indicate a directory, as if by POSIX `S_ISDIR`, returns `file_status(file_type::directory, prms)`.
- NOTE 5: `file_type::directory` implies that calling `directory_iterator(p)` would succeed.
- (6.2.3) — Otherwise, if the attributes indicate a block special file, as if by POSIX `S_ISBLK`, returns `file_status(file_type::block, prms)`.
- (6.2.4) — Otherwise, if the attributes indicate a character special file, as if by POSIX `S_ISCHR`, returns `file_status(file_type::character, prms)`.
- (6.2.5) — Otherwise, if the attributes indicate a fifo or pipe file, as if by POSIX `S_ISFIFO`, returns `file_status(file_type::fifo, prms)`.
- (6.2.6) — Otherwise, if the attributes indicate a socket, as if by POSIX `S_ISSOCK`, returns `file_status(file_type::socket, prms)`.
- (6.2.7) — Otherwise, if the attributes indicate an implementation-defined file type (31.12.8.2), returns `file_status(file_type::A, prms)`, where *A* is the constant for the implementation-defined file type.
- (6.2.8) — Otherwise, returns `file_status(file_type::unknown, prms)`.

7 *Remarks:* If a symbolic link is encountered during pathname resolution, pathname resolution continues using the contents of the symbolic link.

31.12.13.37 Status known

[fs.op.status.known]

```
bool filesystem::status_known(file_status s) noexcept;
1   Returns: s.type() != file_type::none.
```

31.12.13.38 Symlink status

[fs.op.symlink.status]

```
file_status filesystem::symlink_status(const path& p);
file_status filesystem::symlink_status(const path& p, error_code& ec) noexcept;
```

1 *Effects:* Same as `status()`, above, except that the attributes of *p* are determined as if by using POSIX `lstat()` to obtain a POSIX `struct stat`.

2 Let *prms* denote the result of `(m & perms::mask)`, where *m* is determined as if by converting the `st_mode` member of the obtained `struct stat` to the type `perms`.

3 *Returns:* Same as `status()`, above, except that if the attributes indicate a symbolic link, as if by POSIX `S_ISLNK`, returns `file_status(file_type::symlink, prms)`. The signature with argument *ec* returns `file_status(file_type::none)` if an error occurs.

4 *Throws:* As specified in 31.12.5.

5 *Remarks:* Pathname resolution terminates if *p* names a symbolic link.

31.12.13.39 Temporary directory path

[fs.op.temp.dir.path]

```
path filesystem::temp_directory_path();
```

```
path filesystem::temp_directory_path(error_code& ec);
1 Let p be an unspecified directory path suitable for temporary files.
2 Effects: If exists(p) is false or is_directory(p) is false, an error is reported (31.12.5).
3 Returns: The path p. The signature with argument ec returns path() if an error occurs.
4 Throws: As specified in 31.12.5.
5 EXAMPLE: For POSIX-based operating systems, an implementation can return the path supplied by the first environment variable found in the list TMPDIR, TMP, TEMP, TEMPDIR, or if none of these are found, "/tmp".
For Windows-based operating systems, an implementation can return the path reported by the Windows GetTempPath API function.
```

31.12.13.40 Weakly canonical

[fs.op.weakly.canonical]

```
path filesystem::weakly_canonical(const path& p);
path filesystem::weakly_canonical(const path& p, error_code& ec);
1 Effects: Using status(p) or status(p, ec), respectively, to determine existence, return a path composed by operator/= from the result of calling canonical() with a path argument composed of the leading elements of p that exist, if any, followed by the elements of p that do not exist, if any. For the first form, canonical() is called without an error_code argument. For the second form, canonical() is called with ec as an error_code argument, and path() is returned at the first error occurrence, if any.
2 Postconditions: The returned path is in normal form (31.12.6.2).
3 Returns: p with symlinks resolved and the result normalized (31.12.6.2).
4 Throws: As specified in 31.12.5.
```

- ¹ The contents and meaning of the header <cinttypes> are the same as the C standard library header <inttypes.h>, with the following changes:
- (1.1) — The header <cinttypes> includes the header <cstdint> (17.4.1) instead of <stdint.h>, and
 - (1.2) — `intmax_t` and `uintmax_t` are not required to be able to represent all values of extended integer types wider than `long long` and `unsigned long long`, respectively, and
 - (1.3) — if and only if the type `intmax_t` designates an extended integer type (6.8.2), the following function signatures are added:

```
constexpr intmax_t abs(intmax_t);  
constexpr imaxdiv_t div(intmax_t, intmax_t);
```

which shall have the same semantics as the function signatures `constexpr intmax_t imaxabs(intmax_t)` and `constexpr imaxdiv_t imaxdiv(intmax_t, intmax_t)`, respectively.

SEE ALSO: ISO C 7.8

- ² Each of the PRI macros listed in this subclause is defined if and only if the implementation defines the corresponding *typedef-name* in 17.4.1. Each of the SCN macros listed in this subclause is defined if and only if the implementation defines the corresponding *typedef-name* in 17.4.1 and has a suitable `fscanf` length modifier for the type.

32 Regular expressions library [re]

32.1 General

[re.general]

- ¹ This Clause describes components that C++ programs may use to perform operations involving regular expression matching and searching.
- 2 The following subclauses describe a basic regular expression class template and its traits that can handle char-like (23.1) template arguments, two specializations of this class template that handle sequences of `char` and `wchar_t`, a class template that holds the result of a regular expression match, a series of algorithms that allow a character sequence to be operated upon by a regular expression, and two iterator types for enumerating regular expression matches, as summarized in Table 136.

Table 136: Regular expressions library summary [tab:re.summary]

Subclause	Header
32.2 Requirements	
32.4 Constants	<code><regex></code>
32.5 Exception type	
32.6 Traits	
32.7 Regular expression template	
32.8 Submatches	
32.9 Match results	
32.10 Algorithms	
32.11 Iterators	
32.12 Grammar	

32.2 Requirements

[re.req]

- ¹ This subclause defines requirements on classes representing regular expression traits.
NOTE 1: The class template `regex_traits`, defined in [32.6](#), meets these requirements.
- 2 The class template `basic_regex`, defined in [32.7](#), needs a set of related types and functions to complete the definition of its semantics. These types and functions are provided as a set of member *typedef-names* and functions in the template parameter `traits` used by the `basic_regex` class template. This subclause defines the semantics of these members.
- 3 To specialize class template `basic_regex` for a character container `CharT` and its related regular expression traits class `Traits`, use `basic_regex<CharT, Traits>`.
- 4 In the following requirements,
 - (4.1) — `X` denotes a traits class defining types and functions for the character container type `charT`;
 - (4.2) — `u` is an object of type `X`;
 - (4.3) — `v` is an object of type `const X`;
 - (4.4) — `p` is a value of type `const charT*`;
 - (4.5) — `I1` and `I2` are input iterators ([25.3.5.3](#));
 - (4.6) — `F1` and `F2` are forward iterators ([25.3.5.5](#));
 - (4.7) — `c` is a value of type `const charT`;
 - (4.8) — `s` is an object of type `X::string_type`;
 - (4.9) — `cs` is an object of type `const X::string_type`;
 - (4.10) — `b` is a value of type `bool`;
 - (4.11) — `I` is a value of type `int`;
 - (4.12) — `cl` is an object of type `X::char_class_type`; and

(4.13) — `loc` is an object of type `X::locale_type`.

5 A traits class `X` meets the regular expression traits requirements if the following types and expressions are well-formed and have the specified semantics.

`typename X::char_type`

6 *Result:* `charT`, the character container type used in the implementation of class template `basic_regex`.

`typename X::string_type`

7 *Result:* `basic_string<charT>`

`typename X::locale_type`

8 *Result:* A copy constructible type that represents the locale used by the traits class.

`typename X::char_class_type`

9 *Result:* A bitmask type (16.3.3.3.3) representing a particular character classification.

`X::length(p)`

10 *Result:* `size_t`

11 *Returns:* The smallest `i` such that `p[i] == 0`.

12 *Complexity:* Linear in `i`.

`v.translate(c)`

13 *Result:* `X::char_type`

14 *Returns:* A character such that for any character `d` that is to be considered equivalent to `c` then `v.translate(c) == v.translate(d)`.

`v.translate_nocase(c)`

15 *Result:* `X::char_type`

16 *Returns:* For all characters `C` that are to be considered equivalent to `c` when comparisons are to be performed without regard to case, then `v.translate_nocase(c) == v.translate_nocase(C)`.

`v.transform(F1, F2)`

17 *Result:* `X::string_type`

18 *Returns:* A sort key for the character sequence designated by the iterator range `[F1, F2)` such that if the character sequence `[G1, G2)` sorts before the character sequence `[H1, H2)` then `v.transform(G1, G2) < v.transform(H1, H2)`.

`v.transform_primary(F1, F2)`

19 *Result:* `X::string_type`

20 *Returns:* A sort key for the character sequence designated by the iterator range `[F1, F2)` such that if the character sequence `[G1, G2)` sorts before the character sequence `[H1, H2)` when character case is not considered then `v.transform_primary(G1, G2) < v.transform_primary(H1, H2)`.

`v.lookup_collatename(F1, F2)`

21 *Result:* `X::string_type`

22 *Returns:* A sequence of characters that represents the collating element consisting of the character sequence designated by the iterator range `[F1, F2)`. Returns an empty string if the character sequence is not a valid collating element.

`v.lookup_classname(F1, F2, b)`

23 *Result:* `X::char_class_type`

24 *Returns:* Converts the character sequence designated by the iterator range `[F1, F2)` into a value of a bitmask type that can subsequently be passed to `isctype`. Values returned from `lookup_classname` can be bitwise OR'ed together; the resulting value represents membership in either of the corresponding character classes. If `b` is `true`, the returned bitmask is suitable for matching characters without regard

to their case. Returns 0 if the character sequence is not the name of a character class recognized by `X`. The value returned shall be independent of the case of the characters in the sequence.

```

v.isctype(c, cl)
25   Result: bool
26   Returns: Returns true if character c is a member of one of the character classes designated by cl, false otherwise.

v.value(c, I)
27   Result: int
28   Returns: Returns the value represented by the digit c in base I if the character c is a valid digit in base I; otherwise returns -1.
30   NOTE 2: The value of I will only be 8, 10, or 16.

u.imbue(loc)
29   Result: X::locale_type
30   Effects: Imbues u with the locale loc and returns the previous locale used by u if any.

v.getloc()
31   Result: X::locale_type
32   Returns: Returns the current locale used by v, if any.
33   NOTE 3: Class template regex_traits meets the requirements for a regular expression traits class when it is specialized for char or wchar_t. This class template is described in the header <regex>, and is described in 32.6.
```

}
}

```

32.4 Namespace std::regex_constants

[re.const]

32.4.1 General

[re.const.general]

- ¹ The namespace `std::regex_constants` holds symbolic constants used by the regular expression library. This namespace provides three types, `syntax_option_type`, `match_flag_type`, and `error_type`, along with several constants of these types.

32.4.2 Bitmask type syntax_option_type

[re.synopt]

```

namespace std::regex_constants {
    using syntax_option_type = T1;
    inline constexpr syntax_option_type icase = unspecified;
    inline constexpr syntax_option_type nosubs = unspecified;
    inline constexpr syntax_option_type optimize = unspecified;
    inline constexpr syntax_option_type collate = unspecified;
    inline constexpr syntax_option_type ECMAScript = unspecified;
    inline constexpr syntax_option_type basic = unspecified;
    inline constexpr syntax_option_type extended = unspecified;
    inline constexpr syntax_option_type awk = unspecified;
    inline constexpr syntax_option_type grep = unspecified;
    inline constexpr syntax_option_type egrep = unspecified;
    inline constexpr syntax_option_type multiline = unspecified;
}

```

- ¹ The type `syntax_option_type` is an implementation-defined bitmask type (16.3.3.3). Setting its elements has the effects listed in Table 137. A valid value of type `syntax_option_type` shall have at most one of the grammar elements `ECMAScript`, `basic`, `extended`, `awk`, `grep`, `egrep`, set. If no grammar element is set, the default grammar is `ECMAScript`.

32.4.3 Bitmask type match_flag_type

[re.matchflag]

```

namespace std::regex_constants {
    using match_flag_type = T2;
    inline constexpr match_flag_type match_default = {};
    inline constexpr match_flag_type match_not_bol = unspecified;
    inline constexpr match_flag_type match_not_eol = unspecified;
    inline constexpr match_flag_type match_not_bow = unspecified;
    inline constexpr match_flag_type match_not_eow = unspecified;
    inline constexpr match_flag_type match_any = unspecified;
    inline constexpr match_flag_type match_not_null = unspecified;
    inline constexpr match_flag_type match_continuous = unspecified;
    inline constexpr match_flag_type match_prev_avail = unspecified;
    inline constexpr match_flag_type format_default = {};
    inline constexpr match_flag_type format_sed = unspecified;
    inline constexpr match_flag_type format_no_copy = unspecified;
    inline constexpr match_flag_type format_first_only = unspecified;
}

```

- ¹ The type `match_flag_type` is an implementation-defined bitmask type (16.3.3.3). The constants of that type, except for `match_default` and `format_default`, are bitmask elements. The `match_default` and `format_default` constants are empty bitmasks. Matching a regular expression against a sequence of characters [first, last) proceeds according to the rules of the grammar specified for the regular expression object, modified according to the effects listed in Table 138 for any bitmask elements set.

Table 137: `syntax_option_type` effects [tab:re.synopt]

Element	Effect(s) if set
<code>icase</code>	Specifies that matching of regular expressions against a character container sequence shall be performed without regard to case.
<code>nosubs</code>	Specifies that no sub-expressions shall be considered to be marked, so that when a regular expression is matched against a character container sequence, no sub-expression matches shall be stored in the supplied <code>match_results</code> object.
<code>optimize</code>	Specifies that the regular expression engine should pay more attention to the speed with which regular expressions are matched, and less to the speed with which regular expression objects are constructed. Otherwise it has no detectable effect on the program output.
<code>collate</code>	Specifies that character ranges of the form "[a-b]" shall be locale sensitive.
<code>ECMAScript</code>	Specifies that the grammar recognized by the regular expression engine shall be that used by ECMAScript in ECMA-262, as modified in 32.12 . SEE ALSO: ECMA-262 15.10
<code>basic</code>	Specifies that the grammar recognized by the regular expression engine shall be that used by basic regular expressions in POSIX. SEE ALSO: POSIX, Base Definitions and Headers, Section 9.3
<code>extended</code>	Specifies that the grammar recognized by the regular expression engine shall be that used by extended regular expressions in POSIX. SEE ALSO: POSIX, Base Definitions and Headers, Section 9.4
<code>awk</code>	Specifies that the grammar recognized by the regular expression engine shall be that used by the utility awk in POSIX.
<code>grep</code>	Specifies that the grammar recognized by the regular expression engine shall be that used by the utility grep in POSIX.
<code>egrep</code>	Specifies that the grammar recognized by the regular expression engine shall be that used by the utility grep when given the -E option in POSIX.
<code>multiline</code>	Specifies that ^ shall match the beginning of a line and \$ shall match the end of a line, if the <code>ECMAScript</code> engine is selected.

Table 138: `regex_constants::match_flag_type` effects when obtaining a match against a character container sequence [`first, last`). [tab:re.matchflag]

Element	Effect(s) if set
<code>match_not_bol</code>	The first character in the sequence [<code>first, last</code>) shall be treated as though it is not at the beginning of a line, so the character ^ in the regular expression shall not match [<code>first, first</code>).
<code>match_not_eol</code>	The last character in the sequence [<code>first, last</code>) shall be treated as though it is not at the end of a line, so the character "\$" in the regular expression shall not match [<code>last, last</code>).
<code>match_not_bow</code>	The expression "\b" shall not match the sub-sequence [<code>first, first</code>).
<code>match_not_eow</code>	The expression "\b" shall not match the sub-sequence [<code>last, last</code>).
<code>match_any</code>	If more than one match is possible then any match is an acceptable result.
<code>match_not_null</code>	The expression shall not match an empty sequence.
<code>match_continuous</code>	The expression shall only match a sub-sequence that begins at <code>first</code> .
<code>match_prev_avail</code>	-- <code>first</code> is a valid iterator position. When this flag is set the flags <code>match_not_bol</code> and <code>match_not_bow</code> shall be ignored by the regular expression algorithms (32.10) and iterators (32.11).
<code>format_default</code>	When a regular expression match is to be replaced by a new string, the new string shall be constructed using the rules used by the ECMAScript replace function in ECMA-262, part 15.5.4.11 String.prototype.replace. In addition, during search and replace operations all non-overlapping occurrences of the regular expression shall be located and replaced, and sections of the input that did not match the expression shall be copied unchanged to the output string.

Table 138: `regex_constants::match_flag_type` effects when obtaining a match against a character container sequence [`first`, `last`). (continued)

Element	Effect(s) if set
<code>format_sed</code>	When a regular expression match is to be replaced by a new string, the new string shall be constructed using the rules used by the sed utility in POSIX.
<code>format_no_copy</code>	During a search and replace operation, sections of the character container sequence being searched that do not match the regular expression shall not be copied to the output string.
<code>format_first_only</code>	When specified during a search and replace operation, only the first occurrence of the regular expression shall be replaced.

32.4.4 Implementation-defined `error_type`

[re.err]

```
namespace std::regex_constants {
    using error_type = T3;
    inline constexpr error_type error_collate = unspecified;
    inline constexpr error_type error_ctype = unspecified;
    inline constexpr error_type error_escape = unspecified;
    inline constexpr error_type error_backref = unspecified;
    inline constexpr error_type error_brack = unspecified;
    inline constexpr error_type error_paren = unspecified;
    inline constexpr error_type error_brace = unspecified;
    inline constexpr error_type error_badbrace = unspecified;
    inline constexpr error_type error_range = unspecified;
    inline constexpr error_type error_space = unspecified;
    inline constexpr error_type error_badrepeat = unspecified;
    inline constexpr error_type error_complexity = unspecified;
    inline constexpr error_type error_stack = unspecified;
}
```

- ¹ The type `error_type` is an implementation-defined enumerated type (16.3.3.3.2). Values of type `error_type` represent the error conditions described in Table 139:

Table 139: `error_type` values in the C locale [tab:re.err]

Value	Error condition
<code>error_collate</code>	The expression contains an invalid collating element name.
<code>error_ctype</code>	The expression contains an invalid character class name.
<code>error_escape</code>	The expression contains an invalid escaped character, or a trailing escape.
<code>error_backref</code>	The expression contains an invalid back reference.
<code>error_brack</code>	The expression contains mismatched [and].
<code>error_paren</code>	The expression contains mismatched (and).
<code>error_brace</code>	The expression contains mismatched { and }
<code>error_badbrace</code>	The expression contains an invalid range in a {} expression.
<code>error_range</code>	The expression contains an invalid character range, such as [b-a] in most encodings.
<code>error_space</code>	There is insufficient memory to convert the expression into a finite state machine.
<code>error_badrepeat</code>	One of *?+{} is not preceded by a valid regular expression.
<code>error_complexity</code>	The complexity of an attempted match against a regular expression exceeds a pre-set level.
<code>error_stack</code>	There is insufficient memory to determine whether the regular expression matches the specified character sequence.

32.5 Class `regex_error`

[re.badexp]

```
namespace std {
    class regex_error : public runtime_error {
    public:
        explicit regex_error(regex_constants::error_type ecode);
        regex_constants::error_type code() const;
}
```

```
    };
}
```

- 1 The class `regex_error` defines the type of objects thrown as exceptions to report errors from the regular expression library.

```
regex_error(regex_constants::error_type ecode);
Postconditions: ecode == code().
regex_constants::error_type code() const;
>Returns: The error code that was passed to the constructor.
```

32.6 Class template `regex_traits`

[`re.traits`]

```
namespace std {
    template<class charT>
    struct regex_traits {
        using char_type      = charT;
        using string_type    = basic_string<char_type>;
        using locale_type    = locale;
        using char_class_type = bitmask_type;

        regex_traits();
        static size_t length(const char_type* p);
        charT translate(charT c) const;
        charT translate_nocase(charT c) const;
        template<class ForwardIterator>
            string_type transform(ForwardIterator first, ForwardIterator last) const;
        template<class ForwardIterator>
            string_type transform_primary(
                ForwardIterator first, ForwardIterator last) const;
        template<class ForwardIterator>
            string_type lookup_collatename(
                ForwardIterator first, ForwardIterator last) const;
        template<class ForwardIterator>
            char_class_type lookup_classname(
                ForwardIterator first, ForwardIterator last, bool icase = false) const;
        bool isctype(charT c, char_class_type f) const;
        int value(charT ch, int radix) const;
        locale_type imbue(locale_type l);
        locale_type getloc() const;
    };
}
```

- 1 The specializations `regex_traits<char>` and `regex_traits<wchar_t>` meet the requirements for a regular expression traits class (32.2).

```
using char_class_type = bitmask_type;
2 The type char_class_type is used to represent a character classification and is capable of holding an implementation specific set returned by lookup_classname.
```

```
static size_t length(const char_type* p);
3>Returns: char_traits<charT>::length(p).
charT translate(charT c) const;
4>Returns: c.
charT translate_nocase(charT c) const;
5>Returns: use_facet<ctype<charT>>(getloc()).tolower(c).
template<class ForwardIterator>
    string_type transform(ForwardIterator first, ForwardIterator last) const;
```

- 6 *Effects:* As if by:

```

    string_type str(first, last);
    return use_facet<collate<charT>>(
        getloc()).transform(str.data(), str.data() + str.length());
}

template<class ForwardIterator>
string_type transform_primary(ForwardIterator first, ForwardIterator last) const;

```

7 *Effects:* If

typeid(use_facet<collate<charT>>) == typeid(collate_byname<charT>)

and the form of the sort key returned by `collate_byname<charT>::transform(first, last)` is known and can be converted into a primary sort key then returns that key, otherwise returns an empty string.

```

template<class ForwardIterator>
string_type lookup_collatename(ForwardIterator first, ForwardIterator last) const;

```

8 *Returns:* A sequence of one or more characters that represents the collating element consisting of the character sequence designated by the iterator range `[first, last]`. Returns an empty string if the character sequence is not a valid collating element.

```

template<class ForwardIterator>
char_class_type lookup_classname(
    ForwardIterator first, ForwardIterator last, bool icase = false) const;

```

9 *Returns:* An unspecified value that represents the character classification named by the character sequence designated by the iterator range `[first, last]`. If the parameter `icase` is `true` then the returned mask identifies the character classification without regard to the case of the characters being matched, otherwise it does honor the case of the characters being matched.³⁰⁴ The value returned shall be independent of the case of the characters in the character sequence. If the name is not recognized then returns `char_class_type()`.

10 *Remarks:* For `regex_traits<char>`, at least the narrow character names in [Table 140](#) shall be recognized. For `regex_traits<wchar_t>`, at least the wide character names in [Table 140](#) shall be recognized.

```
bool isctype(charT c, char_class_type f) const;
```

11 *Effects:* Determines if the character `c` is a member of the character classification represented by `f`.

12 *Returns:* Given the following function declaration:

```
// for exposition only
template<class C>
ctype_base::mask convert(typename regex_traits<C>::char_class_type f);
```

that returns a value in which each `ctype_base::mask` value corresponding to a value in `f` named in [Table 140](#) is set, then the result is determined as if by:

```

ctype_base::mask m = convert<charT>(f);
const ctype<charT>& ct = use_facet<ctype<charT>>(getloc());
if (ct.is(m, c)) {
    return true;
} else if (c == ct.widen('_')) {
    charT w[1] = { ct.widen('w') };
    char_class_type x = lookup_classname(w, w+1);
    return (f&x) == x;
} else {
    return false;
}

```

EXAMPLE 1:

```

regex_traits<char> t;
string d("d");
string u("upper");
regex_traits<char>::char_class_type f;
f = t.lookup_classname(d.begin(), d.end());

```

³⁰⁴ For example, if the parameter `icase` is `true` then `[[lower:]]` is the same as `[[alpha:]]`.

```
f |= t.lookup_classname(u.begin(), u.end());
ctype_base::mask m = convert<char>(f); // m == ctype_base::digit|ctype_base::upper
```

EXAMPLE 2:

```
regex_traits<char> t;
string w("w");
regex_traits<char>::char_class_type f;
f = t.lookup_classname(w.begin(), w.end());
t.isctype('A', f); // returns true
t.isctype('_', f); // returns true
t.isctype(' ', f); // returns false
```

int value(charT ch, int radix) const;

13 *Preconditions:* The value of `radix` is 8, 10, or 16.

14 *Returns:* The value represented by the digit `ch` in base `radix` if the character `ch` is a valid digit in base `radix`; otherwise returns -1.

locale_type imbue(locale_type loc);

15 *Effects:* Imbues `this` with a copy of the locale `loc`.

NOTE: Calling `imbue` with a different locale than the one currently in use invalidates all cached data held by `*this`.

16 *Postconditions:* `getloc() == loc`.

17 *Returns:* If no locale has been previously imbued then a copy of the global locale in effect at the time of construction of `*this`, otherwise a copy of the last argument passed to `imbue`.

locale_type getloc() const;

18 *Returns:* If no locale has been imbued then a copy of the global locale in effect at the time of construction of `*this`, otherwise a copy of the last argument passed to `imbue`.

Table 140: Character class names and corresponding `ctype` masks [tab:re.traits.classnames]

Narrow character name	Wide character name	Corresponding <code>ctype_base::mask</code> value
"alnum"	L"alnum"	<code>ctype_base::alnum</code>
"alpha"	L"alpha"	<code>ctype_base::alpha</code>
"blank"	L"blank"	<code>ctype_base::blank</code>
"cntrl"	L"cntrl"	<code>ctype_base::cntrl</code>
"digit"	L"digit"	<code>ctype_base::digit</code>
"d"	L"d"	<code>ctype_base::digit</code>
"graph"	L"graph"	<code>ctype_base::graph</code>
"lower"	L"lower"	<code>ctype_base::lower</code>
"print"	L"print"	<code>ctype_base::print</code>
"punct"	L"punct"	<code>ctype_base::punct</code>
"space"	L"space"	<code>ctype_base::space</code>
"s"	L"s"	<code>ctype_base::space</code>
"upper"	L"upper"	<code>ctype_base::upper</code>
"w"	L"w"	<code>ctype_base::alnum</code>
"xdigit"	L"xdigit"	<code>ctype_base::xdigit</code>

32.7 Class template `basic_regex`

[re.regex]

32.7.1 General

[re.regex.general]

- ¹ For a char-like type `charT`, specializations of class template `basic_regex` represent regular expressions constructed from character sequences of `charT` characters. In the rest of 32.7, `charT` denotes a given char-like type. Storage for a regular expression is allocated and freed as necessary by the member functions of class `basic_regex`.

- ² Objects of type specialization of `basic_regex` are responsible for converting the sequence of `charT` objects to an internal representation. It is not specified what form this representation takes, nor how it is accessed by algorithms that operate on regular expressions.

NOTE: Implementations will typically declare some function templates as friends of `basic_regex` to achieve this.

- ³ The functions described in [32.7](#) report errors by throwing exceptions of type `regex_error`.

```

namespace std {
    template<class charT, class traits = regex_traits<charT>>
    class basic_regex {
public:
    // types
    using value_type =           charT;
    using traits_type =          traits;
    using string_type = typename traits::string_type;
    using flag_type =            regex_constants::syntax_option_type;
    using locale_type = typename traits::locale_type;

    // 32.4.2, constants
    static constexpr flag_type icase = regex_constants::icase;
    static constexpr flag_type nosubs = regex_constants::nosubs;
    static constexpr flag_type optimize = regex_constants::optimize;
    static constexpr flag_type collate = regex_constants::collate;
    static constexpr flag_type ECMAScript = regex_constants::ECMAScript;
    static constexpr flag_type basic = regex_constants::basic;
    static constexpr flag_type extended = regex_constants::extended;
    static constexpr flag_type awk = regex_constants::awk;
    static constexpr flag_type grep = regex_constants::grep;
    static constexpr flag_type egrep = regex_constants::egrep;
    static constexpr flag_type multiline = regex_constants::multiline;

    // 32.7.2, construct/copy/destroy
    basic_regex();
    explicit basic_regex(const charT* p, flag_type f = regex_constants::ECMAScript);
    basic_regex(const charT* p, size_t len, flag_type f = regex_constants::ECMAScript);
    basic_regex(const basic_regex&);
    basic_regex(basic_regex&&) noexcept;
    template<class ST, class SA>
        explicit basic_regex(const basic_string<charT, ST, SA>& s,
                             flag_type f = regex_constants::ECMAScript);
    template<class ForwardIterator>
        basic_regex(ForwardIterator first, ForwardIterator last,
                    flag_type f = regex_constants::ECMAScript);
    basic_regex(initializer_list<charT> il, flag_type f = regex_constants::ECMAScript);

    ~basic_regex();

    // 32.7.3, assign
    basic_regex& operator=(const basic_regex& e);
    basic_regex& operator=(basic_regex&& e) noexcept;
    basic_regex& operator=(const charT* p);
    basic_regex& operator=(initializer_list<charT> il);
    template<class ST, class SA>
        basic_regex& operator=(const basic_string<charT, ST, SA>& s);

    basic_regex& assign(const basic_regex& e);
    basic_regex& assign(basic_regex&& e) noexcept;
    basic_regex& assign(const charT* p, flag_type f = regex_constants::ECMAScript);
    basic_regex& assign(const charT* p, size_t len, flag_type f = regex_constants::ECMAScript);
    template<class ST, class SA>
        basic_regex& assign(const basic_string<charT, ST, SA>& s,
                           flag_type f = regex_constants::ECMAScript);
}

```

```

template<class InputIterator>
basic_regex& assign(InputIterator first, InputIterator last,
                    flag_type f = regex_constants::ECMAScript);
basic_regex& assign(initializer_list<charT>,
                    flag_type f = regex_constants::ECMAScript);

// 32.7.4, const operations
unsigned mark_count() const;
flag_type flags() const;

// 32.7.5, locale
locale_type imbue(locale_type loc);
locale_type getloc() const;

// 32.7.6, swap
void swap(basic_regex&);
};

template<class ForwardIterator>
basic_regex(ForwardIterator, ForwardIterator,
            regex_constants::syntax_option_type = regex_constants::ECMAScript)
-> basic_regex<typename iterator_traits<ForwardIterator>::value_type>;
}

```

32.7.2 Constructors

[re.regex.construct]

```

basic_regex();

1   Postconditions: *this does not match any character sequence.

explicit basic_regex(const charT* p, flag_type f = regex_constants::ECMAScript);

2   Preconditions: [p, p + char_traits<charT>::length(p)) is a valid range.

3   Effects: The object's internal finite state machine is constructed from the regular expression contained
in the sequence of characters [p, p + char_traits<charT>::length(p)), and interpreted according to
the flags f.

4   Postconditions: flags() returns f. mark_count() returns the number of marked sub-expressions
within the expression.

5   Throws: regex_error if [p, p + char_traits<charT>::length(p)) is not a valid regular expression.

basic_regex(const charT* p, size_t len, flag_type f = regex_constants::ECMAScript);

6   Preconditions: [p, p + len) is a valid range.

7   Effects: The object's internal finite state machine is constructed from the regular expression contained
in the sequence of characters [p, p + len), and interpreted according the flags specified in f.

8   Postconditions: flags() returns f. mark_count() returns the number of marked sub-expressions
within the expression.

9   Throws: regex_error if [p, p + len) is not a valid regular expression.

basic_regex(const basic_regex& e);

10  Postconditions: flags() and mark_count() return e.flags() and e.mark_count(), respectively.

basic_regex(basic_regex&& e) noexcept;

11  Postconditions: flags() and mark_count() return the values that e.flags() and e.mark_count(),
respectively, had before construction.

template<class ST, class SA>
explicit basic_regex(const basic_string<charT, ST, SA>& s,
                     flag_type f = regex_constants::ECMAScript);

12  Effects: The object's internal finite state machine is constructed from the regular expression contained
in the string s, and interpreted according to the flags specified in f.

```

13 *Postconditions:* `flags()` returns `f`. `mark_count()` returns the number of marked sub-expressions within the expression.

14 *Throws:* `regex_error` if `s` is not a valid regular expression.

```
template<class ForwardIterator>
basic_regex(ForwardIterator first, ForwardIterator last,
           flag_type f = regex_constants::ECMAScript);
```

15 *Effects:* The object's internal finite state machine is constructed from the regular expression contained in the sequence of characters [`first`, `last`), and interpreted according to the flags specified in `f`.

16 *Postconditions:* `flags()` returns `f`. `mark_count()` returns the number of marked sub-expressions within the expression.

17 *Throws:* `regex_error` if the sequence [`first`, `last`) is not a valid regular expression.

```
basic_regex(initializer_list<charT> il, flag_type f = regex_constants::ECMAScript);
```

18 *Effects:* Same as `basic_regex(il.begin(), il.end(), f)`.

32.7.3 Assignment

[re.regex.assign]

```
basic_regex& operator=(const basic_regex& e);
```

1 *Postconditions:* `flags()` and `mark_count()` return `e.flags()` and `e.mark_count()`, respectively.

```
basic_regex& operator=(basic_regex&& e) noexcept;
```

2 *Postconditions:* `flags()` and `mark_count()` return the values that `e.flags()` and `e.mark_count()`, respectively, had before assignment. `e` is in a valid state with unspecified value.

```
basic_regex& operator=(const charT* p);
```

3 *Effects:* Equivalent to: `return assign(p);`

```
basic_regex& operator=(initializer_list<charT> il);
```

4 *Effects:* Equivalent to: `return assign(il.begin(), il.end());`

```
template<class ST, class SA>
basic_regex& operator=(const basic_string<charT, ST, SA>& s);
```

5 *Effects:* Equivalent to: `return assign(s);`

```
basic_regex& assign(const basic_regex& e);
```

6 *Effects:* Equivalent to: `return *this = e;`

```
basic_regex& assign(basic_regex&& e) noexcept;
```

7 *Effects:* Equivalent to: `return *this = std::move(e);`

```
basic_regex& assign(const charT* p, flag_type f = regex_constants::ECMAScript);
```

8 *Effects:* Equivalent to: `return assign(string_type(p), f);`

```
basic_regex& assign(const charT* p, size_t len, flag_type f = regex_constants::ECMAScript);
```

9 *Effects:* Equivalent to: `return assign(string_type(p, len), f);`

```
template<class ST, class SA>
basic_regex& assign(const basic_string<charT, ST, SA>& s,
                   flag_type f = regex_constants::ECMAScript);
```

10 *Effects:* Assigns the regular expression contained in the string `s`, interpreted according the flags specified in `f`. If an exception is thrown, `*this` is unchanged.

11 *Postconditions:* If no exception is thrown, `flags()` returns `f` and `mark_count()` returns the number of marked sub-expressions within the expression.

12 *Returns:* `*this`.

13 *Throws:* `regex_error` if `s` is not a valid regular expression.

```

template<class InputIterator>
basic_regex& assign(InputIterator first, InputIterator last,
                    flag_type f = regex_constants::ECMAScript);

14   Effects: Equivalent to: return assign(string_type(first, last), f);

basic_regex& assign(initializer_list<charT> il,
                    flag_type f = regex_constants::ECMAScript);

15   Effects: Equivalent to: return assign(il.begin(), il.end(), f);

```

32.7.4 Constant operations

[re.regex.operations]

```
unsigned mark_count() const;
```

1 Effects: Returns the number of marked sub-expressions within the regular expression.

```
flag_type flags() const;
```

2 Effects: Returns a copy of the regular expression syntax flags that were passed to the object's constructor or to the last call to `assign`.

32.7.5 Locale

[re.regex.locale]

```
locale_type imbue(locale_type loc);
```

1 Effects: Returns the result of `traits_inst.imbue(loc)` where `traits_inst` is a (default-initialized) instance of the template type argument `traits` stored within the object. After a call to `imbue` the `basic_regex` object does not match any character sequence.

```
locale_type getloc() const;
```

2 Effects: Returns the result of `traits_inst.getloc()` where `traits_inst` is a (default-initialized) instance of the template parameter `traits` stored within the object.

32.7.6 Swap

[re.regex.swap]

```
void swap(basic_regex& e);
```

1 Effects: Swaps the contents of the two regular expressions.

2 Postconditions: `*this` contains the regular expression that was in `e`, `e` contains the regular expression that was in `*this`.

3 Complexity: Constant time.

32.7.7 Non-member functions

[re.regex.nonmemb]

```

template<class charT, class traits>
void swap(basic_regex<charT, traits>& lhs, basic_regex<charT, traits>& rhs);

```

1 Effects: Calls `lhs.swap(rhs)`.

32.8 Class template sub_match

[re.submatch]

32.8.1 General

[re.submatch.general]

1 Class template `sub_match` denotes the sequence of characters matched by a particular marked sub-expression.

```

namespace std {
    template<class BidirectionalIterator>
    class sub_match : public pair<BidirectionalIterator, BidirectionalIterator> {
        public:
            using value_type      =
                typename iterator_traits<BidirectionalIterator>::value_type;
            using difference_type =
                typename iterator_traits<BidirectionalIterator>::difference_type;
            using iterator          = BidirectionalIterator;
            using string_type       = basic_string<value_type>;
            bool matched;
    };
}

```

```

    constexpr sub_match();

    difference_type length() const;
    operator string_type() const;
    string_type str() const;

    int compare(const sub_match& s) const;
    int compare(const string_type& s) const;
    int compare(const value_type* s) const;

    void swap(sub_match& s) noexcept(see below);
};

}

```

32.8.2 Members

[re.submatch.members]

```
constexpr sub_match();
```

Effects: Value-initializes the pair base class subobject and the member `matched`.

```
difference_type length() const;
```

Returns: `matched` ? `distance(first, second)` : 0.

```
operator string_type() const;
```

Returns: `matched` ? `string_type(first, second)` : `string_type()`.

```
string_type str() const;
```

Returns: `matched` ? `string_type(first, second)` : `string_type()`.

```
int compare(const sub_match& s) const;
```

Returns: `str().compare(s.str())`.

```
int compare(const string_type& s) const;
```

Returns: `str().compare(s)`.

```
int compare(const value_type* s) const;
```

Returns: `str().compare(s)`.

```
void swap(sub_match& s) noexcept(see below);
```

Preconditions: BidirectionalIterator meets the Cpp17Swappable requirements (16.4.4.3).

Effects: Equivalent to:

```
    this->pair<BidirectionalIterator, BidirectionalIterator>::swap(s);
    std::swap(matched, s.matched);
```

Remarks: The exception specification is equivalent to `is_nothrow_swappable_v<BidirectionalIterator>`.

32.8.3 Non-member operators

[re.submatch.op]

Let SM-CAT(I) be

```
compare_three_way_result_t<basic_string<typename iterator_traits<I>::value_type>>
```

```
template<class BiIter>
```

```
    bool operator==(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);
```

Returns: `lhs.compare(rhs) == 0`.

```
template<class BiIter>
```

```
    auto operator<=>(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);
```

Returns: `static_cast<SM-CAT(BiIter)>(lhs.compare(rhs)) <= 0`.

```

template<class BiIter, class ST, class SA>
bool operator==(const sub_match<BiIter>& lhs,
                  const basic_string<typename iterator_traits<BiIter>::value_type, ST, SA>& rhs);
4   Returns:
    lhs.compare(typename sub_match<BiIter>::string_type(rhs.data(), rhs.size())) == 0

template<class BiIter, class ST, class SA>
auto operator<=>(const sub_match<BiIter>& lhs,
                  const basic_string<typename iterator_traits<BiIter>::value_type, ST, SA>& rhs);
5   Returns:
    static_cast<SM-CAT(BiIter)>(lhs.compare(
        typename sub_match<BiIter>::string_type(rhs.data(), rhs.size())
        <=> 0
    ))
template<class BiIter>
bool operator==(const sub_match<BiIter>& lhs,
                  const typename iterator_traits<BiIter>::value_type* rhs);
6   Returns: lhs.compare(rhs) == 0.

template<class BiIter>
auto operator<=>(const sub_match<BiIter>& lhs,
                  const typename iterator_traits<BiIter>::value_type* rhs);
7   Returns: static_cast<SM-CAT(BiIter)>(lhs.compare(rhs) <=> 0).

template<class BiIter>
bool operator==(const sub_match<BiIter>& lhs,
                  const typename iterator_traits<BiIter>::value_type& rhs);
8   Returns: lhs.compare(typename sub_match<BiIter>::string_type(1, rhs)) == 0.

template<class BiIter>
auto operator<=>(const sub_match<BiIter>& lhs,
                  const typename iterator_traits<BiIter>::value_type& rhs);
9   Returns:
    static_cast<SM-CAT(BiIter)>(lhs.compare(
        typename sub_match<BiIter>::string_type(1, rhs)
        <=> 0
    ))

template<class charT, class ST, class BiIter>
basic_ostream<charT, ST>& operator<<(basic_ostream<charT, ST>& os, const sub_match<BiIter>& m);
10  Returns: os << m.str().

```

32.9 Class template `match_results`

[re.results]

32.9.1 General

[re.results.general]

- ¹ Class template `match_results` denotes a collection of character sequences representing the result of a regular expression match. Storage for the collection is allocated and freed as necessary by the member functions of class template `match_results`.
- ² The class template `match_results` meets the requirements of an allocator-aware container and of a sequence container ([24.2.2.1](#), [24.2.4](#)) except that only copy assignment, move assignment, and operations defined for const-qualified sequence containers are supported and that the semantics of the comparison operator functions are different from those required for a container.
- ³ A default-constructed `match_results` object has no fully established result state. A match result is *ready* when, as a consequence of a completed regular expression match modifying such an object, its result state

becomes fully established. The effects of calling most member functions from a `match_results` object that is not ready are undefined.

- ⁴ The `sub_match` object stored at index 0 represents sub-expression 0, i.e., the whole match. In this case the `sub_match` member `matched` is always `true`. The `sub_match` object stored at index `n` denotes what matched the marked sub-expression `n` within the matched expression. If the sub-expression `n` participated in a regular expression match then the `sub_match` member `matched` evaluates to `true`, and members `first` and `second` denote the range of characters [`first`, `second`) which formed that match. Otherwise `matched` is `false`, and members `first` and `second` point to the end of the sequence that was searched.

NOTE: The `sub_match` objects representing different sub-expressions that did not participate in a regular expression match need not be distinct.

```

namespace std {
    template<class BidirectionalIterator,
              class Allocator = allocator<sub_match<BidirectionalIterator>>>
    class match_results {
public:
    using value_type      = sub_match<BidirectionalIterator>;
    using const_reference = const value_type&;
    using reference       = value_type&;
    using const_iterator   = implementation-defined;
    using iterator        = const_iterator;
    using difference_type =
        typename iterator_traits<BidirectionalIterator>::difference_type;
    using size_type        = typename allocator_traits<Allocator>::size_type;
    using allocator_type   = Allocator;
    using char_type        =
        typename iterator_traits<BidirectionalIterator>::value_type;
    using string_type      = basic_string<char_type>;

    // 32.9.2, construct/copy/destroy
    match_results() : match_results(Allocator{}) {}
    explicit match_results(const Allocator& a);
    match_results(const match_results& m);
    match_results(const match_results& m, const Allocator& a);
    match_results(match_results&& m) noexcept;
    match_results(match_results&& m, const Allocator& a);
    match_results& operator=(const match_results& m);
    match_results& operator=(match_results&& m);
    ~match_results();

    // 32.9.3, state
    bool ready() const;

    // 32.9.4, size
    size_type size() const;
    size_type max_size() const;
    [[nodiscard]] bool empty() const;

    // 32.9.5, element access
    difference_type length(size_type sub = 0) const;
    difference_type position(size_type sub = 0) const;
    string_type str(size_type sub = 0) const;
    const_reference operator[](size_type n) const;

    const_reference prefix() const;
    const_reference suffix() const;
    const_iterator begin() const;
    const_iterator end() const;
    const_iterator cbegin() const;
    const_iterator cend() const;
}

```

```

// 32.9.6, format
template<class OutputIter>
OutputIter
format(OutputIter out,
       const char_type* fmt_first, const char_type* fmt_last,
       regex_constants::match_flag_type flags = regex_constants::format_default) const;
template<class OutputIter, class ST, class SA>
OutputIter
format(OutputIter out,
       const basic_string<char_type, ST, SA>& fmt,
       regex_constants::match_flag_type flags = regex_constants::format_default) const;
template<class ST, class SA>
basic_string<char_type, ST, SA>
format(const basic_string<char_type, ST, SA>& fmt,
       regex_constants::match_flag_type flags = regex_constants::format_default) const;
string_type
format(const char_type* fmt,
       regex_constants::match_flag_type flags = regex_constants::format_default) const;

// 32.9.7, allocator
allocator_type get_allocator() const;

// 32.9.8, swap
void swap(match_results& that);
};

}

```

32.9.2 Constructors

[re.results.const]

- ¹ Table 141 lists the postconditions of `match_results` copy/move constructors and copy/move assignment operators. For move operations, the results of the expressions depending on the parameter `m` denote the values they had before the respective function calls.

`explicit match_results(const Allocator& a);`

- ² *Effects:* The stored `Allocator` value is constructed from `a`.

- ³ *Postconditions:* `ready()` returns `false`. `size()` returns 0.

`match_results(const match_results& m);`
`match_results(const match_results& m, const Allocator& a);`

- ⁴ *Effects:* For the first form, the stored `Allocator` value is obtained as specified in 24.2.2.2. For the second form, the stored `Allocator` value is constructed from `a`.

- ⁵ *Postconditions:* As specified in Table 141.

`match_results(match_results&& m) noexcept;`
`match_results(match_results&& m, const Allocator& a);`

- ⁶ *Effects:* For the first form, the stored `Allocator` value is move constructed from `m.get_allocator()`. For the second form, the stored `Allocator` value is constructed from `a`.

- ⁷ *Postconditions:* As specified in Table 141.

- ⁸ *Throws:* The second form throws nothing if `a == m.get_allocator()` is true.

`match_results& operator=(const match_results& m);`

- ⁹ *Postconditions:* As specified in Table 141.

`match_results& operator=(match_results&& m);`

- ¹⁰ *Postconditions:* As specified in Table 141.

32.9.3 State

[re.results.state]

`bool ready() const;`

- ¹ *Returns:* `true` if `*this` has a fully established result state, otherwise `false`.

Table 141: `match_results` copy/move operation postconditions [tab:re.results.const]

Element	Value
<code>ready()</code>	<code>m.ready()</code>
<code>size()</code>	<code>m.size()</code>
<code>str(n)</code>	<code>m.str(n)</code> for all non-negative integers $n < m.size()$
<code>prefix()</code>	<code>m.prefix()</code>
<code>suffix()</code>	<code>m.suffix()</code>
<code>(*this)[n]</code>	<code>m[n]</code> for all non-negative integers $n < m.size()$
<code>length(n)</code>	<code>m.length(n)</code> for all non-negative integers $n < m.size()$
<code>position(n)</code>	<code>m.position(n)</code> for all non-negative integers $n < m.size()$

32.9.4 Size

[re.results.size]

`size_type size() const;`

1 *Returns:* One plus the number of marked sub-expressions in the regular expression that was matched if `*this` represents the result of a successful match. Otherwise returns 0.

NOTE: The state of a `match_results` object can be modified only by passing that object to `regex_match` or `regex_search`. Subclauses 32.10.2 and 32.10.3 specify the effects of those algorithms on their `match_results` arguments.

`size_type max_size() const;`

2 *Returns:* The maximum number of `sub_match` elements that can be stored in `*this`.

`[[nodiscard]] bool empty() const;`

3 *Returns:* `size() == 0`.

32.9.5 Element access

[re.results.acc]

`difference_type length(size_type sub = 0) const;`

1 *Preconditions:* `ready() == true`.

2 *Returns:* `(*this)[sub].length()`.

`difference_type position(size_type sub = 0) const;`

3 *Preconditions:* `ready() == true`.

4 *Returns:* The distance from the start of the target sequence to `(*this)[sub].first`.

`string_type str(size_type sub = 0) const;`

5 *Preconditions:* `ready() == true`.

6 *Returns:* `string_type((*this)[sub])`.

`const_reference operator[](size_type n) const;`

7 *Preconditions:* `ready() == true`.

8 *Returns:* A reference to the `sub_match` object representing the character sequence that matched marked sub-expression n . If $n == 0$ then returns a reference to a `sub_match` object representing the character sequence that matched the whole regular expression. If $n \geq size()$ then returns a `sub_match` object representing an unmatched sub-expression.

`const_reference prefix() const;`

9 *Preconditions:* `ready() == true`.

10 *Returns:* A reference to the `sub_match` object representing the character sequence from the start of the string being matched/searched to the start of the match found.

```

const_reference suffix() const;
11  Preconditions: ready() == true.
12  Returns: A reference to the sub_match object representing the character sequence from the end of the match found to the end of the string being matched/searched.

const_iterator begin() const;
const_iterator cbegin() const;
13  Returns: A starting iterator that enumerates over all the sub-expressions stored in *this.

const_iterator end() const;
const_iterator cend() const;
14  Returns: A terminating iterator that enumerates over all the sub-expressions stored in *this.

```

32.9.6 Formatting

[re.results.form]

```

template<class OutputIter>
OutputIter format(
    OutputIter out,
    const char_type* fmt_first, const char_type* fmt_last,
    regex_constants::match_flag_type flags = regex_constants::format_default) const;
1  Preconditions: ready() == true and OutputIter meets the requirements for a Cpp17OutputIterator
(25.3.5.4).
2  Effects: Copies the character sequence [fmt_first,fmt_last) to OutputIter out. Replaces each format
specifier or escape sequence in the copied range with either the character(s) it represents or the sequence
of characters within *this to which it refers. The bitmasks specified in flags determine which format
specifiers and escape sequences are recognized.
3  Returns: out.

template<class OutputIter, class ST, class SA>
OutputIter format(
    OutputIter out,
    const basic_string<char_type, ST, SA>& fmt,
    regex_constants::match_flag_type flags = regex_constants::format_default) const;
4  Effects: Equivalent to:
    return format(out, fmt.data(), fmt.data() + fmt.size(), flags);

template<class ST, class SA>
basic_string<char_type, ST, SA> format(
    const basic_string<char_type, ST, SA>& fmt,
    regex_constants::match_flag_type flags = regex_constants::format_default) const;
5  Preconditions: ready() == true.
6  Effects: Constructs an empty string result of type basic_string<char_type, ST, SA> and calls:
    format(back_inserter(result), fmt, flags);
7  Returns: result.

string_type format(
    const char_type* fmt,
    regex_constants::match_flag_type flags = regex_constants::format_default) const;
8  Preconditions: ready() == true.
9  Effects: Constructs an empty string result of type string_type and calls:
    format(back_inserter(result), fmt, fmt + char_traits<char_type>::length(fmt), flags);
10 Returns: result.

```

32.9.7 Allocator

[re.results.all]

```
allocator_type get_allocator() const;
```

- 1 *Returns*: A copy of the Allocator that was passed to the object's constructor or, if that allocator has been replaced, a copy of the most recent replacement.

32.9.8 Swap

[re.results.swap]

```
void swap(match_results& that);
```

- 1 *Effects*: Swaps the contents of the two sequences.

- 2 *Postconditions*: `*this` contains the sequence of matched sub-expressions that were in `that`, `that` contains the sequence of matched sub-expressions that were in `*this`.

- 3 *Complexity*: Constant time.

```
template<class BidirectionalIterator, class Allocator>
void swap(match_results<BidirectionalIterator, Allocator>& m1,
          match_results<BidirectionalIterator, Allocator>& m2);
```

- 4 *Effects*: As if by `m1.swap(m2)`.

32.9.9 Non-member functions

[re.results.nonmember]

```
template<class BidirectionalIterator, class Allocator>
bool operator==(const match_results<BidirectionalIterator, Allocator>& m1,
                  const match_results<BidirectionalIterator, Allocator>& m2);
```

- 1 *Returns*: `true` if neither match result is ready, `false` if one match result is ready and the other is not. If both match results are ready, returns `true` only if:

- (1.1) — `m1.empty() && m2.empty()`, or

- (1.2) — `!m1.empty() && !m2.empty()`, and the following conditions are satisfied:

- (1.2.1) — `m1.prefix() == m2.prefix()`,

- (1.2.2) — `m1.size() == m2.size() && equal(m1.begin(), m1.end(), m2.begin()),` and

- (1.2.3) — `m1.suffix() == m2.suffix()`.

NOTE: The algorithm `equal` is defined in [Clause 27](#).

32.10 Regular expression algorithms

[re.alg]

32.10.1 Exceptions

[re.exception]

- 1 The algorithms described in subclause [32.10](#) may throw an exception of type `regex_error`. If such an exception `e` is thrown, `e.code()` shall return either `regex_constants::error_complexity` or `regex_constants::error_stack`.

32.10.2 regex_match

[re.alg.match]

```
template<class BidirectionalIterator, class Allocator, class charT, class traits>
bool regex_match(BidirectionalIterator first, BidirectionalIterator last,
                 match_results<BidirectionalIterator, Allocator>& m,
                 const basic_regex<charT, traits>& e,
                 regex_constants::match_flag_type flags = regex_constants::match_default);
```

- 1 *Preconditions*: BidirectionalIterator models `bidirectional_iterator` ([25.3.4.12](#)).

- 2 *Effects*: Determines whether there is a match between the regular expression `e`, and all of the character sequence [`first, last`). The parameter `flags` is used to control how the expression is matched against the character sequence. When determining if there is a match, only potential matches that match the entire character sequence are considered. Returns `true` if such a match exists, `false` otherwise.

EXAMPLE:

```
std::regex re("Get|GetValue");
std::cmatch m;
regex_search("GetValue", m, re);           // returns true, and m[0] contains "Get"
regex_match ("GetValue", m, re);           // returns true, and m[0] contains "GetValue"
```

```

    regex_search("GetValues", m, re);           // returns true, and m[0] contains "Get"
    regex_match ("GetValues", m, re);           // returns false

```

3 *Postconditions:* `m.ready() == true` in all cases. If the function returns `false`, then the effect on parameter `m` is unspecified except that `m.size()` returns 0 and `m.empty()` returns `true`. Otherwise the effects on parameter `m` are given in [Table 142](#).

Table 142: Effects of `regex_match` algorithm [tab:re.alg.match]

Element	Value
<code>m.size()</code>	<code>1 + e.mark_count()</code>
<code>m.empty()</code>	<code>false</code>
<code>m.prefix().first</code>	<code>first</code>
<code>m.prefix().second</code>	<code>first</code>
<code>m.prefix().matched</code>	<code>false</code>
<code>m.suffix().first</code>	<code>last</code>
<code>m.suffix().second</code>	<code>last</code>
<code>m.suffix().matched</code>	<code>false</code>
<code>m[0].first</code>	<code>first</code>
<code>m[0].second</code>	<code>last</code>
<code>m[0].matched</code>	<code>true</code>
<code>m[n].first</code>	For all integers $0 < n < m.size()$, the start of the sequence that matched sub-expression <code>n</code> . Alternatively, if sub-expression <code>n</code> did not participate in the match, then <code>last</code> .
<code>m[n].second</code>	For all integers $0 < n < m.size()$, the end of the sequence that matched sub-expression <code>n</code> . Alternatively, if sub-expression <code>n</code> did not participate in the match, then <code>last</code> .
<code>m[n].matched</code>	For all integers $0 < n < m.size()$, <code>true</code> if sub-expression <code>n</code> participated in the match, <code>false</code> otherwise.

```

template<class BidirectionalIterator, class charT, class traits>
bool regex_match(BidirectionalIterator first, BidirectionalIterator last,
                 const basic_regex<charT, traits>& e,
                 regex_constants::match_flag_type flags = regex_constants::match_default);

```

4 *Effects:* Behaves “as if” by constructing an instance of `match_results<BidirectionalIterator>` `what`, and then returning the result of `regex_match(first, last, what, e, flags)`.

```

template<class charT, class Allocator, class traits>
bool regex_match(const charT* str,
                 match_results<const charT*, Allocator>& m,
                 const basic_regex<charT, traits>& e,
                 regex_constants::match_flag_type flags = regex_constants::match_default);

```

5 *Returns:* `regex_match(str, str + char_traits<charT>::length(str), m, e, flags)`.

```

template<class ST, class SA, class Allocator, class charT, class traits>
bool regex_match(const basic_string<charT, ST, SA>& s,
                 match_results<typename basic_string<charT, ST, SA>::const_iterator,
                             Allocator>& m,
                 const basic_regex<charT, traits>& e,
                 regex_constants::match_flag_type flags = regex_constants::match_default);

```

6 *Returns:* `regex_match(s.begin(), s.end(), m, e, flags)`.

```

template<class charT, class traits>
bool regex_match(const charT* str,
                 const basic_regex<charT, traits>& e,
                 regex_constants::match_flag_type flags = regex_constants::match_default);

```

7 *Returns:* `regex_match(str, str + char_traits<charT>::length(str), e, flags)`

```
template<class ST, class SA, class charT, class traits>
bool regex_match(const basic_string<charT, ST, SA>& s,
                 const basic_regex<charT, traits>& e,
                 regex_constants::match_flag_type flags = regex_constants::match_default);
8   Returns: regex_match(s.begin(), s.end(), e, flags).
```

32.10.3 regex_search

[re.alg.search]

```
template<class BidirectionalIterator, class Allocator, class charT, class traits>
bool regex_search(BidirectionalIterator first, BidirectionalIterator last,
                  match_results<BidirectionalIterator, Allocator>& m,
                  const basic_regex<charT, traits>& e,
                  regex_constants::match_flag_type flags = regex_constants::match_default);
```

1 *Preconditions:* BidirectionalIterator models bidirectional_iterator (25.3.4.12).

2 *Effects:* Determines whether there is some sub-sequence within [first, last) that matches the regular expression e. The parameter flags is used to control how the expression is matched against the character sequence. Returns true if such a sequence exists, false otherwise.

3 *Postconditions:* m.ready() == true in all cases. If the function returns false, then the effect on parameter m is unspecified except that m.size() returns 0 and m.empty() returns true. Otherwise the effects on parameter m are given in Table 143.

Table 143: Effects of regex_search algorithm [tab:re.alg.search]

Element	Value
m.size()	1 + e.mark_count()
m.empty()	false
m.prefix().first	first
m.prefix().second	m[0].first
m.prefix().matched	m.prefix().first != m.prefix().second
m.suffix().first	m[0].second
m.suffix().second	last
m.suffix().matched	m.suffix().first != m.suffix().second
m[0].first	The start of the sequence of characters that matched the regular expression
m[0].second	The end of the sequence of characters that matched the regular expression
m[0].matched	true
m[n].first	For all integers 0 < n < m.size(), the start of the sequence that matched sub-expression n. Alternatively, if sub-expression n did not participate in the match, then last.
m[n].second	For all integers 0 < n < m.size(), the end of the sequence that matched sub-expression n. Alternatively, if sub-expression n did not participate in the match, then last.
m[n].matched	For all integers 0 < n < m.size(), true if sub-expression n participated in the match, false otherwise.

```
template<class charT, class Allocator, class traits>
bool regex_search(const charT* str, match_results<const charT*, Allocator>& m,
                  const basic_regex<charT, traits>& e,
                  regex_constants::match_flag_type flags = regex_constants::match_default);
```

4 Returns: regex_search(str, str + char_traits<charT>::length(str), m, e, flags).

```

template<class ST, class SA, class Allocator, class charT, class traits>
bool regex_search(const basic_string<charT, ST, SA>& s,
                  match_results<typename basic_string<charT, ST, SA>::const_iterator,
                               Allocator>& m,
                  const basic_regex<charT, traits>& e,
                  regex_constants::match_flag_type flags = regex_constants::match_default);

5   Returns: regex_search(s.begin(), s.end(), m, e, flags).

template<class BidirectionalIterator, class charT, class traits>
bool regex_search(BidirectionalIterator first, BidirectionalIterator last,
                  const basic_regex<charT, traits>& e,
                  regex_constants::match_flag_type flags = regex_constants::match_default);

6   Effects: Behaves “as if” by constructing an object what of type match_results<Bidirectional-
             Iterator> and returning regex_search(first, last, what, e, flags).

template<class charT, class traits>
bool regex_search(const charT* str,
                  const basic_regex<charT, traits>& e,
                  regex_constants::match_flag_type flags = regex_constants::match_default);

7   Returns: regex_search(str, str + char_traits<charT>::length(str), e, flags).

template<class ST, class SA, class charT, class traits>
bool regex_search(const basic_string<charT, ST, SA>& s,
                  const basic_regex<charT, traits>& e,
                  regex_constants::match_flag_type flags = regex_constants::match_default);

8   Returns: regex_search(s.begin(), s.end(), e, flags).

```

32.10.4 regex_replace

[re.alg.replace]

```

template<class OutputIterator, class BidirectionalIterator,
         class traits, class charT, class ST, class SA>
OutputIterator
regex_replace(OutputIterator out,
              BidirectionalIterator first, BidirectionalIterator last,
              const basic_regex<charT, traits>& e,
              const basic_string<charT, ST, SA>& fmt,
              regex_constants::match_flag_type flags = regex_constants::match_default);

template<class OutputIterator, class BidirectionalIterator, class traits, class charT>
OutputIterator
regex_replace(OutputIterator out,
              BidirectionalIterator first, BidirectionalIterator last,
              const basic_regex<charT, traits>& e,
              const charT* fmt,
              regex_constants::match_flag_type flags = regex_constants::match_default);

```

1 Effects: Constructs a `regex_iterator` object `i` as if by

```
    regex_iterator<BidirectionalIterator, charT, traits> i(first, last, e, flags)
```

and uses `i` to enumerate through all of the matches `m` of type `match_results<BidirectionalIterator>` that occur within the sequence `[first, last]`. If no such matches are found and `!(flags & regex_constants::format_no_copy)`, then calls

```
    out = copy(first, last, out)
```

If any matches are found then, for each such match:

(1.1) — If `!(flags & regex_constants::format_no_copy)`, calls

```
    out = copy(m.prefix().first, m.prefix().second, out)
```

(1.2) — Then calls

```
    out = m.format(out, fmt, flags)
```

for the first form of the function and

```
    out = m.format(out, fmt, fmt + char_traits<charT>::length(fmt), flags)
```

for the second.

Finally, if such a match is found and !(flags & regex_constants::format_no_copy), calls

```
out = copy(last_m.suffix().first, last_m.suffix().second, out)
```

where `last_m` is a copy of the last match found. If `flags & regex_constants::format_first_only` is nonzero, then only the first match found is replaced.

2 *Returns:* `out`.

```
template<class traits, class charT, class ST, class SA, class FST, class FSA>
basic_string<charT, ST, SA>
    regex_replace(const basic_string<charT, ST, SA>& s,
                  const basic_regex<charT, traits>& e,
                  const basic_string<charT, FST, FSA>& fmt,
                  regex_constants::match_flag_type flags = regex_constants::match_default);
template<class traits, class charT, class ST, class SA>
basic_string<charT, ST, SA>
    regex_replace(const basic_string<charT, ST, SA>& s,
                  const basic_regex<charT, traits>& e,
                  const charT* fmt,
                  regex_constants::match_flag_type flags = regex_constants::match_default);
```

3 *Effects:* Constructs an empty string `result` of type `basic_string<charT, ST, SA>` and calls:

```
regex_replace(back_inserter(result), s.begin(), s.end(), e, fmt, flags);
```

4 *Returns:* `result`.

```
template<class traits, class charT, class ST, class SA>
basic_string<charT>
    regex_replace(const charT* s,
                  const basic_regex<charT, traits>& e,
                  const basic_string<charT, ST, SA>& fmt,
                  regex_constants::match_flag_type flags = regex_constants::match_default);
template<class traits, class charT>
basic_string<charT>
    regex_replace(const charT* s,
                  const basic_regex<charT, traits>& e,
                  const charT* fmt,
                  regex_constants::match_flag_type flags = regex_constants::match_default);
```

5 *Effects:* Constructs an empty string `result` of type `basic_string<charT>` and calls:

```
regex_replace(back_inserter(result), s, s + char_traits<charT>::length(s), e, fmt, flags);
```

6 *Returns:* `result`.

32.11 Regular expression iterators

[re.iterator]

32.11.1 Class template `regex_iterator`

[re.iterator]

32.11.1.1 General

[re.iterator.general]

- 1 The class template `regex_iterator` is an iterator adaptor. It represents a new view of an existing iterator sequence, by enumerating all the occurrences of a regular expression within that sequence. A `regex_iterator` uses `regex_search` to find successive regular expression matches within the sequence from which it was constructed. After the iterator is constructed, and every time `operator++` is used, the iterator finds and stores a value of `match_results<BidirectionalIterator>`. If the end of the sequence is reached (`regex_search` returns `false`), the iterator becomes equal to the end-of-sequence iterator value. The default constructor constructs an end-of-sequence iterator object, which is the only legitimate iterator to be used for the end condition. The result of `operator*` on an end-of-sequence iterator is not defined. For any other iterator value a `const match_results<BidirectionalIterator>&` is returned. The result of `operator->` on an end-of-sequence iterator is not defined. For any other iterator value a `const match_results<BidirectionalIterator>*` is returned. It is impossible to store things into `regex_iterators`. Two end-of-sequence iterators are always equal. An end-of-sequence iterator is not equal to a non-end-of-sequence iterator. Two non-end-of-sequence iterators are equal when they are constructed from the same arguments.

```

namespace std {
    template<class BidirectionalIterator,
              class charT = typename iterator_traits<BidirectionalIterator>::value_type,
              class traits = regex_traits<charT>>
    class regex_iterator {
public:
    using regex_type      = basic_regex<charT, traits>;
    using iterator_category = forward_iterator_tag;
    using iterator_concept   = input_iterator_tag;
    using value_type       = match_results<BidirectionalIterator>;
    using difference_type  = ptrdiff_t;
    using pointer          = const value_type*;
    using reference         = const value_type&;

    regex_iterator();
    regex_iterator(BidirectionalIterator a, BidirectionalIterator b,
                  const regex_type& re,
                  regex_constants::match_flag_type m = regex_constants::match_default);
    regex_iterator(BidirectionalIterator, BidirectionalIterator,
                  const regex_type&&,
                  regex_constants::match_flag_type = regex_constants::match_default) = delete;
    regex_iterator(const regex_iterator&);
    regex_iterator& operator=(const regex_iterator&);
    bool operator==(const regex_iterator&) const;
    bool operator==(default_sentinel_t) const { return *this == regex_iterator(); }
    const value_type& operator*() const;
    const value_type* operator->() const;
    regex_iterator& operator++();
    regex_iterator operator++(int);

private:
    BidirectionalIterator           begin;           // exposition only
    BidirectionalIterator           end;            // exposition only
    const regex_type*              pregex;          // exposition only
    regex_constants::match_flag_type flags;          // exposition only
    match_results<BidirectionalIterator> match;        // exposition only
};

}

```

- ² An object of type `regex_iterator` that is not an end-of-sequence iterator holds a *zero-length match* if `match[0].matched == true` and `match[0].first == match[0].second`.

NOTE: For example, this can occur when the part of the regular expression that matched consists only of an assertion (such as '^', '\$', '\b', '\B').

32.11.1.2 Constructors

[re.register.cnstr]

`regex_iterator();`

- ¹ *Effects:* Constructs an end-of-sequence iterator.

```
regex_iterator(BidirectionalIterator a, BidirectionalIterator b,
              const regex_type& re,
              regex_constants::match_flag_type m = regex_constants::match_default);
```

- ² *Effects:* Initializes `begin` and `end` to `a` and `b`, respectively, sets `pregex` to `addressof(re)`, sets `flags` to `m`, then calls `regex_search(begin, end, match, *pregex, flags)`. If this call returns `false` the constructor sets `*this` to the end-of-sequence iterator.

32.11.1.3 Comparisons

[re.register.comp]

`bool operator==(const regex_iterator& right) const;`

- ¹ *Returns:* `true` if `*this` and `right` are both end-of-sequence iterators or if the following conditions all hold:

- (1.1) — `begin == right.begin,`

(1.2) — `end == right.end`,
 (1.3) — `pregex == right.pregex`,
 (1.4) — `flags == right.flags`, and
 (1.5) — `match[0] == right.match[0]`;
 otherwise `false`.

32.11.1.4 Indirection

[re.register.deref]

```
const value_type& operator*() const;
1   Returns: match.
const value_type* operator->() const;
2   Returns: addressof(match).
```

32.11.1.5 Increment

[re.register.incr]

```
regex_iterator& operator++();
```

- 1 *Effects*: Constructs a local variable `start` of type `BidirectionalIterator` and initializes it with the value of `match[0].second`.
 2 If the iterator holds a zero-length match and `start == end` the operator sets `*this` to the end-of-sequence iterator and returns `*this`.
 3 Otherwise, if the iterator holds a zero-length match, the operator calls:

```
    regex_search(start, end, match, *pregex,
                flags | regex_constants::match_not_null | regex_constants::match_continuous)
```

If the call returns `true` the operator returns `*this`. Otherwise the operator increments `start` and continues as if the most recent match was not a zero-length match.

- 4 If the most recent match was not a zero-length match, the operator sets `flags` to `flags | regex_constants::match_prev_avail` and calls `regex_search(start, end, match, *pregex, flags)`. If the call returns `false` the iterator sets `*this` to the end-of-sequence iterator. The iterator then returns `*this`.
 5 In all cases in which the call to `regex_search` returns `true`, `match.prefix().first` shall be equal to the previous value of `match[0].second`, and for each index `i` in the half-open range `[0, match.size()` for which `match[i].matched` is `true`, `match.position(i)` shall return `distance(begin, match[i].first)`.
 6 NOTE 1: This means that `match.position(i)` gives the offset from the beginning of the target sequence, which is often not the same as the offset from the sequence passed in the call to `regex_search`.
 7 It is unspecified how the implementation makes these adjustments.
 8 NOTE 2: This means that an implementation can call an implementation-specific search function, in which case a program-defined specialization of `regex_search` will not be called.

```
regex_iterator operator++(int);
```

- 9 *Effects*: As if by:

```
    regex_iterator tmp = *this;
    ++(*this);
    return tmp;
```

32.11.2 Class template regex_token_iterator

[re.tokiter]

32.11.2.1 General

[re.tokiter.general]

- ¹ The class template `regex_token_iterator` is an iterator adaptor; that is to say it represents a new view of an existing iterator sequence, by enumerating all the occurrences of a regular expression within that sequence, and presenting one or more sub-expressions for each match found. Each position enumerated by the iterator is a `sub_match` class template instance that represents what matched a particular sub-expression within the regular expression.

- 2 When class `regex_token_iterator` is used to enumerate a single sub-expression with index -1 the iterator performs field splitting: that is to say it enumerates one sub-expression for each section of the character container sequence that does not match the regular expression specified.
- 3 After it is constructed, the iterator finds and stores a value `regex_iterator<BidirectionalIterator>` `position` and sets the internal count `N` to zero. It also maintains a sequence `subs` which contains a list of the sub-expressions which will be enumerated. Every time `operator++` is used the count `N` is incremented; if `N` exceeds or equals `subs.size()`, then the iterator increments member `position` and sets count `N` to zero.
- 4 If the end of sequence is reached (`position` is equal to the end of sequence iterator), the iterator becomes equal to the end-of-sequence iterator value, unless the sub-expression being enumerated has index -1 , in which case the iterator enumerates one last sub-expression that contains all the characters from the end of the last regular expression match to the end of the input sequence being enumerated, provided that this would not be an empty sub-expression.
- 5 The default constructor constructs an end-of-sequence iterator object, which is the only legitimate iterator to be used for the end condition. The result of `operator*` on an end-of-sequence iterator is not defined. For any other iterator value a `const sub_match<BidirectionalIterator>&` is returned. The result of `operator->` on an end-of-sequence iterator is not defined. For any other iterator value a `const sub_match<BidirectionalIterator>*` is returned.
- 6 It is impossible to store things into `regex_token_iterators`. Two end-of-sequence iterators are always equal. An end-of-sequence iterator is not equal to a non-end-of-sequence iterator. Two non-end-of-sequence iterators are equal when they are constructed from the same arguments.

```
namespace std {
    template<class BidirectionalIterator,
              class charT = typename iterator_traits<BidirectionalIterator>::value_type,
              class traits = regex_traits<charT>>
    class regex_token_iterator {
public:
    using regex_type      = basic_regex<charT, traits>;
    using iterator_category = forward_iterator_tag;
    using iterator_concept   = input_iterator_tag;
    using value_type        = sub_match<BidirectionalIterator>;
    using difference_type   = ptrdiff_t;
    using pointer           = const value_type*;
    using reference         = const value_type&;
    using reference_t       = const value_type&;

    regex_token_iterator();
    regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                        const regex_type& re,
                        int submatch = 0,
                        regex_constants::match_flag_type m =
                            regex_constants::match_default);
    regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                        const regex_type& re,
                        const vector<int>& submatches,
                        regex_constants::match_flag_type m =
                            regex_constants::match_default);
    regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                        const regex_type& re,
                        initializer_list<int> submatches,
                        regex_constants::match_flag_type m =
                            regex_constants::match_default);
    template<size_t N>
    regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                        const regex_type& re,
                        const int (&submatches)[N],
                        regex_constants::match_flag_type m =
                            regex_constants::match_default);
    regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                        const regex_type&& re,
                        int submatch = 0,
                        regex_constants::match_flag_type m =
```

```

        regex_constants::match_default) = delete;
    regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                        const regex_type&& re,
                        const vector<int>& submatches,
                        regex_constants::match_flag_type m =
                            regex_constants::match_default) = delete;
    regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                        const regex_type&& re,
                        initializer_list<int> submatches,
                        regex_constants::match_flag_type m =
                            regex_constants::match_default) = delete;
template<size_t N>
    regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                        const regex_type&& re,
                        const int (&submatches)[N],
                        regex_constants::match_flag_type m =
                            regex_constants::match_default) = delete;
    regex_token_iterator(const regex_token_iterator&);

    regex_token_iterator& operator=(const regex_token_iterator&);

    bool operator==(const regex_token_iterator&) const;
    bool operator==(default_sentinel_t) const { return *this == regex_token_iterator(); }

    const value_type& operator*() const;
    const value_type* operator->() const;
    regex_token_iterator& operator++();
    regex_token_iterator operator++(int);

private:
    using position_iterator =
        regex_iterator<BidirectionalIterator, charT, traits>; // exposition only
    position_iterator position; // exposition only
    const value_type* result; // exposition only
    value_type suffix; // exposition only
    size_t N; // exposition only
    vector<int> subs; // exposition only
};

}

```

- 7 A *suffix iterator* is a `regex_token_iterator` object that points to a final sequence of characters at the end of the target sequence. In a suffix iterator the member `result` holds a pointer to the data member `suffix`, the value of the member `suffix.match` is `true`, `suffix.first` points to the beginning of the final sequence, and `suffix.second` points to the end of the final sequence.
- 8 NOTE: For a suffix iterator, data member `suffix.first` is the same as the end of the last match found, and `suffix.second` is the same as the end of the target sequence.
- 9 The *current match* is `(*position).prefix()` if `subs[N] == -1`, or `(*position)[subs[N]]` for any other value of `subs[N]`.

32.11.2.2 Constructors

[re.tokiter.cnstr]

`regex_token_iterator()`;

- 1 *Effects:* Constructs the end-of-sequence iterator.

```

    regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                        const regex_type& re,
                        int submatch = 0,
                        regex_constants::match_flag_type m = regex_constants::match_default);

    regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                        const regex_type& re,
                        const vector<int>& submatches,
                        regex_constants::match_flag_type m = regex_constants::match_default);

```

```

    regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
        const regex_type& re,
        initializer_list<int> submatches,
        regex_constants::match_flag_type m = regex_constants::match_default);

template<size_t N>
    regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
        const regex_type& re,
        const int (&submatches)[N],
        regex_constants::match_flag_type m = regex_constants::match_default);

```

2 *Preconditions:* Each of the initialization values of `submatches` is ≥ -1 .

3 *Effects:* The first constructor initializes the member `subs` to hold the single value `submatch`. The second, third, and fourth constructors initialize the member `subs` to hold a copy of the sequence of integer values pointed to by the iterator range `[begin(submatches), end(submatches)]`.

4 Each constructor then sets `N` to 0, and `position` to `position_iterator(a, b, re, m)`. If `position` is not an end-of-sequence iterator the constructor sets `result` to the address of the current match. Otherwise if any of the values stored in `subs` is equal to -1 the constructor sets `*this` to a suffix iterator that points to the range `[a, b)`, otherwise the constructor sets `*this` to an end-of-sequence iterator.

32.11.2.3 Comparisons

[re.tokiter.comp]

```
bool operator==(const regex_token_iterator& right) const;
```

1 *Returns:* `true` if `*this` and `right` are both end-of-sequence iterators, or if `*this` and `right` are both suffix iterators and `suffix == right.suffix`; otherwise returns `false` if `*this` or `right` is an end-of-sequence iterator or a suffix iterator. Otherwise returns `true` if `position == right.position`, `N == right.N`, and `subs == right.subs`. Otherwise returns `false`.

32.11.2.4 Indirection

[re.tokiter.deref]

```
const value_type& operator*() const;
```

1 *Returns:* `*result`.

```
const value_type* operator->() const;
```

2 *Returns:* `result`.

32.11.2.5 Increment

[re.tokiter.incr]

```
regex_token_iterator& operator++();
```

1 *Effects:* Constructs a local variable `prev` of type `position_iterator`, initialized with the value of `position`.

2 If `*this` is a suffix iterator, sets `*this` to an end-of-sequence iterator.

3 Otherwise, if `N + 1 < subs.size()`, increments `N` and sets `result` to the address of the current match.

4 Otherwise, sets `N` to 0 and increments `position`. If `position` is not an end-of-sequence iterator the operator sets `result` to the address of the current match.

5 Otherwise, if any of the values stored in `subs` is equal to -1 and `prev->suffix().length()` is not 0 the operator sets `*this` to a suffix iterator that points to the range `[prev->suffix().first, prev->suffix().second]`.

6 Otherwise, sets `*this` to an end-of-sequence iterator.

7 *Returns:* `*this`

```
regex_token_iterator& operator++(int);
```

8 *Effects:* Constructs a copy `tmp` of `*this`, then calls `++(*this)`.

9 *Returns:* `tmp`.

32.12 Modified ECMAScript regular expression grammar

[re.grammar]

- 1 The regular expression grammar recognized by `basic_regex` objects constructed with the ECMAScript flag is that specified by ECMA-262, except as specified below.
- 2 Objects of type specialization of `basic_regex` store within themselves a default-constructed instance of their `traits` template parameter, henceforth referred to as `traits_inst`. This `traits_inst` object is used to support localization of the regular expression; `basic_regex` member functions shall not call any locale dependent C or C++ API, including the formatted string input functions. Instead they shall call the appropriate traits member function to achieve the required effect.
- 3 The following productions within the ECMAScript grammar are modified as follows:

ClassAtom ::

-
- ClassAtomNoDash*
- ClassAtomExClass*
- ClassAtomCollatingElement*
- ClassAtomEquivalence*

IdentityEscape ::

SourceCharacter **but not** `c`

- 4 The following new productions are then added:

ClassAtomExClass ::

- [`:` *ClassName* `:`]

ClassAtomCollatingElement ::

- [`.` *ClassName* `.`]

ClassAtomEquivalence ::

- [`=` *ClassName* `=`]

ClassName ::

- ClassNameCharacter*
- ClassNameCharacter* *ClassName*

ClassNameCharacter ::

SourceCharacter **but not one of** `.` `or = or :`

- 5 The productions *ClassAtomExClass*, *ClassAtomCollatingElement* and *ClassAtomEquivalence* provide functionality equivalent to that of the same features in regular expressions in POSIX.
- 6 The regular expression grammar may be modified by any `regex_constants::syntax_option_type` flags specified when constructing an object of type specialization of `basic_regex` according to the rules in [Table 137](#).
- 7 A *ClassName* production, when used in *ClassAtomExClass*, is not valid if `traits_inst.lookup_classname` returns zero for that name. The names recognized as valid *ClassNames* are determined by the type of the traits class, but at least the following names shall be recognized: `alnum`, `alpha`, `blank`, `cntrl`, `digit`, `graph`, `lower`, `print`, `punct`, `space`, `upper`, `xdigit`, `d`, `s`, `w`. In addition the following expressions shall be equivalent:

`\d` and `[[:digit:]]`

`\D` and `[^[:digit:]]`

`\s` and `[[:space:]]`

`\S` and `[^[:space:]]`

`\w` and `[_[:alnum:]]`

`\W` and `[^_[:alnum:]]`

- 8 A *ClassName* production when used in a *ClassAtomCollatingElement* production is not valid if the value returned by `traits_inst.lookup_collatename` for that name is an empty string.
- 9 The results from multiple calls to `traits_inst.lookup_classname` can be bitwise OR'ed together and subsequently passed to `traits_inst.isctype`.

¹⁰ A *ClassName* production when used in a *ClassAtomEquivalence* production is not valid if the value returned by `traits_inst.lookup_collatename` for that name is an empty string or if the value returned by `traits_inst.transform_primary` for the result of the call to `traits_inst.lookup_collatename` is an empty string.

¹¹ When the sequence of characters being transformed to a finite state machine contains an invalid class name the translator shall throw an exception object of type `regex_error`.

¹² If the *CV* of a *UnicodeEscapeSequence* is greater than the largest value that can be held in an object of type `charT` the translator shall throw an exception object of type `regex_error`.

NOTE: This means that values of the form "uxxx" that do not fit in a character are invalid.

¹³ Where the regular expression grammar requires the conversion of a sequence of characters to an integral value, this is accomplished by calling `traits_inst.value`.

¹⁴ The behavior of the internal finite state machine representation when used to match a sequence of characters is as described in ECMA-262. The behavior is modified according to any `match_flag_type` flags (32.4.3) specified when using the regular expression object in one of the regular expression algorithms (32.10). The behavior is also localized by interaction with the traits class template parameter as follows:

(14.1) — During matching of a regular expression finite state machine against a sequence of characters, two characters *c* and *d* are compared using the following rules:

- (14.1.1) — if `(flags() & regex_constants::icase)` the two characters are equal if `traits_inst.translate_nocase(c) == traits_inst.translate_nocase(d)`;
- (14.1.2) — otherwise, if `flags() & regex_constants::collate` the two characters are equal if `traits_inst.translate(c) == traits_inst.translate(d)`;
- (14.1.3) — otherwise, the two characters are equal if `c == d`.

(14.2) — During matching of a regular expression finite state machine against a sequence of characters, comparison of a collating element range *c1*-*c2* against a character *c* is conducted as follows: if `flags() & regex_constants::collate` is *false* then the character *c* is matched if `c1 <= c && c <= c2`, otherwise *c* is matched in accordance with the following algorithm:

```
string_type str1 = string_type(1,
    flags() & icase ?
        traits_inst.translate_nocase(c1) : traits_inst.translate(c1));
string_type str2 = string_type(1,
    flags() & icase ?
        traits_inst.translate_nocase(c2) : traits_inst.translate(c2));
string_type str = string_type(1,
    flags() & icase ?
        traits_inst.translate_nocase(c) : traits_inst.translate(c));
return traits_inst.transform(str1.begin(), str1.end())
    <= traits_inst.transform(str.begin(), str.end())
    && traits_inst.transform(str.begin(), str.end())
    <= traits_inst.transform(str2.begin(), str2.end());
```

(14.3) — During matching of a regular expression finite state machine against a sequence of characters, testing whether a collating element is a member of a primary equivalence class is conducted by first converting the collating element and the equivalence class to sort keys using `traits::transform_primary`, and then comparing the sort keys for equality.

(14.4) — During matching of a regular expression finite state machine against a sequence of characters, a character *c* is a member of a character class designated by an iterator range `[first, last)` if `traits_inst.isctype(c, traits_inst.lookup_classname(first, last, flags() & icase))` is *true*.

SEE ALSO: ECMA-262 15.10

33 Concurrency support library [thread]

33.1 General

[thread.general]

- ¹ The following subclauses describe components to create and manage threads (6.9.2), perform mutual exclusion, and communicate conditions and values between threads, as summarized in [Table 144](#).

Table 144: Concurrency support library summary [tab:thread.summary]

Subclause	Header
33.2 Requirements	
33.3 Stop tokens	<stop_token>
33.4 Threads	<thread>
33.5 Atomic operations	<atomic>, <stdatomic.h>
33.6 Mutual exclusion	<mutex>, <shared_mutex>
33.7 Condition variables	<condition_variable>
33.8 Semaphores	<semaphore>
33.9 Coordination types	<latch> <barrier>
33.10 Futures	<future>

33.2 Requirements

[thread.req]

33.2.1 Template parameter names

[thread.req.paramname]

- ¹ Throughout this Clause, the names of template parameters are used to express type requirements. **Predicate** is a function object type (22.10). Let **pred** denote an lvalue of type **Predicate**. Then the expression **pred()** shall be well-formed and the type **decltype(pred())** shall model **boolean-testable** (18.5.2). The return value of **pred()**, converted to **bool**, yields **true** if the corresponding test condition is satisfied, and **false** otherwise. If a template parameter is named **Clock**, the corresponding template argument shall be a type **C** that meets the *Cpp17Clock* requirements (29.3); the program is ill-formed if **is_clock_v<C>** is **false**.

33.2.2 Exceptions

[thread.req.exception]

- ¹ Some functions described in this Clause are specified to throw exceptions of type **system_error** (19.5.8). Such exceptions are thrown if any of the function's error conditions is detected or a call to an operating system or other underlying API results in an error that prevents the library function from meeting its specifications. Failure to allocate storage is reported as described in 16.4.6.13.

EXAMPLE: Consider a function in this Clause that is specified to throw exceptions of type **system_error** and specifies error conditions that include **operation_not_permitted** for a thread that does not have the privilege to perform the operation. Assume that, during the execution of this function, an **errno** of **EPERM** is reported by a POSIX API call used by the implementation. Since POSIX specifies an **errno** of **EPERM** when “the caller does not have the privilege to perform the operation”, the implementation maps **EPERM** to an **error_condition** of **operation_not_permitted** (19.5) and an exception of type **system_error** is thrown.

- ² The **error_code** reported by such an exception's **code()** member function compares equal to one of the conditions specified in the function's error condition element.

33.2.3 Native handles

[thread.req.native]

- ¹ Several classes described in this Clause have members **native_handle_type** and **native_handle**. The presence of these members and their semantics is implementation-defined.

NOTE: These members allow implementations to provide access to implementation details. Their names are specified to facilitate portable compile-time detection. Actual use of these members is inherently non-portable.

33.2.4 Timing specifications

[thread.req.timing]

- ¹ Several functions described in this Clause take an argument to specify a timeout. These timeouts are specified as either a **duration** or a **time_point** type as specified in [Clause 29](#).

- ² Implementations necessarily have some delay in returning from a timeout. Any overhead in interrupt response, function return, and scheduling induces a “quality of implementation” delay, expressed as duration D_i . Ideally, this delay would be zero. Further, any contention for processor and memory resources induces a “quality of management” delay, expressed as duration D_m . The delay durations may vary from timeout to timeout, but in all cases shorter is better.
- ³ The functions whose names end in `_for` take an argument that specifies a duration. These functions produce relative timeouts. Implementations should use a steady clock to measure time for these functions.³⁰⁵ Given a duration argument D_t , the real-time duration of the timeout is $D_t + D_i + D_m$.
- ⁴ The functions whose names end in `_until` take an argument that specifies a time point. These functions produce absolute timeouts. Implementations should use the clock specified in the time point to measure time for these functions. Given a clock time point argument C_t , the clock time point of the return from timeout should be $C_t + D_i + D_m$ when the clock is not adjusted during the timeout. If the clock is adjusted to the time C_a during the timeout, the behavior should be as follows:
- (4.1) — If $C_a > C_t$, the waiting function should wake as soon as possible, i.e., $C_a + D_i + D_m$, since the timeout is already satisfied. This specification may result in the total duration of the wait decreasing when measured against a steady clock.
 - (4.2) — If $C_a \leq C_t$, the waiting function should not time out until `Clock::now()` returns a time $C_n \geq C_t$, i.e., waking at $C_t + D_i + D_m$.

NOTE 1: When the clock is adjusted backwards, this specification can result in the total duration of the wait increasing when measured against a steady clock. When the clock is adjusted forwards, this specification can result in the total duration of the wait decreasing when measured against a steady clock.

An implementation returns from such a timeout at any point from the time specified above to the time it would return from a steady-clock relative timeout on the difference between C_t and the time point of the call to the `_until` function.

Recommended practice: Implementations should decrease the duration of the wait when the clock is adjusted forwards.

- ⁵ NOTE 2: If the clock is not synchronized with a steady clock, e.g., a CPU time clock, these timeouts can fail to provide useful functionality.
 - ⁶ The resolution of timing provided by an implementation depends on both operating system and hardware. The finest resolution provided by an implementation is called the *native resolution*.
 - ⁷ Implementation-provided clocks that are used for these functions meet the *Cpp17TrivialClock* requirements (29.3).
 - ⁸ A function that takes an argument which specifies a timeout will throw if, during its execution, a clock, time point, or time duration throws an exception. Such exceptions are referred to as *timeout-related exceptions*.
- NOTE 3: Instantiations of clock, time point and duration types supplied by the implementation as specified in 29.7 do not throw exceptions.

33.2.5 Requirements for *Cpp17Lockable* types

[**thread.req.lockable**]

33.2.5.1 In general

[**thread.req.lockable.general**]

- ¹ An *execution agent* is an entity such as a thread that may perform work in parallel with other execution agents.

NOTE 1: Implementations or users can introduce other kinds of agents such as processes or thread-pool tasks.

The calling agent is determined by context, e.g., the calling thread that contains the call, and so on.

- ² NOTE 2: Some lockable objects are “agent oblivious” in that they work for any execution agent model because they do not determine or store the agent’s ID (e.g., an ordinary spin lock).
- ³ The standard library templates `unique_lock` (33.6.5.4), `shared_lock` (33.6.5.5), `scoped_lock` (33.6.5.3), `lock_guard` (33.6.5.2), `lock`, `try_lock` (33.6.6), and `condition_variable_any` (33.7.5) all operate on user-supplied lockable objects. The *Cpp17BasicLockable* requirements, the *Cpp17Lockable* requirements, the *Cpp17TimedLockable* requirements, the *Cpp17SharedLockable* requirements, and the *Cpp17SharedTimedLockable* requirements list the requirements imposed by these library types in order to acquire or release ownership of a `lock` by a given execution agent.

³⁰⁵) Implementations for which standard time units are meaningful will typically have a steady clock within their hardware implementation.

NOTE 3: The nature of any lock ownership and any synchronization it entails are not part of these requirements.

- ⁴ A lock on an object m is said to be
- (4.1) — a *non-shared lock* if it is acquired by a call to `lock`, `try_lock`, `try_lock_for`, or `try_lock_until` on m , or
 - (4.2) — a *shared lock* if it is acquired by a call to `lock_shared`, `try_lock_shared`, `try_lock_shared_for`, or `try_lock_shared_until` on m .

NOTE 4: Only the method of lock acquisition is considered; the nature of any lock ownership is not part of these definitions.

33.2.5.2 *Cpp17BasicLockable* requirements

[`thread.req.lockable.basic`]

- ¹ A type L meets the *Cpp17BasicLockable* requirements if the following expressions are well-formed and have the specified semantics (m denotes a value of type L).

$m.lock()$

- ² *Effects*: Blocks until a lock can be acquired for the current execution agent. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

$m.unlock()$

- ³ *Preconditions*: The current execution agent holds a non-shared lock on m .

- ⁴ *Effects*: Releases a non-shared lock on m held by the current execution agent.

- ⁵ *Throws*: Nothing.

33.2.5.3 *Cpp17Lockable* requirements

[`thread.req.lockable.req`]

- ¹ A type L meets the *Cpp17Lockable* requirements if it meets the *Cpp17BasicLockable* requirements and the following expressions are well-formed and have the specified semantics (m denotes a value of type L).

$m.try_lock()$

- ² *Effects*: Attempts to acquire a lock for the current execution agent without blocking. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

- ³ *Return type*: `bool`.

- ⁴ *Returns*: `true` if the lock was acquired, otherwise `false`.

33.2.5.4 *Cpp17TimedLockable* requirements

[`thread.req.lockable.timed`]

- ¹ A type L meets the *Cpp17TimedLockable* requirements if it meets the *Cpp17Lockable* requirements and the following expressions are well-formed and have the specified semantics (m denotes a value of type L , `rel_time` denotes a value of an instantiation of `duration` (29.5), and `abs_time` denotes a value of an instantiation of `time_point` (29.6)).

$m.try_lock_for(rel_time)$

- ² *Effects*: Attempts to acquire a lock for the current execution agent within the relative timeout (33.2.4) specified by `rel_time`. The function will not return within the timeout specified by `rel_time` unless it has obtained a lock on m for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

- ³ *Return type*: `bool`.

- ⁴ *Returns*: `true` if the lock was acquired, otherwise `false`.

$m.try_lock_until(abs_time)$

- ⁵ *Effects*: Attempts to acquire a lock for the current execution agent before the absolute timeout (33.2.4) specified by `abs_time`. The function will not return before the timeout specified by `abs_time` unless it has obtained a lock on m for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

- ⁶ *Return type*: `bool`.

- ⁷ *Returns*: `true` if the lock was acquired, otherwise `false`.

33.2.5.5 Cpp17SharedLockable requirements

[thread.req.lockable.shared]

- ¹ A type L meets the *Cpp17SharedLockable* requirements if the following expressions are well-formed, have the specified semantics, and the expression `m.try_lock_shared()` has type `bool` (`m` denotes a value of type L):

`m.lock_shared()`

- ² *Effects:* Blocks until a lock can be acquired for the current execution agent. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

`m.try_lock_shared()`

- ³ *Effects:* Attempts to acquire a lock for the current execution agent without blocking. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

- ⁴ *Returns:* `true` if the lock was acquired, `false` otherwise.

`m.unlock_shared()`

- ⁵ *Preconditions:* The current execution agent holds a shared lock on `m`.

- ⁶ *Effects:* Releases a shared lock on `m` held by the current execution agent.

- ⁷ *Throws:* Nothing.

33.2.5.6 Cpp17SharedTimedLockable requirements

[thread.req.lockable.shared.timed]

- ¹ A type L meets the *Cpp17SharedTimedLockable* requirements if it meets the *Cpp17SharedLockable* requirements, and the following expressions are well-formed, have type `bool`, and have the specified semantics (`m` denotes a value of type L, `rel_time` denotes a value of a specialization of `chrono::duration`, and `abs_time` denotes a value of a specialization of `chrono::time_point`).

`m.try_lock_shared_for(rel_time)`

- ² *Effects:* Attempts to acquire a lock for the current execution agent within the relative timeout (33.2.4) specified by `rel_time`. The function will not return within the timeout specified by `rel_time` unless it has obtained a lock on `m` for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

- ³ *Returns:* `true` if the lock was acquired, `false` otherwise.

`m.try_lock_shared_until(abs_time)`

- ⁴ *Effects:* Attempts to acquire a lock for the current execution agent before the absolute timeout (33.2.4) specified by `abs_time`. The function will not return before the timeout specified by `abs_time` unless it has obtained a lock on `m` for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

- ⁵ *Returns:* `true` if the lock was acquired, `false` otherwise.

33.3 Stop tokens

[thread.stoptoken]

33.3.1 Introduction

[thread.stoptoken.intro]

- ¹ Subclause 33.3 describes components that can be used to asynchronously request that an operation stops execution in a timely manner, typically because the result is no longer required. Such a request is called a *stop request*.

- ² `stop_source`, `stop_token`, and `stop_callback` implement semantics of shared ownership of a *stop state*. Any `stop_source`, `stop_token`, or `stop_callback` that shares ownership of the same stop state is an *associated stop_source*, *stop_token*, or *stop_callback*, respectively. The last remaining owner of the stop state automatically releases the resources associated with the stop state.

- ³ A `stop_token` can be passed to an operation which can either

- (3.1) — actively poll the token to check if there has been a stop request, or
- (3.2) — register a callback using the `stop_callback` class template which will be called in the event that a stop request is made.

A stop request made via a `stop_source` will be visible to all associated `stop_token` and `stop_source` objects. Once a stop request has been made it cannot be withdrawn (a subsequent stop request has no effect).

- ⁴ Callbacks registered via a `stop_callback` object are called when a stop request is first made by any associated `stop_source` object.
- ⁵ Calls to the functions `request_stop`, `stop_requested`, and `stop_possible` do not introduce data races. A call to `request_stop` that returns `true` synchronizes with a call to `stop_requested` on an associated `stop_token` or `stop_source` object that returns `true`. Registration of a callback synchronizes with the invocation of that callback.

33.3.2 Header <stop_token> synopsis

[`thread.stopToken.syn`]

```
namespace std {
    // 33.3.3, class stop_token
    class stop_token;

    // 33.3.4, class stop_source
    class stop_source;

    // no-shared-stop-state indicator
    struct nostopstate_t {
        explicit nostopstate_t() = default;
    };
    inline constexpr nostopstate_t nostopstate{};

    // 33.3.5, class template stop_callback
    template<class Callback>
    class stop_callback;
}
```

33.3.3 Class `stop_token`

[`stopToken`]

33.3.3.1 General

[`stopToken.general`]

- ¹ The class `stop_token` provides an interface for querying whether a stop request has been made (`stop_requested`) or can ever be made (`stop_possible`) using an associated `stop_source` object (33.3.4). A `stop_token` can also be passed to a `stop_callback` (33.3.5) constructor to register a callback to be called when a stop request has been made from an associated `stop_source`.

```
namespace std {
    class stop_token {
    public:
        // 33.3.3.2, constructors, copy, and assignment
        stop_token() noexcept;

        stop_token(const stop_token&) noexcept;
        stop_token(stop_token&&) noexcept;
        stop_token& operator=(const stop_token&) noexcept;
        stop_token& operator=(stop_token&&) noexcept;
        ~stop_token();
        void swap(stop_token&) noexcept;

        // 33.3.3.3, stop handling
        [[nodiscard]] bool stop_requested() const noexcept;
        [[nodiscard]] bool stop_possible() const noexcept;

        [[nodiscard]] friend bool operator==(const stop_token& lhs, const stop_token& rhs) noexcept;
        friend void swap(stop_token& lhs, stop_token& rhs) noexcept;
    };
}
```

33.3.3.2 Constructors, copy, and assignment

[`stopToken.cons`]

`stop_token()` noexcept;

- ¹ *Postconditions:* `stop_possible()` is `false` and `stop_requested()` is `false`.

NOTE 1: Because the created `stop_token` object can never receive a stop request, no resources are allocated for a stop state.

```

stop_token(const stop_token& rhs) noexcept;
2   Postconditions: *this == rhs is true.
    NOTE 2: *this and rhs share the ownership of the same stop state, if any.

stop_token(stop_token&& rhs) noexcept;
3   Postconditions: *this contains the value of rhs prior to the start of construction and rhs.stop_-possible() is false.

~stop_token();
4   Effects: Releases ownership of the stop state, if any.

stop_token& operator=(const stop_token& rhs) noexcept;
5   Effects: Equivalent to: stop_token(rhs).swap(*this).
6   Returns: *this.

stop_token& operator=(stop_token&& rhs) noexcept;
7   Effects: Equivalent to: stop_token(std::move(rhs)).swap(*this).
8   Returns: *this.

void swap(stop_token& rhs) noexcept;
9   Effects: Exchanges the values of *this and rhs.

```

33.3.3.3 Members

[stoptoken.mem]

```

[[nodiscard]] bool stop_requested() const noexcept;
1   Returns: true if *this has ownership of a stop state that has received a stop request; otherwise, false.

[[nodiscard]] bool stop_possible() const noexcept;
2   Returns: false if:
(2.1)   — *this does not have ownership of a stop state, or
(2.2)   — a stop request was not made and there are no associated stop_source objects;
otherwise, true.

```

33.3.3.4 Non-member functions

[stoptoken.nonmembers]

```

[[nodiscard]] bool operator==(const stop_token& lhs, const stop_token& rhs) noexcept;
1   Returns: true if lhs and rhs have ownership of the same stop state or if both lhs and rhs do not have ownership of a stop state; otherwise false.

friend void swap(stop_token& x, stop_token& y) noexcept;
2   Effects: Equivalent to: x.swap(y).

```

33.3.4 Class stop_source

[stopsource]

33.3.4.1 General

[stopsource.general]

- ¹ The class **stop_source** implements the semantics of making a stop request. A stop request made on a **stop_source** object is visible to all associated **stop_source** and **stop_token** (33.3.3) objects. Once a stop request has been made it cannot be withdrawn (a subsequent stop request has no effect).

```

namespace std {
  // no-shared-stop-state indicator
  struct nostopstate_t {
    explicit nostopstate_t() = default;
  };
  inline constexpr nostopstate_t nostopstate{};
}

```

```

class stop_source {
public:
    // 33.3.4.2, constructors, copy, and assignment
    stop_source();
    explicit stop_source(nostopstate_t) noexcept;

    stop_source(const stop_source&) noexcept;
    stop_source(stop_source&&) noexcept;
    stop_source& operator=(const stop_source&) noexcept;
    stop_source& operator=(stop_source&&) noexcept;
    ~stop_source();
    void swap(stop_source&) noexcept;

    // 33.3.4.3, stop handling
    [[nodiscard]] stop_token get_token() const noexcept;
    [[nodiscard]] bool stop_possible() const noexcept;
    [[nodiscard]] bool stop_requested() const noexcept;
    bool request_stop() noexcept;

    [[nodiscard]] friend bool
        operator==(const stop_source& lhs, const stop_source& rhs) noexcept;
    friend void swap(stop_source& lhs, stop_source& rhs) noexcept;
};

}

```

33.3.4.2 Constructors, copy, and assignment

[stopsource.cons]

`stop_source();`

1 *Effects:* Initialises `*this` to have ownership of a new stop state.

2 *Postconditions:* `stop_possible()` is true and `stop_requested()` is false.

3 *Throws:* `bad_alloc` if memory cannot be allocated for the stop state.

`explicit stop_source(nostopstate_t) noexcept;`

4 *Postconditions:* `stop_possible()` is false and `stop_requested()` is false.

NOTE 1: No resources are allocated for the state.

`stop_source(const stop_source& rhs) noexcept;`

5 *Postconditions:* `*this == rhs` is true.

NOTE 2: `*this` and `rhs` share the ownership of the same stop state, if any.

`stop_source(stop_source&& rhs) noexcept;`

6 *Postconditions:* `*this` contains the value of `rhs` prior to the start of construction and `rhs.stop_possible()` is false.

`~stop_source();`

7 *Effects:* Releases ownership of the stop state, if any.

`stop_source& operator=(const stop_source& rhs) noexcept;`

8 *Effects:* Equivalent to: `stop_source(rhs).swap(*this)`.

9 *Returns:* `*this`.

`stop_source& operator=(stop_source&& rhs) noexcept;`

10 *Effects:* Equivalent to: `stop_source(std::move(rhs)).swap(*this)`.

11 *Returns:* `*this`.

`void swap(stop_source& rhs) noexcept;`

12 *Effects:* Exchanges the values of `*this` and `rhs`.

33.3.4.3 Members

[stopsource.mem]

```
[[nodiscard]] stop_token get_token() const noexcept;
1   Returns: stop_token() if stop_possible() is false; otherwise a new associated stop_token object.
```

```
[[nodiscard]] bool stop_possible() const noexcept;
2   Returns: true if *this has ownership of a stop state; otherwise, false.
```

```
[[nodiscard]] bool stop_requested() const noexcept;
3   Returns: true if *this has ownership of a stop state that has received a stop request; otherwise, false.
```

```
bool request_stop() noexcept;
4   Effects: If *this does not have ownership of a stop state, returns false. Otherwise, atomically determines whether the owned stop state has received a stop request, and if not, makes a stop request. The determination and making of the stop request are an atomic read-modify-write operation (6.9.2.2). If the request was made, the callbacks registered by associated stop_callback objects are synchronously called. If an invocation of a callback exits via an exception then terminate is invoked (14.6.2).
```

NOTE: A stop request includes notifying all condition variables of type condition_variable_any temporarily registered during an interruptible wait (33.7.5.3).

```
5   Postconditions: stop_possible() is false or stop_requested() is true.
```

```
6   Returns: true if this call made a stop request; otherwise false.
```

33.3.4.4 Non-member functions

[stopsource.nonmembers]

```
[[nodiscard]] friend bool
operator==(const stop_source& lhs, const stop_source& rhs) noexcept;
1   Returns: true if lhs and rhs have ownership of the same stop state or if both lhs and rhs do not have ownership of a stop state; otherwise false.
```

```
friend void swap(stop_source& x, stop_source& y) noexcept;
2   Effects: Equivalent to: x.swap(y).
```

33.3.5 Class template stop_callback

[stopcallback]

33.3.5.1 General

[stopcallback.general]

```
1 namespace std {
    template<class Callback>
    class stop_callback {
        public:
            using callback_type = Callback;

            // 33.3.5.2, constructors and destructor
            template<class C>
            explicit stop_callback(const stop_token& st, C&& cb)
                noexcept(is_nothrow_constructible_v<Callback, C>);

            template<class C>
            explicit stop_callback(stop_token&& st, C&& cb)
                noexcept(is_nothrow_constructible_v<Callback, C>);
            ~stop_callback();

            stop_callback(const stop_callback&) = delete;
            stop_callback(stop_callback&&) = delete;
            stop_callback& operator=(const stop_callback&) = delete;
            stop_callback& operator=(stop_callback&&) = delete;

        private:
            Callback callback;      // exposition only
    };
}
```

```
template<class Callback>
    stop_callback(stop_token, Callback) -> stop_callback<Callback>;
}
```

- ² *Mandates*: `stop_callback` is instantiated with an argument for the template parameter `Callback` that satisfies both `invocable` and `destructible`.
- ³ *Preconditions*: `stop_callback` is instantiated with an argument for the template parameter `Callback` that models both `invocable` and `destructible`.

33.3.5.2 Constructors and destructor

[`stopcallback.cons`]

```
template<class C>
explicit stop_callback(const stop_token& st, C&& cb)
    noexcept(is_nothrow_constructible_v<Callback, C>);
template<class C>
explicit stop_callback(stop_token&& st, C&& cb)
    noexcept(is_nothrow_constructible_v<Callback, C>);
```

- ¹ *Constraints*: `Callback` and `C` satisfy `constructible_from<Callback, C>`.
- ² *Preconditions*: `Callback` and `C` model `constructible_from<Callback, C>`.
- ³ *Effects*: Initializes `callback` with `std::forward<C>(cb)`. If `st.stop_requested()` is `true`, then `std::forward<Callback>(callback)()` is evaluated in the current thread before the constructor returns. Otherwise, if `st` has ownership of a stop state, acquires shared ownership of that stop state and registers the callback with that stop state such that `std::forward<Callback>(callback)()` is evaluated by the first call to `request_stop()` on an associated `stop_source`.
- ⁴ *Throws*: Any exception thrown by the initialization of `callback`.
- ⁵ *Remarks*: If evaluating `std::forward<Callback>(callback)()` exits via an exception, then `terminate` is invoked ([14.6.2](#)).

```
~stop_callback();
```

- ⁶ *Effects*: Unregisters the callback from the owned stop state, if any. The destructor does not block waiting for the execution of another callback registered by an associated `stop_callback`. If `callback` is concurrently executing on another thread, then the return from the invocation of `callback` strongly happens before ([6.9.2.2](#)) `callback` is destroyed. If `callback` is executing on the current thread, then the destructor does not block ([3.7](#)) waiting for the return from the invocation of `callback`. Releases ownership of the stop state, if any.

33.4 Threads

[`thread.threads`]

33.4.1 General

[`thread.threads.general`]

- ¹ [33.4](#) describes components that can be used to create and manage threads.

NOTE: These threads are intended to map one-to-one with operating system threads.

33.4.2 Header <thread> synopsis

[`thread.syn`]

```
#include <compare>           // see 17.11.1

namespace std {
    // 33.4.3, class thread
    class thread;

    void swap(thread& x, thread& y) noexcept;

    // 33.4.4, class jthread
    class jthread;

    // 33.4.5, namespace this_thread
    namespace this_thread {
        thread::id get_id() noexcept;
```

```

    void yield() noexcept;
    template<class Clock, class Duration>
        void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);
    template<class Rep, class Period>
        void sleep_for(const chrono::duration<Rep, Period>& rel_time);
    }
}

```

33.4.3 Class **thread**

[**thread.thread.class**]

33.4.3.1 General

[**thread.thread.class.general**]

- ¹ The class **thread** provides a mechanism to create a new thread of execution, to join with a thread (i.e., wait for a thread to complete), and to perform other operations that manage and query the state of a thread. A **thread** object uniquely represents a particular thread of execution. That representation may be transferred to other **thread** objects in such a way that no two **thread** objects simultaneously represent the same thread of execution. A thread of execution is *detached* when no **thread** object represents that thread. Objects of class **thread** can be in a state that does not represent a thread of execution.

NOTE: A **thread** object does not represent a thread of execution after default construction, after being moved from, or after a successful call to **detach** or **join**.

```

namespace std {
    class thread {
    public:
        // 33.4.3.2, class thread::id
        class id;
        using native_handle_type = implementation-defined;           // see 33.2.3

        // construct/copy/destroy
        thread() noexcept;
        template<class F, class... Args> explicit thread(F&& f, Args&&... args);
        ~thread();
        thread(const thread&) = delete;
        thread(thread&&) noexcept;
        thread& operator=(const thread&) = delete;
        thread& operator=(thread&&) noexcept;

        // 33.4.3.6, members
        void swap(thread&) noexcept;
        bool joinable() const noexcept;
        void join();
        void detach();
        id get_id() const noexcept;
        native_handle_type native_handle();                         // see 33.2.3

        // static members
        static unsigned int hardware_concurrency() noexcept;
    };
}

```

33.4.3.2 Class **thread::id**

[**thread.thread.id**]

```

namespace std {
    class thread::id {
    public:
        id() noexcept;
    };

    bool operator==(thread::id x, thread::id y) noexcept;
    strong_ordering operator<=(thread::id x, thread::id y) noexcept;

    template<class charT, class traits>
        basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& out, thread::id id);

    template<class charT> struct formatter<thread::id, charT>;
}

```

```
// hash support
template<class T> struct hash;
template<> struct hash<thread::id>;
}
```

- 1 An object of type `thread::id` provides a unique identifier for each thread of execution and a single distinct value for all `thread` objects that do not represent a thread of execution (33.4.3). Each thread of execution has an associated `thread::id` object that is not equal to the `thread::id` object of any other thread of execution and that is not equal to the `thread::id` object of any `thread` object that does not represent threads of execution.
- 2 The *text representation* for the character type `charT` of an object of type `thread::id` is an unspecified sequence of `charT` such that, for two objects of type `thread::id` `x` and `y`, if `x == y` is `true`, the `thread::id` objects have the same text representation, and if `x != y` is `true`, the `thread::id` objects have distinct text representations.
- 3 `thread::id` is a trivially copyable class (11.2). The library may reuse the value of a `thread::id` of a terminated thread that can no longer be joined.
- 4 NOTE 1: Relational operators allow `thread::id` objects to be used as keys in associative containers.

`id() noexcept;`

5 *Postconditions*: The constructed object does not represent a thread of execution.

`bool operator==(thread::id x, thread::id y) noexcept;`

6 *Returns*: `true` only if `x` and `y` represent the same thread of execution or neither `x` nor `y` represents a thread of execution.

`strong_ordering operator<=(thread::id x, thread::id y) noexcept;`

7 Let $P(x, y)$ be an unspecified total ordering over `thread::id` as described in 27.8.

8 *Returns*: `strong_ordering::less` if $P(x, y)$ is `true`. Otherwise, `strong_ordering::greater` if $P(y, x)$ is `true`. Otherwise, `strong_ordering::equal`.

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<< (basic_ostream<charT, traits>& out, thread::id id);
```

9 *Effects*: Inserts the text representation for `charT` of `id` into `out`.

10 *Returns*: `out`.

`template<class charT> struct formatter<thread::id, charT>;`

11 `formatter<thread::id, charT>` interprets *format-spec* as a *thread-id-format-spec*. The syntax of format specifications is as follows:

thread-id-format-spec:
 fill-and-align_{opt} *width_{opt}*

NOTE 2: The productions *fill-and-align* and *width* are described in 22.14.2.2.

12 If the *align* option is omitted it defaults to `>`.

13 A `thread::id` object is formatted by writing its text representation for `charT` to the output with additional padding and adjustments as specified by the format specifiers.

`template<> struct hash<thread::id>;`

14 The specialization is enabled (22.10.19).

33.4.3.3 Constructors

[`thread.thread.constr`]

`thread() noexcept;`

1 *Effects*: The object does not represent a thread of execution.

2 *Postconditions*: `get_id() == id()`.

`template<class F, class... Args> explicit thread(F&& f, Args&&... args);`

3 *Constraints*: `remove_cvref_t<F>` is not the same type as `thread`.

4 *Mandates:* The following are all `true`:

- (4.1) — `is_constructible_v<decay_t<F>, F>`,
- (4.2) — `(is_constructible_v<decay_t<Args>, Args> && ...)`, and
- (4.3) — `is_invocable_v<decay_t<F>, decay_t<Args>...>`.

5 *Effects:* The new thread of execution executes

```
invoke(auto(std::forward<F>(f)), // for invoke, see 22.10.5
       auto(std::forward<Args>(args))...)
```

with the values produced by `auto` being materialized (7.3.5) in the constructing thread. Any return value from this invocation is ignored.

NOTE: This implies that any exceptions not thrown from the invocation of the copy of `f` will be thrown in the constructing thread, not the new thread.

If the invocation of `invoke` terminates with an uncaught exception, `terminate` is invoked (14.6.2).

6 *Synchronization:* The completion of the invocation of the constructor synchronizes with the beginning of the invocation of the copy of `f`.

7 *Postconditions:* `get_id() != id()`. `*this` represents the newly started thread.

8 *Throws:* `system_error` if unable to start the new thread.

9 *Error conditions:*

- (9.1) — `resource_unavailable_try_again` — the system lacked the necessary resources to create another thread, or the system-imposed limit on the number of threads in a process would be exceeded.

```
thread(thread&& x) noexcept;
```

10 *Postconditions:* `x.get_id() == id()` and `get_id()` returns the value of `x.get_id()` prior to the start of construction.

33.4.3.4 Destructor

[`thread.thread.destr`]

```
~thread();
```

1 *Effects:* If `joinable()`, invokes `terminate` (14.6.2). Otherwise, has no effects.

NOTE: Either implicitly detaching or joining a `joinable()` thread in its destructor can result in difficult to debug correctness (for detach) or performance (for join) bugs encountered only when an exception is thrown. These bugs can be avoided by ensuring that the destructor is never executed while the thread is still joinable.

33.4.3.5 Assignment

[`thread.thread.assign`]

```
thread& operator=(thread&& x) noexcept;
```

1 *Effects:* If `joinable()`, invokes `terminate` (14.6.2). Otherwise, assigns the state of `x` to `*this` and sets `x` to a default constructed state.

2 *Postconditions:* `x.get_id() == id()` and `get_id()` returns the value of `x.get_id()` prior to the assignment.

3 *Returns:* `*this`.

33.4.3.6 Members

[`thread.thread.member`]

```
void swap(thread& x) noexcept;
```

1 *Effects:* Swaps the state of `*this` and `x`.

```
bool joinable() const noexcept;
```

2 *Returns:* `get_id() != id()`.

```
void join();
```

3 *Effects:* Blocks until the thread represented by `*this` has completed.

4 *Synchronization:* The completion of the thread represented by `*this` synchronizes with (6.9.2) the corresponding successful `join()` return.

NOTE: Operations on `*this` are not synchronized.

5 *Postconditions:* The thread represented by `*this` has completed. `get_id() == id()`.
 6 *Throws:* `system_error` when an exception is required (33.2.2).
 7 *Error conditions:*
 (7.1) — `resource_deadlock_would_occur` — if deadlock is detected or `get_id() == this_thread::get_id()`.
 (7.2) — `no_such_process` — if the thread is not valid.
 (7.3) — `invalid_argument` — if the thread is not joinable.

```
void detach();
```

8 *Effects:* The thread represented by `*this` continues execution without the calling thread blocking. When `detach()` returns, `*this` no longer represents the possibly continuing thread of execution. When the thread previously represented by `*this` ends execution, the implementation releases any owned resources.

9 *Postconditions:* `get_id() == id()`.
 10 *Throws:* `system_error` when an exception is required (33.2.2).
 11 *Error conditions:*
 (11.1) — `no_such_process` — if the thread is not valid.
 (11.2) — `invalid_argument` — if the thread is not joinable.

```
id get_id() const noexcept;
```

12 *Returns:* A default constructed `id` object if `*this` does not represent a thread, otherwise `this_thread::get_id()` for the thread of execution represented by `*this`.

33.4.3.7 Static members

[thread.thread.static]

```
unsigned hardware_concurrency() noexcept;
```

1 *Returns:* The number of hardware thread contexts.

NOTE: This value should only be considered to be a hint.

If this value is not computable or well-defined, an implementation should return 0.

33.4.3.8 Specialized algorithms

[thread.thread.algorithm]

```
void swap(thread& x, thread& y) noexcept;
```

1 *Effects:* As if by `x.swap(y)`.

33.4.4 Class jthread

[thread.jthread.class]

33.4.4.1 General

[thread.jthread.class.general]

- 1 The class `jthread` provides a mechanism to create a new thread of execution. The functionality is the same as for class `thread` (33.4.3) with the additional abilities to provide a `stop_token` (33.3) to the new thread of execution, make stop requests, and automatically join.

```
namespace std {
  class jthread {
  public:
    // types
    using id = thread::id;
    using native_handle_type = thread::native_handle_type;

    // 33.4.4.2, constructors, move, and assignment
    jthread() noexcept;
    template<class F, class... Args> explicit jthread(F&& f, Args&&... args);
    ~jthread();
    jthread(const jthread&) = delete;
    jthread(jthread&&) noexcept;
    jthread& operator=(const jthread&) = delete;
    jthread& operator=(jthread&&) noexcept;
```

```

// 33.4.4.3, members
void swap(jthread&) noexcept;
[[nodiscard]] bool joinable() const noexcept;
void join();
void detach();
[[nodiscard]] id get_id() const noexcept;
[[nodiscard]] native_handle_type native_handle(); // see 33.2.3

// 33.4.4.4, stop token handling
[[nodiscard]] stop_source get_stop_source() noexcept;
[[nodiscard]] stop_token get_stop_token() const noexcept;
bool request_stop() noexcept;

// 33.4.4.5, specialized algorithms
friend void swap(jthread& lhs, jthread& rhs) noexcept;

// 33.4.4.6, static members
[[nodiscard]] static unsigned int hardware_concurrency() noexcept;

private:
    stop_source ssource; // exposition only
};

}

```

33.4.4.2 Constructors, move, and assignment

[thread.jthread.cons]

jthread() noexcept;

1 *Effects*: Constructs a `jthread` object that does not represent a thread of execution.

2 *Postconditions*: `get_id() == id()` is `true` and `ssource.stop_possible()` is `false`.

template<class F, class... Args> explicit jthread(F&& f, Args&&... args);

3 *Constraints*: `remove_cvref_t<F>` is not the same type as `jthread`.

4 *Mandates*: The following are all `true`:

- (4.1) — `is_constructible_v<decay_t<F>, F>`,
- (4.2) — `(is_constructible_v<decay_t<Args>, Args> && ...)`, and
- (4.3) — `is_invocable_v<decay_t<F>, decay_t<Args>...> ||`
`is_invocable_v<decay_t<F>, stop_token, decay_t<Args>...>`.

5 *Effects*: Initializes `ssource`. The new thread of execution executes

```
invoke(auto(std::forward<F>(f)), get_stop_token(), // for invoke, see 22.10.5
      auto(std::forward<Args>(args))...)
```

if that expression is well-formed, otherwise

```
invoke(auto(std::forward<F>(f)), auto(std::forward<Args>(args))...)
```

with the values produced by `auto` being materialized (7.3.5) in the constructing thread. Any return value from this invocation is ignored.

NOTE 1: This implies that any exceptions not thrown from the invocation of the copy of `f` will be thrown in the constructing thread, not the new thread.

If the `invoke` expression exits via an exception, `terminate` is called.

6 *Synchronization*: The completion of the invocation of the constructor synchronizes with the beginning of the invocation of the copy of `f`.

7 *Postconditions*: `get_id() != id()` is `true` and `ssource.stop_possible()` is `true` and `*this` represents the newly started thread.

NOTE 2: The calling thread can make a stop request only once, because it cannot replace this stop token.

8 *Throws*: `system_error` if unable to start the new thread.

9 *Error conditions*:

(9.1) — `resource_unavailable_try_again` — the system lacked the necessary resources to create another thread, or the system-imposed limit on the number of threads in a process would be exceeded.

```
jthread(jthread&& x) noexcept;
```

10 *Postconditions*: `x.get_id() == id()` and `get_id()` returns the value of `x.get_id()` prior to the start of construction. `ssource` has the value of `x.ssource` prior to the start of construction and `x.ssource.stop_possible()` is `false`.

```
~jthread();
```

11 *Effects*: If `joinable()` is `true`, calls `request_stop()` and then `join()`.
 NOTE 3: Operations on `*this` are not synchronized.

```
jthread& operator=(jthread&& x) noexcept;
```

12 *Effects*: If `&x == this` is `true`, there are no effects. Otherwise, if `joinable()` is `true`, calls `request_stop()` and then `join()`, then assigns the state of `x` to `*this` and sets `x` to a default constructed state.

13 *Postconditions*: `get_id()` returns the value of `x.get_id()` prior to the assignment. `ssource` has the value of `x.ssource` prior to the assignment.

14 *Returns*: `*this`.

33.4.4.3 Members

[`thread.jthread.mem`]

```
void swap(jthread& x) noexcept;
```

1 *Effects*: Exchanges the values of `*this` and `x`.

```
[[nodiscard]] bool joinable() const noexcept;
```

2 *Returns*: `get_id() != id()`.

```
void join();
```

3 *Effects*: Blocks until the thread represented by `*this` has completed.

4 *Synchronization*: The completion of the thread represented by `*this` synchronizes with (6.9.2) the corresponding successful `join()` return.
 NOTE: Operations on `*this` are not synchronized.

5 *Postconditions*: The thread represented by `*this` has completed. `get_id() == id()`.

6 *Throws*: `system_error` when an exception is required (33.2.2).

7 *Error conditions*:

- (7.1) — `resource_deadlock_would_occur` — if deadlock is detected or `get_id() == this_thread::get_id()`.
- (7.2) — `no_such_process` — if the thread is not valid.
- (7.3) — `invalid_argument` — if the thread is not joinable.

```
void detach();
```

8 *Effects*: The thread represented by `*this` continues execution without the calling thread blocking. When `detach()` returns, `*this` no longer represents the possibly continuing thread of execution. When the thread previously represented by `*this` ends execution, the implementation releases any owned resources.

9 *Postconditions*: `get_id() == id()`.

10 *Throws*: `system_error` when an exception is required (33.2.2).

11 *Error conditions*:

- (11.1) — `no_such_process` — if the thread is not valid.
- (11.2) — `invalid_argument` — if the thread is not joinable.

```
id get_id() const noexcept;
```

12 *Returns:* A default constructed `id` object if `*this` does not represent a thread, otherwise `this_-thread::get_id()` for the thread of execution represented by `*this`.

33.4.4.4 Stop token handling

[`thread.jthread.stop`]

```
[[nodiscard]] stop_source get_stop_source() noexcept;
```

1 *Effects:* Equivalent to: `return ssource;`

```
[[nodiscard]] stop_token get_stop_token() const noexcept;
```

2 *Effects:* Equivalent to: `return ssource.get_token();`

```
bool request_stop() noexcept;
```

3 *Effects:* Equivalent to: `return ssource.request_stop();`

33.4.4.5 Specialized algorithms

[`thread.jthread.special`]

```
friend void swap(jthread& x, jthread& y) noexcept;
```

1 *Effects:* Equivalent to: `x.swap(y).`

33.4.4.6 Static members

[`thread.jthread.static`]

```
[[nodiscard]] static unsigned int hardware_concurrency() noexcept;
```

1 *Returns:* `thread::hardware_concurrency()`.

33.4.5 Namespace `this_thread`

[`thread.thread.this`]

```
namespace std::this_thread {
    thread::id get_id() noexcept;

    void yield() noexcept;
    template<class Clock, class Duration>
        void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);
    template<class Rep, class Period>
        void sleep_for(const chrono::duration<Rep, Period>& rel_time);
}
```

```
thread::id this_thread::get_id() noexcept;
```

1 *Returns:* An object of type `thread::id` that uniquely identifies the current thread of execution. Every invocation from this thread of execution returns the same value. The object returned does not compare equal to a default-constructed `thread::id`.

```
void this_thread::yield() noexcept;
```

2 *Effects:* Offers the implementation the opportunity to reschedule.

3 *Synchronization:* None.

```
template<class Clock, class Duration>
    void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);
```

4 *Effects:* Blocks the calling thread for the absolute timeout (33.2.4) specified by `abs_time`.

5 *Synchronization:* None.

6 *Throws:* Timeout-related exceptions (33.2.4).

```
template<class Rep, class Period>
    void sleep_for(const chrono::duration<Rep, Period>& rel_time);
```

7 *Effects:* Blocks the calling thread for the relative timeout (33.2.4) specified by `rel_time`.

8 *Synchronization:* None.

9 *Throws:* Timeout-related exceptions (33.2.4).

33.5 Atomic operations

[atomics]

33.5.1 General

[atomics.general]

- ¹ Subclause 33.5 describes components for fine-grained atomic access. This access is provided via operations on atomic objects.

33.5.2 Header <atomic> synopsis

[atomics.syn]

```

namespace std {
    // 33.5.4, order and consistency
    enum class memory_order : unspecified;
    inline constexpr memory_order memory_order_relaxed = memory_order::relaxed;           // freestanding
    inline constexpr memory_order memory_order_consume = memory_order::consume;           // freestanding
    inline constexpr memory_order memory_order_acquire = memory_order::acquire;           // freestanding
    inline constexpr memory_order memory_order_release = memory_order::release;           // freestanding
    inline constexpr memory_order memory_order_acq_rel = memory_order::acq_rel;           // freestanding
    inline constexpr memory_order memory_order_seq_cst = memory_order::seq_cst;           // freestanding

    template<class T>
        T kill_dependency(T y) noexcept;                                                 // freestanding
}

// 33.5.5, lock-free property

```

33.5.3 Type aliases

[**atomics.alias**]

- 1 The type aliases `atomic_intN_t`, `atomic_uintN_t`, `atomic_intptr_t`, and `atomic_uintptr_t` are defined if and only if `intN_t`, `uintN_t`, `intptr_t`, and `uintptr_t` are defined, respectively.
- 2 The type aliases `atomic_signed_lock_free` and `atomic_unsigned_lock_free` name specializations of `atomic` whose template arguments are integral types, respectively signed and unsigned, and whose `is_always_lock_free` property is `true`.

NOTE: These aliases are optional in freestanding implementations (16.4.2.5).

Implementations should choose for these aliases the integral specializations of `atomic` for which the atomic waiting and notifying operations (33.5.6) are most efficient.

33.5.4 Order and consistency

[**atomics.order**]

```

namespace std {
    enum class memory_order : unspecified {
        relaxed, consume, acquire, release, acq_rel, seq_cst
    };
}

```

- 1 The enumeration `memory_order` specifies the detailed regular (non-atomic) memory synchronization order as defined in 6.9.2 and may provide for operation ordering. Its enumerated values and their meanings are as follows:
 - (1.1) — `memory_order::relaxed`: no operation orders memory.
 - (1.2) — `memory_order::release`, `memory_order::acq_rel`, and `memory_order::seq_cst`: a store operation performs a release operation on the affected memory location.
 - (1.3) — `memory_order::consume`: a load operation performs a consume operation on the affected memory location.

NOTE 1: Prefer `memory_order::acquire`, which provides stronger guarantees than `memory_order::consume`. Implementations have found it infeasible to provide performance better than that of `memory_order::acquire`. Specification revisions are under consideration.

- (1.4) — `memory_order::acquire`, `memory_order::acq_rel`, and `memory_order::seq_cst`: a load operation performs an acquire operation on the affected memory location.

NOTE 2: Atomic operations specifying `memory_order::relaxed` are relaxed with respect to memory ordering. Implementations must still guarantee that any given atomic access to a particular atomic object be indivisible with respect to all other atomic accesses to that object.

- 2 An atomic operation *A* that performs a release operation on an atomic object *M* synchronizes with an atomic operation *B* that performs an acquire operation on *M* and takes its value from any side effect in the release sequence headed by *A*.
- 3 An atomic operation *A* on some atomic object *M* is *coherence-ordered before* another atomic operation *B* on *M* if
 - (3.1) — *A* is a modification, and *B* reads the value stored by *A*, or
 - (3.2) — *A* precedes *B* in the modification order of *M*, or
 - (3.3) — *A* and *B* are not the same atomic read-modify-write operation, and there exists an atomic modification *X* of *M* such that *A* reads the value stored by *X* and *X* precedes *B* in the modification order of *M*, or
 - (3.4) — there exists an atomic modification *X* of *M* such that *A* is coherence-ordered before *X* and *X* is coherence-ordered before *B*.
- 4 There is a single total order *S* on all `memory_order::seq_cst` operations, including fences, that satisfies the following constraints. First, if *A* and *B* are `memory_order::seq_cst` operations and *A* strongly happens before *B*, then *A* precedes *B* in *S*. Second, for every pair of atomic operations *A* and *B* on an object *M*, where *A* is coherence-ordered before *B*, the following four conditions are required to be satisfied by *S*:
 - (4.1) — if *A* and *B* are both `memory_order::seq_cst` operations, then *A* precedes *B* in *S*; and
 - (4.2) — if *A* is a `memory_order::seq_cst` operation and *B* happens before a `memory_order::seq_cst` fence *Y*, then *A* precedes *Y* in *S*; and
 - (4.3) — if a `memory_order::seq_cst` fence *X* happens before *A* and *B* is a `memory_order::seq_cst` operation, then *X* precedes *B* in *S*; and
 - (4.4) — if a `memory_order::seq_cst` fence *X* happens before *A* and *B* happens before a `memory_order::seq_cst` fence *Y*, then *X* precedes *Y* in *S*.
- 5 NOTE 3: This definition ensures that *S* is consistent with the modification order of any atomic object *M*. It also ensures that a `memory_order::seq_cst` load *A* of *M* gets its value either from the last modification of *M* that precedes *A* in *S* or from some non-`memory_order::seq_cst` modification of *M* that does not happen before any modification of *M* that precedes *A* in *S*.
- 6 NOTE 4: We do not require that *S* be consistent with “happens before” (6.9.2.2). This allows more efficient implementation of `memory_order::acquire` and `memory_order::release` on some machine architectures. It can produce surprising results when these are mixed with `memory_order::seq_cst` accesses.
- 7 NOTE 5: `memory_order::seq_cst` ensures sequential consistency only for a program that is free of data races and uses exclusively `memory_order::seq_cst` atomic operations. Any use of weaker ordering will invalidate this guarantee unless extreme care is used. In many cases, `memory_order::seq_cst` atomic operations are reorderable with respect to other atomic operations performed by the same thread.
- 8 Implementations should ensure that no “out-of-thin-air” values are computed that circularly depend on their own computation.

NOTE 6: For example, with *x* and *y* initially zero,

```
// Thread 1:  
r1 = y.load(memory_order::relaxed);  
x.store(r1, memory_order::relaxed);  
  
// Thread 2:  
r2 = x.load(memory_order::relaxed);  
y.store(r2, memory_order::relaxed);
```

this recommendation discourages producing `r1 == r2 == 42`, since the store of 42 to *y* is only possible if the store to *x* stores 42, which circularly depends on the store to *y* storing 42. Note that without this restriction, such an execution is possible.

- ⁹ NOTE 7: The recommendation similarly disallows `r1 == r2 == 42` in the following example, with `x` and `y` again initially zero:

```
// Thread 1:  
r1 = x.load(memory_order::relaxed);  
if (r1 == 42) y.store(42, memory_order::relaxed);  
  
// Thread 2:  
r2 = y.load(memory_order::relaxed);  
if (r2 == 42) x.store(42, memory_order::relaxed);
```

- ¹⁰ Atomic read-modify-write operations shall always read the last value (in the modification order) written before the write associated with the read-modify-write operation.

- ¹¹ Implementations should make atomic stores visible to atomic loads within a reasonable amount of time.

```
template<class T>  
T kill_dependency(T y) noexcept;
```

- ¹² *Effects*: The argument does not carry a dependency to the return value (6.9.2).

- ¹³ *Returns*: `y`.

33.5.5 Lock-free property

[atomics.lockfree]

```
#define ATOMIC_BOOL_LOCK_FREE unspecified  
#define ATOMIC_CHAR_LOCK_FREE unspecified  
#define ATOMIC_CHAR8_T_LOCK_FREE unspecified  
#define ATOMIC_CHAR16_T_LOCK_FREE unspecified  
#define ATOMIC_CHAR32_T_LOCK_FREE unspecified  
#define ATOMIC_WCHAR_T_LOCK_FREE unspecified  
#define ATOMIC_SHORT_LOCK_FREE unspecified  
#define ATOMIC_INT_LOCK_FREE unspecified  
#define ATOMIC_LONG_LOCK_FREE unspecified  
#define ATOMIC_LLONG_LOCK_FREE unspecified  
#define ATOMIC_POINTER_LOCK_FREE unspecified
```

- ¹ The `ATOMIC_..._LOCK_FREE` macros indicate the lock-free property of the corresponding atomic types, with the signed and unsigned variants grouped together. The properties also apply to the corresponding (partial) specializations of the `atomic` template. A value of 0 indicates that the types are never lock-free. A value of 1 indicates that the types are sometimes lock-free. A value of 2 indicates that the types are always lock-free.
- ² On a hosted implementation (16.4.2.5), at least one signed integral specialization of the `atomic` template, along with the specialization for the corresponding unsigned type (6.8.2), is always lock-free.
- ³ The functions `atomic<T>::is_lock_free` and `atomic_is_lock_free` (33.5.8.2) indicate whether the object is lock-free. In any given program execution, the result of the lock-free query is the same for all atomic objects of the same type.
- ⁴ Atomic operations that are not lock-free are considered to potentially block (6.9.2.3).
- ⁵ *Recommended practice*: Operations that are lock-free should also be address-free.³⁰⁶ The implementation of these operations should not depend on any per-process state.

NOTE: This restriction enables communication by memory that is mapped into a process more than once and by memory that is shared between two processes.

33.5.6 Waiting and notifying

[atomics.wait]

- ¹ *Atomic waiting operations* and *atomic notifying operations* provide a mechanism to wait for the value of an atomic object to change more efficiently than can be achieved with polling. An atomic waiting operation may block until it is unblocked by an atomic notifying operation, according to each function's effects.

NOTE 1: Programs are not guaranteed to observe transient atomic values, an issue known as the A-B-A problem, resulting in continued blocking if a condition is only temporarily met.

- ² NOTE 2: The following functions are atomic waiting operations:

- (2.1) — `atomic<T>::wait`,
- (2.2) — `atomic_flag::wait`,

³⁰⁶ That is, atomic operations on the same memory location via two different addresses will communicate atomically.

- (2.3) — `atomic_wait` and `atomic_wait_explicit`,
- (2.4) — `atomic_flag_wait` and `atomic_flag_wait_explicit`, and
- (2.5) — `atomic_ref<T>::wait`.

³ NOTE 3: The following functions are atomic notifying operations:

- (3.1) — `atomic<T>::notify_one` and `atomic<T>::notify_all`,
- (3.2) — `atomic_flag::notify_one` and `atomic_flag::notify_all`,
- (3.3) — `atomic_notify_one` and `atomic_notify_all`,
- (3.4) — `atomic_flag_notify_one` and `atomic_flag_notify_all`, and
- (3.5) — `atomic_ref<T>::notify_one` and `atomic_ref<T>::notify_all`.

⁴ A call to an atomic waiting operation on an atomic object M is *eligible to be unblocked* by a call to an atomic notifying operation on M if there exist side effects X and Y on M such that:

- (4.1) — the atomic waiting operation has blocked after observing the result of X,
- (4.2) — X precedes Y in the modification order of M, and
- (4.3) — Y happens before the call to the atomic notifying operation.

33.5.7 Class template `atomic_ref`

[`atomics.ref.generic`]

33.5.7.1 General

[`atomics.ref.generic.general`]

```
namespace std {
    template<class T> struct atomic_ref {
        private:
            T* ptr;                                // exposition only

        public:
            using value_type = T;
            static constexpr size_t required_alignment = implementation-defined;

            static constexpr bool is_always_lock_free = implementation-defined;
            bool is_lock_free() const noexcept;

            explicit atomic_ref(T&);
            atomic_ref(const atomic_ref&) noexcept;
            atomic_ref& operator=(const atomic_ref&) = delete;

            void store(T, memory_order = memory_order::seq_cst) const noexcept;
            T operator=(T) const noexcept;
            T load(memory_order = memory_order::seq_cst) const noexcept;
            operator T() const noexcept;

            T exchange(T, memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_weak(T&, T,
                                       memory_order, memory_order) const noexcept;
            bool compare_exchange_strong(T&, T,
                                         memory_order, memory_order) const noexcept;
            bool compare_exchange_weak(T&, T,
                                       memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_strong(T&, T,
                                         memory_order = memory_order::seq_cst) const noexcept;

            void wait(T, memory_order = memory_order::seq_cst) const noexcept;
            void notify_one() const noexcept;
            void notify_all() const noexcept;
    };
}
```

¹ An `atomic_ref` object applies atomic operations (33.5.1) to the object referenced by `*ptr` such that, for the lifetime (6.7.3) of the `atomic_ref` object, the object referenced by `*ptr` is an atomic object (6.9.2.2).

² The program is ill-formed if `is_trivially_copyable_v<T>` is false.

- ³ The lifetime (6.7.3) of an object referenced by `*ptr` shall exceed the lifetime of all `atomic_refs` that reference the object. While any `atomic_ref` instances exist that reference the `*ptr` object, all accesses to that object shall exclusively occur through those `atomic_ref` instances. No subobject of the object referenced by `atomic_ref` shall be concurrently referenced by any other `atomic_ref` object.
- ⁴ Atomic operations applied to an object through a referencing `atomic_ref` are atomic with respect to atomic operations applied through any other `atomic_ref` referencing the same object.

NOTE: Atomic operations or the `atomic_ref` constructor can acquire a shared resource, such as a lock associated with the referenced object, to enable atomic operations to be applied to the referenced object.

33.5.7.2 Operations

[`atomics.ref.ops`]

```
static constexpr size_t required_alignment;
```

- ¹ The alignment required for an object to be referenced by an atomic reference, which is at least `alignof(T)`.
- ² NOTE 1: Hardware could require an object referenced by an `atomic_ref` to have stricter alignment (6.7.6) than other objects of type `T`. Further, whether operations on an `atomic_ref` are lock-free could depend on the alignment of the referenced object. For example, lock-free operations on `std::complex<double>` could be supported only if aligned to `2*alignof(double)`.

```
static constexpr bool is_always_lock_free;
```

- ³ The static data member `is_always_lock_free` is `true` if the `atomic_ref` type's operations are always lock-free, and `false` otherwise.

```
bool is_lock_free() const noexcept;
```

- ⁴ *Returns:* `true` if operations on all objects of the type `atomic_ref<T>` are lock-free, `false` otherwise.

```
atomic_ref(T& obj);
```

- ⁵ *Preconditions:* The referenced object is aligned to `required_alignment`.

- ⁶ *Postconditions:* `*this` references `obj`.

- ⁷ *Throws:* Nothing.

```
atomic_ref(const atomic_ref& ref) noexcept;
```

- ⁸ *Postconditions:* `*this` references the object referenced by `ref`.

```
void store(T desired, memory_order order = memory_order::seq_cst) const noexcept;
```

- ⁹ *Preconditions:* The `order` argument is neither `memory_order::consume`, `memory_order::acquire`, nor `memory_order::acq_rel`.

- ¹⁰ *Effects:* Atomically replaces the value referenced by `*ptr` with the value of `desired`. Memory is affected according to the value of `order`.

```
T operator=(T desired) const noexcept;
```

- ¹¹ *Effects:* Equivalent to:

```
    store(desired);
    return desired;
```

```
T load(memory_order order = memory_order::seq_cst) const noexcept;
```

- ¹² *Preconditions:* The `order` argument is neither `memory_order::release` nor `memory_order::acq_rel`.

- ¹³ *Effects:* Memory is affected according to the value of `order`.

- ¹⁴ *Returns:* Atomically returns the value referenced by `*ptr`.

```
operator T() const noexcept;
```

- ¹⁵ *Effects:* Equivalent to: `return load();`

```
T exchange(T desired, memory_order order = memory_order::seq_cst) const noexcept;
```

- ¹⁶ *Effects:* Atomically replaces the value referenced by `*ptr` with `desired`. Memory is affected according to the value of `order`. This operation is an atomic read-modify-write operation (6.9.2).

17 *Returns:* Atomically returns the value referenced by `*ptr` immediately before the effects.

```
bool compare_exchange_weak(T& expected, T desired,
                           memory_order success, memory_order failure) const noexcept;

bool compare_exchange_strong(T& expected, T desired,
                             memory_order success, memory_order failure) const noexcept;

bool compare_exchange_weak(T& expected, T desired,
                           memory_order order = memory_order::seq_cst) const noexcept;

bool compare_exchange_strong(T& expected, T desired,
                            memory_order order = memory_order::seq_cst) const noexcept;
```

18 *Preconditions:* The `failure` argument is neither `memory_order::release` nor `memory_order::acq_rel`.

19 *Effects:* Retrieves the value in `expected`. It then atomically compares the value representation of the value referenced by `*ptr` for equality with that previously retrieved from `expected`, and if `true`, replaces the value referenced by `*ptr` with that in `desired`. If and only if the comparison is `true`, memory is affected according to the value of `success`, and if the comparison is `false`, memory is affected according to the value of `failure`. When only one `memory_order` argument is supplied, the value of `success` is `order`, and the value of `failure` is `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`. If and only if the comparison is `false` then, after the atomic operation, the value in `expected` is replaced by the value read from the value referenced by `*ptr` during the atomic comparison. If the operation returns `true`, these operations are atomic read-modify-write operations (6.9.2.2) on the value referenced by `*ptr`. Otherwise, these operations are atomic load operations on that memory.

20 *Returns:* The result of the comparison.

21 *Remarks:* A weak compare-and-exchange operation may fail spuriously. That is, even when the contents of memory referred to by `expected` and `ptr` are equal, it may return `false` and store back to `expected` the same memory contents that were originally there.

NOTE 2: This spurious failure enables implementation of compare-and-exchange on a broader class of machines, e.g., load-locked store-conditional machines. A consequence of spurious failure is that nearly all uses of weak compare-and-exchange will be in a loop. When a compare-and-exchange is in a loop, the weak version will yield better performance on some platforms. When a weak compare-and-exchange would require a loop and a strong one would not, the strong one is preferable.

```
void wait(T old, memory_order order = memory_order::seq_cst) const noexcept;
```

22 *Preconditions:* `order` is neither `memory_order::release` nor `memory_order::acq_rel`.

23 *Effects:* Repeatedly performs the following steps, in order:

- (23.1) — Evaluates `load(order)` and compares its value representation for equality against that of `old`.
- (23.2) — If they compare unequal, returns.
- (23.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

24 *Remarks:* This function is an atomic waiting operation (33.5.6) on atomic object `*ptr`.

```
void notify_one() const noexcept;
```

25 *Effects:* Unblocks the execution of at least one atomic waiting operation on `*ptr` that is eligible to be unblocked (33.5.6) by this call, if any such atomic waiting operations exist.

26 *Remarks:* This function is an atomic notifying operation (33.5.6) on atomic object `*ptr`.

```
void notify_all() const noexcept;
```

27 *Effects:* Unblocks the execution of all atomic waiting operations on `*ptr` that are eligible to be unblocked (33.5.6) by this call.

28 *Remarks:* This function is an atomic notifying operation (33.5.6) on atomic object `*ptr`.

33.5.7.3 Specializations for integral types

[atomics.ref.int]

- ¹ There are specializations of the `atomic_ref` class template for the integral types `char`, `signed char`, `unsigned char`, `short`, `unsigned short`, `int`, `unsigned int`, `long`, `unsigned long`, `long long`, `unsigned long long`, `char8_t`, `char16_t`, `char32_t`, `wchar_t`, and any other types needed by the `typedefs` in the header `<cstdint>` (17.4.1). For each such type *integral-type*, the specialization `atomic_ref<integral-type>` provides additional atomic operations appropriate to integral types.

NOTE 1: The specialization `atomic_ref<bool>` uses the primary template (33.5.7).

```
namespace std {
    template<> struct atomic_ref<integral-type> {
        private:
            integral-type* ptr;           // exposition only

        public:
            using value_type = integral-type;
            using difference_type = value_type;
            static constexpr size_t required_alignment = implementation-defined;

            static constexpr bool is_always_lock_free = implementation-defined;
            bool is_lock_free() const noexcept;

            explicit atomic_ref(integral-type&);
            atomic_ref(const atomic_ref&) noexcept;
            atomic_ref& operator=(const atomic_ref&) = delete;

            void store(integral-type, memory_order = memory_order::seq_cst) const noexcept;
            integral-type operator=(integral-type) const noexcept;
            integral-type load(memory_order = memory_order::seq_cst) const noexcept;
            operator integral-type() const noexcept;

            integral-type exchange(integral-type,
                                  memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_weak(integral-type&, integral-type,
                                       memory_order, memory_order) const noexcept;
            bool compare_exchange_strong(integral-type&, integral-type,
                                         memory_order, memory_order) const noexcept;
            bool compare_exchange_weak(integral-type&, integral-type,
                                       memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_strong(integral-type&, integral-type,
                                         memory_order = memory_order::seq_cst) const noexcept;

            integral-type fetch_add(integral-type,
                                   memory_order = memory_order::seq_cst) const noexcept;
            integral-type fetch_sub(integral-type,
                                   memory_order = memory_order::seq_cst) const noexcept;
            integral-type fetch_and(integral-type,
                                   memory_order = memory_order::seq_cst) const noexcept;
            integral-type fetch_or(integral-type,
                                   memory_order = memory_order::seq_cst) const noexcept;
            integral-type fetch_xor(integral-type,
                                   memory_order = memory_order::seq_cst) const noexcept;

            integral-type operator++(int) const noexcept;
            integral-type operator--(int) const noexcept;
            integral-type operator++() const noexcept;
            integral-type operator--() const noexcept;
            integral-type operator+=(integral-type) const noexcept;
            integral-type operator-=(integral-type) const noexcept;
            integral-type operator&=(integral-type) const noexcept;
            integral-type operator|=(integral-type) const noexcept;
            integral-type operator^=(integral-type) const noexcept;

            void wait(integral-type, memory_order = memory_order::seq_cst) const noexcept;
    };
}
```

```

    void notify_one() const noexcept;
    void notify_all() const noexcept;
};

}

```

- 2 Descriptions are provided below only for members that differ from the primary template.
- 3 The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in [Table 145](#).

```
integral-type fetch_key(integral-type operand,
    memory_order order = memory_order::seq_cst) const noexcept;
```

- 4 *Effects*: Atomically replaces the value referenced by **ptr* with the result of the computation applied to the value referenced by **ptr* and the given operand. Memory is affected according to the value of *order*. These operations are atomic read-modify-write operations ([6.9.2.2](#)).

- 5 *Returns*: Atomically, the value referenced by **ptr* immediately before the effects.

- 6 *Remarks*: For signed integer types, the result is as if the object value and parameters were converted to their corresponding unsigned types, the computation performed on those types, and the result converted back to the signed type.

NOTE 2: There are no undefined results arising from the computation.

```
integral-type operator op=(integral-type operand) const noexcept;
```

- 7 *Effects*: Equivalent to: `return fetch_key(operand) op operand;`

33.5.7.4 Specializations for floating-point types

[[atomics.ref.float](#)]

- 1 There are specializations of the `atomic_ref` class template for all cv-unqualified floating-point types. For each such type *floating-point-type*, the specialization `atomic_ref<floating-point>` provides additional atomic operations appropriate to floating-point types.

```

namespace std {
    template<> struct atomic_ref<floating-point-type> {
        private:
            floating-point-type* ptr; // exposition only

        public:
            using value_type = floating-point-type;
            using difference_type = value_type;
            static constexpr size_t required_alignment = implementation-defined;

            static constexpr bool is_always_lock_free = implementation-defined;
            bool is_lock_free() const noexcept;

            explicit atomic_ref(floating-point-type&);
            atomic_ref(const atomic_ref&) noexcept;
            atomic_ref& operator=(const atomic_ref&) = delete;

            void store(floating-point-type, memory_order = memory_order::seq_cst) const noexcept;
            floating-point-type operator=(floating-point-type) const noexcept;
            floating-point-type load(memory_order = memory_order::seq_cst) const noexcept;
            operator floating-point-type() const noexcept;

            floating-point-type exchange(floating-point-type,
                memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_weak(floating-point-type&, floating-point-type,
                memory_order, memory_order) const noexcept;
            bool compare_exchange_strong(floating-point-type&, floating-point-type,
                memory_order, memory_order) const noexcept;
            bool compare_exchange_weak(floating-point-type&, floating-point-type,
                memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_strong(floating-point-type&, floating-point-type,
                memory_order = memory_order::seq_cst) const noexcept;
    };
}
```

```

floating-point-type fetch_add(floating-point-type,
                               memory_order = memory_order::seq_cst) const noexcept;
floating-point-type fetch_sub(floating-point-type,
                               memory_order = memory_order::seq_cst) const noexcept;

floating-point-type operator+=(floating-point-type) const noexcept;
floating-point-type operator-=(floating-point-type) const noexcept;

void wait(floating-point-type, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() const noexcept;
void notify_all() const noexcept;
};

}

```

- 2 Descriptions are provided below only for members that differ from the primary template.
- 3 The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in [Table 145](#).

```

floating-point-type fetch_key(floating-point-type operand,
                             memory_order order = memory_order::seq_cst) const noexcept;

```

- 4 *Effects*: Atomically replaces the value referenced by `*ptr` with the result of the computation applied to the value referenced by `*ptr` and the given operand. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations ([6.9.2.2](#)).

- 5 *Returns*: Atomically, the value referenced by `*ptr` immediately before the effects.

- 6 *Remarks*: If the result is not a representable value for its type ([7.1](#)), the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on `floating-point-type` should conform to the `std::numeric_limits<floating-point-type>` traits associated with the floating-point type ([17.3.3](#)). The floating-point environment ([28.3](#)) for atomic arithmetic operations on `floating-point-type` may be different than the calling thread's floating-point environment.

```

floating-point-type operator op=(floating-point-type operand) const noexcept;

```

- 7 *Effects*: Equivalent to: `return fetch_key(operand) op operand;`

33.5.7.5 Partial specialization for pointers

[`atomics.ref.pointer`]

```

namespace std {
    template<class T> struct atomic_ref<T*> {
        private:
            T** ptr;           // exposition only

        public:
            using value_type = T*;
            using difference_type = ptrdiff_t;
            static constexpr size_t required_alignment = implementation-defined;

            static constexpr bool is_always_lock_free = implementation-defined;
            bool is_lock_free() const noexcept;

            explicit atomic_ref(T*&);

            atomic_ref(const atomic_ref&) noexcept;
            atomic_ref& operator=(const atomic_ref&) = delete;

            void store(T*, memory_order = memory_order::seq_cst) const noexcept;
            T* operator=(T*) const noexcept;
            T* load(memory_order = memory_order::seq_cst) const noexcept;
            operator T*() const noexcept;

            T* exchange(T*, memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_weak(T*&, T*,
                                      memory_order, memory_order) const noexcept;
            bool compare_exchange_strong(T*&, T*,
                                         memory_order, memory_order) const noexcept;
    };
}

```

```

    bool compare_exchange_weak(T*&, T*,
                               memory_order = memory_order::seq_cst) const noexcept;
    bool compare_exchange_strong(T*&, T*,
                               memory_order = memory_order::seq_cst) const noexcept;

    T* fetch_add(difference_type, memory_order = memory_order::seq_cst) const noexcept;
    T* fetch_sub(difference_type, memory_order = memory_order::seq_cst) const noexcept;

    T* operator++(int) const noexcept;
    T* operator--(int) const noexcept;
    T* operator++() const noexcept;
    T* operator--() const noexcept;
    T* operator+=(difference_type) const noexcept;
    T* operator-=(difference_type) const noexcept;

    void wait(T*, memory_order = memory_order::seq_cst) const noexcept;
    void notify_one() const noexcept;
    void notify_all() const noexcept;
};

}

```

- ¹ Descriptions are provided below only for members that differ from the primary template.
- ² The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in [Table 146](#).

T* `fetch_key`(difference_type operand, memory_order order = memory_order::seq_cst) const noexcept;

³ *Mandates:* T is a complete object type.

⁴ *Effects:* Atomically replaces the value referenced by *ptr with the result of the computation applied to the value referenced by *ptr and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations ([6.9.2.2](#)).

⁵ *Returns:* Atomically, the value referenced by *ptr immediately before the effects.

⁶ *Remarks:* The result may be an undefined address, but the operations otherwise have no undefined behavior.

T* operator *op*=(difference_type operand) const noexcept;

⁷ *Effects:* Equivalent to: return `fetch_key`(operand) *op* operand;

33.5.7.6 Member operators common to integers and pointers to objects [atomics.ref.memop]

value_type operator++(int) const noexcept;

¹ *Effects:* Equivalent to: return `fetch_add`(1);

value_type operator--(int) const noexcept;

² *Effects:* Equivalent to: return `fetch_sub`(1);

value_type operator++() const noexcept;

³ *Effects:* Equivalent to: return `fetch_add`(1) + 1;

value_type operator--() const noexcept;

⁴ *Effects:* Equivalent to: return `fetch_sub`(1) - 1;

33.5.8 Class template atomic

[atomics.types.generic]

33.5.8.1 General

[atomics.types.generic.general]

```

namespace std {
    template<class T> struct atomic {
        using value_type = T;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const volatile noexcept;
        bool is_lock_free() const noexcept;
    };
}

```

```

// 33.5.8.2, operations on atomic types
constexpr atomic() noexcept(is_nothrow_default_constructible_v<T>);
constexpr atomic(T) noexcept;
atomic(const atomic&) = delete;
atomic& operator=(const atomic&) = delete;
atomic& operator=(const atomic&) volatile = delete;

T load(memory_order = memory_order::seq_cst) const volatile noexcept;
T load(memory_order = memory_order::seq_cst) const noexcept;
operator T() const volatile noexcept;
operator T() const noexcept;
void store(T, memory_order = memory_order::seq_cst) volatile noexcept;
void store(T, memory_order = memory_order::seq_cst) noexcept;
T operator=(T) volatile noexcept;
T operator=(T) noexcept;

T exchange(T, memory_order = memory_order::seq_cst) volatile noexcept;
T exchange(T, memory_order = memory_order::seq_cst) noexcept;
bool compare_exchange_weak(T&, T, memory_order, memory_order) volatile noexcept;
bool compare_exchange_weak(T&, T, memory_order, memory_order) noexcept;
bool compare_exchange_strong(T&, T, memory_order, memory_order) volatile noexcept;
bool compare_exchange_strong(T&, T, memory_order, memory_order) noexcept;
bool compare_exchange_weak(T&, T, memory_order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_weak(T&, T, memory_order = memory_order::seq_cst) noexcept;
bool compare_exchange_strong(T&, T, memory_order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(T&, T, memory_order = memory_order::seq_cst) noexcept;

void wait(T, memory_order = memory_order::seq_cst) const volatile noexcept;
void wait(T, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() volatile noexcept;
void notify_one() noexcept;
void notify_all() volatile noexcept;
void notify_all() noexcept;
};

}

```

- ¹ The template argument for T shall meet the *Cpp17CopyConstructible* and *Cpp17CopyAssignable* requirements. The program is ill-formed if any of

- (1.1) — *is_trivially_copyable_v*<T>,
- (1.2) — *is_copy_constructible_v*<T>,
- (1.3) — *is_move_constructible_v*<T>,
- (1.4) — *is_copy_assignable_v*<T>, or
- (1.5) — *is_move_assignable_v*<T>

is false.

NOTE 1: Type arguments that are not also statically initializable can be difficult to use.

- ² The specialization *atomic*<bool> is a standard-layout struct.

- ³ NOTE 2: The representation of an atomic specialization need not have the same size and alignment requirement as its corresponding argument type.

33.5.8.2 Operations on atomic types

[atomics.types.operations]

```
constexpr atomic() noexcept(is_nothrow_default_constructible_v<T>);
```

- ¹ *Mandates*: *is_default_constructible_v*<T> is true.

- ² *Effects*: Initializes the atomic object with the value of T(). Initialization is not an atomic operation (6.9.2).

```
constexpr atomic(T desired) noexcept;
```

- ³ *Effects*: Initializes the object with the value *desired*. Initialization is not an atomic operation (6.9.2).

NOTE 1: It is possible to have an access to an atomic object A race with its construction, for example by communicating the address of the just-constructed object A to another thread via `memory_order::relaxed` operations on a suitable atomic pointer variable, and then immediately accessing A in the receiving thread. This results in undefined behavior.

```
static constexpr bool is_always_lock_free = implementation-defined;
```

4 The `static` data member `is_always_lock_free` is `true` if the atomic type's operations are always lock-free, and `false` otherwise.

NOTE 2: The value of `is_always_lock_free` is consistent with the value of the corresponding `ATOMIC_..._LOCK_FREE` macro, if defined.

```
bool is_lock_free() const volatile noexcept;
bool is_lock_free() const noexcept;
```

5 *Returns*: `true` if the object's operations are lock-free, `false` otherwise.

NOTE 3: The return value of the `is_lock_free` member function is consistent with the value of `is_always_lock_free` for the same type.

```
void store(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
void store(T desired, memory_order order = memory_order::seq_cst) noexcept;
```

6 *Constraints*: For the `volatile` overload of this function, `is_always_lock_free` is `true`.

7 *Preconditions*: The `order` argument is neither `memory_order::consume`, `memory_order::acquire`, nor `memory_order::acq_rel`.

8 *Effects*: Atomically replaces the value pointed to by `this` with the value of `desired`. Memory is affected according to the value of `order`.

```
T operator=(T desired) volatile noexcept;
T operator=(T desired) noexcept;
```

9 *Constraints*: For the `volatile` overload of this function, `is_always_lock_free` is `true`.

10 *Effects*: Equivalent to `store(desired)`.

11 *Returns*: `desired`.

```
T load(memory_order order = memory_order::seq_cst) const volatile noexcept;
T load(memory_order order = memory_order::seq_cst) const noexcept;
```

12 *Constraints*: For the `volatile` overload of this function, `is_always_lock_free` is `true`.

13 *Preconditions*: The `order` argument is neither `memory_order::release` nor `memory_order::acq_rel`.

14 *Effects*: Memory is affected according to the value of `order`.

15 *Returns*: Atomically returns the value pointed to by `this`.

```
operator T() const volatile noexcept;
operator T() const noexcept;
```

16 *Constraints*: For the `volatile` overload of this function, `is_always_lock_free` is `true`.

17 *Effects*: Equivalent to: `return load()`;

```
T exchange(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
T exchange(T desired, memory_order order = memory_order::seq_cst) noexcept;
```

18 *Constraints*: For the `volatile` overload of this function, `is_always_lock_free` is `true`.

19 *Effects*: Atomically replaces the value pointed to by `this` with `desired`. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations (6.9.2).

20 *Returns*: Atomically returns the value pointed to by `this` immediately before the effects.

```
bool compare_exchange_weak(T& expected, T desired,
                           memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,
                           memory_order success, memory_order failure) noexcept;
bool compare_exchange_strong(T& expected, T desired,
                            memory_order success, memory_order failure) volatile noexcept;
```

```

bool compare_exchange_strong(T& expected, T desired,
                             memory_order success, memory_order failure) noexcept;
bool compare_exchange_weak(T& expected, T desired,
                           memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,
                           memory_order order = memory_order::seq_cst) noexcept;
bool compare_exchange_strong(T& expected, T desired,
                            memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
                            memory_order order = memory_order::seq_cst) noexcept;
21   Constraints: For the volatile overload of this function, is_always_lock_free is true.
22   Preconditions: The failure argument is neither memory_order::release nor memory_order::acq_rel.
23   Effects: Retrieves the value in expected. It then atomically compares the value representation of
              the value pointed to by this for equality with that previously retrieved from expected, and if true,
              replaces the value pointed to by this with that in desired. If and only if the comparison is true,
              memory is affected according to the value of success, and if the comparison is false, memory is affected
              according to the value of failure. When only one memory_order argument is supplied, the value of
              success is order, and the value of failure is order except that a value of memory_order::acq_rel
              shall be replaced by the value memory_order::acquire and a value of memory_order::release shall
              be replaced by the value memory_order::relaxed. If and only if the comparison is false then, after
              the atomic operation, the value in expected is replaced by the value pointed to by this during the
              atomic comparison. If the operation returns true, these operations are atomic read-modify-write
              operations (6.9.2) on the memory pointed to by this. Otherwise, these operations are atomic load
              operations on that memory.
24   Returns: The result of the comparison.
25   NOTE 4: For example, the effect of compare_exchange_strong on objects without padding bits (6.8.1) is
    if (memcmp(this, &expected, sizeof(*this)) == 0)
        memcpy(this, &desired, sizeof(*this));
    else
        memcpy(&expected, this, sizeof(*this));
EXAMPLE 1: The expected use of the compare-and-exchange operations is as follows. The compare-and-exchange
operations will update expected when another iteration of the loop is needed.
```

```

    expected = current.load();
    do {
        desired = function(expected);
    } while (!current.compare_exchange_weak(expected, desired));

```

EXAMPLE 2: Because the expected value is updated only on failure, code releasing the memory containing the `expected` value on success will work. For example, list head insertion will act atomically and would not introduce a data race in the following code:

```

do {
    p->next = head;                                     // make new list node point to the current head
} while (!head.compare_exchange_weak(p->next, p)); // try to insert

```

26 Implementations should ensure that weak compare-and-exchange operations do not consistently return `false` unless either the atomic object has value different from `expected` or there are concurrent modifications to the atomic object.

27 Remarks: A weak compare-and-exchange operation may fail spuriously. That is, even when the contents of memory referred to by `expected` and `this` are equal, it may return `false` and store back to `expected` the same memory contents that were originally there.

NOTE 5: This spurious failure enables implementation of compare-and-exchange on a broader class of machines, e.g., load-locked store-conditional machines. A consequence of spurious failure is that nearly all uses of weak compare-and-exchange will be in a loop. When a compare-and-exchange is in a loop, the weak version will yield better performance on some platforms. When a weak compare-and-exchange would require a loop and a strong one would not, the strong one is preferable.

28 NOTE 6: Under cases where the `memcpy` and `memcmp` semantics of the compare-and-exchange operations apply, the comparisons can fail for values that compare equal with `operator==` if the value representation has trap bits or

alternate representations of the same value. Notably, on implementations conforming to ISO/IEC/IEEE 60559, floating-point -0.0 and +0.0 will not compare equal with `memcmp` but will compare equal with `operator==`, and NaNs with the same payload will compare equal with `memcmp` but will not compare equal with `operator==`.

NOTE 7: Because compare-and-exchange acts on an object's value representation, padding bits that never participate in the object's value representation are ignored. As a consequence, the following code is guaranteed to avoid spurious failure:

```
struct padded {
    char clank = 0x42;
    // Padding here.
    unsigned biff = 0xC0DEFEFE;
};

atomic<padded> pad = {};
```

```
bool zap() {
    padded expected, desired{0, 0};
    return pad.compare_exchange_strong(expected, desired);
}
```

NOTE 8: For a union with bits that participate in the value representation of some members but not others, compare-and-exchange might always fail. This is because such padding bits have an indeterminate value when they do not participate in the value representation of the active member. As a consequence, the following code is not guaranteed to ever succeed:

```
union pony {
    double celestia = 0.;
    short luna;      // padded
};

atomic<pony> princesses = {};
```

```
bool party(pony desired) {
    pony expected;
    return princesses.compare_exchange_strong(expected, desired);
}
```

```
void wait(T old, memory_order order = memory_order::seq_cst) const volatile noexcept;
void wait(T old, memory_order order = memory_order::seq_cst) const noexcept;
```

29 *Preconditions:* `order` is neither `memory_order::release` nor `memory_order::acq_rel`.

30 *Effects:* Repeatedly performs the following steps, in order:

(30.1) — Evaluates `load(order)` and compares its value representation for equality against that of `old`.

(30.2) — If they compare unequal, returns.

(30.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

31 *Remarks:* This function is an atomic waiting operation (33.5.6).

```
void notify_one() volatile noexcept;
void notify_one() noexcept;
```

32 *Effects:* Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (33.5.6) by this call, if any such atomic waiting operations exist.

33 *Remarks:* This function is an atomic notifying operation (33.5.6).

```
void notify_all() volatile noexcept;
void notify_all() noexcept;
```

34 *Effects:* Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (33.5.6) by this call.

35 *Remarks:* This function is an atomic notifying operation (33.5.6).

33.5.8.3 Specializations for integers

[atomics.types.int]

- ¹ There are specializations of the `atomic` class template for the integral types `char`, `signed char`, `unsigned char`, `short`, `unsigned short`, `int`, `unsigned int`, `long`, `unsigned long`, `long long`, `unsigned long long`, `char8_t`, `char16_t`, `char32_t`, `wchar_t`, and any other types needed by the `typedefs` in the header

<cstdint> (17.4.1). For each such type *integral-type*, the specialization `atomic<integral-type>` provides additional atomic operations appropriate to integral types.

NOTE 1: The specialization `atomic<bool>` uses the primary template (33.5.8).

```
namespace std {
    template<> struct atomic<integral-type> {
        using value_type = integral-type;
        using difference_type = value_type;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const volatile noexcept;
        bool is_lock_free() const noexcept;

        constexpr atomic() noexcept;
        constexpr atomic(integral-type) noexcept;
        atomic(const atomic&) = delete;
        atomic& operator=(const atomic&) = delete;
        atomic& operator=(const atomic&) volatile = delete;

        void store(integral-type, memory_order = memory_order::seq_cst) volatile noexcept;
        void store(integral-type, memory_order = memory_order::seq_cst) noexcept;
        integral-type operator=(integral-type) volatile noexcept;
        integral-type operator=(integral-type) noexcept;
        integral-type load(memory_order = memory_order::seq_cst) const volatile noexcept;
        integral-type load(memory_order = memory_order::seq_cst) const noexcept;
        operator integral-type() const volatile noexcept;
        operator integral-type() const noexcept;

        integral-type exchange(integral-type,
                               memory_order = memory_order::seq_cst) volatile noexcept;
        integral-type exchange(integral-type,
                               memory_order = memory_order::seq_cst) noexcept;
        bool compare_exchange_weak(integral-type&, integral-type,
                                   memory_order, memory_order) volatile noexcept;
        bool compare_exchange_weak(integral-type&, integral-type,
                                   memory_order, memory_order) noexcept;
        bool compare_exchange_strong(integral-type&, integral-type,
                                    memory_order, memory_order) volatile noexcept;
        bool compare_exchange_strong(integral-type&, integral-type,
                                    memory_order, memory_order) noexcept;
        bool compare_exchange_weak(integral-type&, integral-type,
                                   memory_order = memory_order::seq_cst) volatile noexcept;
        bool compare_exchange_weak(integral-type&, integral-type,
                                   memory_order = memory_order::seq_cst) noexcept;
        bool compare_exchange_strong(integral-type&, integral-type,
                                    memory_order = memory_order::seq_cst) volatile noexcept;
        bool compare_exchange_strong(integral-type&, integral-type,
                                    memory_order = memory_order::seq_cst) noexcept;

        integral-type fetch_add(integral-type,
                               memory_order = memory_order::seq_cst) volatile noexcept;
        integral-type fetch_add(integral-type,
                               memory_order = memory_order::seq_cst) noexcept;
        integral-type fetch_sub(integral-type,
                               memory_order = memory_order::seq_cst) volatile noexcept;
        integral-type fetch_sub(integral-type,
                               memory_order = memory_order::seq_cst) noexcept;
        integral-type fetch_and(integral-type,
                               memory_order = memory_order::seq_cst) volatile noexcept;
        integral-type fetch_and(integral-type,
                               memory_order = memory_order::seq_cst) noexcept;
        integral-type fetch_or(integral-type,
                               memory_order = memory_order::seq_cst) volatile noexcept;
        integral-type fetch_or(integral-type,
                               memory_order = memory_order::seq_cst) noexcept;
    };
}
```

```

integral-type fetch_or(integral-type,
                      memory_order = memory_order::seq_cst) noexcept;
integral-type fetch_xor(integral-type,
                       memory_order = memory_order::seq_cst) volatile noexcept;
integral-type fetch_xor(integral-type,
                       memory_order = memory_order::seq_cst) noexcept;

integral-type operator++(int) volatile noexcept;
integral-type operator++(int) noexcept;
integral-type operator--(int) volatile noexcept;
integral-type operator--(int) noexcept;
integral-type operator++() volatile noexcept;
integral-type operator++() noexcept;
integral-type operator--() volatile noexcept;
integral-type operator--() noexcept;
integral-type operator+=(integral-type) volatile noexcept;
integral-type operator+=(integral-type) noexcept;
integral-type operator-=(integral-type) volatile noexcept;
integral-type operator-=(integral-type) noexcept;
integral-type operator&=(integral-type) volatile noexcept;
integral-type operator&=(integral-type) noexcept;
integral-type operator|=(integral-type) volatile noexcept;
integral-type operator|=(integral-type) noexcept;
integral-type operator^=(integral-type) volatile noexcept;
integral-type operator^=(integral-type) noexcept;

void wait(integral-type, memory_order = memory_order::seq_cst) const volatile noexcept;
void wait(integral-type, memory_order = memory_order::seq_cst) const noexcept;

void notify_one() noexcept;
void notify_all() volatile noexcept;
void notify_all() noexcept;
};

}

```

- ² The atomic integral specializations are standard-layout structs. They each have a trivial destructor.
- ³ Descriptions are provided below only for members that differ from the primary template.
- ⁴ The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in [Table 145](#).

Table 145: Atomic arithmetic computations [tab:atomic.types.int.comp]

key	Op	Computation	key	Op	Computation
add	+	addition	sub	-	subtraction
or		bitwise inclusive or	xor	^	bitwise exclusive or
and	&	bitwise and			

T fetch_key(T operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T fetch_key(T operand, memory_order order = memory_order::seq_cst) noexcept;

- ⁵ *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.
- ⁶ *Effects:* Atomically replaces the value pointed to by `this` with the result of the computation applied to the value pointed to by `this` and the given `operand`. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations ([6.9.2](#)).
- ⁷ *Returns:* Atomically, the value pointed to by `this` immediately before the effects.
- ⁸ *Remarks:* For signed integer types, the result is as if the object value and parameters were converted to their corresponding unsigned types, the computation performed on those types, and the result converted back to the signed type.

NOTE 2: There are no undefined results arising from the computation.

T operator *op*=(T operand) volatile noexcept;
T operator *op*=(T operand) noexcept;

9 *Constraints*: For the volatile overload of this function, *is_always_lock_free* is true.

10 *Effects*: Equivalent to: return *fetch_key*(*operand*) *op* *operand*;

33.5.8.4 Specializations for floating-point types [atomics.types.float]

1 There are specializations of the `atomic` class template for all cv-unqualified floating-point types. For each such type *floating-point-type*, the specialization `atomic<floating-point-type>` provides additional atomic operations appropriate to floating-point types.

```
namespace std {
    template<> struct atomic<floating-point-type> {
        using value_type = floating-point-type;
        using difference_type = value_type;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const volatile noexcept;
        bool is_lock_free() const noexcept;

        constexpr atomic() noexcept;
        constexpr atomic(floating-point-type) noexcept;
        atomic(const atomic&) = delete;
        atomic& operator=(const atomic&) = delete;
        atomic& operator=(const atomic&) volatile = delete;

        void store(floating-point-type, memory_order = memory_order::seq_cst) volatile noexcept;
        void store(floating-point-type, memory_order = memory_order::seq_cst) noexcept;
        floating-point-type operator=(floating-point-type) volatile noexcept;
        floating-point-type operator=(floating-point-type) noexcept;
        floating-point-type load(memory_order = memory_order::seq_cst) volatile noexcept;
        floating-point-type load(memory_order = memory_order::seq_cst) noexcept;
        operator floating-point-type() volatile noexcept;
        operator floating-point-type() noexcept;

        floating-point-type exchange(floating-point-type,
                                     memory_order = memory_order::seq_cst) volatile noexcept;
        floating-point-type exchange(floating-point-type,
                                     memory_order = memory_order::seq_cst) noexcept;
        bool compare_exchange_weak(floating-point-type&, floating-point-type,
                                   memory_order, memory_order) volatile noexcept;
        bool compare_exchange_weak(floating-point-type&, floating-point-type,
                                   memory_order, memory_order) noexcept;
        bool compare_exchange_strong(floating-point-type&, floating-point-type,
                                    memory_order, memory_order) volatile noexcept;
        bool compare_exchange_strong(floating-point-type&, floating-point-type,
                                    memory_order, memory_order) noexcept;
        bool compare_exchange_weak(floating-point-type&, floating-point-type,
                                   memory_order = memory_order::seq_cst) volatile noexcept;
        bool compare_exchange_weak(floating-point-type&, floating-point-type,
                                   memory_order = memory_order::seq_cst) noexcept;
        bool compare_exchange_strong(floating-point-type&, floating-point-type,
                                    memory_order = memory_order::seq_cst) volatile noexcept;
        bool compare_exchange_strong(floating-point-type&, floating-point-type,
                                    memory_order = memory_order::seq_cst) noexcept;

        floating-point-type fetch_add(floating-point-type,
                                      memory_order = memory_order::seq_cst) volatile noexcept;
        floating-point-type fetch_add(floating-point-type,
                                      memory_order = memory_order::seq_cst) noexcept;
        floating-point-type fetch_sub(floating-point-type,
                                    memory_order = memory_order::seq_cst) volatile noexcept;
        floating-point-type fetch_sub(floating-point-type,
                                    memory_order = memory_order::seq_cst) noexcept;
    };
}
```

```

floating-point-type operator+=(floating-point-type) volatile noexcept;
floating-point-type operator+=(floating-point-type) noexcept;
floating-point-type operator-=(floating-point-type) volatile noexcept;
floating-point-type operator-=(floating-point-type) noexcept;

void wait(floating-point-type, memory_order = memory_order::seq_cst) const volatile noexcept;
void wait(floating-point-type, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() volatile noexcept;
void notify_one() noexcept;
void notify_all() volatile noexcept;
void notify_all() noexcept;
};

}

```

- 2 The atomic floating-point specializations are standard-layout structs. They each have a trivial destructor.
- 3 Descriptions are provided below only for members that differ from the primary template.
- 4 The following operations perform arithmetic addition and subtraction computations. The correspondence among key, operator, and computation is specified in [Table 145](#).

```

T fetch_key(T operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T fetch_key(T operand, memory_order order = memory_order::seq_cst) noexcept;

5 Constraints: For the volatile overload of this function, is_always_lock_free is true.
6 Effects: Atomically replaces the value pointed to by this with the result of the computation applied to the value pointed to by this and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.9.2).
7 Returns: Atomically, the value pointed to by this immediately before the effects.
8 Remarks: If the result is not a representable value for its type (7.1) the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on floating-point-type should conform to the std::numeric_limits<floating-point-type> traits associated with the floating-point type (17.3.3). The floating-point environment (28.3) for atomic arithmetic operations on floating-point-type may be different than the calling thread's floating-point environment.

```

```

T operator op=(T operand) volatile noexcept;
T operator op=(T operand) noexcept;

9 Constraints: For the volatile overload of this function, is_always_lock_free is true.
10 Effects: Equivalent to: return fetch_key(operand) op operand;
11 Remarks: If the result is not a representable value for its type (7.1) the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on floating-point-type should conform to the std::numeric_limits<floating-point-type> traits associated with the floating-point type (17.3.3). The floating-point environment (28.3) for atomic arithmetic operations on floating-point-type may be different than the calling thread's floating-point environment.

```

33.5.8.5 Partial specialization for pointers

[`atomics.types.pointer`]

```

namespace std {

T* operator-=(ptrdiff_t) noexcept;

void wait(T*, memory_order = memory_order::seq_cst) const volatile noexcept;
void wait(T*, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() volatile noexcept;
void notify_one() noexcept;
void notify_all() volatile noexcept;
void notify_all() noexcept;
};

}

```

- ¹ There is a partial specialization of the `atomic` class template for pointers. Specializations of this partial specialization are standard-layout structs. They each have a trivial destructor.
- ² Descriptions are provided below only for members that differ from the primary template.
- ³ The following operations perform pointer arithmetic. The correspondence among key, operator, and computation is specified in [Table 146](#).

Table 146: Atomic pointer computations [tab:atomic.types.pointer.comp]

key	Op	Computation	key	Op	Computation
add	+	addition	sub	-	subtraction

```
T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) noexcept;
```

- 4 *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.
- 5 *Mandates:* T is a complete object type.
- NOTE: Pointer arithmetic on `void*` or function pointers is ill-formed.
- 6 *Effects:* Atomically replaces the value pointed to by `this` with the result of the computation applied to the value pointed to by `this` and the given `operand`. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations (6.9.2).
- 7 *Returns:* Atomically, the value pointed to by `this` immediately before the effects.
- 8 *Remarks:* The result may be an undefined address, but the operations otherwise have no undefined behavior.

```
T* operator op=(ptrdiff_t operand) volatile noexcept;
T* operator op=(ptrdiff_t operand) noexcept;
```

- 9 *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.
- 10 *Effects:* Equivalent to: `return fetch_key(operand) op operand;`

33.5.8.6 Member operators common to integers and pointers to objects[atomics.types.memop]

```
value_type operator++(int) volatile noexcept;
value_type operator++(int) noexcept;
```

- 1 *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.
- 2 *Effects:* Equivalent to: `return fetch_add(1);`

```
value_type operator--(int) volatile noexcept;
value_type operator--(int) noexcept;
```

- 3 *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.
- 4 *Effects:* Equivalent to: `return fetch_sub(1);`

```
value_type operator++() volatile noexcept;
value_type operator++() noexcept;
```

- 5 *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.
- 6 *Effects:* Equivalent to: `return fetch_add(1) + 1;`

```
value_type operator--() volatile noexcept;
value_type operator--() noexcept;
```

- 7 *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.
- 8 *Effects:* Equivalent to: `return fetch_sub(1) - 1;`

33.5.8.7 Partial specializations for smart pointers [util.smartptr.atomic]

33.5.8.7.1 General [util.smartptr.atomic.general]

- 1 The library provides partial specializations of the `atomic` template for shared-ownership smart pointers (20.3.2).

NOTE 1: The partial specializations are declared in header `<memory>` (20.2.2).

The behavior of all operations is as specified in 33.5.8, unless specified otherwise. The template parameter T of these partial specializations may be an incomplete type.

- 2 All changes to an atomic smart pointer in 33.5.8.7, and all associated `use_count` increments, are guaranteed to be performed atomically. Associated `use_count` decrements are sequenced after the atomic operation, but are not required to be part of it. Any associated deletion and deallocation are sequenced after the atomic update step and are not part of the atomic operation.

NOTE 2: If the atomic operation uses locks, locks acquired by the implementation will be held when any `use_count` adjustments are performed, and will not be held when any destruction or deallocation resulting from this is performed.

³ EXAMPLE:

```
template<typename T> class atomic_list {
    struct node {
        T t;
        shared_ptr<node> next;
    };
    atomic<shared_ptr<node>> head;

public:
    shared_ptr<node> find(T t) const {
        auto p = head.load();
        while (p && p->t != t)
            p = p->next;

        return p;
    }

    void push_front(T t) {
        auto p = make_shared<node>();
        p->t = t;
        p->next = head;
        while (!head.compare_exchange_weak(p->next, p)) {}
    }
};
```

33.5.8.7.2 Partial specialization for shared_ptr

[util.smartptr.atomic.shared]

```
namespace std {
    template<class T> struct atomic<shared_ptr<T>> {
        using value_type = shared_ptr<T>;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const noexcept;

        constexpr atomic() noexcept;
        constexpr atomic(nullptr_t) noexcept : atomic() { }
        atomic(shared_ptr<T> desired) noexcept;
        atomic(const atomic&) = delete;
        void operator=(const atomic&) = delete;

        shared_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
        operator shared_ptr<T>() const noexcept;
        void store(shared_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
        void operator=(shared_ptr<T> desired) noexcept;

        shared_ptr<T> exchange(shared_ptr<T> desired,
                               memory_order order = memory_order::seq_cst) noexcept;
        bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
                                  memory_order success, memory_order failure) noexcept;
        bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
                                    memory_order success, memory_order failure) noexcept;
        bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
                                  memory_order order = memory_order::seq_cst) noexcept;
        bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
                                    memory_order order = memory_order::seq_cst) noexcept;

        void wait(shared_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
        void notify_one() noexcept;
        void notify_all() noexcept;

private:
    shared_ptr<T> p; // exposition only
    };
}
```

```
constexpr atomic() noexcept;
```

1 *Effects:* Initializes p{}.

```
atomic(shared_ptr<T> desired) noexcept;
```

2 *Effects:* Initializes the object with the value desired. Initialization is not an atomic operation (6.9.2).

NOTE: It is possible to have an access to an atomic object A race with its construction, for example, by communicating the address of the just-constructed object A to another thread via `memory_order::relaxed` operations on a suitable atomic pointer variable, and then immediately accessing A in the receiving thread. This results in undefined behavior.

```
void store(shared_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
```

3 *Preconditions:* order is neither `memory_order::consume`, `memory_order::acquire`, nor `memory_order::acq_rel`.

4 *Effects:* Atomically replaces the value pointed to by `this` with the value of desired as if by `p.swap(desired)`. Memory is affected according to the value of order.

```
void operator=(shared_ptr<T> desired) noexcept;
```

5 *Effects:* Equivalent to `store(desired)`.

```
shared_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
```

6 *Preconditions:* order is neither `memory_order::release` nor `memory_order::acq_rel`.

7 *Effects:* Memory is affected according to the value of order.

8 *Returns:* Atomically returns p.

```
operator shared_ptr<T>() const noexcept;
```

9 *Effects:* Equivalent to: `return load()`;

```
shared_ptr<T> exchange(shared_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
```

10 *Effects:* Atomically replaces p with desired as if by `p.swap(desired)`. Memory is affected according to the value of order. This is an atomic read-modify-write operation (6.9.2).

11 *Returns:* Atomically returns the value of p immediately before the effects.

```
bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
                           memory_order success, memory_order failure) noexcept;
```

```
bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
                           memory_order success, memory_order failure) noexcept;
```

12 *Preconditions:* failure is neither `memory_order::release` nor `memory_order::acq_rel`.

13 *Effects:* If p is equivalent to expected, assigns desired to p and has synchronization semantics corresponding to the value of success, otherwise assigns p to expected and has synchronization semantics corresponding to the value of failure.

14 *Returns:* true if p was equivalent to expected, false otherwise.

15 *Remarks:* Two `shared_ptr` objects are equivalent if they store the same pointer value and either share ownership or are both empty. The weak form may fail spuriously. See 33.5.8.2.

16 If the operation returns true, expected is not accessed after the atomic update and the operation is an atomic read-modify-write operation (6.9.2) on the memory pointed to by this. Otherwise, the operation is an atomic load operation on that memory, and expected is updated with the existing value read from the atomic object in the attempted atomic update. The `use_count` update corresponding to the write to expected is part of the atomic operation. The write to expected itself is not required to be part of the atomic operation.

```
bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
                           memory_order order = memory_order::seq_cst) noexcept;
```

17 *Effects:* Equivalent to:

```
    return compare_exchange_weak(expected, desired, order, fail_order);
```

where `fail_order` is the same as `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`.

```
bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
                             memory_order order = memory_order::seq_cst) noexcept;
```

18 *Effects:* Equivalent to:

```
    return compare_exchange_strong(expected, desired, order, fail_order);
```

where `fail_order` is the same as `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`.

```
void wait(shared_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
```

19 *Preconditions:* `order` is neither `memory_order::release` nor `memory_order::acq_rel`.

20 *Effects:* Repeatedly performs the following steps, in order:

(20.1) — Evaluates `load(order)` and compares it to `old`.

(20.2) — If the two are not equivalent, returns.

(20.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

21 *Remarks:* Two `shared_ptr` objects are equivalent if they store the same pointer and either share ownership or are both empty. This function is an atomic waiting operation (33.5.6).

```
void notify_one() noexcept;
```

22 *Effects:* Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (33.5.6) by this call, if any such atomic waiting operations exist.

23 *Remarks:* This function is an atomic notifying operation (33.5.6).

```
void notify_all() noexcept;
```

24 *Effects:* Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (33.5.6) by this call.

25 *Remarks:* This function is an atomic notifying operation (33.5.6).

33.5.8.7.3 Partial specialization for `weak_ptr`

[util.smartptr.atomic.weak]

```
namespace std {
    template<class T> struct atomic<weak_ptr<T>> {
        using value_type = weak_ptr<T>;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const noexcept;

        constexpr atomic() noexcept;
        atomic(weak_ptr<T> desired) noexcept;
        atomic(const atomic&) = delete;
        void operator=(const atomic&) = delete;

        weak_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
        operator weak_ptr<T>() const noexcept;
        void store(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
        void operator=(weak_ptr<T> desired) noexcept;

        weak_ptr<T> exchange(weak_ptr<T> desired,
                            memory_order order = memory_order::seq_cst) noexcept;
        bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
                                  memory_order success, memory_order failure) noexcept;
        bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
                                    memory_order success, memory_order failure) noexcept;
        bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
                                  memory_order order = memory_order::seq_cst) noexcept;
```

```

    bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
                                memory_order order = memory_order::seq_cst) noexcept;

    void wait(weak_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
    void notify_one() noexcept;
    void notify_all() noexcept;

    private:
        weak_ptr<T> p; // exposition only
    };
}

```

constexpr atomic() noexcept;

1 *Effects:* Initializes p{ }.

atomic(weak_ptr<T> desired) noexcept;

2 *Effects:* Initializes the object with the value **desired**. Initialization is not an atomic operation (6.9.2).

NOTE: It is possible to have an access to an atomic object **A** race with its construction, for example, by communicating the address of the just-constructed object **A** to another thread via **memory_order::relaxed** operations on a suitable atomic pointer variable, and then immediately accessing **A** in the receiving thread. This results in undefined behavior.

void store(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;

3 *Preconditions:* **order** is neither **memory_order::consume**, **memory_order::acquire**, nor **memory_order::acq_rel**.

4 *Effects:* Atomically replaces the value pointed to by **this** with the value of **desired** as if by **p.swap(desired)**. Memory is affected according to the value of **order**.

void operator=(weak_ptr<T> desired) noexcept;

5 *Effects:* Equivalent to **store(desired)**.

weak_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;

6 *Preconditions:* **order** is neither **memory_order::release** nor **memory_order::acq_rel**.

7 *Effects:* Memory is affected according to the value of **order**.

8 *Returns:* Atomically returns **p**.

operator weak_ptr<T>() const noexcept;

9 *Effects:* Equivalent to: **return load();**

weak_ptr<T> exchange(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;

10 *Effects:* Atomically replaces **p** with **desired** as if by **p.swap(desired)**. Memory is affected according to the value of **order**. This is an atomic read-modify-write operation (6.9.2.2).

11 *Returns:* Atomically returns the value of **p** immediately before the effects.

bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,

memory_order success, memory_order failure) noexcept;

bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,

memory_order success, memory_order failure) noexcept;

12 *Preconditions:* **failure** is neither **memory_order::release** nor **memory_order::acq_rel**.

13 *Effects:* If **p** is equivalent to **expected**, assigns **desired** to **p** and has synchronization semantics corresponding to the value of **success**, otherwise assigns **p** to **expected** and has synchronization semantics corresponding to the value of **failure**.

14 *Returns:* **true** if **p** was equivalent to **expected**, **false** otherwise.

15 *Remarks:* Two **weak_ptr** objects are equivalent if they store the same pointer value and either share ownership or are both empty. The weak form may fail spuriously. See 33.5.8.2.

16 If the operation returns **true**, **expected** is not accessed after the atomic update and the operation is an atomic read-modify-write operation (6.9.2) on the memory pointed to by **this**. Otherwise, the

operation is an atomic load operation on that memory, and `expected` is updated with the existing value read from the atomic object in the attempted atomic update. The `use_count` update corresponding to the write to `expected` is part of the atomic operation. The write to `expected` itself is not required to be part of the atomic operation.

```
bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
                           memory_order order = memory_order::seq_cst) noexcept;
```

17 *Effects:* Equivalent to:

```
        return compare_exchange_weak(expected, desired, order, fail_order);
```

where `fail_order` is the same as `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`.

```
bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
                             memory_order order = memory_order::seq_cst) noexcept;
```

18 *Effects:* Equivalent to:

```
        return compare_exchange_strong(expected, desired, order, fail_order);
```

where `fail_order` is the same as `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`.

```
void wait(weak_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
```

19 *Preconditions:* `order` is neither `memory_order::release` nor `memory_order::acq_rel`.

20 *Effects:* Repeatedly performs the following steps, in order:

- (20.1) — Evaluates `load(order)` and compares it to `old`.
- (20.2) — If the two are not equivalent, returns.
- (20.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

21 *Remarks:* Two `weak_ptr` objects are equivalent if they store the same pointer and either share ownership or are both empty. This function is an atomic waiting operation (33.5.6).

```
void notify_one() noexcept;
```

22 *Effects:* Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (33.5.6) by this call, if any such atomic waiting operations exist.

23 *Remarks:* This function is an atomic notifying operation (33.5.6).

```
void notify_all() noexcept;
```

24 *Effects:* Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (33.5.6) by this call.

25 *Remarks:* This function is an atomic notifying operation (33.5.6).

33.5.9 Non-member functions

[**atomics.nonmembers**]

- ¹ A non-member function template whose name matches the pattern `atomic_f` or the pattern `atomic_f_-explicit` invokes the member function `f`, with the value of the first parameter as the object expression and the values of the remaining parameters (if any) as the arguments of the member function call, in order. An argument for a parameter of type `atomic<T>::value_type*` is dereferenced when passed to the member function call. If no such member function exists, the program is ill-formed.
- ² NOTE: The non-member functions enable programmers to write code that can be compiled as either C or C++, for example in a shared header file.

33.5.10 Flag type and operations

[**atomics.flag**]

```
namespace std {
    struct atomic_flag {
        constexpr atomic_flag() noexcept;
        atomic_flag(const atomic_flag&) = delete;
        atomic_flag& operator=(const atomic_flag&) = delete;
```

```

atomic_flag& operator=(const atomic_flag&) volatile = delete;

bool test(memory_order = memory_order::seq_cst) const volatile noexcept;
bool test(memory_order = memory_order::seq_cst) const noexcept;
bool test_and_set(memory_order = memory_order::seq_cst) volatile noexcept;
bool test_and_set(memory_order = memory_order::seq_cst) noexcept;
void clear(memory_order = memory_order::seq_cst) volatile noexcept;
void clear(memory_order = memory_order::seq_cst) noexcept;

void wait(bool, memory_order = memory_order::seq_cst) const volatile noexcept;
void wait(bool, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() volatile noexcept;
void notify_one() noexcept;
void notify_all() volatile noexcept;
void notify_all() noexcept;
};

}

```

- 1 The `atomic_flag` type provides the classic test-and-set functionality. It has two states, set and clear.
- 2 Operations on an object of type `atomic_flag` shall be lock-free. The operations should also be address-free.
- 3 The `atomic_flag` type is a standard-layout struct. It has a trivial destructor.

`constexpr atomic_flag::atomic_flag() noexcept;`

- 4 *Effects:* Initializes `*this` to the clear state.

```

bool atomic_flag_test(const volatile atomic_flag* object) noexcept;
bool atomic_flag_test(const atomic_flag* object) noexcept;
bool atomic_flag_test_explicit(const volatile atomic_flag* object,
                               memory_order order) noexcept;
bool atomic_flag_test_explicit(const atomic_flag* object,
                               memory_order order) noexcept;
bool atomic_flag::test(memory_order order = memory_order::seq_cst) const volatile noexcept;
bool atomic_flag::test(memory_order order = memory_order::seq_cst) const noexcept;

```

- 5 For `atomic_flag_test`, let `order` be `memory_order::seq_cst`.

Preconditions: `order` is neither `memory_order::release` nor `memory_order::acq_rel`.

Effects: Memory is affected according to the value of `order`.

Returns: Atomically returns the value pointed to by `object` or `this`.

```

bool atomic_flag_test_and_set(volatile atomic_flag* object) noexcept;
bool atomic_flag_test_and_set(atomic_flag* object) noexcept;
bool atomic_flag_test_and_set_explicit(volatile atomic_flag* object, memory_order order) noexcept;
bool atomic_flag_test_and_set_explicit(atomic_flag* object, memory_order order) noexcept;
bool atomic_flag::test_and_set(memory_order order = memory_order::seq_cst) volatile noexcept;
bool atomic_flag::test_and_set(memory_order order = memory_order::seq_cst) noexcept;

```

- 9 *Effects:* Atomically sets the value pointed to by `object` or by `this` to true. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations (6.9.2).

Returns: Atomically, the value of the object immediately before the effects.

```

void atomic_flag_clear(volatile atomic_flag* object) noexcept;
void atomic_flag_clear(atomic_flag* object) noexcept;
void atomic_flag_clear_explicit(volatile atomic_flag* object, memory_order order) noexcept;
void atomic_flag_clear_explicit(atomic_flag* object, memory_order order) noexcept;
void atomic_flag::clear(memory_order order = memory_order::seq_cst) volatile noexcept;
void atomic_flag::clear(memory_order order = memory_order::seq_cst) noexcept;

```

- 11 *Preconditions:* The `order` argument is neither `memory_order::consume`, `memory_order::acquire`, nor `memory_order::acq_rel`.

Effects: Atomically sets the value pointed to by `object` or by `this` to false. Memory is affected according to the value of `order`.

```

void atomic_flag_wait(const volatile atomic_flag* object, bool old) noexcept;
void atomic_flag_wait(const atomic_flag* object, bool old) noexcept;
void atomic_flag_wait_explicit(const volatile atomic_flag* object,
                               bool old, memory_order order) noexcept;
void atomic_flag_wait_explicit(const atomic_flag* object,
                               bool old, memory_order order) noexcept;
void atomic_flag::wait(bool old, memory_order order =
                      memory_order::seq_cst) const volatile noexcept;
void atomic_flag::wait(bool old, memory_order order =
                      memory_order::seq_cst) const noexcept;

```

13 For `atomic_flag_wait`, let `order` be `memory_order::seq_cst`. Let `flag` be `object` for the non-member functions and `this` for the member functions.

14 *Preconditions:* `order` is neither `memory_order::release` nor `memory_order::acq_rel`.

15 *Effects:* Repeatedly performs the following steps, in order:

(15.1) — Evaluates `flag->test(order) != old`.

(15.2) — If the result of that evaluation is `true`, returns.

(15.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

16 *Remarks:* This function is an atomic waiting operation (33.5.6).

```

void atomic_flag_notify_one(volatile atomic_flag* object) noexcept;
void atomic_flag_notify_one(atomic_flag* object) noexcept;
void atomic_flag::notify_one() volatile noexcept;
void atomic_flag::notify_one() noexcept;

```

17 *Effects:* Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (33.5.6) by this call, if any such atomic waiting operations exist.

18 *Remarks:* This function is an atomic notifying operation (33.5.6).

```

void atomic_flag_notify_all(volatile atomic_flag* object) noexcept;
void atomic_flag_notify_all(atomic_flag* object) noexcept;
void atomic_flag::notify_all() volatile noexcept;
void atomic_flag::notify_all() noexcept;

```

19 *Effects:* Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (33.5.6) by this call.

20 *Remarks:* This function is an atomic notifying operation (33.5.6).

`#define ATOMIC_FLAG_INIT see below`

21 *Remarks:* The macro `ATOMIC_FLAG_INIT` is defined in such a way that it can be used to initialize an object of type `atomic_flag` to the clear state. The macro can be used in the form:

`atomic_flag guard = ATOMIC_FLAG_INIT;`

It is unspecified whether the macro can be used in other initialization contexts. For a complete static-duration object, that initialization shall be static.

33.5.11 Fences

[**atomics.fences**]

- This subclause introduces synchronization primitives called *fences*. Fences can have acquire semantics, release semantics, or both. A fence with acquire semantics is called an *acquire fence*. A fence with release semantics is called a *release fence*.
- A release fence *A* synchronizes with an acquire fence *B* if there exist atomic operations *X* and *Y*, both operating on some atomic object *M*, such that *A* is sequenced before *X*, *X* modifies *M*, *Y* is sequenced before *B*, and *Y* reads the value written by *X* or a value written by any side effect in the hypothetical release sequence *X* would head if it were a release operation.
- A release fence *A* synchronizes with an atomic operation *B* that performs an acquire operation on an atomic object *M* if there exists an atomic operation *X* such that *A* is sequenced before *X*, *X* modifies *M*, and *B* reads the value written by *X* or a value written by any side effect in the hypothetical release sequence *X* would head if it were a release operation.

- ⁴ An atomic operation *A* that is a release operation on an atomic object *M* synchronizes with an acquire fence *B* if there exists some atomic operation *X* on *M* such that *X* is sequenced before *B* and reads the value written by *A* or a value written by any side effect in the release sequence headed by *A*.

```
extern "C" void atomic_thread_fence(memory_order order) noexcept;
```

- 5 *Effects*: Depending on the value of *order*, this operation:

- (5.1) — has no effects, if *order* == `memory_order::relaxed`;
- (5.2) — is an acquire fence, if *order* == `memory_order::acquire` or *order* == `memory_order::consume`;
- (5.3) — is a release fence, if *order* == `memory_order::release`;
- (5.4) — is both an acquire fence and a release fence, if *order* == `memory_order::acq_rel`;
- (5.5) — is a sequentially consistent acquire and release fence, if *order* == `memory_order::seq_cst`.

```
extern "C" void atomic_signal_fence(memory_order order) noexcept;
```

- 6 *Effects*: Equivalent to `atomic_thread_fence(order)`, except that the resulting ordering constraints are established only between a thread and a signal handler executed in the same thread.

- 7 NOTE: `atomic_signal_fence` can be used to specify the order in which actions performed by the thread become visible to the signal handler. Compiler optimizations and reorderings of loads and stores are inhibited in the same way as with `atomic_thread_fence`, but the hardware fence instructions that `atomic_thread_fence` would have inserted are not emitted.

33.5.12 C compatibility

[`stdatomic.h.syn`]

The header `<stdatomic.h>` provides the following definitions:

```
template<class T>
using std::atomic = std::atomic<T>;           // exposition only

#define _Atomic(T) std::atomic<T>

#define ATOMIC_BOOL_LOCK_FREE see below

- ¹ Each *using-declaration* for some name *A* in the synopsis above makes available the same entity as `std::A` declared in `<atomic>` (33.5.2). Each macro listed above other than `_Atomic(T)` is defined as in `<atomic>`. It is unspecified whether `<stdatomic.h>` makes available any declarations in namespace `std`.
- ² Each of the *using-declarations* for `intN_t`, `uintN_t`, `intptr_t`, and `uintptr_t` listed above is defined if and only if the implementation defines the corresponding *typedef-name* in 33.5.2.
- ³ Neither the `_Atomic` macro, nor any of the non-macro global namespace declarations, are provided by any C++ standard library header other than `<stdatomic.h>`.
- ⁴ *Recommended practice:* Implementations should ensure that C and C++ representations of atomic objects are compatible, so that the same object can be accessed as both an `_Atomic(T)` from C code and an `atomic<T>` from C++ code. The representations should be the same, and the mechanisms used to ensure atomicity and memory ordering should be compatible.

33.6 Mutual exclusion

[thread.mutex]

33.6.1 General

[thread.mutex.general]

- ¹ Subclause 33.6 provides mechanisms for mutual exclusion: mutexes, locks, and call once. These mechanisms ease the production of race-free programs (6.9.2).

33.6.2 Header <mutex> synopsis

[mutex.syn]

```
namespace std {
    // 33.6.4.2.2, class mutex
    class mutex;
    // 33.6.4.2.3, class recursive_mutex
    class recursive_mutex;
    // 33.6.4.3.2 class timed_mutex
    class timed_mutex;
    // 33.6.4.3.3, class recursive_timed_mutex
    class recursive_timed_mutex;

    struct defer_lock_t { explicit defer_lock_t() = default; };
    struct try_to_lock_t { explicit try_to_lock_t() = default; };
    struct adopt_lock_t { explicit adopt_lock_t() = default; };

    inline constexpr defer_lock_t  defer_lock {};
    inline constexpr try_to_lock_t try_to_lock {};
    inline constexpr adopt_lock_t  adopt_lock {};

    // 33.6.5, locks
    template<class Mutex> class lock_guard;
    template<class... MutexTypes> class scoped_lock;
    template<class Mutex> class unique_lock;

    template<class Mutex>
        void swap(unique_lock<Mutex>& x, unique_lock<Mutex>& y) noexcept;

    // 33.6.6, generic locking algorithms
    template<class L1, class L2, class... L3> int try_lock(L1&, L2&, L3&...);
    template<class L1, class L2, class... L3> void lock(L1&, L2&, L3&...);

    struct once_flag;

    template<class Callable, class... Args>
        void call_once(once_flag& flag, Callable&& func, Args&&... args);
}
```

33.6.3 Header <shared_mutex> synopsis

[shared.mutex.syn]

```
namespace std {
    // 33.6.4.4.2, class shared_mutex
    class shared_mutex;
```

```
// 33.6.4.5.2, class shared_timed_mutex
class shared_timed_mutex;
// 33.6.5.5, class template shared_lock
template<class Mutex> class shared_lock;
template<class Mutex>
void swap(shared_lock<Mutex>& x, shared_lock<Mutex>& y) noexcept;
}
```

33.6.4 Mutex requirements

[**thread.mutex.requirements**]

33.6.4.1 In general

[**thread.mutex.requirements.general**]

- 1 A mutex object facilitates protection against data races and allows safe synchronization of data between execution agents (33.2.5). An execution agent *owns* a mutex from the time it successfully calls one of the lock functions until it calls unlock. Mutexes can be either recursive or non-recursive, and can grant simultaneous ownership to one or many execution agents. Both recursive and non-recursive mutexes are supplied.

33.6.4.2 Mutex types

[**thread.mutex.requirements.mutex**]

33.6.4.2.1 General

[**thread.mutex.requirements.mutex.general**]

- 1 The *mutex types* are the standard library types `mutex`, `recursive_mutex`, `timed_mutex`, `recursive_timed_mutex`, `shared_mutex`, and `shared_timed_mutex`. They meet the requirements set out in 33.6.4.2. In this description, `m` denotes an object of a mutex type.
- NOTE 1: The mutex types meet the *Cpp17Lockable* requirements (33.2.5.3).
- 2 The mutex types meet *Cpp17DefaultConstructible* and *Cpp17Destructible*. If initialization of an object of a mutex type fails, an exception of type `system_error` is thrown. The mutex types are neither copyable nor movable.
 - 3 The error conditions for error codes, if any, reported by member functions of the mutex types are as follows:

- (3.1) — `resource_unavailable_try_again` — if any native handle type manipulated is not available.
- (3.2) — `operation_not_permitted` — if the thread does not have the privilege to perform the operation.
- (3.3) — `invalid_argument` — if any native handle type manipulated as part of mutex construction is incorrect.

- 4 The implementation provides lock and unlock operations, as described below. For purposes of determining the existence of a data race, these behave as atomic operations (6.9.2). The lock and unlock operations on a single mutex appears to occur in a single total order.

NOTE 2: This can be viewed as the modification order (6.9.2) of the mutex.

NOTE 3: Construction and destruction of an object of a mutex type need not be thread-safe; other synchronization can be used to ensure that mutex objects are initialized and visible to other threads.

- 5 The expression `m.lock()` is well-formed and has the following semantics:

6 *Preconditions*: If `m` is of type `mutex`, `timed_mutex`, `shared_mutex`, or `shared_timed_mutex`, the calling thread does not own the mutex.

7 *Effects*: Blocks the calling thread until ownership of the mutex can be obtained for the calling thread.

8 *Synchronization*: Prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

9 *Postconditions*: The calling thread owns the mutex.

10 *Return type*: `void`.

11 *Throws*: `system_error` when an exception is required (33.2.2).

12 *Error conditions*:

- (12.1) — `operation_not_permitted` — if the thread does not have the privilege to perform the operation.
- (12.2) — `resource_deadlock_would_occur` — if the implementation detects that a deadlock would occur.

- 13 The expression `m.try_lock()` is well-formed and has the following semantics:

14 *Preconditions*: If `m` is of type `mutex`, `timed_mutex`, `shared_mutex`, or `shared_timed_mutex`, the calling thread does not own the mutex.

15 *Effects*: Attempts to obtain ownership of the mutex for the calling thread without blocking. If ownership is not obtained, there is no effect and `try_lock()` immediately returns. An implementation may fail to obtain the lock even if it is not held by any other thread.

NOTE 4: This spurious failure is normally uncommon, but allows interesting implementations based on a simple compare and exchange (33.5).

An implementation should ensure that `try_lock()` does not consistently return `false` in the absence of contending mutex acquisitions.

16 *Synchronization:* If `try_lock()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

NOTE 5: Since `lock()` does not synchronize with a failed subsequent `try_lock()`, the visibility rules are weak enough that little would be known about the state after a failure, even in the absence of spurious failures.

17 *Return type:* `bool`.

18 *Returns:* `true` if ownership was obtained, otherwise `false`.

19 *Throws:* Nothing.

20 The expression `m.unlock()` is well-formed and has the following semantics:

21 *Preconditions:* The calling thread owns the mutex.

22 *Effects:* Releases the calling thread's ownership of the mutex.

23 *Return type:* `void`.

24 *Synchronization:* This operation synchronizes with (6.9.2) subsequent lock operations that obtain ownership on the same object.

25 *Throws:* Nothing.

33.6.4.2.2 Class mutex

[thread.mutex.class]

```
namespace std {
    class mutex {
        public:
            constexpr mutex() noexcept;
            ~mutex();

            mutex(const mutex&) = delete;
            mutex& operator=(const mutex&) = delete;

            void lock();
            bool try_lock();
            void unlock();

            using native_handle_type = implementation-defined;           // see 33.2.3
            native_handle_type native_handle();                          // see 33.2.3
    };
}
```

- 1 The class `mutex` provides a non-recursive mutex with exclusive ownership semantics. If one thread owns a mutex object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`) until the owning thread has released ownership with a call to `unlock()`.
- 2 NOTE 1: After a thread A has called `unlock()`, releasing a mutex, it is possible for another thread B to lock the same mutex, observe that it is no longer in use, unlock it, and destroy it, before thread A appears to have returned from its unlock call. Implementations are required to handle such scenarios correctly, as long as thread A doesn't access the mutex after the unlock call returns. These cases typically occur when a reference-counted object contains a mutex that is used to protect the reference count.
- 3 The class `mutex` meets all of the mutex requirements (33.6.4). It is a standard-layout class (11.2).
- 4 NOTE 2: A program can deadlock if the thread that owns a `mutex` object calls `lock()` on that object. If the implementation can detect the deadlock, a `resource_deadlock_would_occur` error condition can be observed.
- 5 The behavior of a program is undefined if it destroys a `mutex` object owned by any thread or a thread terminates while owning a `mutex` object.

33.6.4.2.3 Class recursive_mutex

[thread.mutex.recursive]

```
namespace std {
    class recursive_mutex {
        public:
```

```

recursive_mutex();
~recursive_mutex();

recursive_mutex(const recursive_mutex&) = delete;
recursive_mutex& operator=(const recursive_mutex&) = delete;

void lock();
bool try_lock() noexcept;
void unlock();

using native_handle_type = implementation-defined;           // see 33.2.3
native_handle_type native_handle();                            // see 33.2.3
};

}

```

- ¹ The class `recursive_mutex` provides a recursive mutex with exclusive ownership semantics. If one thread owns a `recursive_mutex` object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`) until the first thread has completely released ownership.
- ² The class `recursive_mutex` meets all of the mutex requirements (33.6.4). It is a standard-layout class (11.2).
- ³ A thread that owns a `recursive_mutex` object may acquire additional levels of ownership by calling `lock()` or `try_lock()` on that object. It is unspecified how many levels of ownership may be acquired by a single thread. If a thread has already acquired the maximum level of ownership for a `recursive_mutex` object, additional calls to `try_lock()` fail, and additional calls to `lock()` throw an exception of type `system_error`. A thread shall call `unlock()` once for each level of ownership acquired by calls to `lock()` and `try_lock()`. Only when all levels of ownership have been released may ownership be acquired by another thread.
- ⁴ The behavior of a program is undefined if:
 - (4.1) — it destroys a `recursive_mutex` object owned by any thread or
 - (4.2) — a thread terminates while owning a `recursive_mutex` object.

33.6.4.3 Timed mutex types

[thread.timedmutex.requirements]

33.6.4.3.1 General

[thread.timedmutex.requirements.general]

- ¹ The *timed mutex types* are the standard library types `timed_mutex`, `recursive_timed_mutex`, and `shared_timed_mutex`. They meet the requirements set out below. In this description, `m` denotes an object of a mutex type, `rel_time` denotes an object of an instantiation of `duration` (29.5), and `abs_time` denotes an object of an instantiation of `time_point` (29.6).

NOTE 1: The timed mutex types meet the *Cpp17TimedLockable* requirements (33.2.5.4).

- ² The expression `m.try_lock_for(rel_time)` is well-formed and has the following semantics:

- ³ *Preconditions*: If `m` is of type `timed_mutex` or `shared_timed_mutex`, the calling thread does not own the mutex.
- ⁴ *Effects*: The function attempts to obtain ownership of the mutex within the relative timeout (33.2.4) specified by `rel_time`. If the time specified by `rel_time` is less than or equal to `rel_time.zero()`, the function attempts to obtain ownership without blocking (as if by calling `try_lock()`). The function returns within the timeout specified by `rel_time` only if it has obtained ownership of the mutex object.

NOTE 2: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so.

- ⁵ *Synchronization*: If `try_lock_for()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

- ⁶ *Return type*: `bool`.

- ⁷ *Returns*: `true` if ownership was obtained, otherwise `false`.

- ⁸ *Throws*: Timeout-related exceptions (33.2.4).

- ⁹ The expression `m.try_lock_until(abs_time)` is well-formed and has the following semantics:

- ¹⁰ *Preconditions*: If `m` is of type `timed_mutex` or `shared_timed_mutex`, the calling thread does not own the mutex.

11 *Effects:* The function attempts to obtain ownership of the mutex. If `abs_time` has already passed, the function attempts to obtain ownership without blocking (as if by calling `try_lock()`). The function returns before the absolute timeout (33.2.4) specified by `abs_time` only if it has obtained ownership of the mutex object.

NOTE 3: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so.

12 *Synchronization:* If `try_lock_until()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

13 *Return type:* `bool`.

14 *Returns:* `true` if ownership was obtained, otherwise `false`.

15 *Throws:* Timeout-related exceptions (33.2.4).

33.6.4.3.2 Class `timed_mutex`

[`thread.timedmutex.class`]

```
namespace std {
    class timed_mutex {
        public:
            timed_mutex();
            ~timed_mutex();

            timed_mutex(const timed_mutex&) = delete;
            timed_mutex& operator=(const timed_mutex&) = delete;

            void lock();           // blocking
            bool try_lock();
            template<class Rep, class Period>
                bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
            template<class Clock, class Duration>
                bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
            void unlock();

            using native_handle_type = implementation-defined;           // see 33.2.3
            native_handle_type native_handle();                          // see 33.2.3
    };
}
```

1 The class `timed_mutex` provides a non-recursive mutex with exclusive ownership semantics. If one thread owns a `timed_mutex` object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`, `try_lock_for()`, and `try_lock_until()`) until the owning thread has released ownership with a call to `unlock()` or the call to `try_lock_for()` or `try_lock_until()` times out (having failed to obtain ownership).

2 The class `timed_mutex` meets all of the timed mutex requirements (33.6.4.3). It is a standard-layout class (11.2).

3 The behavior of a program is undefined if:

- (3.1) — it destroys a `timed_mutex` object owned by any thread,
- (3.2) — a thread that owns a `timed_mutex` object calls `lock()`, `try_lock()`, `try_lock_for()`, or `try_lock_until()` on that object, or
- (3.3) — a thread terminates while owning a `timed_mutex` object.

33.6.4.3.3 Class `recursive_timed_mutex`

[`thread.timedmutex.recursive`]

```
namespace std {
    class recursive_timed_mutex {
        public:
            recursive_timed_mutex();
            ~recursive_timed_mutex();

            recursive_timed_mutex(const recursive_timed_mutex&) = delete;
            recursive_timed_mutex& operator=(const recursive_timed_mutex&) = delete;
```

```

    void lock();      // blocking
    bool try_lock() noexcept;
    template<class Rep, class Period>
        bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
    template<class Clock, class Duration>
        bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
    void unlock();

    using native_handle_type = implementation-defined;           // see 33.2.3
    native_handle_type native_handle();                                // see 33.2.3
};

}

```

- ¹ The class `recursive_timed_mutex` provides a recursive mutex with exclusive ownership semantics. If one thread owns a `recursive_timed_mutex` object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`, `try_lock_for()`, and `try_lock_until()`) until the owning thread has completely released ownership or the call to `try_lock_for()` or `try_lock_until()` times out (having failed to obtain ownership).
- ² The class `recursive_timed_mutex` meets all of the timed mutex requirements (33.6.4.3). It is a standard-layout class (11.2).
- ³ A thread that owns a `recursive_timed_mutex` object may acquire additional levels of ownership by calling `lock()`, `try_lock()`, `try_lock_for()`, or `try_lock_until()` on that object. It is unspecified how many levels of ownership may be acquired by a single thread. If a thread has already acquired the maximum level of ownership for a `recursive_timed_mutex` object, additional calls to `try_lock()`, `try_lock_for()`, or `try_lock_until()` fail, and additional calls to `lock()` throw an exception of type `system_error`. A thread shall call `unlock()` once for each level of ownership acquired by calls to `lock()`, `try_lock()`, `try_lock_for()`, and `try_lock_until()`. Only when all levels of ownership have been released may ownership of the object be acquired by another thread.
- ⁴ The behavior of a program is undefined if:
 - (4.1) — it destroys a `recursive_timed_mutex` object owned by any thread, or
 - (4.2) — a thread terminates while owning a `recursive_timed_mutex` object.

33.6.4.4 Shared mutex types

[thread.sharedmutex.requirements]

33.6.4.4.1 General

[thread.sharedmutex.requirements.general]

- ¹ The standard library types `shared_mutex` and `shared_timed_mutex` are *shared mutex types*. Shared mutex types meet the requirements of mutex types (33.6.4.2) and additionally meet the requirements set out below. In this description, `m` denotes an object of a shared mutex type.
NOTE: The shared mutex types meet the `Cpp17SharedLockable` requirements (33.2.5.5).
- ² In addition to the exclusive lock ownership mode specified in 33.6.4.2, shared mutex types provide a *shared lock* ownership mode. Multiple execution agents can simultaneously hold a shared lock ownership of a shared mutex type. But no execution agent holds a shared lock while another execution agent holds an exclusive lock on the same shared mutex type, and vice-versa. The maximum number of execution agents which can share a shared lock on a single shared mutex type is unspecified, but is at least 10000. If more than the maximum number of execution agents attempt to obtain a shared lock, the excess execution agents block until the number of shared locks are reduced below the maximum amount by other execution agents releasing their shared lock.
- ³ The expression `m.lock_shared()` is well-formed and has the following semantics:

⁴ *Preconditions*: The calling thread has no ownership of the mutex.

⁵ *Effects*: Blocks the calling thread until shared ownership of the mutex can be obtained for the calling thread. If an exception is thrown then a shared lock has not been acquired for the current thread.

⁶ *Synchronization*: Prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

⁷ *Postconditions*: The calling thread has a shared lock on the mutex.

⁸ *Return type*: `void`.

⁹ *Throws*: `system_error` when an exception is required (33.2.2).

¹⁰ *Error conditions*:

- (10.1) — `operation_not_permitted` — if the thread does not have the privilege to perform the operation.
- (10.2) — `resource_deadlock_would_occur` — if the implementation detects that a deadlock would occur.
- 11 The expression `m.unlock_shared()` is well-formed and has the following semantics:
- 12 *Preconditions*: The calling thread holds a shared lock on the mutex.
- 13 *Effects*: Releases a shared lock on the mutex held by the calling thread.
- 14 *Return type*: `void`.
- 15 *Synchronization*: This operation synchronizes with (6.9.2) subsequent `lock()` operations that obtain ownership on the same object.
- 16 *Throws*: Nothing.
- 17 The expression `m.try_lock_shared()` is well-formed and has the following semantics:
- 18 *Preconditions*: The calling thread has no ownership of the mutex.
- 19 *Effects*: Attempts to obtain shared ownership of the mutex for the calling thread without blocking. If shared ownership is not obtained, there is no effect and `try_lock_shared()` immediately returns. An implementation may fail to obtain the lock even if it is not held by any other thread.
- 20 *Synchronization*: If `try_lock_shared()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.
- 21 *Return type*: `bool`.
- 22 *Returns*: `true` if the shared lock was acquired, otherwise `false`.
- 23 *Throws*: Nothing.

33.6.4.4.2 Class `shared_mutex`

[`thread.sharedmutex.class`]

```
namespace std {
    class shared_mutex {
        public:
            shared_mutex();
            ~shared_mutex();

            shared_mutex(const shared_mutex&) = delete;
            shared_mutex& operator=(const shared_mutex&) = delete;

            // exclusive ownership
            void lock();                                // blocking
            bool try_lock();                            // blocking
            void unlock();

            // shared ownership
            void lock_shared();                         // blocking
            bool try_lock_shared();                     // see 33.2.3
            void unlock_shared();                       // see 33.2.3
    };
}
```

- 1 The class `shared_mutex` provides a non-recursive mutex with shared ownership semantics.
- 2 The class `shared_mutex` meets all of the shared mutex requirements (33.6.4.4). It is a standard-layout class (11.2).
- 3 The behavior of a program is undefined if:
- (3.1) — it destroys a `shared_mutex` object owned by any thread,
- (3.2) — a thread attempts to recursively gain any ownership of a `shared_mutex`, or
- (3.3) — a thread terminates while possessing any ownership of a `shared_mutex`.
- 4 `shared_mutex` may be a synonym for `shared_timed_mutex`.

33.6.4.5 Shared timed mutex types[**thread.sharedtimedmutex.requirements**]**33.6.4.5.1 General**[**thread.sharedtimedmutex.requirements.general**]

- ¹ The standard library type `shared_timed_mutex` is a *shared timed mutex type*. Shared timed mutex types meet the requirements of timed mutex types (33.6.4.3), shared mutex types (33.6.4.4), and additionally meet the requirements set out below. In this description, `m` denotes an object of a shared timed mutex type, `rel_time` denotes an object of an instantiation of duration (29.5), and `abs_time` denotes an object of an instantiation of `time_point` (29.6).

NOTE 1: The shared timed mutex types meet the *Cpp17SharedTimedLockable* requirements (33.2.5.6).

- ² The expression `m.try_lock_shared_for(rel_time)` is well-formed and has the following semantics:

³ *Preconditions*: The calling thread has no ownership of the mutex.

⁴ *Effects*: Attempts to obtain shared lock ownership for the calling thread within the relative timeout (33.2.4) specified by `rel_time`. If the time specified by `rel_time` is less than or equal to `rel_time.zero()`, the function attempts to obtain ownership without blocking (as if by calling `try_lock_shared()`). The function returns within the timeout specified by `rel_time` only if it has obtained shared ownership of the mutex object.

NOTE 2: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so.

If an exception is thrown then a shared lock has not been acquired for the current thread.

⁵ *Synchronization*: If `try_lock_shared_for()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

⁶ *Return type*: `bool`.

⁷ *Returns*: `true` if the shared lock was acquired, otherwise `false`.

⁸ *Throws*: Timeout-related exceptions (33.2.4).

- ⁹ The expression `m.try_lock_shared_until(abs_time)` is well-formed and has the following semantics:

¹⁰ *Preconditions*: The calling thread has no ownership of the mutex.

¹¹ *Effects*: The function attempts to obtain shared ownership of the mutex. If `abs_time` has already passed, the function attempts to obtain shared ownership without blocking (as if by calling `try_lock_shared()`). The function returns before the absolute timeout (33.2.4) specified by `abs_time` only if it has obtained shared ownership of the mutex object.

NOTE 3: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so.

If an exception is thrown then a shared lock has not been acquired for the current thread.

¹² *Synchronization*: If `try_lock_shared_until()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

¹³ *Return type*: `bool`.

¹⁴ *Returns*: `true` if the shared lock was acquired, otherwise `false`.

¹⁵ *Throws*: Timeout-related exceptions (33.2.4).

33.6.4.5.2 Class `shared_timed_mutex`[**thread.sharedtimedmutex.class**]

```
namespace std {
    class shared_timed_mutex {
        public:
            shared_timed_mutex();
            ~shared_timed_mutex();

            shared_timed_mutex(const shared_timed_mutex&) = delete;
            shared_timed_mutex& operator=(const shared_timed_mutex&) = delete;

            // exclusive ownership
            void lock();                                // blocking
            bool try_lock();
            template<class Rep, class Period>
                bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
```

```

template<class Clock, class Duration>
    bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
void unlock();

// shared ownership
void lock_shared();           // blocking
bool try_lock_shared();
template<class Rep, class Period>
    bool try_lock_shared_for(const chrono::duration<Rep, Period>& rel_time);
template<class Clock, class Duration>
    bool try_lock_shared_until(const chrono::time_point<Clock, Duration>& abs_time);
void unlock_shared();
};

}

```

- ¹ The class `shared_timed_mutex` provides a non-recursive mutex with shared ownership semantics.
- ² The class `shared_timed_mutex` meets all of the shared timed mutex requirements (33.6.4.5). It is a standard-layout class (11.2).
- ³ The behavior of a program is undefined if:
 - (3.1) — it destroys a `shared_timed_mutex` object owned by any thread,
 - (3.2) — a thread attempts to recursively gain any ownership of a `shared_timed_mutex`, or
 - (3.3) — a thread terminates while possessing any ownership of a `shared_timed_mutex`.

33.6.5 Locks

[thread.lock]

33.6.5.1 General

[thread.lock.general]

- ¹ A *lock* is an object that holds a reference to a lockable object and may unlock the lockable object during the lock's destruction (such as when leaving block scope). An execution agent may use a lock to aid in managing ownership of a lockable object in an exception safe manner. A lock is said to *own* a lockable object if it is currently managing the ownership of that lockable object for an execution agent. A lock does not manage the lifetime of the lockable object it references.

NOTE: Locks are intended to ease the burden of unlocking the lockable object under both normal and exceptional circumstances.

- ² Some lock constructors take tag types which describe what should be done with the lockable object during the lock's construction.

```

namespace std {
    struct defer_lock_t { };          // do not acquire ownership of the mutex
    struct try_to_lock_t { };         // try to acquire ownership of the mutex
                                      // without blocking
    struct adopt_lock_t { };          // assume the calling thread has already
                                      // obtained mutex ownership and manage it

    inline constexpr defer_lock_t    defer_lock { };
    inline constexpr try_to_lock_t   try_to_lock { };
    inline constexpr adopt_lock_t   adopt_lock { };
}

```

33.6.5.2 Class template lock_guard

[thread.lock.guard]

```

namespace std {
    template<class Mutex>
    class lock_guard {
    public:
        using mutex_type = Mutex;

        explicit lock_guard(mutex_type& m);
        lock_guard(mutex_type& m, adopt_lock_t);
        ~lock_guard();

        lock_guard(const lock_guard&) = delete;
        lock_guard& operator=(const lock_guard&) = delete;
    };
}

```

```

private:
    mutex_type& pm;           // exposition only
};

}

```

- ¹ An object of type `lock_guard` controls the ownership of a lockable object within a scope. A `lock_guard` object maintains ownership of a lockable object throughout the `lock_guard` object's lifetime (6.7.3). The behavior of a program is undefined if the lockable object referenced by `pm` does not exist for the entire lifetime of the `lock_guard` object. The supplied `Mutex` type shall meet the *Cpp17BasicLockable* requirements (33.2.5.2).

```

explicit lock_guard(mutex_type& m);
2   Effects: Initializes pm with m. Calls m.lock().

```

```

lock_guard(mutex_type& m, adopt_lock_t);
3   Preconditions: The calling thread holds a non-shared lock on m.
4   Effects: Initializes pm with m.
5   Throws: Nothing.

```

```

~lock_guard();
6   Effects: Equivalent to: pm.unlock()

```

33.6.5.3 Class template `scoped_lock`

[thread.lock.scoped]

```

namespace std {
    template<class... MutexTypes>
    class scoped_lock {
public:
    using mutex_type = see below;      // Only if sizeof...(MutexTypes) == 1 is true

    explicit scoped_lock(MutexTypes&... m);
    explicit scoped_lock(adopt_lock_t, MutexTypes&... m);
    ~scoped_lock();

    scoped_lock(const scoped_lock&) = delete;
    scoped_lock& operator=(const scoped_lock&) = delete;

private:
    tuple<MutexTypes&...> pm;      // exposition only
};
}

```

- ¹ An object of type `scoped_lock` controls the ownership of lockable objects within a scope. A `scoped_lock` object maintains ownership of lockable objects throughout the `scoped_lock` object's lifetime (6.7.3). The behavior of a program is undefined if the lockable objects referenced by `pm` do not exist for the entire lifetime of the `scoped_lock` object.

- (1.1) — If `sizeof...(MutexTypes)` is one, let `Mutex` denote the sole type constituting the pack `MutexTypes`. `Mutex` shall meet the *Cpp17BasicLockable* requirements (33.2.5.2). The member `typedef-name mutex_type` denotes the same type as `Mutex`.
- (1.2) — Otherwise, all types in the template parameter pack `MutexTypes` shall meet the *Cpp17Lockable* requirements (33.2.5.3) and there is no member `mutex_type`.

```

explicit scoped_lock(MutexTypes&... m);

```

- ² Effects: Initializes `pm` with `tie(m...)`. Then if `sizeof...(MutexTypes)` is 0, no effects. Otherwise if `sizeof...(MutexTypes)` is 1, then `m.lock()`. Otherwise, `lock(m...)`.

```

explicit scoped_lock(adopt_lock_t, MutexTypes&... m);

```

- ³ Preconditions: The calling thread holds a non-shared lock on each element of `m`.

- ⁴ Effects: Initializes `pm` with `tie(m...)`.

- ⁵ Throws: Nothing.

```
~scoped_lock();
```

- 6 *Effects:* For all *i* in [0, *sizeof*...(*MutexTypes*)), *get*<*i*>(*pm*).*unlock*().

33.6.5.4 Class template `unique_lock`

[`thread.lock.unique`]

33.6.5.4.1 General

[`thread.lock.unique.general`]

```
namespace std {
    template<class Mutex>
    class unique_lock {
        public:
            using mutex_type = Mutex;

            // 33.6.5.4.2, construct/copy/destroy
            unique_lock() noexcept;
            explicit unique_lock(mutex_type& m);
            unique_lock(mutex_type& m, defer_lock_t) noexcept;
            unique_lock(mutex_type& m, try_to_lock_t);
            unique_lock(mutex_type& m, adopt_lock_t);
            template<class Clock, class Duration>
                unique_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
            template<class Rep, class Period>
                unique_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
            ~unique_lock();

            unique_lock(const unique_lock&) = delete;
            unique_lock& operator=(const unique_lock&) = delete;

            unique_lock(unique_lock&& u) noexcept;
            unique_lock& operator=(unique_lock&& u);

            // 33.6.5.4.3, locking
            void lock();
            bool try_lock();

            template<class Rep, class Period>
                bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
            template<class Clock, class Duration>
                bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);

            void unlock();

            // 33.6.5.4.4, modifiers
            void swap(unique_lock& u) noexcept;
            mutex_type* release() noexcept;

            // 33.6.5.4.5, observers
            bool owns_lock() const noexcept;
            explicit operator bool () const noexcept;
            mutex_type* mutex() const noexcept;

        private:
            mutex_type* pm;           // exposition only
            bool owns;               // exposition only
        };
}
```

- 1 An object of type `unique_lock` controls the ownership of a lockable object within a scope. Ownership of the lockable object may be acquired at construction or after construction, and may be transferred, after acquisition, to another `unique_lock` object. Objects of type `unique_lock` are not copyable but are movable. The behavior of a program is undefined if the contained pointer *pm* is not null and the lockable object pointed to by *pm* does not exist for the entire remaining lifetime (6.7.3) of the `unique_lock` object. The supplied `Mutex` type shall meet the *Cpp17BasicLockable* requirements (33.2.5.2).

² NOTE: `unique_lock<Mutex>` meets the *Cpp17BasicLockable* requirements. If `Mutex` meets the *Cpp17Lockable* requirements (33.2.5.3), `unique_lock<Mutex>` also meets the *Cpp17Lockable* requirements; if `Mutex` meets the *Cpp17TimedLockable* requirements (33.2.5.4), `unique_lock<Mutex>` also meets the *Cpp17TimedLockable* requirements.

33.6.5.4.2 Constructors, destructor, and assignment

[`thread.lock.unique.cons`]

`unique_lock() noexcept;`

¹ *Postconditions*: `pm == nullptr` and `owns == false`.

`explicit unique_lock(mutex_type& m);`

² *Effects*: Calls `m.lock()`.

³ *Postconditions*: `pm == addressof(m)` and `owns == true`.

`unique_lock(mutex_type& m, defer_lock_t) noexcept;`

⁴ *Postconditions*: `pm == addressof(m)` and `owns == false`.

`unique_lock(mutex_type& m, try_to_lock_t);`

⁵ *Preconditions*: The supplied `Mutex` type meets the *Cpp17Lockable* requirements (33.2.5.3).

⁶ *Effects*: Calls `m.try_lock()`.

⁷ *Postconditions*: `pm == addressof(m)` and `owns == res`, where `res` is the value returned by the call to `m.try_lock()`.

`unique_lock(mutex_type& m, adopt_lock_t);`

⁸ *Preconditions*: The calling thread holds a non-shared lock on `m`.

⁹ *Postconditions*: `pm == addressof(m)` and `owns == true`.

¹⁰ *Throws*: Nothing.

`template<class Clock, class Duration>`

`unique_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);`

¹¹ *Preconditions*: The supplied `Mutex` type meets the *Cpp17TimedLockable* requirements (33.2.5.4).

¹² *Effects*: Calls `m.try_lock_until(abs_time)`.

¹³ *Postconditions*: `pm == addressof(m)` and `owns == res`, where `res` is the value returned by the call to `m.try_lock_until(abs_time)`.

`template<class Rep, class Period>`

`unique_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);`

¹⁴ *Preconditions*: The supplied `Mutex` type meets the *Cpp17TimedLockable* requirements (33.2.5.4).

¹⁵ *Effects*: Calls `m.try_lock_for(rel_time)`.

¹⁶ *Postconditions*: `pm == addressof(m)` and `owns == res`, where `res` is the value returned by the call to `m.try_lock_for(rel_time)`.

`unique_lock(unique_lock&& u) noexcept;`

¹⁷ *Postconditions*: `pm == u_p.pm` and `owns == u_p.owns` (where `u_p` is the state of `u` just prior to this construction), `u.pm == 0` and `u.owns == false`.

`unique_lock& operator=(unique_lock&& u);`

¹⁸ *Effects*: If `owns` calls `pm->unlock()`.

¹⁹ *Postconditions*: `pm == u_p.pm` and `owns == u_p.owns` (where `u_p` is the state of `u` just prior to this construction), `u.pm == 0` and `u.owns == false`.

²⁰ NOTE: With a recursive mutex it is possible for both `*this` and `u` to own the same mutex before the assignment. In this case, `*this` will own the mutex after the assignment and `u` will not.

²¹ *Throws*: Nothing.

`~unique_lock();`

²² *Effects*: If `owns` calls `pm->unlock()`.

33.6.5.4.3 Locking

[thread.lock.unique.locking]

`void lock();`1 *Effects:* As if by `pm->lock()`.2 *Postconditions:* `owns == true`.3 *Throws:* Any exception thrown by `pm->lock()`. `system_error` when an exception is required (33.2.2).4 *Error conditions:*(4.1) — `operation_not_permitted` — if `pm` is `nullptr`.(4.2) — `resource_deadlock_would_occur` — if on entry `owns` is `true`.`bool try_lock();`5 *Preconditions:* The supplied Mutex meets the *Cpp17Lockable* requirements (33.2.5.3).6 *Effects:* As if by `pm->try_lock()`.7 *Postconditions:* `owns == res`, where `res` is the value returned by `pm->try_lock()`.8 *Returns:* The value returned by `pm->try_lock()`.9 *Throws:* Any exception thrown by `pm->try_lock()`. `system_error` when an exception is required (33.2.2).10 *Error conditions:*(10.1) — `operation_not_permitted` — if `pm` is `nullptr`.(10.2) — `resource_deadlock_would_occur` — if on entry `owns` is `true`.`template<class Clock, class Duration>``bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);`11 *Preconditions:* The supplied Mutex type meets the *Cpp17TimedLockable* requirements (33.2.5.4).12 *Effects:* As if by `pm->try_lock_until(abs_time)`.13 *Postconditions:* `owns == res`, where `res` is the value returned by `pm->try_lock_until(abs_time)`.14 *Returns:* The value returned by `pm->try_lock_until(abs_time)`.15 *Throws:* Any exception thrown by `pm->try_lock_until(abstime)`. `system_error` when an exception is required (33.2.2).16 *Error conditions:*(16.1) — `operation_not_permitted` — if `pm` is `nullptr`.(16.2) — `resource_deadlock_would_occur` — if on entry `owns` is `true`.`template<class Rep, class Period>``bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);`17 *Preconditions:* The supplied Mutex type meets the *Cpp17TimedLockable* requirements (33.2.5.4).18 *Effects:* As if by `pm->try_lock_for(rel_time)`.19 *Postconditions:* `owns == res`, where `res` is the value returned by `pm->try_lock_for(rel_time)`.20 *Returns:* The value returned by `pm->try_lock_for(rel_time)`.21 *Throws:* Any exception thrown by `pm->try_lock_for(rel_time)`. `system_error` when an exception is required (33.2.2).22 *Error conditions:*(22.1) — `operation_not_permitted` — if `pm` is `nullptr`.(22.2) — `resource_deadlock_would_occur` — if on entry `owns` is `true`.`void unlock();`23 *Effects:* As if by `pm->unlock()`.24 *Postconditions:* `owns == false`.25 *Throws:* `system_error` when an exception is required (33.2.2).

26 *Error conditions:*(26.1) — `operation_not_permitted` — if on entry `owns` is `false`.**33.6.5.4.4 Modifiers**[`thread.lock.unique.mod`]`void swap(unique_lock& u) noexcept;`1 *Effects:* Swaps the data members of `*this` and `u`.`mutex_type* release() noexcept;`2 *Postconditions:* `pm == 0` and `owns == false`.3 *Returns:* The previous value of `pm`.`template<class Mutex>``void swap(unique_lock<Mutex>& x, unique_lock<Mutex>& y) noexcept;`4 *Effects:* As if by `x.swap(y)`.**33.6.5.4.5 Observers**[`thread.lock.unique.obs`]`bool owns_lock() const noexcept;`1 *Returns:* `owns`.`explicit operator bool() const noexcept;`2 *Returns:* `owns`.`mutex_type *mutex() const noexcept;`3 *Returns:* `pm`.**33.6.5.5 Class template shared_lock**[`thread.lock.shared`]**33.6.5.5.1 General**[`thread.lock.shared.general`]

```

            shared_lock& operator=(const shared_lock&) = delete;

            shared_lock(shared_lock&& u) noexcept;
            shared_lock& operator=(shared_lock&& u) noexcept;

            // 33.6.5.5.3, locking
            void lock();                                     // blocking
            bool try_lock();
            template<class Rep, class Period>
                bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
            template<class Clock, class Duration>
                bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
            void unlock();
    };
}
```

```

// 33.6.5.4, modifiers
void swap(shared_lock& u) noexcept;
mutex_type* release() noexcept;

// 33.6.5.5, observers
bool owns_lock() const noexcept;
explicit operator bool () const noexcept;
mutex_type* mutex() const noexcept;

private:
    mutex_type* pm;                                // exposition only
    bool owns;                                     // exposition only
};

}

```

- 1 An object of type `shared_lock` controls the shared ownership of a lockable object within a scope. Shared ownership of the lockable object may be acquired at construction or after construction, and may be transferred, after acquisition, to another `shared_lock` object. Objects of type `shared_lock` are not copyable but are movable. The behavior of a program is undefined if the contained pointer `pm` is not null and the lockable object pointed to by `pm` does not exist for the entire remaining lifetime (6.7.3) of the `shared_lock` object. The supplied `Mutex` type shall meet the *Cpp17SharedLockable* requirements (33.2.5.5).
- 2 NOTE: `shared_lock<Mutex>` meets the *Cpp17Lockable* requirements (33.2.5.3). If `Mutex` meets the *Cpp17SharedTimedLockable* requirements (33.2.5.6), `shared_lock<Mutex>` also meets the *Cpp17TimedLockable* requirements (33.2.5.4).

33.6.5.5.2 Constructors, destructor, and assignment

[thread.lock.shared.cons]

```

shared_lock() noexcept;

1   Postconditions: pm == nullptr and owns == false.

explicit shared_lock(mutex_type& m);

2   Effects: Calls m.lock_shared().

3   Postconditions: pm == addressof(m) and owns == true.

shared_lock(mutex_type& m, defer_lock_t) noexcept;

4   Postconditions: pm == addressof(m) and owns == false.

shared_lock(mutex_type& m, try_to_lock_t);

5   Effects: Calls m.try_lock_shared().

6   Postconditions: pm == addressof(m) and owns == res where res is the value returned by the call to
                    m.try_lock_shared().

shared_lock(mutex_type& m, adopt_lock_t);

7   Preconditions: The calling thread holds a shared lock on m.

8   Postconditions: pm == addressof(m) and owns == true.

template<class Clock, class Duration>
shared_lock(mutex_type& m,
           const chrono::time_point<Clock, Duration>& abs_time);

9   Preconditions: Mutex meets the Cpp17SharedTimedLockable requirements (33.2.5.6).

10  Effects: Calls m.try_lock_shared_until(abs_time).

11  Postconditions: pm == addressof(m) and owns == res where res is the value returned by the call to
                    m.try_lock_shared_until(abs_time).

template<class Rep, class Period>
shared_lock(mutex_type& m,
           const chrono::duration<Rep, Period>& rel_time);

12  Preconditions: Mutex meets the Cpp17SharedTimedLockable requirements (33.2.5.6).

13  Effects: Calls m.try_lock_shared_for(rel_time).

```

14 *Postconditions:* `pm == addressof(m)` and `owns == res` where `res` is the value returned by the call to `m.try_lock_shared_for(rel_time)`.

15 `~shared_lock();`

15 *Effects:* If `owns` calls `pm->unlock_shared()`.

16 `shared_lock(shared_lock&& sl) noexcept;`

16 *Postconditions:* `pm == sl.p.pm` and `owns == sl.p.owns` (where `sl.p` is the state of `sl` just prior to this construction), `sl.pm == nullptr` and `sl.owns == false`.

17 `shared_lock& operator=(shared_lock&& sl) noexcept;`

17 *Effects:* If `owns` calls `pm->unlock_shared()`.

18 *Postconditions:* `pm == sl.p.pm` and `owns == sl.p.owns` (where `sl.p` is the state of `sl` just prior to this assignment), `sl.pm == nullptr` and `sl.owns == false`.

33.6.5.5.3 Locking

[thread.lock.shared.locking]

`void lock();`

1 *Effects:* As if by `pm->lock_shared()`.

2 *Postconditions:* `owns == true`.

3 *Throws:* Any exception thrown by `pm->lock_shared()`. `system_error` when an exception is required ([33.2.2](#)).

4 *Error conditions:*

(4.1) — `operation_not_permitted` — if `pm` is `nullptr`.

(4.2) — `resource_deadlock_would_occur` — if on entry `owns` is `true`.

`bool try_lock();`

5 *Effects:* As if by `pm->try_lock_shared()`.

6 *Postconditions:* `owns == res`, where `res` is the value returned by the call to `pm->try_lock_shared()`.

7 *Returns:* The value returned by the call to `pm->try_lock_shared()`.

8 *Throws:* Any exception thrown by `pm->try_lock_shared()`. `system_error` when an exception is required ([33.2.2](#)).

9 *Error conditions:*

(9.1) — `operation_not_permitted` — if `pm` is `nullptr`.

(9.2) — `resource_deadlock_would_occur` — if on entry `owns` is `true`.

`template<class Clock, class Duration>``bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);`

10 *Preconditions:* `Mutex` meets the `Cpp17SharedTimedLockable` requirements ([33.2.5.6](#)).

11 *Effects:* As if by `pm->try_lock_shared_until(abs_time)`.

12 *Postconditions:* `owns == res`, where `res` is the value returned by the call to `pm->try_lock_shared_until(abs_time)`.

13 *Returns:* The value returned by the call to `pm->try_lock_shared_until(abs_time)`.

14 *Throws:* Any exception thrown by `pm->try_lock_shared_until(abs_time)`. `system_error` when an exception is required ([33.2.2](#)).

15 *Error conditions:*

(15.1) — `operation_not_permitted` — if `pm` is `nullptr`.

(15.2) — `resource_deadlock_would_occur` — if on entry `owns` is `true`.

`template<class Rep, class Period>``bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);`

16 *Preconditions:* `Mutex` meets the `Cpp17SharedTimedLockable` requirements ([33.2.5.6](#)).

17 *Effects:* As if by `pm->try_lock_shared_for(rel_time)`.
 18 *Postconditions:* `owns == res`, where `res` is the value returned by the call to `pm->try_lock_shared_for(rel_time)`.
 19 *Returns:* The value returned by the call to `pm->try_lock_shared_for(rel_time)`.
 20 *Throws:* Any exception thrown by `pm->try_lock_shared_for(rel_time)`. `system_error` when an exception is required (33.2.2).
 21 *Error conditions:*
 (21.1) — `operation_not_permitted` — if `pm` is `nullptr`.
 (21.2) — `resource_deadlock_would_occur` — if on entry `owns` is `true`.

```
void unlock();
```

22 *Effects:* As if by `pm->unlock_shared()`.
 23 *Postconditions:* `owns == false`.
 24 *Throws:* `system_error` when an exception is required (33.2.2).
 25 *Error conditions:*
 (25.1) — `operation_not_permitted` — if on entry `owns` is `false`.

33.6.5.4 Modifiers

[thread.lock.shared.mod]

`void swap(shared_lock& sl) noexcept;`1 *Effects:* Swaps the data members of `*this` and `sl`.`mutex_type* release() noexcept;`2 *Postconditions:* `pm == nullptr` and `owns == false`.3 *Returns:* The previous value of `pm`.

```
template<class Mutex>
void swap(shared_lock<Mutex>& x, shared_lock<Mutex>& y) noexcept;
```

4 *Effects:* As if by `x.swap(y)`.**33.6.5.5 Observers**

[thread.lock.shared.obs]

`bool owns_lock() const noexcept;`1 *Returns:* `owns`.`explicit operator bool() const noexcept;`2 *Returns:* `owns`.`mutex_type* mutex() const noexcept;`3 *Returns:* `pm`.**33.6.6 Generic locking algorithms**

[thread.lock.algorithm]

`template<class L1, class L2, class... L3> int try_lock(L1&, L2&, L3&...);`1 *Preconditions:* Each template parameter type meets the Cpp17Lockable requirements.NOTE 1: The `unique_lock` class template meets these requirements when suitably instantiated.2 *Effects:* Calls `try_lock()` for each argument in order beginning with the first until all arguments have been processed or a call to `try_lock()` fails, either by returning `false` or by throwing an exception. If a call to `try_lock()` fails, `unlock()` is called for all prior arguments with no further calls to `try_lock()`.3 *Returns:* `-1` if all calls to `try_lock()` returned `true`, otherwise a zero-based index value that indicates the argument for which `try_lock()` returned `false`.`template<class L1, class L2, class... L3> void lock(L1&, L2&, L3&...);`4 *Preconditions:* Each template parameter type meets the Cpp17Lockable requirements.NOTE 2: The `unique_lock` class template meets these requirements when suitably instantiated.

5 *Effects:* All arguments are locked via a sequence of calls to `lock()`, `try_lock()`, or `unlock()` on each argument. The sequence of calls does not result in deadlock, but is otherwise unspecified.

NOTE 3: A deadlock avoidance algorithm such as try-and-back-off can be used, but the specific algorithm is not specified to avoid over-constraining implementations.

If a call to `lock()` or `try_lock()` throws an exception, `unlock()` is called for any argument that had been locked by a call to `lock()` or `try_lock()`.

33.6.7 Call once

[**thread.once**]

33.6.7.1 Struct once_flag

[**thread.once.onceflag**]

```
namespace std {
    struct once_flag {
        constexpr once_flag() noexcept;

        once_flag(const once_flag&) = delete;
        once_flag& operator=(const once_flag&) = delete;
    };
}
```

1 The class `once_flag` is an opaque data structure that `call_once` uses to initialize data without causing a data race or deadlock.

`constexpr once_flag() noexcept;`

2 *Synchronization:* The construction of a `once_flag` object is not synchronized.

3 *Postconditions:* The object's internal state is set to indicate to an invocation of `call_once` with the object as its initial argument that no function has been called.

33.6.7.2 Function call_once

[**thread.once.callonce**]

```
template<class Callable, class... Args>
void call_once(once_flag& flag, Callable&& func, Args&&... args);
```

1 *Mandates:* `is_invocable_v<Callable, Args...>` is true.

2 *Effects:* An execution of `call_once` that does not call its `func` is a *passive* execution. An execution of `call_once` that calls its `func` is an *active* execution. An active execution calls `INVOKE(std::forward<Callable>(func), std::forward<Args>(args)...)` (22.10.4). If such a call to `func` throws an exception the execution is *exceptional*, otherwise it is *returning*. An exceptional execution propagates the exception to the caller of `call_once`. Among all executions of `call_once` for any given `once_flag`: at most one is a returning execution; if there is a returning execution, it is the last active execution; and there are passive executions only if there is a returning execution.

NOTE: Passive executions allow other threads to reliably observe the results produced by the earlier returning execution.

3 *Synchronization:* For any given `once_flag`: all active executions occur in a total order; completion of an active execution synchronizes with (6.9.2) the start of the next one in this total order; and the returning execution synchronizes with the return from all passive executions.

4 *Throws:* `system_error` when an exception is required (33.2.2), or any exception thrown by `func`.

5 *EXAMPLE:*

```
// global flag, regular function
void init();
std::once_flag flag;

void f() {
    std::call_once(flag, init);
}

// function static flag, function object
struct initializer {
    void operator()();
};

// local flag, function object
void g();
std::once_flag g_flag;

void h() {
    std::call_once(g_flag, g);
}
```

```

void g() {
    static std::once_flag flag2;
    std::call_once(flag2, initializer());
}

// object flag, member function
class information {
    std::once_flag verified;
    void verifier();
public:
    void verify() { std::call_once(verified, &information::verifier, *this); }
};

```

33.7 Condition variables

[thread.condition]

33.7.1 General

[thread.condition.general]

- ¹ Condition variables provide synchronization primitives used to block a thread until notified by some other thread that some condition is met or until a system time is reached. Class `condition_variable` provides a condition variable that can only wait on an object of type `unique_lock<mutex>`, allowing the implementation to be more efficient. Class `condition_variable_any` provides a general condition variable that can wait on objects of user-supplied lock types.
- ² Condition variables permit concurrent invocation of the `wait`, `wait_for`, `wait_until`, `notify_one` and `notify_all` member functions.
- ³ The executions of `notify_one` and `notify_all` are atomic. The executions of `wait`, `wait_for`, and `wait_until` are performed in three atomic parts:
 1. the release of the mutex and entry into the waiting state;
 2. the unblocking of the wait; and
 3. the reacquisition of the lock.
- ⁴ The implementation behaves as if all executions of `notify_one`, `notify_all`, and each part of the `wait`, `wait_for`, and `wait_until` executions are executed in a single unspecified total order consistent with the “happens before” order.
- ⁵ Condition variable construction and destruction need not be synchronized.

33.7.2 Header <condition_variable> synopsis

[condition.variable.syn]

```

namespace std {
    // 33.7.4, class condition_variable
    class condition_variable;
    // 33.7.5, class condition_variable_any
    class condition_variable_any;

    // 33.7.3, non-member functions
    void notify_all_at_thread_exit(condition_variable& cond, unique_lock<mutex> lk);

    enum class cv_status { no_timeout, timeout };
}

```

33.7.3 Non-member functions

[thread.condition.nonmember]

```
void notify_all_at_thread_exit(condition_variable& cond, unique_lock<mutex> lk);
```

- ¹ *Preconditions:* `lk` is locked by the calling thread and either
 - (1.1) — no other thread is waiting on `cond`, or
 - (1.2) — `lk.mutex()` returns the same value for each of the lock arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.
- ² *Effects:* Transfers ownership of the lock associated with `lk` into internal storage and schedules `cond` to be notified when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed. This notification is equivalent to:

```
lk.unlock();
```

cond.notify_all();

3 *Synchronization:* The implied `lk.unlock()` call is sequenced after the destruction of all objects with
thread storage duration associated with the current thread.

4 NOTE 1: The supplied lock is held until the thread exits, which can cause deadlock due to lock ordering issues.

5 NOTE 2: It is the user's responsibility to ensure that waiting threads do not erroneously assume that the thread
has finished if they experience spurious wakeups. This typically requires that the condition being waited for
is satisfied while holding the lock on `lk`, and that this lock is not released and reacquired prior to calling
`notify_all_at_thread_exit`.

33.7.4 Class `condition_variable`

[thread.condition.condvar]

```
namespace std {
    class condition_variable {
        public:
            condition_variable();
            ~condition_variable();

            condition_variable(const condition_variable&) = delete;
            condition_variable& operator=(const condition_variable&) = delete;

            void notify_one() noexcept;
            void notify_all() noexcept;
            void wait(unique_lock<mutex>& lock);
            template<class Predicate>
                void wait(unique_lock<mutex>& lock, Predicate pred);
            template<class Clock, class Duration>
                cv_status wait_until(unique_lock<mutex>& lock,
                                     const chrono::time_point<Clock, Duration>& abs_time);
            template<class Clock, class Duration, class Predicate>
                bool wait_until(unique_lock<mutex>& lock,
                               const chrono::time_point<Clock, Duration>& abs_time,
                               Predicate pred);
            template<class Rep, class Period>
                cv_status wait_for(unique_lock<mutex>& lock,
                                   const chrono::duration<Rep, Period>& rel_time);
            template<class Rep, class Period, class Predicate>
                bool wait_for(unique_lock<mutex>& lock,
                              const chrono::duration<Rep, Period>& rel_time,
                              Predicate pred);

            using native_handle_type = implementation-defined;           // see 33.2.3
            native_handle_type native_handle();                          // see 33.2.3
        };
    }
}
```

1 The class `condition_variable` is a standard-layout class (11.2).

`condition_variable();`

2 *Throws:* `system_error` when an exception is required (33.2.2).

3 *Error conditions:*

(3.1) — `resource_unavailable_try_again` — if some non-memory resource limitation prevents initial-
ization.

`~condition_variable();`

4 *Preconditions:* There is no thread blocked on `*this`.

NOTE 1: That is, all threads have been notified; they can subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. Undefined behavior ensues if a thread waits on `*this` once the destructor has been started, especially when the waiting threads are calling the wait functions in a loop or using the overloads of `wait`, `wait_for`, or `wait_until` that take a predicate.

```
void notify_one() noexcept;
```

5 *Effects:* If any threads are blocked waiting for `*this`, unblocks one of those threads.

```
void notify_all() noexcept;
```

6 *Effects:* Unblocks all threads that are blocked waiting for `*this`.

```
void wait(unique_lock<mutex>& lock);
```

7 *Preconditions:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread, and either

(7.1) — no other thread is waiting on this `condition_variable` object or

(7.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

8 *Effects:*

(8.1) — Atomically calls `lock.unlock()` and blocks on `*this`.

(8.2) — When unblocked, calls `lock.lock()` (possibly blocking on the lock), then returns.

(8.3) — The function will unblock when signaled by a call to `notify_one()` or a call to `notify_all()`, or spuriously.

9 *Postconditions:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.

10 *Throws:* Nothing.

11 *Remarks:* If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

NOTE 2: This can happen if the re-locking of the mutex throws an exception.

```
template<class Predicate>
void wait(unique_lock<mutex>& lock, Predicate pred);
```

12 *Preconditions:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread, and either

(12.1) — no other thread is waiting on this `condition_variable` object or

(12.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

13 *Effects:* Equivalent to:

```
while (!pred())
    wait(lock);
```

14 *Postconditions:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.

15 *Throws:* Any exception thrown by `pred`.

16 *Remarks:* If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

NOTE 3: This can happen if the re-locking of the mutex throws an exception.

```
template<class Clock, class Duration>
cv_status wait_until(unique_lock<mutex>& lock,
                     const chrono::time_point<Clock, Duration>& abs_time);
```

17 *Preconditions:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread, and either

(17.1) — no other thread is waiting on this `condition_variable` object or

(17.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

18 *Effects:*

(18.1) — Atomically calls `lock.unlock()` and blocks on `*this`.

(18.2) — When unblocked, calls `lock.lock()` (possibly blocking on the lock), then returns.

(18.3) — The function will unblock when signaled by a call to `notify_one()`, a call to `notify_all()`, expiration of the absolute timeout (33.2.4) specified by `abs_time`, or spuriously.

(18.4) — If the function exits via an exception, `lock.lock()` is called prior to exiting the function.

19 *Postconditions*: `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.
 20 *Returns*: `cv_status::timeout` if the absolute timeout (33.2.4) specified by `abs_time` expired, otherwise
 `cv_status::no_timeout`.
 21 *Throws*: Timeout-related exceptions (33.2.4).
 22 *Remarks*: If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

NOTE 4: This can happen if the re-locking of the mutex throws an exception.

```
template<class Rep, class Period>
cv_status wait_for(unique_lock<mutex>& lock,
                  const chrono::duration<Rep, Period>& rel_time);
```

23 *Preconditions*: `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread, and either
 (23.1) — no other thread is waiting on this `condition_variable` object or
 (23.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently
 waiting (via `wait`, `wait_for`, or `wait_until`) threads.

24 *Effects*: Equivalent to:

```
    return wait_until(lock, chrono::steady_clock::now() + rel_time);
```

25 *Postconditions*: `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.

26 *Returns*: `cv_status::timeout` if the relative timeout (33.2.4) specified by `rel_time` expired, otherwise
 `cv_status::no_timeout`.

27 *Throws*: Timeout-related exceptions (33.2.4).

28 *Remarks*: If the function fails to meet the postcondition, `terminate` is invoked (14.6.2).

NOTE 5: This can happen if the re-locking of the mutex throws an exception.

```
template<class Clock, class Duration, class Predicate>
bool wait_until(unique_lock<mutex>& lock,
                const chrono::time_point<Clock, Duration>& abs_time,
                Predicate pred);
```

29 *Preconditions*: `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread, and either
 (29.1) — no other thread is waiting on this `condition_variable` object or
 (29.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently
 waiting (via `wait`, `wait_for`, or `wait_until`) threads.

30 *Effects*: Equivalent to:

```
    while (!pred())
        if (wait_until(lock, abs_time) == cv_status::timeout)
            return pred();
        return true;
```

31 *Postconditions*: `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.

32 NOTE 6: The returned value indicates whether the predicate evaluated to `true` regardless of whether the timeout
 was triggered.

33 *Throws*: Timeout-related exceptions (33.2.4) or any exception thrown by `pred`.

34 *Remarks*: If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

NOTE 7: This can happen if the re-locking of the mutex throws an exception.

```
template<class Rep, class Period, class Predicate>
bool wait_for(unique_lock<mutex>& lock,
              const chrono::duration<Rep, Period>& rel_time,
              Predicate pred);
```

35 *Preconditions*: `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread, and either
 (35.1) — no other thread is waiting on this `condition_variable` object or
 (35.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently
 waiting (via `wait`, `wait_for`, or `wait_until`) threads.

36 *Effects*: Equivalent to:

```
37     return wait_until(lock, chrono::steady_clock::now() + rel_time, std::move(pred));
```

38 NOTE 8: There is no blocking if `pred()` is initially `true`, even if the timeout has already expired.

39 *Postconditions*: `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.

40 NOTE 9: The returned value indicates whether the predicate evaluates to `true` regardless of whether the timeout was triggered.

41 *Throws*: Timeout-related exceptions (33.2.4) or any exception thrown by `pred`.

42 *Remarks*: If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

43 NOTE 10: This can happen if the re-locking of the mutex throws an exception.

33.7.5 Class condition_variable_any

[`thread.condition.condvarany`]

33.7.5.1 General

[`thread.condition.condvarany.general`]

¹ In this subclause 33.7.5, template arguments for template parameters named `Lock` shall meet the *Cpp17BasicLockable* requirements (33.2.5.2).

NOTE 1: All of the standard mutex types meet this requirement. If a type other than one of the standard mutex types or a `unique_lock` wrapper for a standard mutex type is used with `condition_variable_any`, any necessary synchronization is assumed to be in place with respect to the predicate associated with the `condition_variable_any` instance.

```
namespace std {
    class condition_variable_any {
        public:
            condition_variable_any();
            ~condition_variable_any();

            condition_variable_any(const condition_variable_any&) = delete;
            condition_variable_any& operator=(const condition_variable_any&) = delete;

            void notify_one() noexcept;
            void notify_all() noexcept;

            // 33.7.5.2, noninterruptible waits
            template<class Lock>
            void wait(Lock& lock);
            template<class Lock, class Predicate>
            void wait(Lock& lock, Predicate pred);

            template<class Lock, class Clock, class Duration>
            cv_status wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time);
            template<class Lock, class Clock, class Duration, class Predicate>
            bool wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time,
                            Predicate pred);
            template<class Lock, class Rep, class Period>
            cv_status wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time);
            template<class Lock, class Rep, class Period, class Predicate>
            bool wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time, Predicate pred);

            // 33.7.5.3, interruptible waits
            template<class Lock, class Predicate>
            bool wait(Lock& lock, stop_token stoken, Predicate pred);
            template<class Lock, class Clock, class Duration, class Predicate>
            bool wait_until(Lock& lock, stop_token stoken,
                           const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);
            template<class Lock, class Rep, class Period, class Predicate>
            bool wait_for(Lock& lock, stop_token stoken,
                          const chrono::duration<Rep, Period>& rel_time, Predicate pred);
    };
}
```

```

condition_variable_any();

2      Throws: bad_alloc or system_error when an exception is required (33.2.2).

3      Error conditions:

(3.1)   — resource_unavailable_try_again — if some non-memory resource limitation prevents initialization.

(3.2)   — operation_not_permitted — if the thread does not have the privilege to perform the operation.

```

```
~condition_variable_any();
```

4 *Preconditions:* There is no thread blocked on `*this`.

NOTE 2: That is, all threads have been notified; they can subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. Undefined behavior ensues if a thread waits on `*this` once the destructor has been started, especially when the waiting threads are calling the wait functions in a loop or using the overloads of `wait`, `wait_for`, or `wait_until` that take a predicate.

```
void notify_one() noexcept;
```

5 *Effects:* If any threads are blocked waiting for `*this`, unblocks one of those threads.

```
void notify_all() noexcept;
```

6 *Effects:* Unblocks all threads that are blocked waiting for `*this`.

33.7.5.2 Noninterruptible waits

[`thread.condvarany.wait`]

```

template<class Lock>
void wait(Lock& lock);

```

1 *Effects:*

- (1.1) — Atomically calls `lock.unlock()` and blocks on `*this`.
- (1.2) — When unblocked, calls `lock.lock()` (possibly blocking on the lock) and returns.
- (1.3) — The function will unblock when signaled by a call to `notify_one()`, a call to `notify_all()`, or spuriously.

2 *Postconditions:* `lock` is locked by the calling thread.

3 *Throws:* Nothing.

4 *Remarks:* If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

NOTE 1: This can happen if the re-locking of the mutex throws an exception.

```

template<class Lock, class Predicate>
void wait(Lock& lock, Predicate pred);

```

5 *Effects:* Equivalent to:

```
while (!pred())
    wait(lock);
```

```

template<class Lock, class Clock, class Duration>
cv_status wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time);

```

6 *Effects:*

- (6.1) — Atomically calls `lock.unlock()` and blocks on `*this`.
- (6.2) — When unblocked, calls `lock.lock()` (possibly blocking on the lock) and returns.
- (6.3) — The function will unblock when signaled by a call to `notify_one()`, a call to `notify_all()`, expiration of the absolute timeout (33.2.4) specified by `abs_time`, or spuriously.
- (6.4) — If the function exits via an exception, `lock.lock()` is called prior to exiting the function.

7 *Postconditions:* `lock` is locked by the calling thread.

8 *Returns:* `cv_status::timeout` if the absolute timeout (33.2.4) specified by `abs_time` expired, otherwise `cv_status::no_timeout`.

9 *Throws:* Timeout-related exceptions (33.2.4).

10 *Remarks:* If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).
 NOTE 2: This can happen if the re-locking of the mutex throws an exception.

```
template<class Lock, class Rep, class Period>
    cv_status wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time);
```

11 *Effects:* Equivalent to:
 `return wait_until(lock, chrono::steady_clock::now() + rel_time);`

12 *Postconditions:* lock is locked by the calling thread.

13 *Returns:* `cv_status::timeout` if the relative timeout (33.2.4) specified by `rel_time` expired, otherwise `cv_status::no_timeout`.

14 *Throws:* Timeout-related exceptions (33.2.4).

15 *Remarks:* If the function fails to meet the postcondition, `terminate` is invoked (14.6.2).
 NOTE 3: This can happen if the re-locking of the mutex throws an exception.

```
template<class Lock, class Clock, class Duration, class Predicate>
    bool wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);
```

16 *Effects:* Equivalent to:
 `while (!pred())`
 `if (wait_until(lock, abs_time) == cv_status::timeout)`
 `return pred();`
 `return true;`

17 NOTE 4: There is no blocking if `pred()` is initially `true`, or if the timeout has already expired.

18 NOTE 5: The returned value indicates whether the predicate evaluates to `true` regardless of whether the timeout was triggered.

```
template<class Lock, class Rep, class Period, class Predicate>
    bool wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time, Predicate pred);
```

19 *Effects:* Equivalent to:
 `return wait_until(lock, chrono::steady_clock::now() + rel_time, std::move(pred));`

33.7.5.3 Interruptible waits

[thread.condvarany.intwait]

1 The following wait functions will be notified when there is a stop request on the passed `stop_token`. In that case the functions return immediately, returning `false` if the predicate evaluates to `false`.

```
template<class Lock, class Predicate>
    bool wait(Lock& lock, stop_token stoken, Predicate pred);
```

2 *Effects:* Registers for the duration of this call `*this` to get notified on a stop request on `stoken` during this call and then equivalent to:
 `while (!stoken.stop_requested()) {`
 `if (pred())`
 `return true;`
 `wait(lock);`
 `}`
 `return pred();`

3 NOTE 1: The returned value indicates whether the predicate evaluated to `true` regardless of whether there was a stop request.

4 *Postconditions:* lock is locked by the calling thread.

5 *Throws:* Any exception thrown by `pred`.

6 *Remarks:* If the function fails to meet the postcondition, `terminate` is called (14.6.2).
 NOTE 2: This can happen if the re-locking of the mutex throws an exception.

```
template<class Lock, class Clock, class Duration, class Predicate>
    bool wait_until(Lock& lock, stop_token stoken,
```

const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);

7 *Effects:* Registers for the duration of this call *this to get notified on a stop request on stoken during this call and then equivalent to:

```

while (!stoken.stop_requested()) {
    if (pred())
        return true;
    if (wait_until(lock, abs_time) == cv_status::timeout)
        return pred();
}
return pred();

```

8 NOTE 3: There is no blocking if pred() is initially true, stoken.stop_requested() was already true or the timeout has already expired.

9 NOTE 4: The returned value indicates whether the predicate evaluated to true regardless of whether the timeout was triggered or a stop request was made.

10 *Postconditions:* lock is locked by the calling thread.

11 *Throws:* Timeout-related exceptions (33.2.4), or any exception thrown by pred.

12 *Remarks:* If the function fails to meet the postcondition, terminate is called (14.6.2).

NOTE 5: This can happen if the re-locking of the mutex throws an exception.

```

template<class Lock, class Rep, class Period, class Predicate>
    bool wait_for(Lock& lock, stop_token stoken,
                  const chrono::duration<Rep, Period>& rel_time, Predicate pred);

```

13 *Effects:* Equivalent to:

```

    return wait_until(lock, std::move(stoken), chrono::steady_clock::now() + rel_time,
                      std::move(pred));

```

33.8 Semaphore

[thread.sema]

33.8.1 General

[thread.sema.general]

- 1 Semaphores are lightweight synchronization primitives used to constrain concurrent access to a shared resource. They are widely used to implement other synchronization primitives and, whenever both are applicable, can be more efficient than condition variables.
- 2 A counting semaphore is a semaphore object that models a non-negative resource count. A binary semaphore is a semaphore object that has only two states. A binary semaphore should be more efficient than the default implementation of a counting semaphore with a unit resource count.

33.8.2 Header <semaphore> synopsis

[semaphore.syn]

```

namespace std {
    // 33.8.3, class template counting_semaphore
    template<ptrdiff_t least_max_value = implementation-defined>
        class counting_semaphore;

    using binary_semaphore = counting_semaphore<1>;
}

```

33.8.3 Class template counting_semaphore

[thread.sema.cnt]

```

namespace std {
    template<ptrdiff_t least_max_value = implementation-defined>
        class counting_semaphore {
    public:
        static constexpr ptrdiff_t max() noexcept;

        constexpr explicit counting_semaphore(ptrdiff_t desired);
        ~counting_semaphore();

        counting_semaphore(const counting_semaphore&) = delete;
        counting_semaphore& operator=(const counting_semaphore&) = delete;
}

```

```

void release(ptrdiff_t update = 1);
void acquire();
bool try_acquire() noexcept;
template<class Rep, class Period>
    bool try_acquire_for(const chrono::duration<Rep, Period>& rel_time);
template<class Clock, class Duration>
    bool try_acquire_until(const chrono::time_point<Clock, Duration>& abs_time);

private:
    ptrdiff_t counter;           // exposition only
};

}

```

- ¹ Class template `counting_semaphore` maintains an internal counter that is initialized when the semaphore is created. The counter is decremented when a thread acquires the semaphore, and is incremented when a thread releases the semaphore. If a thread tries to acquire the semaphore when the counter is zero, the thread will block until another thread increments the counter by releasing the semaphore.
- ² `least_max_value` shall be non-negative; otherwise the program is ill-formed.
- ³ Concurrent invocations of the member functions of `counting_semaphore`, other than its destructor, do not introduce data races.

`static constexpr ptrdiff_t max() noexcept;`
⁴ *Returns*: The maximum value of `counter`. This value is greater than or equal to `least_max_value`.

`constexpr explicit counting_semaphore(ptrdiff_t desired);`
⁵ *Preconditions*: `desired >= 0` is true, and `desired <= max()` is true.
⁶ *Effects*: Initializes `counter` with `desired`.
⁷ *Throws*: Nothing.

`void release(ptrdiff_t update = 1);`
⁸ *Preconditions*: `update >= 0` is true, and `update <= max() - counter` is true.
⁹ *Effects*: Atomically execute `counter += update`. Then, unblocks any threads that are waiting for `counter` to be greater than zero.
¹⁰ *Synchronization*: Strongly happens before invocations of `try_acquire` that observe the result of the effects.
¹¹ *Throws*: `system_error` when an exception is required ([33.2.2](#)).
¹² *Error conditions*: Any of the error conditions allowed for mutex types ([33.6.4.2](#)).

`bool try_acquire() noexcept;`
¹³ *Effects*: Attempts to atomically decrement `counter` if it is positive, without blocking. If `counter` is not decremented, there is no effect and `try_acquire` immediately returns. An implementation may fail to decrement `counter` even if it is positive.

NOTE: This spurious failure is normally uncommon, but allows interesting implementations based on a simple compare and exchange ([33.5](#)).

An implementation should ensure that `try_acquire` does not consistently return `false` in the absence of contending semaphore operations.

¹⁴ *Returns*: `true` if `counter` was decremented, otherwise `false`.

`void acquire();`
¹⁵ *Effects*: Repeatedly performs the following steps, in order:
(15.1) — Evaluates `try_acquire()`. If the result is `true`, returns.
(15.2) — Blocks on `*this` until `counter` is greater than zero.
¹⁶ *Throws*: `system_error` when an exception is required ([33.2.2](#)).
¹⁷ *Error conditions*: Any of the error conditions allowed for mutex types ([33.6.4.2](#)).

```
template<class Rep, class Period>
    bool try_acquire_for(const chrono::duration<Rep, Period>& rel_time);
template<class Clock, class Duration>
    bool try_acquire_until(const chrono::time_point<Clock, Duration>& abs_time);
```

18 *Effects:* Repeatedly performs the following steps, in order:

- (18.1) — Evaluates `try_acquire()`. If the result is `true`, returns `true`.
- (18.2) — Blocks on `*this` until `counter` is greater than zero or until the timeout expires. If it is unblocked by the timeout expiring, returns `false`.

The timeout expires (33.2.4) when the current time is after `abs_time` (for `try_acquire_until`) or when at least `rel_time` has passed from the start of the function (for `try_acquire_for`).

19 *Throws:* Timeout-related exceptions (33.2.4), or `system_error` when a non-timeout-related exception is required (33.2.2).

20 *Error conditions:* Any of the error conditions allowed for mutex types (33.6.4.2).

33.9 Coordination types

[**thread.coord**]

33.9.1 General

[**thread.coord.general**]

- ¹ Subclause 33.9 describes various concepts related to thread coordination, and defines the coordination types `latch` and `barrier`. These types facilitate concurrent computation performed by a number of threads.

33.9.2 Latches

[**thread.latch**]

33.9.2.1 General

[**thread.latch.general**]

- ¹ A latch is a thread coordination mechanism that allows any number of threads to block until an expected number of threads arrive at the latch (via the `count_down` function). The expected count is set when the latch is created. An individual latch is a single-use object; once the expected count has been reached, the latch cannot be reused.

33.9.2.2 Header <latch> synopsis

[**latch.syn**]

```
namespace std {
    class latch;
}
```

33.9.2.3 Class latch

[**thread.latch.class**]

```
namespace std {
    class latch {
        public:
            static constexpr ptrdiff_t max() noexcept;

            constexpr explicit latch(ptrdiff_t expected);
            ~latch();

            latch(const latch&) = delete;
            latch& operator=(const latch&) = delete;

            void count_down(ptrdiff_t update = 1);
            bool try_wait() const noexcept;
            void wait() const;
            void arrive_and_wait(ptrdiff_t update = 1);

        private:
            ptrdiff_t counter; // exposition only
        };
}
```

¹ A `latch` maintains an internal counter that is initialized when the latch is created. Threads can block on the `latch` object, waiting for counter to be decremented to zero.

² Concurrent invocations of the member functions of `latch`, other than its destructor, do not introduce data races.

```

static constexpr ptrdiff_t max() noexcept;
3   Returns: The maximum value of counter that the implementation supports.

constexpr explicit latch(ptrdiff_t expected);
4   Preconditions: expected >= 0 is true and expected <= max() is true.
5   Effects: Initializes counter with expected.
6   Throws: Nothing.

void count_down(ptrdiff_t update = 1);
7   Preconditions: update >= 0 is true, and update <= counter is true.
8   Effects: Atomically decrements counter by update. If counter is equal to zero, unblocks all threads
blocked on *this.
9   Synchronization: Strongly happens before the returns from all calls that are unblocked.
10  Throws: system_error when an exception is required (33.2.2).
11  Error conditions: Any of the error conditions allowed for mutex types (33.6.4.2).

bool try_wait() const noexcept;
12 Returns: With very low probability false. Otherwise counter == 0.

void wait() const;
13 Effects: If counter equals zero, returns immediately. Otherwise, blocks on *this until a call to
count_down that decrements counter to zero.
14 Throws: system_error when an exception is required (33.2.2).
15 Error conditions: Any of the error conditions allowed for mutex types (33.6.4.2).

void arrive_and_wait(ptrdiff_t update = 1);
16 Effects: Equivalent to:
            count_down(update);
            wait();

```

33.9.3 Barriers

[thread.barrier]

33.9.3.1 General

[thread.barrier.general]

- ¹ A barrier is a thread coordination mechanism whose lifetime consists of a sequence of barrier phases, where each phase allows at most an expected number of threads to block until the expected number of threads arrive at the barrier.

NOTE: A barrier is useful for managing repeated tasks that are handled by multiple threads.

33.9.3.2 Header <barrier> synopsis

[barrier.syn]

```

namespace std {
    template<class CompletionFunction = see below>
        class barrier;
}

```

33.9.3.3 Class template barrier

[thread.barrier.class]

```

namespace std {
    template<class CompletionFunction = see below>
        class barrier {
    public:
        using arrival_token = see below;

        static constexpr ptrdiff_t max() noexcept;

        constexpr explicit barrier(ptrdiff_t expected,
                                  CompletionFunction f = CompletionFunction());
        ~barrier();
}

```

```

    barrier(const barrier&) = delete;
    barrier& operator=(const barrier&) = delete;

    [[nodiscard]] arrival_token arrive(ptrdiff_t update = 1);
    void wait(arrival_token&& arrival) const;

    void arrive_and_wait();
    void arrive_and_drop();

    private:
        CompletionFunction completion;      // exposition only
    };
}

```

- ¹ Each *barrier phase* consists of the following steps:
 - (1.1) — The expected count is decremented by each call to `arrive` or `arrive_and_drop`.
 - (1.2) — Exactly once after the expected count reaches zero, a thread executes the completion step during its call to `arrive`, `arrive_and_drop`, or `wait`, except that it is implementation-defined whether the step executes if no thread calls `wait`.
 - (1.3) — When the completion step finishes, the expected count is reset to what was specified by the `expected` argument to the constructor, possibly adjusted by calls to `arrive_and_drop`, and the next phase starts.
- ² Each phase defines a *phase synchronization point*. Threads that arrive at the barrier during the phase can block on the phase synchronization point by calling `wait`, and will remain blocked until the phase completion step is run.
- ³ The *phase completion step* that is executed at the end of each phase has the following effects:
 - (3.1) — Invokes the completion function, equivalent to `completion()`.
 - (3.2) — Unblocks all threads that are blocked on the phase synchronization point.

The end of the completion step strongly happens before the returns from all calls that were unblocked by the completion step. For specializations that do not have the default value of the `CompletionFunction` template parameter, the behavior is undefined if any of the barrier object's member functions other than `wait` are called while the completion step is in progress.

- ⁴ Concurrent invocations of the member functions of `barrier`, other than its destructor, do not introduce data races. The member functions `arrive` and `arrive_and_drop` execute atomically.
- ⁵ `CompletionFunction` shall meet the *Cpp17MoveConstructible* ([Table 31](#)) and *Cpp17Destructible* ([Table 35](#)) requirements. `is_nothrow_invocable_v<CompletionFunction&>` shall be `true`.
- ⁶ The default value of the `CompletionFunction` template parameter is an unspecified type, such that, in addition to satisfying the requirements of `CompletionFunction`, it meets the *Cpp17DefaultConstructible* requirements ([Table 30](#)) and `completion()` has no effects.
- ⁷ `barrier::arrival_token` is an unspecified type, such that it meets the *Cpp17MoveConstructible* ([Table 31](#)), *Cpp17MoveAssignable* ([Table 33](#)), and *Cpp17Destructible* ([Table 35](#)) requirements.

`static constexpr ptrdiff_t max() noexcept;`

- ⁸ *Returns*: The maximum expected count that the implementation supports.

`constexpr explicit barrier(ptrdiff_t expected,
 CompletionFunction f = CompletionFunction());`

- ⁹ *Preconditions*: `expected >= 0` is `true` and `expected <= max()` is `true`.
- ¹⁰ *Effects*: Sets both the initial expected count for each barrier phase and the current expected count for the first phase to `expected`. Initializes `completion` with `std::move(f)`. Starts the first phase.

NOTE 1: If `expected` is 0 this object can only be destroyed.

- ¹¹ *Throws*: Any exception thrown by `CompletionFunction`'s move constructor.

`[[nodiscard]] arrival_token arrive(ptrdiff_t update = 1);`

- ¹² *Preconditions*: `update > 0` is `true`, and `update` is less than or equal to the expected count for the current barrier phase.

13 *Effects:* Constructs an object of type `arrival_token` that is associated with the phase synchronization point for the current phase. Then, decrements the expected count by `update`.

14 *Synchronization:* The call to `arrive` strongly happens before the start of the phase completion step for the current phase.

15 *Returns:* The constructed `arrival_token` object.

16 *Throws:* `system_error` when an exception is required ([33.2.2](#)).

17 *Error conditions:* Any of the error conditions allowed for mutex types ([33.6.4.2](#)).

18 NOTE 2: This call can cause the completion step for the current phase to start.

```
void wait(arrival_token&& arrival) const;
```

19 *Preconditions:* `arrival` is associated with the phase synchronization point for the current phase or the immediately preceding phase of the same barrier object.

20 *Effects:* Blocks at the synchronization point associated with `std::move(arrival)` until the phase completion step of the synchronization point's phase is run.

 NOTE 3: If `arrival` is associated with the synchronization point for a previous phase, the call returns immediately.

21 *Throws:* `system_error` when an exception is required ([33.2.2](#)).

22 *Error conditions:* Any of the error conditions allowed for mutex types ([33.6.4.2](#)).

```
void arrive_and_wait();
```

23 *Effects:* Equivalent to: `wait(arrive())`.

```
void arrive_and_drop();
```

24 *Preconditions:* The expected count for the current barrier phase is greater than zero.

25 *Effects:* Decrements the initial expected count for all subsequent phases by one. Then decrements the expected count for the current phase by one.

26 *Synchronization:* The call to `arrive_and_drop` strongly happens before the start of the phase completion step for the current phase.

27 *Throws:* `system_error` when an exception is required ([33.2.2](#)).

28 *Error conditions:* Any of the error conditions allowed for mutex types ([33.6.4.2](#)).

29 NOTE 4: This call can cause the completion step for the current phase to start.

33.10 Futures

[futures]

33.10.1 Overview

[futures.overview]

¹ [33.10](#) describes components that a C++ program can use to retrieve in one thread the result (value or exception) from a function that has run in the same thread or another thread.

NOTE: These components are not restricted to multi-threaded programs but can be useful in single-threaded programs as well.

33.10.2 Header <future> synopsis

[future.syn]

```
namespace std {
    enum class future_errc {
        broken_promise = implementation-defined,
        future_already_retrieved = implementation-defined,
        promise_already_satisfied = implementation-defined,
        no_state = implementation-defined
    };

    enum class launch : unspecified {
        async = unspecified,
        deferred = unspecified,
        implementation-defined
    };
}
```

```

enum class future_status {
    ready,
    timeout,
    deferred
};

// 33.10.3, error handling
template<> struct is_error_code_enum<future_errc> : public true_type { };
error_code make_error_code(future_errc e) noexcept;
error_condition make_error_condition(future_errc e) noexcept;

const error_category& future_category() noexcept;

// 33.10.4, class future_error
class future_error;

// 33.10.6, class template promise
template<class R> class promise;
template<class R> class promise<R&>;
template<> class promise<void>;

template<class R>
void swap(promise<R>& x, promise<R>& y) noexcept;

template<class R, class Alloc>
struct uses_allocator<promise<R>, Alloc>;

// 33.10.7, class template future
template<class R> class future;
template<class R> class future<R&>;
template<> class future<void>;

// 33.10.8, class template shared_future
template<class R> class shared_future;
template<class R> class shared_future<R&>;
template<> class shared_future<void>;

// 33.10.10, class template packaged_task
template<class> class packaged_task; // not defined
template<class R, class... ArgTypes>
class packaged_task<R(ArgTypes...)>;

template<class R, class... ArgTypes>
void swap(packaged_task<R(ArgTypes...)>&, packaged_task<R(ArgTypes...)>&) noexcept;

// 33.10.9, function template async
template<class F, class... Args>
[[nodiscard]] future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
async(F&& f, Args&&... args);
template<class F, class... Args>
[[nodiscard]] future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
async(launch policy, F&& f, Args&&... args);
}

```

¹ The enum type `launch` is a bitmask type (16.3.3.3.3) with elements `launch::async` and `launch::deferred`.
 NOTE: Implementations can provide bitmasks to specify restrictions on task interaction by functions launched by `async()` applicable to a corresponding subset of available launch policies. Implementations can extend the behavior of the first overload of `async()` by adding their extensions to the launch policy under the “as if” rule.

² The enum values of `future_errc` are distinct and not zero.

33.10.3 Error handling[**futures.errors**]

```
const error_category& future_category() noexcept;
1   Returns: A reference to an object of a type derived from class error_category.
2   The object's default_error_condition and equivalent virtual functions shall behave as specified for
      the class error_category. The object's name virtual function returns a pointer to the string "future".
error_code make_error_code(future_errc e) noexcept;
3   Returns: error_code(static_cast<int>(e), future_category()).
error_condition make_error_condition(future_errc e) noexcept;
4   Returns: error_condition(static_cast<int>(e), future_category()).
```

33.10.4 Class future_error[**futures.future.error**]

```
namespace std {
    class future_error : public logic_error {
        public:
            explicit future_error(future_errc e);

            const error_code& code() const noexcept;
            const char* what() const noexcept;

        private:
            error_code ec_; // exposition only
    };
}

explicit future_error(future_errc e);
1   Effects: Initializes ec_ with make_error_code(e).
const error_code& code() const noexcept;
2   Returns: ec_.
const char* what() const noexcept;
3   Returns: An NTBS incorporating code().message().
```

33.10.5 Shared state[**futures.state**]

- 1 Many of the classes introduced in subclause 33.10 use some state to communicate results. This *shared state* consists of some state information and some (possibly not yet evaluated) *result*, which can be a (possibly `void`) value or an exception.
- NOTE 1: Futures, promises, and tasks defined in this Clause reference such shared state.
- 2 NOTE 2: The result can be any kind of object including a function to compute that result, as used by `async` when `policy` is `launch::deferred`.
 - 3 An *asynchronous return object* is an object that reads results from a shared state. A *waiting function* of an asynchronous return object is one that potentially blocks to wait for the shared state to be made ready. If a waiting function can return before the state is made ready because of a timeout (33.2.5), then it is a *timed waiting function*, otherwise it is a *non-timed waiting function*.
 - 4 An *asynchronous provider* is an object that provides a result to a shared state. The result of a shared state is set by respective functions on the asynchronous provider.

NOTE 3: Such as promises or tasks.

The means of setting the result of a shared state is specified in the description of those classes and functions that create such a state object.

- 5 When an asynchronous return object or an asynchronous provider is said to release its shared state, it means:
 - (5.1) — if the return object or provider holds the last reference to its shared state, the shared state is destroyed; and
 - (5.2) — the return object or provider gives up its reference to its shared state; and

- (5.3) — these actions will not block for the shared state to become ready, except that it may block if all of the following are true: the shared state was created by a call to `std::async`, the shared state is not yet ready, and this was the last reference to the shared state.
- 6 When an asynchronous provider is said to make its shared state ready, it means:
- (6.1) — first, the provider marks its shared state as ready; and
- (6.2) — second, the provider unblocks any execution agents waiting for its shared state to become ready.
- 7 When an asynchronous provider is said to abandon its shared state, it means:
- (7.1) — first, if that state is not ready, the provider
- (7.1.1) — stores an exception object of type `future_error` with an error condition of `broken_promise` within its shared state; and then
- (7.1.2) — makes its shared state ready;
- (7.2) — second, the provider releases its shared state.
- 8 A shared state is *ready* only if it holds a value or an exception ready for retrieval. Waiting for a shared state to become ready may invoke code to compute the result on the waiting thread if so specified in the description of the class or function that creates the state object.
- 9 Calls to functions that successfully set the stored result of a shared state synchronize with (6.9.2) calls to functions successfully detecting the ready state resulting from that setting. The storage of the result (whether normal or exceptional) into the shared state synchronizes with (6.9.2) the successful return from a call to a waiting function on the shared state.
- 10 Some functions (e.g., `promise::set_value_at_thread_exit`) delay making the shared state ready until the calling thread exits. The destruction of each of that thread's objects with thread storage duration (6.7.5.3) is sequenced before making that shared state ready.
- 11 Access to the result of the same shared state may conflict (6.9.2).

NOTE 4: This explicitly specifies that the result of the shared state is visible in the objects that reference this state in the sense of data race avoidance (16.4.6.10). For example, concurrent accesses through references returned by `shared_future::get()` (33.10.8) must either use read-only operations or provide additional synchronization.

33.10.6 Class template promise

[**futures.promise**]

```
namespace std {
    template<class R>
    class promise {
        public:
            promise();
            template<class Allocator>
            promise(allocator_arg_t, const Allocator& a);
            promise(promise&& rhs) noexcept;
            promise(const promise&) = delete;
            ~promise();

            // assignment
            promise& operator=(promise&& rhs) noexcept;
            promise& operator=(const promise&) = delete;
            void swap(promise& other) noexcept;

            // retrieving the result
            future<R> get_future();

            // setting the result
            void set_value(see below);
            void set_exception(exception_ptr p);

            // setting the result with deferred notification
            void set_value_at_thread_exit(see below);
            void set_exception_at_thread_exit(exception_ptr p);
    };
}
```

```
template<class R, class Alloc>
    struct uses_allocator<promise<R>, Alloc>;
}
```

- 1 For the primary template, `R` shall be an object type that meets the *Cpp17Destructible* requirements.
- 2 The implementation provides the template `promise` and two specializations, `promise<R&>` and `promise<void>`. These differ only in the argument type of the member functions `set_value` and `set_value_at_thread_exit`, as set out in their descriptions, below.
- 3 The `set_value`, `set_exception`, `set_value_at_thread_exit`, and `set_exception_at_thread_exit` member functions behave as though they acquire a single mutex associated with the promise object while updating the promise object.

```
template<class R, class Alloc>
    struct uses_allocator<promise<R>, Alloc>
        : true_type { };
```

- 4 *Preconditions:* `Alloc` meets the *Cpp17Allocator* requirements ([16.4.4.6.1](#)).

```
promise();
template<class Allocator>
promise(allocator_arg_t, const Allocator& a);
```

- 5 *Effects:* Creates a shared state. The second constructor uses the allocator `a` to allocate memory for the shared state.

```
promise(promise&& rhs) noexcept;
```

- 6 *Effects:* Transfers ownership of the shared state of `rhs` (if any) to the newly-constructed object.

- 7 *Postconditions:* `rhs` has no shared state.

```
~promise();
```

- 8 *Effects:* Abandons any shared state ([33.10.5](#)).

```
promise& operator=(promise&& rhs) noexcept;
```

- 9 *Effects:* Abandons any shared state ([33.10.5](#)) and then as if `promise(std::move(rhs)).swap(*this)`.

- 10 *Returns:* `*this`.

```
void swap(promise& other) noexcept;
```

- 11 *Effects:* Exchanges the shared state of `*this` and `other`.

- 12 *Postconditions:* `*this` has the shared state (if any) that `other` had prior to the call to `swap`. `other` has the shared state (if any) that `*this` had prior to the call to `swap`.

```
future<R> get_future();
```

- 13 *Synchronization:* Calls to this function do not introduce data races ([6.9.2](#)) with calls to `set_value`, `set_exception`, `set_value_at_thread_exit`, or `set_exception_at_thread_exit`.

NOTE: Such calls need not synchronize with each other.

- 14 *Returns:* A `future<R>` object with the same shared state as `*this`.

- 15 *Throws:* `future_error` if `*this` has no shared state or if `get_future` has already been called on a `promise` with the same shared state as `*this`.

- 16 *Error conditions:*

- (16.1) — `future_already_retrieved` if `get_future` has already been called on a `promise` with the same shared state as `*this`.

- (16.2) — `no_state` if `*this` has no shared state.

```
void promise::set_value(const R& r);
void promise::set_value(R&& r);
void promise<R&>::set_value(R& r);
void promise<void>::set_value();
```

- 17 *Effects:* Atomically stores the value `r` in the shared state and makes that state ready ([33.10.5](#)).

18 *Throws:*

(18.1) — `future_error` if its shared state already has a stored value or exception, or
 (18.2) — for the first version, any exception thrown by the constructor selected to copy an object of `R`, or
 (18.3) — for the second version, any exception thrown by the constructor selected to move an object of `R`.

19 *Error conditions:*

(19.1) — `promise_already_satisfied` if its shared state already has a stored value or exception.
 (19.2) — `no_state` if `*this` has no shared state.

```
void set_exception(exception_ptr p);
```

20 *Preconditions:* `p` is not null.

21 *Effects:* Atomically stores the exception pointer `p` in the shared state and makes that state ready ([33.10.5](#)).

22 *Throws:* `future_error` if its shared state already has a stored value or exception.

23 *Error conditions:*

(23.1) — `promise_already_satisfied` if its shared state already has a stored value or exception.
 (23.2) — `no_state` if `*this` has no shared state.

```
void promise::set_value_at_thread_exit(const R& r);
void promise::set_value_at_thread_exit(R&& r);
void promise<R&>::set_value_at_thread_exit(R& r);
void promise<void>::set_value_at_thread_exit();
```

24 *Effects:* Stores the value `r` in the shared state without making that state ready immediately. Schedules that state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.

25 *Throws:*

(25.1) — `future_error` if its shared state already has a stored value or exception, or
 (25.2) — for the first version, any exception thrown by the constructor selected to copy an object of `R`, or
 (25.3) — for the second version, any exception thrown by the constructor selected to move an object of `R`.

26 *Error conditions:*

(26.1) — `promise_already_satisfied` if its shared state already has a stored value or exception.
 (26.2) — `no_state` if `*this` has no shared state.

```
void set_exception_at_thread_exit(exception_ptr p);
```

27 *Preconditions:* `p` is not null.

28 *Effects:* Stores the exception pointer `p` in the shared state without making that state ready immediately. Schedules that state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.

29 *Throws:* `future_error` if an error condition occurs.

30 *Error conditions:*

(30.1) — `promise_already_satisfied` if its shared state already has a stored value or exception.
 (30.2) — `no_state` if `*this` has no shared state.

```
template<class R>
void swap(promise<R>& x, promise<R>& y) noexcept;
```

31 *Effects:* As if by `x.swap(y)`.

33.10.7 Class template future

[futures.unique.future]

- ¹ The class template `future` defines a type for asynchronous return objects which do not share their shared state with other asynchronous return objects. A default-constructed `future` object has no shared state. A `future` object with shared state can be created by functions on asynchronous providers ([33.10.5](#)) or by the move constructor and shares its shared state with the original asynchronous provider. The result (value or

exception) of a `future` object can be set by calling a respective function on an object that shares the same shared state.

- 2 NOTE 1: Member functions of `future` do not synchronize with themselves or with member functions of `shared_future`.
- 3 The effect of calling any member function other than the destructor, the move-assignment operator, `share`, or `valid` on a `future` object for which `valid() == false` is undefined.

NOTE 2: It is valid to move from a `future` object for which `valid() == false`.

Recommended practice: Implementations should detect this case and throw an object of type `future_error` with an error condition of `future_errc::no_state`.

```
namespace std {
    template<class R>
    class future {
        public:
            future() noexcept;
            future(future&&) noexcept;
            future(const future&) = delete;
            ~future();
            future& operator=(const future&) = delete;
            future& operator=(future&&) noexcept;
            shared_future<R> share() noexcept;

            // retrieving the value
            see below get();

            // functions to check state
            bool valid() const noexcept;

            void wait() const;
            template<class Rep, class Period>
                future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
            template<class Clock, class Duration>
                future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
    };
}
```

- 4 For the primary template, `R` shall be an object type that meets the *Cpp17Destructible* requirements.
- 5 The implementation provides the template `future` and two specializations, `future<R&>` and `future<void>`. These differ only in the return type and return value of the member function `get`, as set out in its description, below.

`future() noexcept;`

- 6 *Effects:* The object does not refer to a shared state.

- 7 *Postconditions:* `valid() == false`.

`future(future&& rhs) noexcept;`

- 8 *Effects:* Move constructs a `future` object that refers to the shared state that was originally referred to by `rhs` (if any).

- 9 *Postconditions:*

- (9.1) — `valid()` returns the same value as `rhs.valid()` prior to the constructor invocation.

- (9.2) — `rhs.valid() == false`.

`~future();`

- 10 *Effects:*

- (10.1) — Releases any shared state ([33.10.5](#));

- (10.2) — destroys `*this`.

`future& operator=(future&& rhs) noexcept;`

- 11 *Effects:* If `addressof(rhs) == this` is true, there are no effects. Otherwise:

(11.1) — Releases any shared state (33.10.5).

(11.2) — move assigns the contents of `rhs` to `*this`.

12 *Postconditions:*

(12.1) — `valid()` returns the same value as `rhs.valid()` prior to the assignment.

(12.2) — If `addressof(rhs) == this` is `false`, `rhs.valid() == false`.

```
shared_future<R> share() noexcept;
```

13 *Postconditions:* `valid() == false`.

14 *Returns:* `shared_future<R>(std::move(*this))`.

```
R future::get();
R& future<R&>::get();
void future<void>::get();
```

15 NOTE 3: As described above, the template and its two required specializations differ only in the return type and return value of the member function `get`.

16 *Effects:*

(16.1) — `wait()`s until the shared state is ready, then retrieves the value stored in the shared state;

(16.2) — releases any shared state (33.10.5).

17 *Postconditions:* `valid() == false`.

18 *Returns:*

(18.1) — `future::get()` returns the value `v` stored in the object's shared state as `std::move(v)`.

(18.2) — `future<R&>::get()` returns the reference stored as value in the object's shared state.

(18.3) — `future<void>::get()` returns nothing.

19 *Throws:* The stored exception, if an exception was stored in the shared state.

```
bool valid() const noexcept;
```

20 *Returns:* `true` only if `*this` refers to a shared state.

```
void wait() const;
```

21 *Effects:* Blocks until the shared state is ready.

```
template<class Rep, class Period>
future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
```

22 *Effects:* None if the shared state contains a deferred function (33.10.9), otherwise blocks until the shared state is ready or until the relative timeout (33.2.4) specified by `rel_time` has expired.

23 *Returns:*

(23.1) — `future_status::deferred` if the shared state contains a deferred function.

(23.2) — `future_status::ready` if the shared state is ready.

(23.3) — `future_status::timeout` if the function is returning because the relative timeout (33.2.4) specified by `rel_time` has expired.

24 *Throws:* timeout-related exceptions (33.2.4).

```
template<class Clock, class Duration>
future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
```

25 *Effects:* None if the shared state contains a deferred function (33.10.9), otherwise blocks until the shared state is ready or until the absolute timeout (33.2.4) specified by `abs_time` has expired.

26 *Returns:*

(26.1) — `future_status::deferred` if the shared state contains a deferred function.

(26.2) — `future_status::ready` if the shared state is ready.

(26.3) — `future_status::timeout` if the function is returning because the absolute timeout (33.2.4) specified by `abs_time` has expired.

27 *Throws:* timeout-related exceptions (33.2.4).

33.10.8 Class template shared_future

[**futures.shared.future**]

- 1 The class template `shared_future` defines a type for asynchronous return objects which may share their shared state with other asynchronous return objects. A default-constructed `shared_future` object has no shared state. A `shared_future` object with shared state can be created by conversion from a `future` object and shares its shared state with the original asynchronous provider (33.10.5) of the shared state. The result (value or exception) of a `shared_future` object can be set by calling a respective function on an object that shares the same shared state.
- 2 NOTE 1: Member functions of `shared_future` do not synchronize with themselves, but they synchronize with the shared state.
- 3 The effect of calling any member function other than the destructor, the move-assignment operator, the copy-assignment operator, or `valid()` on a `shared_future` object for which `valid() == false` is undefined.
NOTE 2: It is valid to copy or move from a `shared_future` object for which `valid()` is `false`.

Recommended practice: Implementations should detect this case and throw an object of type `future_error` with an error condition of `future_errc::no_state`.

```
namespace std {
    template<class R>
    class shared_future {
        public:
            shared_future() noexcept;
            shared_future(const shared_future& rhs) noexcept;
            shared_future(future<R>&&) noexcept;
            shared_future(shared_future&& rhs) noexcept;
            ~shared_future();
            shared_future& operator=(const shared_future& rhs) noexcept;
            shared_future& operator=(shared_future&& rhs) noexcept;

            // retrieving the value
            see below get() const;

            // functions to check state
            bool valid() const noexcept;

            void wait() const;
            template<class Rep, class Period>
                future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
            template<class Clock, class Duration>
                future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
    };
}
```

- 4 For the primary template, `R` shall be an object type that meets the *Cpp17Destructible* requirements.
- 5 The implementation provides the template `shared_future` and two specializations, `shared_future<R&>` and `shared_future<void>`. These differ only in the return type and return value of the member function `get`, as set out in its description, below.

```
shared_future() noexcept;
```

- 6 *Effects:* The object does not refer to a shared state.

- 7 *Postconditions:* `valid() == false`.

```
shared_future(const shared_future& rhs) noexcept;
```

- 8 *Effects:* The object refers to the same shared state as `rhs` (if any).

- 9 *Postconditions:* `valid()` returns the same value as `rhs.valid()`.

```
shared_future(future<R>&& rhs) noexcept;
```

```
shared_future(shared_future&& rhs) noexcept;
```

- 10 *Effects:* Move constructs a `shared_future` object that refers to the shared state that was originally referred to by `rhs` (if any).

11 *Postconditions:*
 (11.1) — `valid()` returns the same value as `rhs.valid()` returned prior to the constructor invocation.
 (11.2) — `rhs.valid() == false`.

`~shared_future();`

12 *Effects:*

- (12.1) — Releases any shared state ([33.10.5](#));
 (12.2) — destroys `*this`.

`shared_future& operator=(shared_future&& rhs) noexcept;`

13 *Effects:* If `addressof(rhs) == this` is true, there are no effects. Otherwise:

- (13.1) — Releases any shared state ([33.10.5](#));
 (13.2) — move assigns the contents of `rhs` to `*this`.

14 *Postconditions:*

- (14.1) — `valid()` returns the same value as `rhs.valid()` returned prior to the assignment.
 (14.2) — If `addressof(rhs) == this` is false, `rhs.valid() == false`.

`shared_future& operator=(const shared_future& rhs) noexcept;`

15 *Effects:* If `addressof(rhs) == this` is true, there are no effects. Otherwise:

- (15.1) — Releases any shared state ([33.10.5](#));
 (15.2) — assigns the contents of `rhs` to `*this`.

 NOTE 3: As a result, `*this` refers to the same shared state as `rhs` (if any).

16 *Postconditions:* `valid() == rhs.valid()`.

```
const R& shared_future::get() const;
R& shared_future<R>::get() const;
void shared_future<void>::get() const;
```

17 NOTE 4: As described above, the template and its two required specializations differ only in the return type and return value of the member function `get`.

18 NOTE 5: Access to a value object stored in the shared state is unsynchronized, so it is possible for operations on `R` to introduce a data race ([6.9.2](#)).

19 *Effects:* `wait()`s until the shared state is ready, then retrieves the value stored in the shared state.

20 *Returns:*

- (20.1) — `shared_future::get()` returns a const reference to the value stored in the object's shared state.
 NOTE 6: Access through that reference after the shared state has been destroyed produces undefined behavior; this can be avoided by not storing the reference in any storage with a greater lifetime than the `shared_future` object that returned the reference.

- (20.2) — `shared_future<R>::get()` returns the reference stored as value in the object's shared state.

- (20.3) — `shared_future<void>::get()` returns nothing.

21 *Throws:* The stored exception, if an exception was stored in the shared state.

`bool valid() const noexcept;`

22 *Returns:* true only if `*this` refers to a shared state.

`void wait() const;`

23 *Effects:* Blocks until the shared state is ready.

```
template<class Rep, class Period>
future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
```

24 *Effects:* None if the shared state contains a deferred function ([33.10.9](#)), otherwise blocks until the shared state is ready or until the relative timeout ([33.2.4](#)) specified by `rel_time` has expired.

25 *Returns:*

- (25.1) — `future_status::deferred` if the shared state contains a deferred function.
- (25.2) — `future_status::ready` if the shared state is ready.
- (25.3) — `future_status::timeout` if the function is returning because the relative timeout (33.2.4) specified by `rel_time` has expired.
- 26 *Throws:* timeout-related exceptions (33.2.4).

```
template<class Clock, class Duration>
future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
```

27 *Effects:* None if the shared state contains a deferred function (33.10.9), otherwise blocks until the shared state is ready or until the absolute timeout (33.2.4) specified by `abs_time` has expired.

28 *Returns:*

- (28.1) — `future_status::deferred` if the shared state contains a deferred function.
- (28.2) — `future_status::ready` if the shared state is ready.
- (28.3) — `future_status::timeout` if the function is returning because the absolute timeout (33.2.4) specified by `abs_time` has expired.

29 *Throws:* timeout-related exceptions (33.2.4).

33.10.9 Function template `async`

[**futures.async**]

- ¹ The function template `async` provides a mechanism to launch a function potentially in a new thread and provides the result of the function in a `future` object with which it shares a shared state.

```
template<class F, class... Args>
[[nodiscard]] future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
async(F&& f, Args&&... args);
template<class F, class... Args>
[[nodiscard]] future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
async(launch policy, F&& f, Args&&... args);
```

- 2 *Mandates:* The following are all true:

- (2.1) — `is_constructible_v<decay_t<F>, F>`,
- (2.2) — `(is_constructible_v<decay_t<Args>, Args> && ...)`, and
- (2.3) — `is_invocable_v<decay_t<F>, decay_t<Args>...>`.

3 *Effects:* The first function behaves the same as a call to the second function with a `policy` argument of `launch::async` | `launch::deferred` and the same arguments for `F` and `Args`. The second function creates a shared state that is associated with the returned `future` object. The further behavior of the second function depends on the `policy` argument as follows (if more than one of these conditions applies, the implementation may choose any of the corresponding policies):

- (3.1) — If `launch::async` is set in `policy`, calls `invoke(auto(std::forward<F>(f)), auto(std::forward<Args>(args))...)` (22.10.5, 33.4.3.3) as if in a new thread of execution represented by a `thread` object with the values produced by `auto` being materialized (7.3.5) in the thread that called `async`. Any return value is stored as the result in the shared state. Any exception propagated from the execution of `invoke(auto(std::forward<F>(f)), auto(std::forward<Args>(args))...)` is stored as the exceptional result in the shared state. The `thread` object is stored in the shared state and affects the behavior of any asynchronous return objects that reference that state.
- (3.2) — If `launch::deferred` is set in `policy`, stores `auto(std::forward<F>(f))` and `auto(std::forward<Args>(args))...` in the shared state. These copies of `f` and `args` constitute a *deferred function*. Invocation of the deferred function evaluates `invoke(std::move(g), std::move(xyz))` where `g` is the stored value of `auto(std::forward<F>(f))` and `xyz` is the stored copy of `auto(std::forward<Args>(args))...`. Any return value is stored as the result in the shared state. Any exception propagated from the execution of the deferred function is stored as the exceptional result in the shared state. The shared state is not made ready until the function has completed. The first call to a non-timed waiting function (33.10.5) on an asynchronous return object referring to this shared state invokes the deferred function in the thread that called the waiting function. Once evaluation of `invoke(std::move(g), std::move(xyz))` begins, the function is no longer considered deferred.

Recommended practice: If this policy is specified together with other policies, such as when using a `policy` value of `launch::async` | `launch::deferred`, implementations should defer invocation or the selection of the policy when no more concurrency can be effectively exploited.

- (3.3) — If no value is set in the launch policy, or a value is set that is neither specified in this document nor by the implementation, the behavior is undefined.

- 4 *Synchronization:* The invocation of `async` synchronizes with the invocation of `f`. The completion of the function `f` is sequenced before the shared state is made ready.

NOTE 1: These apply regardless of the provided `policy` argument, and even if the corresponding `future` object is moved to another thread. However, it is possible for `f` not to be called at all, in which case its completion never happens.

If the implementation chooses the `launch::async` policy,

- (4.1) — a call to a waiting function on an asynchronous return object that shares the shared state created by this `async` call shall block until the associated thread has completed, as if joined, or else time out (33.4.3.6);

- (4.2) — the associated thread completion synchronizes with (6.9.2) the return from the first function that successfully detects the ready status of the shared state or with the return from the last function that releases the shared state, whichever happens first.

- 5 *Returns:* An object of type `future<invoke_result_t<decay_t<F>, decay_t<Args>...>>` that refers to the shared state created by this call to `async`.

NOTE 2: If a future obtained from `async` is moved outside the local scope, the future's destructor can block for the shared state to become ready.

- 6 *Throws:* `system_error` if `policy == launch::async` and the implementation is unable to start a new thread, or `std::bad_alloc` if memory for the internal data structures cannot be allocated.

- 7 *Error conditions:*

- (7.1) — `resource_unavailable_try_again` — if `policy == launch::async` and the system is unable to start a new thread.

- 8 EXAMPLE:

```
int work1(int value);
int work2(int value);
int work(int value) {
    auto handle = std::async([=]{ return work2(value); });
    int tmp = work1(value);
    return tmp + handle.get();    // #1
}
```

NOTE 3: It is possible for line #1 not to result in concurrency because the `async` call uses the default policy, which can use `launch::deferred`, in which case it is possible that the lambda is not invoked until the `get()` call; in that case, `work1` and `work2` are called on the same thread and there is no concurrency.

33.10.10 Class template `packaged_task`

[`futures.task`]

33.10.10.1 General

[`futures.task.general`]

- 1 The class template `packaged_task` defines a type for wrapping a function or callable object so that the return value of the function or callable object is stored in a future when it is invoked.
- 2 When the `packaged_task` object is invoked, its stored task is invoked and the result (whether normal or exceptional) stored in the shared state. Any futures that share the shared state will then be able to access the stored result.

```
namespace std {
    template<class> class packaged_task; // not defined

    template<class R, class... ArgTypes>
    class packaged_task<R(ArgTypes...)> {
        public:
            // construction and destruction
            packaged_task() noexcept;
            template<class F>
            explicit packaged_task(F&& f);
```

```

~packaged_task();

// no copy
packaged_task(const packaged_task&) = delete;
packaged_task& operator=(const packaged_task&) = delete;

// move support
packaged_task(packaged_task&& rhs) noexcept;
packaged_task& operator=(packaged_task&& rhs) noexcept;
void swap(packaged_task& other) noexcept;

bool valid() const noexcept;

// result retrieval
future<R> get_future();

// execution
void operator()(ArgTypes... );
void make_ready_at_thread_exit(ArgTypes...);

void reset();
};

template<class R, class... ArgTypes>
packaged_task(R (*)(ArgTypes...)) -> packaged_task<R(ArgTypes...)>;

template<class F> packaged_task(F) -> packaged_task<see below>;
}

```

33.10.10.2 Member functions

[[futures.task.members](#)]

`packaged_task() noexcept;`

1 *Effects:* The object has no shared state and no stored task.

`template<class F>
explicit packaged_task(F&& f);`

2 *Constraints:* `remove_cvref_t<F>` is not the same type as `packaged_task<R(ArgTypes...)>`.

3 *Mandates:* `is_invocable_r_v<R, F&, ArgTypes...>` is true.

4 *Preconditions:* Invoking a copy of `f` behaves the same as invoking `f`.

5 *Effects:* Constructs a new `packaged_task` object with a shared state and initializes the object's stored task with `std::forward<F>(f)`.

6 *Throws:* Any exceptions thrown by the copy or move constructor of `f`, or `bad_alloc` if memory for the internal data structures cannot be allocated.

`template<class F> packaged_task(F) -> packaged_task<see below>;`

7 *Constraints:* `&F::operator()` is well-formed when treated as an unevaluated operand ([7.2.3](#)) and either

(7.1) — `F::operator()` is a non-static member function and `decltype(&F::operator())` is either of the form `R(G::*)(A...)` *cv* $\&_{opt}$ `noexcept_{opt}` or of the form `R(*)(G, A...)` `noexcept_{opt}` for a type `G`, or

(7.2) — `F::operator()` is a static member function and `decltype(&F::operator())` is of the form `R(*)(A...)` `noexcept_{opt}`.

8 *Remarks:* The deduced type is `packaged_task<R(A...)>`.

`packaged_task(packaged_task&& rhs) noexcept;`

9 *Effects:* Transfers ownership of `rhs`'s shared state to `*this`, leaving `rhs` with no shared state. Moves the stored task from `rhs` to `*this`.

10 *Postconditions:* `rhs` has no shared state.

```

    packaged_task& operator=(packaged_task&& rhs) noexcept;
11   Effects:
(11.1)   — Releases any shared state (33.10.5);
(11.2)   — calls packaged_task(std::move(rhs)).swap(*this).
    ~packaged_task();

12   Effects: Abandons any shared state (33.10.5).

    void swap(packaged_task& other) noexcept;
13   Effects: Exchanges the shared states and stored tasks of *this and other.
14   Postconditions: *this has the same shared state and stored task (if any) as other prior to the call to swap. other has the same shared state and stored task (if any) as *this prior to the call to swap.

    bool valid() const noexcept;
15   Returns: true only if *this has a shared state.

    future<R> get_future();
16   Synchronization: Calls to this function do not introduce data races (6.9.2) with calls to operator() or make_ready_at_thread_exit.
    NOTE 1: Such calls need not synchronize with each other.
17   Returns: A future object that shares the same shared state as *this.
18   Throws: A future_error object if an error occurs.
19   Error conditions:
(19.1)   — future_already_retrieved if get_future has already been called on a packaged_task object with the same shared state as *this.
(19.2)   — no_state if *this has no shared state.

    void operator()(ArgTypes... args);
20   Effects: As if by INVOKE<R>(f, t1, t2, ..., tN) (22.10.4), where f is the stored task of *this and t1, t2, ..., tN are the values in args..... If the task returns normally, the return value is stored as the asynchronous result in the shared state of *this, otherwise the exception thrown by the task is stored. The shared state of *this is made ready, and any threads blocked in a function waiting for the shared state of *this to become ready are unblocked.
21   Throws: A future_error exception object if there is no shared state or the stored task has already been invoked.
22   Error conditions:
(22.1)   — promise_already_satisfied if the stored task has already been invoked.
(22.2)   — no_state if *this has no shared state.

    void make_ready_at_thread_exit(ArgTypes... args);
23   Effects: As if by INVOKE<R>(f, t1, t2, ..., tN) (22.10.4), where f is the stored task and t1, t2, ..., tN are the values in args..... If the task returns normally, the return value is stored as the asynchronous result in the shared state of *this, otherwise the exception thrown by the task is stored. In either case, this is done without making that state ready (33.10.5) immediately. Schedules the shared state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.
24   Throws: future_error if an error condition occurs.
25   Error conditions:
(25.1)   — promise_already_satisfied if the stored task has already been invoked.
(25.2)   — no_state if *this has no shared state.

```

```

void reset();

26   Effects: As if *this = packaged_task(std::move(f)), where f is the task stored in *this.
    NOTE 2: This constructs a new shared state for *this. The old state is abandoned (33.10.5).

27   Throws:
(27.1)   — bad_alloc if memory for the new shared state cannot be allocated.
(27.2)   — Any exception thrown by the move constructor of the task stored in the shared state.
(27.3)   — future_error with an error condition of no_state if *this has no shared state.

```

33.10.10.3 Globals

[**futures.task.nonmembers**]

```

template<class R, class... ArgTypes>
void swap(packaged_task<R(ArgTypes...)>& x, packaged_task<R(ArgTypes...)>& y) noexcept;

```

1 Effects: As if by **x.swap(y)**.

Annex A (informative)

Grammar summary [gram]

A.1 General

[gram.general]

- ¹ This summary of C++ grammar is intended to be an aid to comprehension. It is not an exact statement of the language. In particular, the grammar described here accepts a superset of valid C++ constructs. Disambiguation rules (8.9, 9.2, 6.5.2) are applied to distinguish expressions from declarations. Further, access control, ambiguity, and type rules are used to weed out syntactically valid but meaningless constructs.

A.2 Keywords

[gram.key]

- ¹ New context-dependent keywords are introduced into a program by `typedef` (9.2.4), `namespace` (9.8.2), `class` (Clause 11), `enumeration` (9.7.1), and `template` (Clause 13) declarations.

```

typedef-name:
    identifier
    simple-template-id

namespace-name:
    identifier
    namespace-alias

namespace-alias:
    identifier

class-name:
    identifier

Annex B (normative)

Implementation quantities [implimits]

- ¹ Because computers are finite, C++ implementations are inevitably limited in the size of the programs they can successfully process. Every implementation shall document those limitations where known. This documentation may cite fixed limits where they exist, say how to compute variable limits as a function of available resources, or say that fixed limits do not exist or are unknown.
- ² The limits may constrain quantities that include those described below or others. The bracketed number following each quantity is recommended as the minimum for that quantity. However, these quantities are only guidelines and do not determine compliance.
- (2.1) — Nesting levels of compound statements (8.4), iteration control structures (8.6), and selection control structures (8.5) [256].
 - (2.2) — Nesting levels of conditional inclusion (15.2) [256].
 - (2.3) — Pointer (9.3.4.2), pointer-to-member (9.3.4.4), array (9.3.4.5), and function (9.3.4.6) declarators (in any combination) modifying a type in a declaration [256].
 - (2.4) — Nesting levels of parenthesized expressions (7.5.3) within a full-expression [256].
 - (2.5) — Number of characters in an internal identifier (5.10) or macro name (15.6) [1 024].
 - (2.6) — Number of characters in an external identifier (5.10, 6.6) [1 024].
 - (2.7) — External identifiers (6.6) in one translation unit [65 536].
 - (2.8) — Identifiers with block scope declared in one block (6.4.3) [1 024].
 - (2.9) — Structured bindings (9.6) introduced in one declaration [256].
 - (2.10) — Macro identifiers (15.6) simultaneously defined in one translation unit [65 536].
 - (2.11) — Parameters in one function definition (9.5.1) [256].
 - (2.12) — Arguments in one function call (7.6.1.3) [256].
 - (2.13) — Parameters in one macro definition (15.6) [256].
 - (2.14) — Arguments in one macro invocation (15.6) [256].
 - (2.15) — Characters in one logical source line (5.2) [65 536].
 - (2.16) — Characters in a *string-literal* (5.13.5) (after concatenation (5.2)) [65 536].
 - (2.17) — Size of an object (6.7.2) [262 144].
 - (2.18) — Nesting levels for #include files (15.3) [256].
 - (2.19) — Case labels for a switch statement (8.5.3) (excluding those for any nested switch statements) [16 384].
 - (2.20) — Non-static data members (including inherited ones) in a single class (11.4) [16 384].
 - (2.21) — Lambda-captures in one lambda-expression (7.5.5.3) [256].
 - (2.22) — Enumeration constants in a single enumeration (9.7.1) [4 096].
 - (2.23) — Levels of nested class definitions (11.4.12) in a single member-specification [256].
 - (2.24) — Functions registered by atexit() (17.5) [32].
 - (2.25) — Functions registered by at_quick_exit() (17.5) [32].
 - (2.26) — Direct and indirect base classes (11.7) [16 384].
 - (2.27) — Direct base classes for a single class (11.7) [1 024].
 - (2.28) — Class members declared in a single member-specification (including member functions) (11.4) [4 096].
 - (2.29) — Final overriding virtual functions in a class, accessible or not (11.7.3) [16 384].
 - (2.30) — Direct and indirect virtual bases of a class (11.7.2) [1 024].

- (2.31) — Static data members of a class (11.4.9.3) [1 024].
- (2.32) — Friend declarations in a class (11.8.4) [4 096].
- (2.33) — Access control declarations in a class (11.8.2) [4 096].
- (2.34) — Member initializers in a constructor definition (11.9.3) [6 144].
- (2.35) — *initializer-clauses* in one *braced-init-list* (9.4) [16 384].
- (2.36) — Scope qualifications of one identifier (7.5.4.3) [256].
- (2.37) — Nested *linkage-specifications* (9.11) [1 024].
- (2.38) — Recursive constexpr function invocations (9.2.6) [512].
- (2.39) — Full-expressions evaluated within a core constant expression (7.7) [1 048 576].
- (2.40) — Template parameters in a template declaration (13.2) [1 024].
- (2.41) — Recursively nested template instantiations (13.9.2), including substitution during template argument deduction (13.10.3) [1 024].
- (2.42) — Handlers per try block (14.4) [256].
- (2.43) — Number of placeholders (22.10.15.5) [10].

Annex C (informative)

Compatibility

[diff]

C.1 C++ and ISO C++ 2020

[diff.cpp20]

C.1.1 General

[diff.cpp20.general]

- ¹ Subclause C.1 lists the differences between C++ and ISO C++ 2020 (ISO/IEC 14882:2020, *Programming Languages — C++*), by the chapters of this document.

C.1.2 Clause 5: lexical conventions

[diff.cpp20.lex]

- ¹ Affected subclause: 5.10

Change: Previously valid identifiers containing characters not present in UAX #44 properties XID_Start or XID_Continue, or not in Normalization Form C, are now rejected.

Rationale: Prevent confusing characters in identifiers. Requiring normalization of names ensures consistent linker behavior.

Effect on original feature: Some identifiers are no longer well-formed.

- ² Affected subclause: 5.13.5

Change: Concatenated *string-literals* can no longer have conflicting *encoding-prefixes*.

Rationale: Removal of unimplemented conditionally-supported feature.

Effect on original feature: Concatenation of *string-literals* with different *encoding-prefixes* is now ill-formed. For example:

```
auto c = L"a" U"b";           // was conditionally-supported; now ill-formed
```

C.1.3 Clause 7: expressions

[diff.cpp20.expr]

- ¹ Affected subclause: 7.5.4.2

Change: Change move-eligible *id-expressions* from lvalues to xvalues.

Rationale: Simplify the rules for implicit move.

Effect on original feature: Valid C++ 2020 code that relies on a returned *id-expression*'s being an lvalue may change behavior or fail to compile. For example:

```
decltype(auto) f(int&& x) { return (x); }           // returns int&&; previously returned int&
int& g(int&& x) { return x; }                         // ill-formed; previously well-formed
```

- ² Affected subclause: 7.6.1.2

Change: Change the meaning of comma in subscript expressions.

Rationale: Enable repurposing a deprecated syntax to support multidimensional indexing.

Effect on original feature: Valid C++ 2020 code that uses a comma expression within a subscript expression may fail to compile. For example:

```
arr[1, 2]           // was equivalent to arr[(1, 2)],
                    // now equivalent to arr.operator[](1, 2) or ill-formed
```

C.1.4 Clause 8: statements

[diff.cpp20.stmt]

- ¹ Affected subclause: 8.6.5

Change: The lifetime of temporary objects in the *for-range-initializer* is extended until the end of the loop (6.7.7).

Rationale: Improve usability of the range-based **for** statement.

Effect on original feature: Destructors of some temporary objects are invoked later. For example:

```
void f() {
    std::vector<int> v = { 42, 17, 13 };
    std::mutex m;

    for (int x :
        static_cast<void>(std::lock_guard<std::mutex>(m)), v) { // lock released in C++ 2020
        std::lock_guard<std::mutex> guard(m);                      // OK in C++ 2020, now deadlocks
```

```

    }
}
```

C.1.5 Clause 9: declarations

[diff.cpp20.dcl]

- ¹ Affected subclause: [9.4.3](#)

Change: UTF-8 string literals may initialize arrays of `char` or `unsigned char`.

Rationale: Compatibility with previously written code that conformed to previous versions of this document.

Effect on original feature: Arrays of `char` or `unsigned char` may now be initialized with a UTF-8 string literal. This can affect initialization that includes arrays that are directly initialized within class types, typically aggregates. For example:

```

struct A {
    char8_t s[10];
};

struct B {
    char s[10];
};

void f(A);
void f(B);

int main() {
    f({u8""});           // ambiguous
}
```

C.1.6 Clause 13: templates

[diff.cpp20.temp]

- ¹ Affected subclause: [13.10.3.6](#)

Change: Deducing template arguments from exception specifications.

Rationale: Facilitate generic handling of throwing and non-throwing functions.

Effect on original feature: Valid ISO C++ 2020 code may be ill-formed in this revision of C++. For example:

```

template<bool> struct A {};
template<bool B> void f(void (*)(A<B>) noexcept(B));
void g(A<false>) noexcept;
void h() {
    f(g);           // ill-formed; previously well-formed
}
```

C.1.7 Clause 16: library introduction

[diff.cpp20.library]

- ¹ Affected subclause: [16.4.2.3](#)

Change: New headers.

Rationale: New functionality.

Effect on original feature: The following C++ headers are new: `<expected>` ([22.8.2](#)), `<flat_map>` ([24.6.4](#)), `<flat_set>` ([24.6.5](#)), `<generator>` ([26.8.2](#)), `<print>` ([31.7.4](#)), `<spanstream>` ([31.9.2](#)), `<stacktrace>` ([19.6.2](#)), and `<stdatomic.h>` ([33.5.12](#)). Valid C++ 2020 code that `#includes` headers with these names may be invalid in this revision of C++.

C.1.8 Clause 18: concepts library

[diff.cpp20.concepts]

- ¹ Affected subclauses: [17.11.4](#), [18.5.4](#), and [18.5.5](#)

Change: Replace `common_reference_with` in `three_way_comparable_with`, `equality_comparable_with`, and `totally_ordered_with` with an exposition-only concept.

Rationale: Allow uncopyable, but movable, types to model these concepts.

Effect on original feature: Valid C++ 2020 code relying on subsumption with `common_reference_with` may fail to compile in this revision of C++. For example:

```

template<class T, class U>
    requires equality_comparable_with<T, U>
bool attempted_equals(const T&, const U& u);    // previously selected overload
```

```
template<class T, class U>
    requires common_reference_with<const remove_reference_t<T>&, const remove_reference_t<U>&>
bool attempted_equals(const T& t, const U& u); // ambiguous overload; previously
                                                // rejected by partial ordering
bool test(shared_ptr<int> p) {
    return attempted_equals(p, nullptr);           // ill-formed; previously well-formed
}
```

C.1.9 Clause 20: memory management library

[diff.cpp20.memory]

¹ Affected subclause: 20.2.9.1**Change:** Forbid partial and explicit program-defined specializations of `allocator_traits`.**Rationale:** Allow addition of `allocate_at_least` to `allocator_traits`, and potentially other members in the future.**Effect on original feature:** Valid C++ 2020 code that partially or explicitly specializes `allocator_traits` is ill-formed with no diagnostic required in this revision of C++.**C.1.10 Clause 22: general utilities library**

[diff.cpp20.utilities]

¹ Affected subclause: 22.14**Change:** Signature changes: `format`, `format_to`, `vformat_to`, `format_to_n`, `formatted_size`. Removal of `format_args_t`.**Rationale:** Improve safety via compile-time format string checks, avoid unnecessary template instantiations.**Effect on original feature:** Valid C++ 2020 code that contained errors in format strings or relied on previous format string signatures or `format_args_t` may become ill-formed. For example:

```
auto s = std::format("{:d}", "I am not a number");           // ill-formed,
                                                               // previously threw format_error
```

² Affected subclause: 22.14**Change:** Signature changes: `format`, `format_to`, `format_to_n`, `formatted_size`.**Rationale:** Enable formatting of views that do not support iteration when const-qualified and that are not copyable.**Effect on original feature:** Valid C++ 2020 code that passes bit fields to formatting functions may become ill-formed. For example:

```
struct tiny {
    int bit: 1;
};

auto t = tiny();
std::format("{}", t.bit);           // ill-formed, previously returned "0"
```

³ Affected subclause: 22.14.2.2**Change:** Restrict types of formatting arguments used as *width* or *precision* in a `std-format-spec`.**Rationale:** Disallow types that do not have useful or portable semantics as a formatting width or precision.**Effect on original feature:** Valid C++ 2020 code that passes a boolean or character type as *arg-id* becomes invalid. For example:

```
std::format("{}{}*", "", true);      // ill-formed, previously returned "*"
std::format("{}{}*", "", '1');       // ill-formed, previously returned an
                                         // implementation-defined number of '*' characters
```

⁴ Affected subclause: 22.14.6.3**Change:** Removed the `formatter` specialization:

```
template<size_t N> struct formatter<const char[N], charT>;
```

Rationale: The specialization is inconsistent with the design of `formatter`, which is intended to be instantiated only with cv-unqualified object types.**Effect on original feature:** Valid C++ 2020 code that instantiated the removed specialization can become ill-formed.**C.1.11 Clause 23: strings library**

[diff.cpp20.strings]

¹ Affected subclause: 23.4**Change:** Additional rvalue overload for the `substr` member function and the corresponding constructor.**Rationale:** Improve efficiency of operations on rvalues.

Effect on original feature: Valid C++ 2020 code that created a substring by calling `substr` (or the corresponding constructor) on an xvalue expression with type `S` that is a specialization of `basic_string` may change meaning in this revision of C++. For example:

```
std::string s1 = "some long string that forces allocation", s2 = s1;
std::move(s1).substr(10, 5);
assert(s1 == s2);           // unspecified, previously guaranteed to be true
std::string s3(std::move(s2), 10, 5);
assert(s1 == s2);           // unspecified, previously guaranteed to be true
```

C.1.12 Clause 24: containers library

[diff.cpp20.containers]

- ¹ **Affected subclauses:** 24.2.7 and 24.2.8

Change: Heterogeneous `extract` and `erase` overloads for associative containers.

Rationale: Improve efficiency of erasing elements from associative containers.

Effect on original feature: Valid C++ 2020 code may fail to compile in this revision of C++. For example:

```
struct B {
    auto operator<=>(const B&) const = default;
};

struct D : private B {
    void f(std::set<B, std::less<>>& s) {
        s.erase(*this);           // ill formed; previously well-formed
    }
};
```

C.1.13 Clause 33: concurrency support library

[diff.cpp20.thread]

- ¹ **Affected subclause:** 33.9.3

Change: In this revision of C++, it is implementation-defined whether a barrier's phase completion step runs if no thread calls `wait`. Previously the phase completion step was guaranteed to run on the last thread that calls `arrive` or `arrive_and_drop` during the phase. In this revision of C++, it can run on any of the threads that arrived or waited at the barrier during the phase.

Rationale: Correct contradictory wording and improve implementation flexibility for performance.

Effect on original feature: Valid C++ 2020 code using a barrier might have different semantics in this revision of C++ if it depends on a completion function's side effects occurring exactly once, on a specific thread running the phase completion step, or on a completion function's side effects occurring without `wait` having been called. For example:

```
auto b0 = std::barrier(1);
b0.arrive();
b0.arrive();           // implementation-defined; previously well-defined

int data = 0;
auto b1 = std::barrier(1, [&] { data++; });
b1.arrive();
assert(data == 1);     // implementation-defined; previously well-defined
b1.arrive();           // implementation-defined; previously well-defined
```

C.2 C++ and ISO C++ 2017

[diff.cpp17]

C.2.1 General

[diff.cpp17.general]

- ¹ Subclause C.2 lists the differences between C++ and ISO C++ 2017 (ISO/IEC 14882:2017, *Programming Languages — C++*), by the chapters of this document.

C.2.2 Clause 5: lexical conventions

[diff.cpp17.lex]

- ¹ **Affected subclauses:** 5.4, 10.1, 10.3, 15.1, 15.4, and 15.5

Change: New identifiers with special meaning.

Rationale: Required for new features.

Effect on original feature: Logical lines beginning with `module` or `import` may be interpreted differently in this revision of C++. For example:

```
class module {};
module m1;           // was variable declaration; now module-declaration
module *m2;          // variable declaration
```

```
class import {};
import j1;           // was variable declaration; now module-import-declaration
::import j2;         // variable declaration
```

2 Affected subclause: 5.8

Change: *header-name* tokens are formed in more contexts.

Rationale: Required for new features.

Effect on original feature: When the identifier `import` is followed by a `<` character, a *header-name* token may be formed. For example:

```
template<typename> class import {};
import<int> f();           // ill-formed; previously well-formed
::import<int> g();         // OK
```

3 Affected subclause: 5.11

Change: New keywords.

Rationale: Required for new features.

- (3.1) — The `char8_t` keyword is added to differentiate the types of ordinary and UTF-8 literals (5.13.5).
- (3.2) — The `concept` keyword is added to enable the definition of concepts (13.7.9).
- (3.3) — The `consteval` keyword is added to declare immediate functions (9.2.6).
- (3.4) — The `constinit` keyword is added to prevent unintended dynamic initialization (9.2.7).
- (3.5) — The `co_await`, `co_yield`, and `co_return` keywords are added to enable the definition of coroutines (9.5.4).
- (3.6) — The `requires` keyword is added to introduce constraints through a *requires-clause* (13.1) or a *requires-expression* (7.5.7).

Effect on original feature: Valid C++ 2017 code using `char8_t`, `concept`, `consteval`, `constinit`, `co_await`, `co_yield`, `co_return`, or `requires` as an identifier is not valid in this revision of C++.

4 Affected subclause: 5.12

Change: New operator `<=`.

Rationale: Necessary for new functionality.

Effect on original feature: Valid C++ 2017 code that contains a `<=` token immediately followed by a `>` token may be ill-formed or have different semantics in this revision of C++. For example:

```
namespace N {
    struct X {};
    bool operator<=(X, X);
    template<bool(X, X)> struct Y {};
    Y<operator<=> y;           // ill-formed; previously well-formed
}
```

5 Affected subclause: 5.13

Change: Type of UTF-8 string and character literals.

Rationale: Required for new features. The changed types enable function overloading, template specialization, and type deduction to distinguish ordinary and UTF-8 string and character literals.

Effect on original feature: Valid C++ 2017 code that depends on UTF-8 string literals having type “array of `const char`” and UTF-8 character literals having type “`char`” is not valid in this revision of C++. For example:

```
const auto *u8s = u8"text";      // u8s previously deduced as const char*; now deduced as const char8_t*
const char *ps = u8s;            // ill-formed; previously well-formed

auto u8c = u8'c';              // u8c previously deduced as char; now deduced as char8_t
char *pc = &u8c;                // ill-formed; previously well-formed

std::string s = u8"text";       // ill-formed; previously well-formed

void f(const char *s);
f(u8"text");                  // ill-formed; previously well-formed

template<typename> struct ct;
```

```
template<> struct ct<char> {
    using type = char;
};
ct<decltype(u8'c')>::type x;      // ill-formed; previously well-formed.
```

C.2.3 Clause 6: basics

[diff.cpp17.basic]

¹ **Affected subclause:** 6.7.3

Change: A pseudo-destructor call ends the lifetime of the object to which it is applied.

Rationale: Increase consistency of the language model.

Effect on original feature: Valid ISO C++ 2017 code may be ill-formed or have undefined behavior in this revision of C++. For example:

```
int f() {
    int a = 123;
    using T = int;
    a.~T();
    return a;           // undefined behavior; previously returned 123
}
```

² **Affected subclause:** 6.9.2.2

Change: Except for the initial release operation, a release sequence consists solely of atomic read-modify-write operations.

Rationale: Removal of rarely used and confusing feature.

Effect on original feature: If a `memory_order_release` atomic store is followed by a `memory_order_relaxed` store to the same variable by the same thread, then reading the latter value with a `memory_order_acquire` load no longer provides any “happens before” guarantees, even in the absence of intervening stores by another thread.

C.2.4 Clause 7: expressions

[diff.cpp17.expr]

¹ **Affected subclause:** 7.5.5.3

Change: Implicit lambda capture may capture additional entities.

Rationale: Rule simplification, necessary to resolve interactions with `constexpr if`.

Effect on original feature: Lambdas with a `capture-default` may capture local entities that were not captured in C++ 2017 if those entities are only referenced in contexts that do not result in an odr-use.

C.2.5 Clause 9: declarations

[diff.cpp17.dcl.dcl]

¹ **Affected subclause:** 9.2.4

Change: Unnamed classes with a `typedef` name for linkage purposes can contain only C-compatible constructs.

Rationale: Necessary for implementability.

Effect on original feature: Valid C++ 2017 code may be ill-formed in this revision of C++. For example:

```
typedef struct {
    void f() {}           // ill-formed; previously well-formed
} S;
```

² **Affected subclause:** 9.3.4.7

Change: A function cannot have different default arguments in different translation units.

Rationale: Required for modules support.

Effect on original feature: Valid C++ 2017 code may be ill-formed in this revision of C++, with no diagnostic required. For example:

```
// Translation unit 1
int f(int a = 42);
int g() { return f(); }

// Translation unit 2
int f(int a = 76) { return a; }           // ill-formed, no diagnostic required; previously well-formed
int g();
int main() { return g(); }                 // used to return 42
```

³ **Affected subclause:** 9.4.2

Change: A class that has user-declared constructors is never an aggregate.

Rationale: Remove potentially error-prone aggregate initialization which may apply notwithstanding the

declared constructors of a class.

Effect on original feature: Valid C++ 2017 code that aggregate-initializes a type with a user-declared constructor may be ill-formed or have different semantics in this revision of C++. For example:

```

struct A {                                // not an aggregate; previously an aggregate
    A() = delete;
};

struct B {                                // not an aggregate; previously an aggregate
    B() = default;
    int i = 0;
};

struct C {                                // not an aggregate; previously an aggregate
    C(C&&) = default;
    int a, b;
};

A a{};                                // ill-formed; previously well-formed
B b = {1};                            // ill-formed; previously well-formed
auto* c = new C{2, 3}; // ill-formed; previously well-formed

struct Y;

struct X {
    operator Y();
};

struct Y {                                // not an aggregate; previously an aggregate
    Y(const Y&) = default;
    X x;
};

Y y{X{}};                            // copy constructor call; previously aggregate-initialization

```

⁴ **Affected subclause:** 9.4.5

Change: Boolean conversion from a pointer or pointer-to-member type is now a narrowing conversion.

Rationale: Catches bugs.

Effect on original feature: Valid C++ 2017 code may fail to compile in this revision of C++. For example:

```
bool y[] = { "bc" }; // ill-formed; previously well-formed
```

C.2.6 Clause 11: classes

[diff.cpp17.class]

¹ **Affected subclauses:** 11.4.5 and 11.4.8.3

Change: The class name can no longer be used parenthesized immediately after an *explicit decl-specifier* in a constructor declaration. The *conversion-function-id* can no longer be used parenthesized immediately after an *explicit decl-specifier* in a conversion function declaration.

Rationale: Necessary for new functionality.

Effect on original feature: Valid C++ 2017 code may fail to compile in this revision of C++. For example:

```

struct S {
    explicit (S)(const S&);      // ill-formed; previously well-formed
    explicit (operator int)();    // ill-formed; previously well-formed
    explicit(true) (S)(int);    // OK
};

```

² **Affected subclauses:** 11.4.5 and 11.4.7

Change: A *simple-template-id* is no longer valid as the *declarator-id* of a constructor or destructor.

Rationale: Remove potentially error-prone option for redundancy.

Effect on original feature: Valid C++ 2017 code may fail to compile in this revision of C++. For example:

```

template<class T>
struct A {
    A<T>();                  // error: simple-template-id not allowed for constructor
    A(int);                  // OK, injected-class-name used

```

```
~A<T>();           // error: simple-template-id not allowed for destructor
};
```

³ **Affected subclause:** 11.9.6

Change: A function returning an implicitly movable entity may invoke a constructor taking an rvalue reference to a type different from that of the returned expression. Function and catch-clause parameters can be thrown using move constructors.

Rationale: Side effect of making it easier to write more efficient code that takes advantage of moves.

Effect on original feature: Valid C++ 2017 code may fail to compile or have different semantics in this revision of C++. For example:

```
struct base {
    base();
    base(base const &);

private:
    base(base &&);

};

struct derived : base {};

base f(base b) {
    throw b;           // error: base(base &&) is private
    derived d;
    return d;          // error: base(base &&) is private
}

struct S {
    S(const char *s) : m(s) { }
    S(const S&) = default;
    S(S&& other) : m(other.m) { other.m = nullptr; }
    const char * m;
};

S consume(S&& s) { return s; }

void g() {
    S s("text");
    consume(static_cast<S&&>(s));
    char c = *s.m;           // undefined behavior; previously ok
}
```

C.2.7 Clause 12: overloading

[diff.cpp17.over]

¹ **Affected subclause:** 12.2.2.3

Change: Equality and inequality expressions can now find reversed and rewritten candidates.

Rationale: Improve consistency of equality with three-way comparison and make it easier to write the full complement of equality operations.

Effect on original feature: For certain pairs of types where one is convertible to the other, equality or inequality expressions between an object of one type and an object of the other type invoke a different operator. Also, for certain types, equality or inequality expressions between two objects of that type become ambiguous. For example:

```
struct A {
    operator int() const;
};

bool operator==(A, int);           // #1
// #2 is built-in candidate: bool operator==(int, int);
// #3 is built-in candidate: bool operator!=(int, int);

int check(A x, A y) {
    return (x == y) +               // ill-formed; previously well-formed
           (10 == x) +             // calls #1, previously selected #2
           (10 != x);            // calls #1, previously selected #3
}
```

² Affected subclause: 12.2.2.3

Change: Overload resolution may change for equality operators (7.6.10).

Rationale: Support calling `operator==` with reversed order of arguments.

Effect on original feature: Valid C++ 2017 code that uses equality operators with conversion functions may be ill-formed or have different semantics in this revision of C++. For example:

```
struct A {
    operator int() const { return 10; }
};

bool operator==(A, int);           // #1
// #2 is built-in candidate: bool operator==(int, int);
bool b = 10 == A();               // calls #1 with reversed order of arguments; previously selected #2

struct B {
    bool operator==(const B&);    // member function with no cv-qualifier
};
B b1;
bool eq = (b1 == b1);            // ambiguous; previously well-formed
```

C.2.8 Clause 13: templates

[diff.cpp17.temp]

¹ Affected subclause: 13.3

Change: An *unqualified-id* that is followed by a < and for which name lookup finds nothing or finds a function will be treated as a *template-name* in order to potentially cause argument dependent lookup to be performed.

Rationale: It was problematic to call a function template with an explicit template argument list via argument dependent lookup because of the need to have a template with the same name visible via normal lookup.

Effect on original feature: Previously valid code that uses a function name as the left operand of a < operator would become ill-formed. For example:

```
struct A {};
bool operator<(void (*fp)(), A);
void f() {}
int main() {
    A a;
    f < a;      // ill-formed; previously well-formed
    (f) < a;    // still well-formed
}
```

C.2.9 Clause 14: exception handling

[diff.cpp17.except]

¹ Affected subclause: 14.5

Change: Remove `throw()` exception specification.

Rationale: Removal of obsolete feature that has been replaced by `noexcept`.

Effect on original feature: A valid C++ 2017 function declaration, member function declaration, function pointer declaration, or function reference declaration that uses `throw()` for its exception specification will be rejected as ill-formed in this revision of C++. It should simply be replaced with `noexcept` for no change of meaning since C++ 2017.

NOTE: There is no way to write a function declaration that is non-throwing in this revision of C++ and is also non-throwing in C++ 2003 except by using the preprocessor to generate a different token sequence in each case.

C.2.10 Clause 16: library introduction

[diff.cpp17.library]

¹ Affected subclause: 16.4.2.3

Change: New headers.

Rationale: New functionality.

Effect on original feature: The following C++ headers are new: `<barrier>` (33.9.3.2), `<bit>` (22.15.2), `<charconv>` (22.13.1), `<compare>` (17.11.1), `<concepts>` (18.3), `<coroutine>` (17.12.2), `<format>` (22.14.1), `<latch>` (33.9.2.2), `<numbers>` (28.8.1), `<ranges>` (26.2), `<semaphore>` (33.8.2), `<source_location>` (17.8.1), `` (24.7.2.1), `<stop_token>` (33.3.2), `<syncstream>` (31.11.1), and `<version>` (17.3.1). Valid C++ 2017 code that `#includes` headers with these names may be invalid in this revision of C++.

² **Affected subclause:** 16.4.2.3**Change:** Remove vacuous C++ header files.**Rationale:** The empty headers implied a false requirement to achieve C compatibility with the C++ headers.**Effect on original feature:** A valid C++ 2017 program that #includes any of the following headers may fail to compile: <ccomplex>, <ciso646>, <cstdalign>, <cstdbool>, and <ctgmath>. To retain the same behavior:

- (2.1) — a #include of <ccomplex> can be replaced by a #include of <complex> (28.4.2),
- (2.2) — a #include of <ctgmath> can be replaced by a #include of <cmath> (28.7.1) and a #include of <complex>, and
- (2.3) — a #include of <ciso646>, <cstdalign>, or <cstdbool> can simply be removed.

C.2.11 Clause 24: containers library

[diff.cpp17.containers]

¹ **Affected subclauses:** 24.3.9 and 24.3.10**Change:** Return types of remove, remove_if, and unique changed from void to container::size_type.**Rationale:** Improve efficiency and convenience of finding number of removed elements.**Effect on original feature:** Code that depends on the return types can have different semantics in this revision of C++. Translation units compiled against this version of C++ may be incompatible with translation units compiled against C++ 2017, either failing to link or having undefined behavior.**C.2.12 Clause 25: iterators library**

[diff.cpp17.iterators]

¹ **Affected subclause:** 25.3.2.3**Change:** The specialization of iterator_traits for void* and for function pointer types no longer contains any nested typedefs.**Rationale:** Corrects an issue misidentifying pointer types that are not incrementable as iterator types.**Effect on original feature:** A valid C++ 2017 program that relies on the presence of the typedefs may fail to compile, or have different behavior.**C.2.13 Clause 27: algorithms library**

[diff.cpp17.alg.reqs]

¹ **Affected subclause:** 27.2**Change:** The number and order of deducible template parameters for algorithm declarations is now unspecified, instead of being as-declared.**Rationale:** Increase implementor freedom and allow some function templates to be implemented as function objects with templated call operators.**Effect on original feature:** A valid C++ 2017 program that passes explicit template arguments to algorithms not explicitly specified to allow such in this version of C++ may fail to compile or have undefined behavior.**C.2.14 Clause 31: input/output library**

[diff.cpp17.input.output]

¹ **Affected subclause:** 31.7.5.3.3**Change:** Character array extraction only takes array types.**Rationale:** Increase safety via preventing buffer overflow at compile time.**Effect on original feature:** Valid C++ 2017 code may fail to compile in this revision of C++. For example:

```
auto p = new char[100];
char q[100];
std::cin >> std::setw(20) >> p;           // ill-formed; previously well-formed
std::cin >> std::setw(20) >> q;           // OK
```

² **Affected subclause:** 31.7.6.3.4**Change:** Overload resolution for ostream inserters used with UTF-8 literals.**Rationale:** Required for new features.**Effect on original feature:** Valid C++ 2017 code that passes UTF-8 literals to basic_ostream<char, ...>::operator<< or basic_ostream<wchar_t, ...>::operator<< is now ill-formed. For example:

```
std::cout << u8"text";           // previously called operator<<(const char*) and printed a string;
                                         // now ill-formed
std::cout << u8'X';           // previously called operator<<(char) and printed a character;
                                         // now ill-formed
```

³ **Affected subclause:** 31.7.6.3.4**Change:** Overload resolution for ostream inserters used with wchar_t, char16_t, or char32_t types.

Rationale: Removal of surprising behavior.

Effect on original feature: Valid C++ 2017 code that passes `wchar_t`, `char16_t`, or `char32_t` characters or strings to `basic_ostream<char, ...>::operator<<` or that passes `char16_t` or `char32_t` characters or strings to `basic_ostream<wchar_t, ...>::operator<<` is now ill-formed. For example:

```
std::cout << u"text";           // previously formatted the string as a pointer value;
                                // now ill-formed
std::cout << u'X';            // previously formatted the character as an integer value;
                                // now ill-formed
```

⁴ **Affected subclause:** [31.12.6](#)

Change: Return type of filesystem path format observer member functions.

Rationale: Required for new features.

Effect on original feature: Valid C++ 2017 code that depends on the `u8string()` and `generic_u8string()` member functions of `std::filesystem::path` returning `std::string` is not valid in this revision of C++. For example:

```
std::filesystem::path p;
std::string s1 = p.u8string();      // ill-formed; previously well-formed
std::string s2 = p.generic_u8string(); // ill-formed; previously well-formed
```

C.2.15 Annex D: compatibility features

[[diff.cpp17.depr](#)]

¹ **Change:** Remove `uncaught_exception`.

Rationale: The function did not have a clear specification when multiple exceptions were active, and has been superseded by `uncaught_exceptions`.

Effect on original feature: A valid C++ 2017 program that calls `std::uncaught_exception` may fail to compile. It can be revised to use `std::uncaught_exceptions` instead, for clear and portable semantics.

² **Change:** Remove support for adaptable function API.

Rationale: The deprecated support relied on a limited convention that cannot be extended to support the general case or new language features. It has been superseded by direct language support with `decltype`, and by the `std::bind` and `std::not_fn` function templates.

Effect on original feature: A valid C++ 2017 program that relies on the presence of `result_type`, `argument_type`, `first_argument_type`, or `second_argument_type` in a standard library class may fail to compile. A valid C++ 2017 program that calls `not1` or `not2`, or uses the class templates `unary_negate` or `binary_negate`, may fail to compile.

³ **Change:** Remove redundant members from `std::allocator`.

Rationale: `std::allocator` was overspecified, encouraging direct usage in user containers rather than relying on `std::allocator_traits`, leading to poor containers.

Effect on original feature: A valid C++ 2017 program that directly makes use of the `pointer`, `const_pointer`, `reference`, `const_reference`, `rebind`, `address`, `construct`, `destroy`, or `max_size` members of `std::allocator`, or that directly calls `allocate` with an additional hint argument, may fail to compile.

⁴ **Change:** Remove `raw_storage_iterator`.

Rationale: The iterator encouraged use of potentially-throwing algorithms, but did not return the number of elements successfully constructed, as would be necessary to destroy them.

Effect on original feature: A valid C++ 2017 program that uses this iterator class may fail to compile.

⁵ **Change:** Remove temporary buffers API.

Rationale: The temporary buffer facility was intended to provide an efficient optimization for small memory requests, but there is little evidence this was achieved in practice, while requiring the user to provide their own exception-safe wrappers to guard use of the facility in many cases.

Effect on original feature: A valid C++ 2017 program that calls `get_temporary_buffer` or `return_temporary_buffer` may fail to compile.

⁶ **Change:** Remove `shared_ptr::unique`.

Rationale: The result of a call to this member function is not reliable in the presence of multiple threads and weak pointers. The member function `use_count` is similarly unreliable, but has a clearer contract in such cases, and remains available for well-defined use in single-threaded cases.

Effect on original feature: A valid C++ 2017 program that calls `unique` on a `shared_ptr` object may fail to compile.

⁷ **Affected subclause:** [D.19](#)

Change: Remove deprecated type traits.

Rationale: The traits had unreliable or awkward interfaces. The `is_literal_type` trait provided no way to detect which subset of constructors and member functions of a type were declared `constexpr`. The `result_of` trait had a surprising syntax that did not directly support function types. It has been superseded by the `invoke_result` trait.

Effect on original feature: A valid C++ 2017 program that relies on the `is_literal_type` or `result_of` type traits, on the `is_literal_type_v` variable template, or on the `result_of_t` alias template may fail to compile.

C.3 C++ and ISO C++ 2014

[diff.cpp14]

C.3.1 General

[diff.cpp14.general]

- ¹ Subclause C.3 lists the differences between C++ and ISO C++ 2014 (ISO/IEC 14882:2014, *Programming Languages — C++*), in addition to those listed above, by the chapters of this document.

C.3.2 Clause 5: lexical conventions

[diff.cpp14.lex]

- ¹ **Affected subclause:** 5.2

Change: Removal of trigraph support as a required feature.

Rationale: Prevents accidental uses of trigraphs in non-raw string literals and comments.

Effect on original feature: Valid C++ 2014 code that uses trigraphs may not be valid or may have different semantics in this revision of C++. Implementations may choose to translate trigraphs as specified in C++ 2014 if they appear outside of a raw string literal, as part of the implementation-defined mapping from input source file characters to the translation character set.

- ² **Affected subclause:** 5.9

Change: *pp-number* can contain p *sign* and P *sign*.

Rationale: Necessary to enable *hexadecimal-floating-point-literals*.

Effect on original feature: Valid C++ 2014 code may fail to compile or produce different results in this revision of C++. Specifically, character sequences like `0p+0` and `0e1_p+0` are three separate tokens each in C++ 2014, but one single token in this revision of C++. For example:

```
#define F(a) b ## a
int b0p = F(0p+0); // ill-formed; equivalent to "int b0p = b0p + 0;" in C++ 2014
```

C.3.3 Clause 7: expressions

[diff.cpp14.expr]

- ¹ **Affected subclauses:** 7.6.1.6 and 7.6.2.3

Change: Remove increment operator with `bool` operand.

Rationale: Obsolete feature with occasionally surprising semantics.

Effect on original feature: A valid C++ 2014 expression utilizing the increment operator on a `bool` lvalue is ill-formed in this revision of C++.

- ² **Affected subclauses:** 7.6.2.8 and 7.6.2.9

Change: Dynamic allocation mechanism for over-aligned types.

Rationale: Simplify use of over-aligned types.

Effect on original feature: In C++ 2014 code that uses a *new-expression* to allocate an object with an over-aligned class type, where that class has no allocation functions of its own, `::operator new(std::size_t)` is used to allocate the memory. In this revision of C++, `::operator new(std::size_t, std::align_val_t)` is used instead.

C.3.4 Clause 9: declarations

[diff.cpp14.dcl.dcl]

- ¹ **Affected subclause:** 9.2.2

Change: Removal of `register storage-class-specifier`.

Rationale: Enable repurposing of deprecated keyword in future revisions of C++.

Effect on original feature: A valid C++ 2014 declaration utilizing the `register storage-class-specifier` is ill-formed in this revision of C++. The specifier can simply be removed to retain the original meaning.

- ² **Affected subclause:** 9.2.9.6

Change: `auto` deduction from *braced-init-list*.

Rationale: More intuitive deduction behavior.

Effect on original feature: Valid C++ 2014 code may fail to compile or may change meaning in this revision of C++. For example:

```
auto x1{1}; // was std::initializer_list<int>, now int
```

```
auto x2{1, 2};      // was std::initializer_list<int>, now ill-formed
```

³ **Affected subclause:** 9.3.4.6

Change: Make exception specifications be part of the type system.

Rationale: Improve type-safety.

Effect on original feature: Valid C++ 2014 code may fail to compile or change meaning in this revision of C++. For example:

```
void g1() noexcept;
void g2();
template<class T> int f(T *, T *);
int x = f(g1, g2);           // ill-formed; previously well-formed
```

⁴ **Affected subclause:** 9.4.2

Change: Definition of an aggregate is extended to apply to user-defined types with base classes.

Rationale: To increase convenience of aggregate initialization.

Effect on original feature: Valid C++ 2014 code may fail to compile or produce different results in this revision of C++; initialization from an empty initializer list will perform aggregate initialization instead of invoking a default constructor for the affected types. For example:

```
struct derived;
struct base {
    friend struct derived;
private:
    base();
};
struct derived : base {};

derived d1{};          // error; the code was well-formed in C++ 2014
derived d2;            // still OK
```

C.3.5 Clause 11: classes

[diff.cpp14.class]

¹ **Affected subclause:** 11.9.4

Change: Inheriting a constructor no longer injects a constructor into the derived class.

Rationale: Better interaction with other language features.

Effect on original feature: Valid C++ 2014 code that uses inheriting constructors may not be valid or may have different semantics. A *using-declaration* that names a constructor now makes the corresponding base class constructors visible to initializations of the derived class rather than declaring additional derived class constructors. For example:

```
struct A {
    template<typename T> A(T, typename T::type = 0);
    A(int);
};
struct B : A {
    using A::A;
    B(int);
};
B b(42L);           // now calls B(int), used to call B<long>(long),
                    // which called A(int) due to substitution failure
                    // in A<long>(long).
```

C.3.6 Clause 13: templates

[diff.cpp14.temp]

¹ **Affected subclause:** 13.10.3.6

Change: Allowance to deduce from the type of a non-type template argument.

Rationale: In combination with the ability to declare non-type template arguments with placeholder types, allows partial specializations to decompose from the type deduced for the non-type template argument.

Effect on original feature: Valid C++ 2014 code may fail to compile or produce different results in this revision of C++. For example:

```
template <int N> struct A;
template <typename T, T N> int foo(A<N> *) = delete;
void foo(void *);
```

```
void bar(A<0> *p) {
    foo(p);           // ill-formed; previously well-formed
}
```

C.3.7 Clause 14: exception handling

[diff.cpp14.exception]

- ¹
- Affected subclause:
- [14.5](#)

Change: Remove dynamic exception specifications.

Rationale: Dynamic exception specifications were a deprecated feature that was complex and brittle in use. They interacted badly with the type system, which became a more significant issue in this revision of C++ where (non-dynamic) exception specifications are part of the function type.

Effect on original feature: A valid C++ 2014 function declaration, member function declaration, function pointer declaration, or function reference declaration, if it has a potentially throwing dynamic exception specification, is rejected as ill-formed in this revision of C++. Violating a non-throwing dynamic exception specification calls `terminate` rather than `unexpected`, and it is unspecified whether stack unwinding is performed prior to such a call.

C.3.8 Clause 16: library introduction

[diff.cpp14.library]

- ¹
- Affected subclause:
- [16.4.2.3](#)

Change: New headers.

Rationale: New functionality.

Effect on original feature: The following C++ headers are new: `<any>` ([22.7.2](#)), `<charconv>` ([22.13.1](#)), `<execution>` ([22.12.2](#)), `<filesystem>` ([31.12.4](#)), `<memory_resource>` ([20.4.1](#)), `<optional>` ([22.5.2](#)), `<string_view>` ([23.3.2](#)), and `<variant>` ([22.6.2](#)). Valid C++ 2014 code that `#includes` headers with these names may be invalid in this revision of C++.

- ²
- Affected subclause:
- [16.4.5.2.3](#)

Change: New reserved namespaces.

Rationale: Reserve namespaces for future revisions of the standard library that can otherwise be incompatible with existing programs.

Effect on original feature: The global namespaces `std` followed by an arbitrary sequence of *digits* ([5.10](#)) are reserved for future standardization. Valid C++ 2014 code that uses such a top-level namespace, e.g., `std2`, may be invalid in this revision of C++.

C.3.9 Clause 22: general utilities library

[diff.cpp14.utilities]

- ¹
- Affected subclause:
- [22.10.17](#)

Change: Constructors taking allocators removed.

Rationale: No implementation consensus.

Effect on original feature: Valid C++ 2014 code may fail to compile or may change meaning in this revision of C++. Specifically, constructing a `std::function` with an allocator is ill-formed and uses-allocator construction will not pass an allocator to `std::function` constructors in this revision of C++.

- ²
- Affected subclause:
- [20.3.2.2](#)

Change: Different constraint on conversions from `unique_ptr`.

Rationale: Adding array support to `shared_ptr`, via the syntax `shared_ptr<T[]>` and `shared_ptr<T[N]>`.

Effect on original feature: Valid C++ 2014 code may fail to compile or may change meaning in this revision of C++. For example:

```
#include <memory>
std::unique_ptr<int[]> arr(new int[1]);
std::shared_ptr<int> ptr(std::move(arr)); // error: int(*)[] is not compatible with int*
```

C.3.10 Clause 23: strings library

[diff.cpp14.string]

- ¹
- Affected subclause:
- [23.4.3](#)

Change: Non-const `.data()` member added.

Rationale: The lack of a non-const `.data()` differed from the similar member of `std::vector`. This change regularizes behavior.

Effect on original feature: Overloaded functions which have differing code paths for `char*` and `const char*` arguments will execute differently when called with a non-const string's `.data()` member in this revision of C++. For example:

```
int f(char *) = delete;
```

```
int f(const char *);
string s;
int x = f(s.data());           // ill-formed; previously well-formed
```

C.3.11 Clause 24: containers library

[diff.cpp14.containers]

- ¹ **Affected subclause:** 24.2.7

Change: Requirements change:

Rationale: Increase portability, clarification of associative container requirements.

Effect on original feature: Valid C++ 2014 code that attempts to use associative containers having a comparison object with non-const function call operator may fail to compile in this revision of C++. For example:

```
#include <set>

struct compare
{
    bool operator()(int a, int b)
    {
        return a < b;
    }
};

int main() {
    const std::set<int, compare> s;
    s.find(0);
}
```

C.3.12 Annex D: compatibility features

[diff.cpp14.depr]

- ¹ **Change:** The class templates `auto_ptr`, `unary_function`, and `binary_function`, the function templates `random_shuffle`, and the function templates (and their return types) `ptr_fun`, `mem_fun`, `mem_fun_ref`, `bind1st`, and `bind2nd` are not defined.

Rationale: Superseded by new features.

Effect on original feature: Valid C++ 2014 code that uses these class templates and function templates may fail to compile in this revision of C++.

- ² **Change:** Remove old iostreams members [depr.ios.members].

Rationale: Redundant feature for compatibility with pre-standard code has served its time.

Effect on original feature: A valid C++ 2014 program using these identifiers may be ill-formed in this revision of C++.

C.4 C++ and ISO C++ 2011

[diff.cpp11]

C.4.1 General

[diff.cpp11.general]

- ¹ Subclause C.4 lists the differences between C++ and ISO C++ 2011 (ISO/IEC 14882:2011, *Programming Languages — C++*), in addition to those listed above, by the chapters of this document.

C.4.2 Clause 5: lexical conventions

[diff.cpp11.lex]

- ¹ **Affected subclause:** 5.9

Change: `pp-number` can contain one or more single quotes.

Rationale: Necessary to enable single quotes as digit separators.

Effect on original feature: Valid C++ 2011 code may fail to compile or may change meaning in this revision of C++. For example, the following code is valid both in C++ 2011 and in this revision of C++, but the macro invocation produces different outcomes because the single quotes delimit a *character-literal* in C++ 2011, whereas they are digit separators in this revision of C++. For example:

```
#define M(x, ...) __VA_ARGS__
int x[2] = { M('1'2,3'4, 5) };
// int x[2] = { 5 };      — C++ 2011
// int x[2] = { 3'4, 5 }; — this revision of C++
```

C.4.3 Clause 6: basics

[diff.cpp11.basic]

- ¹
- Affected subclause:**
- [6.7.5.3](#)

Change: New usual (non-placement) deallocator.**Rationale:** Required for sized deallocation.**Effect on original feature:** Valid C++ 2011 code can declare a global placement allocation function and deallocation function as follows:

```
void* operator new(std::size_t, std::size_t);
void operator delete(void*, std::size_t) noexcept;
```

In this revision of C++, however, the declaration of `operator delete` can match a predefined usual (non-placement) `operator delete` ([6.7.5.5](#)). If so, the program is ill-formed, as it was for class member allocation functions and deallocation functions ([7.6.2.8](#)).

C.4.4 Clause 7: expressions

[diff.cpp11.expr]

- ¹
- Affected subclause:**
- [7.6.16](#)

Change: A conditional expression with a throw expression as its second or third operand keeps the type and value category of the other operand.**Rationale:** Formerly mandated conversions (lvalue-to-rvalue ([7.3.2](#)), array-to-pointer ([7.3.3](#)), and function-to-pointer ([7.3.4](#)) standard conversions), especially the creation of the temporary due to lvalue-to-rvalue conversion, were considered gratuitous and surprising.**Effect on original feature:** Valid C++ 2011 code that relies on the conversions may behave differently in this revision of C++. For example:

```
struct S {
    int x = 1;
    void mf() { x = 2; }
};

int f(bool cond) {
    S s;
    (cond ? s : throw 0).mf();
    return s.x;
}
```

In C++ 2011, `f(true)` returns 1. In this revision of C++, it returns 2.

```
sizeof(true ? "" : throw 0)
```

In C++ 2011, the expression yields `sizeof(const char*)`. In this revision of C++, it yields `sizeof(const char[1])`.

C.4.5 Clause 9: declarations

[diff.cpp11.dcl.dcl]

- ¹
- Affected subclause:**
- [9.2.6](#)

Change: `constexpr` non-static member functions are not implicitly `const` member functions.**Rationale:** Necessary to allow `constexpr` member functions to mutate the object.**Effect on original feature:** Valid C++ 2011 code may fail to compile in this revision of C++. For example:

```
struct S {
    constexpr const int &f();
    int &f();
};
```

This code is valid in C++ 2011 but invalid in this revision of C++ because it declares the same member function twice with different return types.

- ²
- Affected subclause:**
- [9.4.2](#)

Change: Classes with default member initializers can be aggregates.**Rationale:** Necessary to allow default member initializers to be used by aggregate initialization.**Effect on original feature:** Valid C++ 2011 code may fail to compile or may change meaning in this revision of C++. For example:

```
struct S {           // Aggregate in C++ 2014 onwards.
    int m = 1;
};
struct X {
    operator int();
}
```

```

operator S();
};

X a{};
S b{a};           // uses copy constructor in C++ 2011,
                  // performs aggregate initialization in this revision of C++

```

C.4.6 Clause 16: library introduction

[diff.cpp11.library]

- ¹ **Affected subclause:** 16.4.2.3

Change: New header.**Rationale:** New functionality.**Effect on original feature:** The C++ header <shared_mutex> (33.6.3) is new. Valid C++ 2011 code that #includes a header with that name may be invalid in this revision of C++.**C.4.7 Clause 31: input/output library**

[diff.cpp11.input.output]

- ¹ **Affected subclause:** 31.13

Change: gets is not defined.**Rationale:** Use of gets is considered dangerous.**Effect on original feature:** Valid C++ 2011 code that uses the gets function may fail to compile in this revision of C++.**C.5 C++ and ISO C++ 2003**

[diff.cpp03]

C.5.1 General

[diff.cpp03.general]

- ¹ Subclause C.5 lists the differences between C++ and ISO C++ 2003 (ISO/IEC 14882:2003, *Programming Languages — C++*), in addition to those listed above, by the chapters of this document.

C.5.2 Clause 5: lexical conventions

[diff.cpp03.lex]

- ¹ **Affected subclause:** 5.4

Change: New kinds of *string-literals*.**Rationale:** Required for new features.**Effect on original feature:** Valid C++ 2003 code may fail to compile or produce different results in this revision of C++. Specifically, macros named R, u8, u8R, u, uR, U, UR, or LR will not be expanded when adjacent to a *string-literal* but will be interpreted as part of the *string-literal*. For example:

```
#define u8 "abc"
const char* s = u8"def";           // Previously "abcdef", now "def"
```

- ² **Affected subclause:** 5.4

Change: User-defined literal string support.**Rationale:** Required for new features.**Effect on original feature:** Valid C++ 2003 code may fail to compile or produce different results in this revision of C++. For example:

```
#define _x "there"
"hello"_x           // #1
```

Previously, #1 would have consisted of two separate preprocessing tokens and the macro _x would have been expanded. In this revision of C++, #1 consists of a single preprocessing token, so the macro is not expanded.

- ³ **Affected subclause:** 5.11

Change: New keywords.**Rationale:** Required for new features.**Effect on original feature:** Added to Table 5, the following identifiers are new keywords: alignas, alignof, char16_t, char32_t, constexpr, decltype, noexcept, nullptr, static_assert, and thread_local. Valid C++ 2003 code using these identifiers is invalid in this revision of C++.

- ⁴ **Affected subclause:** 5.13.2

Change: Type of integer literals.**Rationale:** C99 compatibility.**Effect on original feature:** Certain integer literals whose value is larger than the maximum representable value of type long can change from an unsigned integer type to signed long long.

C.5.3 Clause 7: expressions

[diff.cpp03.expr]

1 Affected subclause: 7.3.12**Change:** Only literals are integer null pointer constants.**Rationale:** Removing surprising interactions with templates and constant expressions.**Effect on original feature:** Valid C++ 2003 code may fail to compile or produce different results in this revision of C++. For example:

```
void f(void *);      // #1
void f(...);         // #2
template<int N> void g() {
    f(0*N);          // calls #2; used to call #1
}
```

2 Affected subclause: 7.6.5**Change:** Specify rounding for results of integer / and %.**Rationale:** Increase portability, C99 compatibility.**Effect on original feature:** Valid C++ 2003 code that uses integer division rounds the result toward 0 or toward negative infinity, whereas this revision of C++ always rounds the result toward 0.**3 Affected subclause: 7.6.14****Change:** && is valid in a *type-name*.**Rationale:** Required for new features.**Effect on original feature:** Valid C++ 2003 code may fail to compile or produce different results in this revision of C++. For example:

```
bool b1 = new int && false;           // previously false, now ill-formed
struct S { operator int(); };
bool b2 = &S::operator int && false;    // previously false, now ill-formed
```

C.5.4 Clause 9: declarations

[diff.cpp03.dcl.dcl]

1 Affected subclause: 9.2**Change:** Remove auto as a storage class specifier.**Rationale:** New feature.**Effect on original feature:** Valid C++ 2003 code that uses the keyword auto as a storage class specifier may be invalid in this revision of C++. In this revision of C++, auto indicates that the type of a variable is to be deduced from its initializer expression.**2 Affected subclause: 9.4.5****Change:** Narrowing restrictions in aggregate initializers.**Rationale:** Catches bugs.**Effect on original feature:** Valid C++ 2003 code may fail to compile in this revision of C++. For example:

```
int x[] = { 2.0 };
```

This code is valid in C++ 2003 but invalid in this revision of C++ because double to int is a narrowing conversion.

C.5.5 Clause 11: classes

[diff.cpp03.class]

1 Affected subclauses: 11.4.5.2, 11.4.7, 11.4.5.3, and 11.4.6**Change:** Implicitly-declared special member functions are defined as deleted when the implicit definition would have been ill-formed.**Rationale:** Improves template argument deduction failure.**Effect on original feature:** A valid C++ 2003 program that uses one of these special member functions in a context where the definition is not required (e.g., in an expression that is not potentially evaluated) becomes ill-formed.**2 Affected subclause: 11.4.7****Change:** User-declared destructors have an implicit exception specification.**Rationale:** Clarification of destructor requirements.**Effect on original feature:** Valid C++ 2003 code may execute differently in this revision of C++. In particular, destructors that throw exceptions will call std::terminate (without calling std::unexpected) if their exception specification is non-throwing.

C.5.6 Clause 13: templates

[diff.cpp03.temp]

1 Affected subclause: 13.2**Change:** Repurpose `export` for modules ([Clause 10](#), [15.4](#), [15.5](#)).**Rationale:** No implementation consensus for the C++ 2003 meaning of `export`.**Effect on original feature:** A valid C++ 2003 program containing `export` is ill-formed in this revision of C++.**2 Affected subclause: 13.4****Change:** Remove whitespace requirement for nested closing template right angle brackets.**Rationale:** Considered a persistent but minor annoyance. Template aliases representing non-class types would exacerbate whitespace issues.**Effect on original feature:** Change to semantics of well-defined expression. A valid C++ 2003 expression containing a right angle bracket (“>”) followed immediately by another right angle bracket may now be treated as closing two templates. For example:

```
template <class T> struct X { };
template <int N> struct Y { };
X< Y< 1 >> 2 > > x;
```

This code is valid in C++ 2003 because “>>” is a right-shift operator, but invalid in this revision of C++ because “>>” closes two templates.

3 Affected subclause: 13.8.4.2**Change:** Allow dependent calls of functions with internal linkage.**Rationale:** Overly constrained, simplify overload resolution rules.**Effect on original feature:** A valid C++ 2003 program can get a different result in this revision of C++.**C.5.7 Clause 16: library introduction**

[diff.cpp03.library]

1 Affected: Clause 16 – Clause 33**Change:** New reserved identifiers.**Rationale:** Required by new features.**Effect on original feature:** Valid C++ 2003 code that uses any identifiers added to the C++ standard library by later revisions of C++ may fail to compile or produce different results in this revision of C++. A comprehensive list of identifiers used by the C++ standard library can be found in the Index of Library Names in this document.**2 Affected subclause: 16.4.2.3****Change:** New headers.**Rationale:** New functionality.**Effect on original feature:** The following C++ headers are new: `<array>` ([24.3.2](#)), `<atomic>` ([33.5.2](#)), `<chrono>` ([29.2](#)), `<codecvt>` ([D.26.2](#)), `<condition_variable>` ([33.7.2](#)), `<forward_list>` ([24.3.4](#)), `<future>` ([33.10.2](#)), `<initializer_list>` ([17.10.2](#)), `<mutex>` ([33.6.2](#)), `<random>` ([28.5.2](#)), `<ratio>` ([21.4.2](#)), `<regex>` ([32.3](#)), `<scoped_allocator>` ([20.5.1](#)), `<system_error>` ([19.5.2](#)), `<thread>` ([33.4.2](#)), `<tuple>` ([22.4.2](#)), `<type-index>` ([22.11.1](#)), `<type_traits>` ([21.3.3](#)), `<unordered_map>` ([24.5.2](#)), and `<unordered_set>` ([24.5.3](#)). In addition the following C compatibility headers are new: `<cfenv>` ([28.3.1](#)), `<cinttypes>` ([31.13.2](#)), `<cstdint>` ([17.4.1](#)), and `<cuchar>` ([23.5.5](#)). Valid C++ 2003 code that `#includes` headers with these names may be invalid in this revision of C++.**3 Affected subclause: 16.4.4.3****Effect on original feature:** Function `swap` moved to a different header**Rationale:** Remove dependency on `<algorithm>` ([27.4](#)) for `swap`.**Effect on original feature:** Valid C++ 2003 code that has been compiled expecting `swap` to be in `<algorithm>` ([27.4](#)) may have to instead include `<utility>` ([22.2.1](#)).**4 Affected subclause: 16.4.5.2.2****Change:** New reserved namespace.**Rationale:** New functionality.**Effect on original feature:** The global namespace `posix` is now reserved for standardization. Valid C++ 2003 code that uses a top-level namespace `posix` may be invalid in this revision of C++.**5 Affected subclause: 16.4.6.3****Change:** Additional restrictions on macro names.**Rationale:** Avoid hard to diagnose or non-portable constructs.**Effect on original feature:** Names of attribute identifiers may not be used as macro names. Valid C++

2003 code that defines `override`, `final`, `carries_dependency`, or `noreturn` as macros is invalid in this revision of C++.

C.5.8 Clause 17: language support library

[diff.cpp03.language.support]

- ¹ Affected subclause: 17.6.3.2

Change: operator new may throw exceptions other than `std::bad_alloc`.

Rationale: Consistent application of `noexcept`.

Effect on original feature: Valid C++ 2003 code that assumes that global operator new only throws `std::bad_alloc` may execute differently in this revision of C++. Valid C++ 2003 code that replaces the global replaceable operator new is ill-formed in this revision of C++, because the exception specification of `throw(std::bad_alloc)` was removed.

C.5.9 Clause 19: diagnostics library

[diff.cpp03.diagnostics]

- ¹ Affected subclause: 19.4

Change: Thread-local error numbers.

Rationale: Support for new thread facilities.

Effect on original feature: Valid but implementation-specific C++ 2003 code that relies on `errno` being the same across threads may change behavior in this revision of C++.

C.5.10 Clause 22: general utilities library

[diff.cpp03.utilities]

- ¹ Affected subclauses: 22.10.6, 22.10.7, 22.10.8, 22.10.10, and 22.10.11

Change: Standard function object types no longer derived from `std::unary_function` or `std::binary_function`.

Rationale: Superseded by new feature; `unary_function` and `binary_function` are no longer defined.

Effect on original feature: Valid C++ 2003 code that depends on function object types being derived from `unary_function` or `binary_function` may fail to compile in this revision of C++.

C.5.11 Clause 23: strings library

[diff.cpp03.strings]

- ¹ Affected subclause: 23.4

Change: `basic_string` requirements no longer allow reference-counted strings.

Rationale: Invalidation is subtly different with reference-counted strings. This change regularizes behavior.

Effect on original feature: Valid C++ 2003 code may execute differently in this revision of C++.

- ² Affected subclause: 23.4.3.2

Change: Loosen `basic_string` invalidation rules.

Rationale: Allow small-string optimization.

Effect on original feature: Valid C++ 2003 code may execute differently in this revision of C++. Some `const` member functions, such as `data` and `c_str`, no longer invalidate iterators.

C.5.12 Clause 24: containers library

[diff.cpp03.containers]

- ¹ Affected subclause: 24.2

Change: Complexity of `size()` member functions now constant.

Rationale: Lack of specification of complexity of `size()` resulted in divergent implementations with inconsistent performance characteristics.

Effect on original feature: Some container implementations that conform to C++ 2003 may not conform to the specified `size()` requirements in this revision of C++. Adjusting containers such as `std::list` to the stricter requirements may require incompatible changes.

- ² Affected subclause: 24.2

Change: Requirements change: relaxation.

Rationale: Clarification.

Effect on original feature: Valid C++ 2003 code that attempts to meet the specified container requirements may now be over-specified. Code that attempted to be portable across containers may need to be adjusted as follows:

- (2.1) — not all containers provide `size()`; use `empty()` instead of `size() == 0`;
- (2.2) — not all containers are empty after construction (`array`);
- (2.3) — not all containers have constant complexity for `swap()` (`array`).

³ Affected subclause: 24.2**Change:** Requirements change: default constructible.**Rationale:** Clarification of container requirements.**Effect on original feature:** Valid C++ 2003 code that attempts to explicitly instantiate a container using a user-defined type with no default constructor may fail to compile.**⁴ Affected subclauses: 24.2.4 and 24.2.7****Change:** Signature changes: from `void` return types.**Rationale:** Old signature threw away useful information that may be expensive to recalculate.**Effect on original feature:** The following member functions have changed:

- (4.1) — `erase(iterator)` for `set`, `multiset`, `map`, `multimap`
- (4.2) — `erase(begin, end)` for `set`, `multiset`, `map`, `multimap`
- (4.3) — `insert(pos, num, val)` for `vector`, `deque`, `list`, `forward_list`
- (4.4) — `insert(pos, beg, end)` for `vector`, `deque`, `list`, `forward_list`

Valid C++ 2003 code that relies on these functions returning `void` (e.g., code that creates a pointer to member function that points to one of these functions) will fail to compile with this revision of C++.

⁵ Affected subclauses: 24.2.4 and 24.2.7**Change:** Signature changes: from `iterator` to `const_iterator` parameters.**Rationale:** Overspecification.**Effect on original feature:** The signatures of the following member functions changed from taking an `iterator` to taking a `const_iterator`:

- (5.1) — `insert(iterator, val)` for `vector`, `deque`, `list`, `set`, `multiset`, `map`, `multimap`
- (5.2) — `insert(pos, beg, end)` for `vector`, `deque`, `list`, `forward_list`
- (5.3) — `erase(begin, end)` for `set`, `multiset`, `map`, `multimap`
- (5.4) — all forms of `list::splice`
- (5.5) — all forms of `list::merge`

Valid C++ 2003 code that uses these functions may fail to compile with this revision of C++.

⁶ Affected subclauses: 24.2.4 and 24.2.7**Change:** Signature changes: `resize`.**Rationale:** Performance, compatibility with move semantics.**Effect on original feature:** For `vector`, `deque`, and `list` the fill value passed to `resize` is now passed by reference instead of by value, and an additional overload of `resize` has been added. Valid C++ 2003 code that uses this function may fail to compile with this revision of C++.**C.5.13 Clause 27: algorithms library**

[diff.cpp03.algorithms]

¹ Affected subclause: 27.1**Change:** Result state of inputs after application of some algorithms.**Rationale:** Required by new feature.**Effect on original feature:** A valid C++ 2003 program may detect that an object with a valid but unspecified state has a different valid but unspecified state with this revision of C++. For example, `std::remove` and `std::remove_if` may leave the tail of the input sequence with a different set of values than previously.**C.5.14 Clause 28: numerics library**

[diff.cpp03.numerics]

¹ Affected subclause: 28.4**Change:** Specified representation of complex numbers.**Rationale:** Compatibility with C99.**Effect on original feature:** Valid C++ 2003 code that uses implementation-specific knowledge about the binary representation of the required template specializations of `std::complex` may not be compatible with this revision of C++.**C.5.15 Clause 30: localization library**

[diff.cpp03.locale]

¹ Affected subclause: 30.4.3.2.3**Change:** The `num_get` facet recognizes hexadecimal floating point values.

Rationale: Required by new feature.

Effect on original feature: Valid C++ 2003 code may have different behavior in this revision of C++.

C.5.16 Clause 31: input/output library

[diff.cpp03.input.output]

- ¹ **Affected subclauses:** 31.7.5.2.4, 31.7.6.2.4, and 31.5.4.4

Change: Specify use of `explicit` in existing boolean conversion functions.

Rationale: Clarify intentions, avoid workarounds.

Effect on original feature: Valid C++ 2003 code that relies on implicit boolean conversions will fail to compile with this revision of C++. Such conversions occur in the following conditions:

- (1.1) — passing a value to a function that takes an argument of type `bool`;
- (1.2) — using `operator==` to compare to `false` or `true`;
- (1.3) — returning a value from a function with a return type of `bool`;
- (1.4) — initializing members of type `bool` via aggregate initialization;
- (1.5) — initializing a `const bool&` which would bind to a temporary object.

- ² **Affected subclause:** 31.5.2.2.1

Change: Change base class of `std::ios_base::failure`.

Rationale: More detailed error messages.

Effect on original feature: `std::ios_base::failure` is no longer derived directly from `std::exception`, but is now derived from `std::system_error`, which in turn is derived from `std::runtime_error`. Valid C++ 2003 code that assumes that `std::ios_base::failure` is derived directly from `std::exception` may execute differently in this revision of C++.

- ³ **Affected subclause:** 31.5.2

Change: Flag types in `std::ios_base` are now bitmasks with values defined as `constexpr` static members.

Rationale: Required for new features.

Effect on original feature: Valid C++ 2003 code that relies on `std::ios_base` flag types being represented as `std::bitset` or as an integer type may fail to compile with this revision of C++. For example:

```
#include <iostream>

int main() {
    int flag = std::ios_base::hex;
    std::cout.setf(flag);           // error: setf does not take argument of type int
}
```

C.6 C++ and ISO C

[diff.iso]

C.6.1 General

[diff.iso.general]

- ¹ Subclause C.6 lists the differences between C++ and ISO C, in addition to those listed above, by the chapters of this document.

C.6.2 Clause 5: lexical conventions

[diff.lex]

- ¹ **Affected subclause:** 5.11

Change: New Keywords

New keywords are added to C++; see 5.11.

Rationale: These keywords were added in order to implement the new semantics of C++.

Effect on original feature: Change to semantics of well-defined feature. Any ISO C programs that used any of these keywords as identifiers are not valid C++ programs.

Difficulty of converting: Syntactic transformation. Converting one specific program is easy. Converting a large collection of related programs takes more work.

How widely used: Common.

- ² **Affected subclause:** 5.13.3

Change: Type of `character-literal` is changed from `int` to `char`.

Rationale: This is needed for improved overloaded function argument type matching. For example:

```
int function( int i );
int function( char c );
```

```
function( 'x' );
```

It is preferable that this call match the second version of function rather than the first.

Effect on original feature: Change to semantics of well-defined feature. ISO C programs which depend on

```
sizeof('x') == sizeof(int)
```

will not work the same as C++ programs.

Difficulty of converting: Simple.

How widely used: Programs which depend upon `sizeof('x')` are probably rare.

3 Affected subclause: 5.13.5

Change: Concatenated *string-literals* can no longer have conflicting *encoding-prefixes*.

Rationale: Removal of non-portable feature.

Effect on original feature: Concatenation of *string-literals* with different *encoding-prefixes* is now ill-formed.

Difficulty of converting: Syntactic transformation.

How widely used: Seldom.

4 Affected subclause: 5.13.5

Change: String literals made `const`.

The type of a *string-literal* is changed from “array of `char`” to “array of `const char`”. The type of a UTF-8 string literal is changed from “array of `char`” to “array of `const char8_t`”. The type of a UTF-16 string literal is changed from “array of *some-integer-type*” to “array of `const char16_t`”. The type of a UTF-32 string literal is changed from “array of *some-integer-type*” to “array of `const char32_t`”. The type of a wide string literal is changed from “array of `wchar_t`” to “array of `const wchar_t`”.

Rationale: This avoids calling an inappropriate overloaded function, which would possibly attempt to modify its argument.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Syntactic transformation. The fix is to add a cast:

```
char* p = "abc";           // valid in C, invalid in C++
void f(char*) {
    char* p = (char*)"abc"; // OK, cast added
    f(p);
    f((char*)"def");     // OK, cast added
}
```

How widely used: Programs that have a legitimate reason to treat string literal objects as potentially modifiable memory are probably rare.

C.6.3 Clause 6: basics

[diff.basic]

1 Affected subclause: 6.2

Change: C++ does not have “tentative definitions” as in C.

E.g., at file scope,

```
int i;
int i;
```

is valid in C, invalid in C++. This makes it impossible to define mutually referential file-local objects with static storage duration, if initializers are restricted to the syntactic forms of C. For example,

```
struct X { int i; struct X* next; };

static struct X a;
static struct X b = { 0, &a };
static struct X a = { 1, &b };
```

Rationale: This avoids having different initialization rules for fundamental types and user-defined types.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. In C++, the initializer for one of a set of mutually-referential file-local objects with static storage duration must invoke a function call to achieve the initialization.

How widely used: Seldom.

2 Affected subclause: 6.4

Change: A `struct` is a scope in C++, not in C. For example,

```
struct X {
    struct Y { int a; } b;
};
struct Y c;
```

is valid in C but not in C++, which would require `X::Y c;`.

Rationale: Class scope is crucial to C++, and a struct is a class.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: C programs use `struct` extremely frequently, but the change is only noticeable when `struct`, enumeration, or enumerator names are referred to outside the `struct`. The latter is probably rare.

3 Affected subclause: 6.6 [also 9.2.9]

Change: A name of file scope that is explicitly declared `const`, and not explicitly declared `extern`, has internal linkage, while in C it would have external linkage.

Rationale: Because `const` objects may be used as values during translation in C++, this feature urges programmers to provide an explicit initializer for each `const` object. This feature allows the user to put `const` objects in source files that are included in more than one translation unit.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: Seldom.

4 Affected subclause: 6.9.3.1

Change: The `main` function cannot be called recursively and cannot have its address taken.

Rationale: The `main` function may require special actions.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Trivial: create an intermediary function such as `mymain(argc, argv)`.

How widely used: Seldom.

5 Affected subclause: 6.8

Change: C allows “compatible types” in several places, C++ does not.

For example, otherwise-identical `struct` types with different tag names are “compatible” in C but are distinctly different types in C++.

Rationale: Stricter type checking is essential for C++.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. The “typesafe linkage” mechanism will find many, but not all, of such problems. Those problems not found by typesafe linkage will continue to function properly, according to the “layout compatibility rules” of this document.

How widely used: Common.

C.6.4 Clause 7: expressions

[diff.expr]

1 Affected subclause: 7.3.12

Change: Converting `void*` to a pointer-to-object type requires casting.

```
char a[10];
void* b=a;
void foo() {
    char* c=b;
}
```

ISO C accepts this usage of pointer to `void` being assigned to a pointer to object type. C++ does not.

Rationale: C++ tries harder than C to enforce compile-time type safety.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Can be automated. Violations will be diagnosed by the C++ translator. The fix is to add a cast. For example:

```
char* c = (char*) b;
```

How widely used: This is fairly widely used but it is good programming practice to add the cast when assigning pointer-to-void to pointer-to-object. Some ISO C translators will give a warning if the cast is not used.

2 Affected subclauses: 7.6.1.6 and 7.6.2.3

Change: Decrement operator is not allowed with `bool` operand.

Rationale: Feature with surprising semantics.

Effect on original feature: A valid ISO C expression utilizing the decrement operator on a `bool` lvalue (for instance, via the C `typedef` in `<stdbool.h>` (17.14.5)) is ill-formed in C++.

³ **Affected subclauses:** 7.6.2.5 and 7.6.3

Change: In C++, types can only be defined in declarations, not in expressions.

In C, a `sizeof` expression or cast expression may define a new type. For example,

```
p = (void*)(struct x {int i;} *)0;
```

defines a new type, `struct x`.

Rationale: This prohibition helps to clarify the location of definitions in the source code.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Syntactic transformation.

How widely used: Seldom.

⁴ **Affected subclauses:** 7.6.16, 7.6.19, and 7.6.20

Change: The result of a conditional expression, an assignment expression, or a comma expression may be an lvalue.

Rationale: C++ is an object-oriented language, placing relatively more emphasis on lvalues. For example, function calls may yield lvalues.

Effect on original feature: Change to semantics of well-defined feature. Some C expressions that implicitly rely on lvalue-to-rvalue conversions will yield different results. For example,

```
char arr[100];
sizeof(0, arr)
```

yields 100 in C++ and `sizeof(char*)` in C.

Difficulty of converting: Programs must add explicit casts to the appropriate rvalue.

How widely used: Rare.

C.6.5 Clause 8: statements

[diff.stat]

¹ **Affected subclauses:** 8.5.3 and 8.7.6

Change: It is now invalid to jump past a declaration with explicit or implicit initializer (except across entire block not entered).

Rationale: Constructors used in initializers may allocate resources which need to be de-allocated upon leaving the block. Allowing jump past initializers would require complicated runtime determination of allocation. Furthermore, many operations on such an uninitialized object have undefined behavior. With this simple compile-time rule, C++ assures that if an initialized variable is in scope, then it has assuredly been initialized.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: Seldom.

² **Affected subclause:** 8.7.4

Change: It is now invalid to return (explicitly or implicitly) from a function which is declared to return a value without actually returning a value.

Rationale: The caller and callee may assume fairly elaborate return-value mechanisms for the return of class objects. If some flow paths execute a return without specifying any value, the implementation must embody many more complications. Besides, promising to return a value of a given type, and then not returning such a value, has always been recognized to be a questionable practice, tolerated only because very-old C had no distinction between functions with `void` and `int` return types.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. Add an appropriate return value to the source code, such as zero.

How widely used: Seldom. For several years, many existing C implementations have produced warnings in this case.

C.6.6 Clause 9: declarations

[diff.dcl]

¹ **Affected subclause:** 9.2.2

Change: In C++, the `static` or `extern` specifiers can only be applied to names of objects or functions.

Using these specifiers with type declarations is illegal in C++. In C, these specifiers are ignored when used on type declarations.

Example:

```
static struct S {           // valid C, invalid in C++
    int i;
};
```

Rationale: Storage class specifiers don't have any meaning when associated with a type. In C++, class members can be declared with the `static` storage class specifier. Storage class specifiers on type declarations can be confusing for users.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Syntactic transformation.

How widely used: Seldom.

2 **Affected subclause:** 9.2.2

Change: In C++, `register` is not a storage class specifier.

Rationale: The storage class specifier had no effect in C++.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Syntactic transformation.

How widely used: Common.

3 **Affected subclause:** 9.2.4

Change: A C++ `typedef-name` must be different from any class type name declared in the same scope (except if the `typedef` is a synonym of the class name with the same name). In C, a `typedef-name` and a `struct` tag name declared in the same scope can have the same name (because they have different name spaces).

Example:

```
typedef struct name1 { /* ... */ } name1;           // valid C and C++
struct name { /* ... */ };
typedef int name;          // valid C, invalid C++
```

Rationale: For ease of use, C++ doesn't require that a type name be prefixed with the keywords `class`, `struct` or `union` when used in object declarations or type casts.

Example:

```
class name { /* ... */ };
name i;           // i has type class name
```

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. One of the 2 types has to be renamed.

How widely used: Seldom.

4 **Affected subclause:** 9.2.9 [see also 6.6]

Change: Const objects must be initialized in C++ but can be left uninitialized in C.

Rationale: A const object cannot be assigned to so it must be initialized to hold a useful value.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: Seldom.

5 **Affected subclause:** 9.2.9.6

Change: The keyword `auto` cannot be used as a storage class specifier.

Example:

```
void f() {
    auto int x;           // valid C, invalid C++
}
```

Rationale: Allowing the use of `auto` to deduce the type of a variable from its initializer results in undesired interpretations of `auto` as a storage class specifier in certain contexts.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Syntactic transformation.

How widely used: Rare.

6 **Affected subclause:** 9.3.4.6

Change: In C++, a function declared with an empty parameter list takes no arguments. In C, an empty parameter list means that the number and type of the function arguments are unknown.

Example:

```
int f();           // means int f(void) in C++
```

```
// int f( unknown ) in C
```

Rationale: This is to avoid erroneous function calls (i.e., function calls with the wrong number or type of arguments).

Effect on original feature: Change to semantics of well-defined feature. This feature was marked as “obsolescent” in C.

Difficulty of converting: Syntactic transformation. The function declarations using C incomplete declaration style must be completed to become full prototype declarations. A program may need to be updated further if different calls to the same (non-prototype) function have different numbers of arguments or if the type of corresponding arguments differed.

How widely used: Common.

⁷ **Affected subclause:** 9.3.4.6 [see 7.6.2.5]

Change: In C++, types may not be defined in return or parameter types. In C, these type definitions are allowed.

Example:

```
void f( struct S { int a; } arg ) {}      // valid C, invalid C++
enum E { A, B, C } f() {}                 // valid C, invalid C++
```

Rationale: When comparing types in different translation units, C++ relies on name equivalence when C relies on structural equivalence. Regarding parameter types: since the type defined in a parameter list would be in the scope of the function, the only legal calls in C++ would be from within the function itself.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. The type definitions must be moved to file scope, or in header files.

How widely used: Seldom. This style of type definition is seen as poor coding style.

⁸ **Affected subclause:** 9.5

Change: In C++, the syntax for function definition excludes the “old-style” C function. In C, “old-style” syntax is allowed, but deprecated as “obsolescent”.

Rationale: Prototypes are essential to type safety.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Syntactic transformation.

How widely used: Common in old programs, but already known to be obsolescent.

⁹ **Affected subclause:** 9.4.2

Change: In C++, designated initialization support is restricted compared to the corresponding functionality in C. In C++, designators for non-static data members must be specified in declaration order, designators for array elements and nested designators are not supported, and designated and non-designated initializers cannot be mixed in the same initializer list.

Example:

```
struct A { int x, y; };
struct B { struct A a; };
struct A a = {.y = 1, .x = 2}; // valid C, invalid C++
int arr[3] = {[1] = 5};     // valid C, invalid C++
struct B b = {.a.x = 0};    // valid C, invalid C++
struct A c = {.x = 1, 2};   // valid C, invalid C++
```

Rationale: In C++, members are destroyed in reverse construction order and the elements of an initializer list are evaluated in lexical order, so field initializers must be specified in order. Array designators conflict with *lambda-expression* syntax. Nested designators are seldom used.

Effect on original feature: Deletion of feature that is incompatible with C++.

Difficulty of converting: Syntactic transformation.

How widely used: Out-of-order initializers are common. The other features are seldom used.

¹⁰ **Affected subclause:** 9.4.3

Change: In C++, when initializing an array of character with a string, the number of characters in the string (including the terminating '\0') must not exceed the number of elements in the array. In C, an array can be initialized with a string even if the array is not large enough to contain the string-terminating '\0'.

Example:

```
char array[4] = "abcd";           // valid C, invalid C++
```

Rationale: When these non-terminated arrays are manipulated by standard string functions, there is potential for major catastrophe.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. The arrays must be declared one element bigger to contain the string terminating '\0'.

How widely used: Seldom. This style of array initialization is seen as poor coding style.

¹¹ **Affected subclause:** 9.7.1

Change: C++ objects of enumeration type can only be assigned values of the same enumeration type. In C, objects of enumeration type can be assigned values of any integral type.

Example:

```
enum color { red, blue, green };
enum color c = 1;           // valid C, invalid C++
```

Rationale: The type-safe nature of C++.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Syntactic transformation. (The type error produced by the assignment can be automatically corrected by applying an explicit cast.)

How widely used: Common.

¹² **Affected subclause:** 9.7.1

Change: In C++, the type of an enumerator is its enumeration. In C, the type of an enumerator is int.

Example:

```
enum e { A };
sizeof(A) == sizeof(int)      // in C
sizeof(A) == sizeof(e)        // in C++
/* and sizeof(int) is not necessarily equal to sizeof(e) */
```

Rationale: In C++, an enumeration is a distinct type.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: Seldom. The only time this affects existing C code is when the size of an enumerator is taken. Taking the size of an enumerator is not a common C coding practice.

¹³ **Affected subclause:** 9.12.2

Change: In C++, an *alignment-specifier* is an *attribute-specifier*. In C, an *alignment-specifier* is a *declaration-specifier*.

Example:

```
#include <stdalign.h>
unsigned alignas(8) int x;      // valid C, invalid C++
unsigned int y alignas(8);      // valid C++, invalid C
```

Rationale: C++ requires unambiguous placement of the *alignment-specifier*.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Syntactic transformation.

How widely used: Seldom.

C.6.7 Clause 11: classes

[diff.class]

¹ **Affected subclause:** 11.3 [see also 9.2.4]

Change: In C++, a class declaration introduces the class name into the scope where it is declared and hides any object, function or other declaration of that name in an enclosing scope. In C, an inner scope declaration of a struct tag name never hides the name of an object or function in an outer scope.

Example:

```
int x[99];
void f() {
    struct x { int a; };
    sizeof(x); /* size of the array in C */
    /* size of the struct in C++ */
}
```

Rationale: This is one of the few incompatibilities between C and C++ that can be attributed to the new C++ name space definition where a name can be declared as a type and as a non-type in a single scope causing the non-type name to hide the type name and requiring that the keywords `class`, `struct`, `union` or `enum` be used to refer to the type name. This new name space definition provides important notational conveniences to C++ programmers and helps making the use of the user-defined types as similar as possible to the use of fundamental types. The advantages of the new name space definition were judged to outweigh by far the incompatibility with C described above.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation. If the hidden name that needs to be accessed is at global scope, the `::` C++ operator can be used. If the hidden name is at block scope, either the type or the struct tag has to be renamed.

How widely used: Seldom.

² **Affected subclause:** 11.4.5.3

Change: Copying volatile objects.

The implicitly-declared copy constructor and implicitly-declared copy assignment operator cannot make a copy of a volatile lvalue. For example, the following is valid in ISO C:

```
struct X { int i; };
volatile struct X x1 = {0};           // invalid C++
struct X x2 = x1;
struct X x3;                        // also invalid C++
x3 = x1;
```

Rationale: Several alternatives were debated at length. Changing the parameter to `volatile const X&` would greatly complicate the generation of efficient code for class objects. Discussion of providing two alternative signatures for these implicitly-defined operations raised unanswered concerns about creating ambiguities and complicating the rules that specify the formation of these operators according to the bases and members.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. If volatile semantics are required for the copy, a user-declared constructor or assignment must be provided. If non-volatile semantics are required, an explicit `const_cast` can be used.

How widely used: Seldom.

³ **Affected subclause:** 11.4.10

Change: Bit-fields of type plain `int` are signed.

Rationale: The signedness needs to be consistent among template specializations. For consistency, the implementation freedom was eliminated for non-dependent types, too.

Effect on original feature: The choice is implementation-defined in C, but not so in C++.

Difficulty of converting: Syntactic transformation.

How widely used: Seldom.

⁴ **Affected subclause:** 11.4.12

Change: In C++, the name of a nested class is local to its enclosing class. In C the name of the nested class belongs to the same scope as the name of the outermost enclosing class.

Example:

```
struct X {
    struct Y { /* ... */ } y;
};
struct Y yy;                      // valid C, invalid C++
```

Rationale: C++ classes have member functions which require that classes establish scopes. The C rule would leave classes as an incomplete scope mechanism which would prevent C++ programmers from maintaining locality within a class. A coherent set of scope rules for C++ based on the C rule would be very complicated and C++ programmers would be unable to predict reliably the meanings of nontrivial examples involving nested or local functions.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation. To make the struct type name visible in the scope of the enclosing struct, the struct tag can be declared in the scope of the enclosing struct, before the enclosing struct is defined. Example:

```
struct Y;                         // struct Y and struct X are at the same scope
```

```
struct X {
    struct Y { /* ... */ } y;
};
```

All the definitions of C struct types enclosed in other struct definitions and accessed outside the scope of the enclosing struct can be exported to the scope of the enclosing struct. Note: this is a consequence of the difference in scope rules, which is documented in [6.4](#).

How widely used: Seldom.

⁵ **Affected subclause:** [6.5.2](#)

Change: In C++, a *typedef-name* may not be redeclared in a class definition after being used in that definition.

Example:

```
typedef int I;
struct S {
    I i;
    int I;           // valid C, invalid C++
};
```

Rationale: When classes become complicated, allowing such a redefinition after the type has been used can create confusion for C++ programmers as to what the meaning of I really is.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. Either the type or the struct member has to be renamed.

How widely used: Seldom.

C.6.8 Clause 15: preprocessing directives

[diff.cpp]

¹ **Affected subclause:** [15.11](#)

Change: Whether `__STDC__` is defined and if so, what its value is, are implementation-defined.

Rationale: C++ is not identical to ISO C. Mandating that `__STDC__` be defined would require that translators make an incorrect claim.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: Programs and headers that reference `__STDC__` are quite common.

C.7 C standard library

[diff.library]

C.7.1 General

[diff.library.general]

¹ Subclause [C.7](#) summarizes the explicit changes in headers, definitions, declarations, or behavior between the C standard library in the C standard and the parts of the C++ standard library that were included from the C standard library.

C.7.2 Modifications to headers

[diff.mods.to.headers]

- ¹ For compatibility with the C standard library, the C++ standard library provides the C headers enumerated in [17.14](#).
- ² There are no C++ headers for the C standard library's headers `<stdnoreturn.h>` and `<threads.h>`, nor are these headers from the C standard library headers themselves part of C++.
- ³ The C headers `<complex.h>` and `<tgmath.h>` do not contain any of the content from the C standard library and instead merely include other headers from the C++ standard library.

C.7.3 Modifications to definitions

[diff.mods.todefinitions]

C.7.3.1 Types `char16_t` and `char32_t`

[diff.char16]

¹ The types `char16_t` and `char32_t` are distinct types rather than typedefs to existing integral types. The tokens `char16_t` and `char32_t` are keywords in C++ ([5.11](#)). They do not appear as macro or type names defined in `<cuchar>` ([23.5.5](#)).

C.7.3.2 Type `wchar_t`

[diff.wchar.t]

- ¹ The type `wchar_t` is a distinct type rather than a typedef to an existing integral type. The token `wchar_t` is a keyword in C++ ([5.11](#)). It does not appear as a macro or type name defined in any of `<cstddef>` ([17.2.1](#)), `<cstdlib>` ([17.2.2](#)), or `<cwchar>` ([23.5.4](#)).

C.7.3.3 Header <assert.h>

[diff.header.assert.h]

- ¹ The token `static_assert` is a keyword in C++. It does not appear as a macro name defined in `<cassert>` (19.3.2).

C.7.3.4 Header <iso646.h>

[diff.header.iso646.h]

- ¹ The tokens `and`, `and_eq`, `bitand`, `bitor`, `compl`, `not`, `not_eq`, `or`, `or_eq`, `xor`, and `xor_eq` are keywords in C++ (5.11), and are not introduced as macros by `<iso646.h>` (17.14.3).

C.7.3.5 Header <stdalign.h>

[diff.header.stdalign.h]

- ¹ The token `alignas` is a keyword in C++ (5.11), and is not introduced as a macro by `<stdalign.h>` (17.14.4).

C.7.3.6 Header <stdbool.h>

[diff.headerstdbool.h]

- ¹ The tokens `bool`, `true`, and `false` are keywords in C++ (5.11), and are not introduced as macros by `<stdbool.h>` (17.14.5).

C.7.3.7 Macro NULL

[diff.null]

- ¹ The macro `NULL`, defined in any of `<clocale>` (30.5.1), `<cstddef>` (17.2.1), `<cstdio>` (31.13.1), `<cstdlib>` (17.2.2), `<cstring>` (23.5.3), `<ctime>` (29.14), or `<cwchar>` (23.5.4), is an implementation-defined null pointer constant in C++ (17.2).

C.7.4 Modifications to declarations

[diff.mods.to.declarations]

- ¹ Header `<cstring>` (23.5.3): The following functions have different declarations:

- (1.1) — `strchr`
- (1.2) — `struprbrk`
- (1.3) — `strrchr`
- (1.4) — `strstr`
- (1.5) — `memchr`

Subclause 23.5.3 describes the changes.

- ² Header `<cwchar>` (23.5.4): The following functions have different declarations:

- (2.1) — `wcschr`
- (2.2) — `wcspbrk`
- (2.3) — `wcsrchr`
- (2.4) — `wcsstr`
- (2.5) — `wmemchr`

Subclause 23.5.4 describes the changes.

- ³ Header `<cstddef>` (17.2.1) declares the names `nullptr_t`, `byte`, and `to_integer`, and the operators and operator templates in (17.2.5), in addition to the names declared in `<stddef.h>` (17.14) in the C standard library.

C.7.5 Modifications to behavior

[diff.mods.to.behavior]

C.7.5.1 General

[diff.mods.to.behavior.general]

- ¹ Header `<stdlib.h>` (17.2.2): The following functions have different behavior:

- (1.1) — `atexit`
- (1.2) — `exit`
- (1.3) — `abort`

Subclause 17.5 describes the changes.

- ² Header `<csetjmp>` (17.13.3): The following functions have different behavior:

- (2.1) — `longjmp`

Subclause 17.13.3 describes the changes.

C.7.5.2 Macro `offsetof(type, member-designator)`

[diff.offsetof]

- ¹ The macro `offsetof`, defined in <cstddef> (17.2.1), accepts a restricted set of *type* arguments in C++. Subclause 17.2.4 describes the change.

C.7.5.3 Memory allocation functions

[diff.malloc]

- ¹ The functions `aligned_alloc`, `calloc`, `malloc`, and `realloc` are restricted in C++. Subclause 20.2.12 describes the changes.

Annex D (normative)

Compatibility features [depr]

D.1 General

[depr.general]

- ¹ This Annex describes features of the C++ Standard that are specified for compatibility with existing implementations.
- ² These are deprecated features, where *deprecated* is defined as: Normative for the current revision of C++, but having been identified as a candidate for removal from future revisions. An implementation may declare library names and entities described in this Clause with the **deprecated** attribute (9.12.5).

D.2 Arithmetic conversion on enumerations

[depr.arith.conv.enum]

- ¹ The ability to apply the usual arithmetic conversions (7.4) on operands where one is of enumeration type and the other is of a different enumeration type or a floating-point type is deprecated.

NOTE: Three-way comparisons (7.6.8) between such operands are ill-formed.

EXAMPLE:

```
enum E1 { e };
enum E2 { f };
bool b = e <= 3.7;           // deprecated
int k = f - e;              // deprecated
auto cmp = e <=> f;        // error
```

D.3 Implicit capture of ***this** by reference

[depr.capture.this]

- ¹ For compatibility with prior revisions of C++, a *lambda-expression* with *capture-default* = (7.5.5.3) may implicitly capture ***this** by reference.

EXAMPLE:

```
struct X {
    int x;
    void foo(int n) {
        auto f = [=]() { x = n; };           // deprecated: x means this->x, not a copy thereof
        auto g = [=, this]() { x = n; };     // recommended replacement
    }
};
```

D.4 Array comparisons

[depr.array.comp]

- ¹ Equality and relational comparisons (7.6.10, 7.6.9) between two operands of array type are deprecated.

NOTE: Three-way comparisons (7.6.8) between such operands are ill-formed.

EXAMPLE:

```
int arr1[5];
int arr2[5];
bool same = arr1 == arr2;           // deprecated, same as &arr1[0] == &arr2[0],
                                    // does not compare array contents
auto cmp = arr1 <=> arr2;         // error
```

D.5 Deprecated volatile types

[depr.volatile.type]

- ¹ Postfix **++** and **--** expressions (7.6.1.6) and prefix **++** and **--** expressions (7.6.2.3) of volatile-qualified arithmetic and pointer types are deprecated.

EXAMPLE 1:

```
volatile int velociraptor;
++velociraptor;                  // deprecated
```

- ² Certain assignments where the left operand is a volatile-qualified non-class type are deprecated; see 7.6.19.

EXAMPLE 2:

```
int neck, tail;
volatile int brachiosaur;
brachiosaur = neck;           // OK
tail = brachiosaur;          // OK
tail = brachiosaur = neck;    // deprecated
brachiosaur += neck;         // OK
```

- ³ A function type (9.3.4.6) with a parameter with volatile-qualified type or with a volatile-qualified return type is deprecated.

EXAMPLE 3:

```
volatile struct amber jurassic();           // deprecated
void trex(volatile short left_arm, volatile short right_arm); // deprecated
void fly(volatile struct pterosaur* pteranodon); // OK
```

- ⁴ A structured binding (9.6) of a volatile-qualified type is deprecated.

EXAMPLE 4:

```
struct linhenykus { short forelimb; };
void park(linhenykus alvarezsauroid) {
    volatile auto [what_is_this] = alvarezsauroid;           // deprecated
    // ...
}
```

D.6 Redeclaration of static constexpr data members [depr.static.constexpr]

- ¹ For compatibility with prior revisions of C++, a `constexpr` static data member may be redundantly redeclared outside the class with no initializer. This usage is deprecated.

EXAMPLE:

```
struct A {
    static constexpr int n = 5; // definition (declaration in C++ 2014)
};

constexpr int A::n; // redundant declaration (definition in C++ 2014)
```

D.7 Non-local use of TU-local entities

[depr.local]

- ¹ A declaration of a non-TU-local entity that is an exposure (6.6) is deprecated.

NOTE: Such a declaration in an importable module unit is ill-formed.

EXAMPLE:

```
namespace {
    struct A {
        void f() {}
    };
}
A h(); // deprecated: not internal linkage
inline void g() {A().f();} // deprecated: inline and not internal linkage
```

D.8 Implicit declaration of copy functions

[depr.impldec]

- ¹ The implicit definition of a copy constructor (11.4.5.3) as defaulted is deprecated if the class has a user-declared copy assignment operator or a user-declared destructor (11.4.7). The implicit definition of a copy assignment operator (11.4.6) as defaulted is deprecated if the class has a user-declared copy constructor or a user-declared destructor. It is possible that future versions of C++ will specify that these implicit definitions are deleted (9.5.3).

D.9 Literal operator function declarations using an identifier

[depr.lit]

- ¹ A *literal-operator-id* (12.6) of the form

`operator string-literal identifier`

is deprecated.

D.10 template keyword before qualified names [depr.template.template]

- ¹ The use of the keyword `template` before the qualified name of a class or alias template without a template argument list is deprecated ([13.3](#)).

D.11 Requires paragraph [depr.res.on.required]

- ¹ In addition to the elements specified in [16.3.2.4](#), descriptions of function semantics may also contain a *Requires:* element to denote the preconditions for calling a function.
- ² Violation of any preconditions specified in a function's *Requires:* element results in undefined behavior unless the function's *Throws:* element specifies throwing an exception when the precondition is violated.

D.12 has_denorm members in numeric_limits [depr.numeric.limits.has.denorm]

- ¹ The following type is defined in addition to those specified in `<limits>` ([17.3.3](#)):

```
namespace std {
    enum float_denorm_style {
        denorm_ineterminate = -1,
        denorm_absent = 0,
        denorm_present = 1
    };
}
```

- ² The following members are defined in addition to those specified in [17.3.5.1](#):

```
static constexpr float_denorm_style has_denorm = denorm_absent;
static constexpr bool has_denorm_loss = false;
```

- ³ The values of `has_denorm` and `has_denorm_loss` of specializations of `numeric_limits` are unspecified.

- ⁴ The following members of the specialization `numeric_limits<bool>` are defined in addition to those specified in [17.3.5.3](#):

```
static constexpr float_denorm_style has_denorm = denorm_absent;
static constexpr bool has_denorm_loss = false;
```

D.13 Deprecated C macros [depr.c.macros]

- ¹ The header `<stdalign.h>` has the following macro:

```
#define __alignas_is_defined 1
```

- ² The header `<stdbool.h>` has the following macro:

```
#define __bool_true_false_are_defined 1
```

D.14 Relational operators [depr.relops]

- ¹ The header `<utility>` ([22.2.1](#)) has the following additions:

```
namespace std::rel_ops {
    template<class T> bool operator!=(const T&, const T&);
    template<class T> bool operator> (const T&, const T&);
    template<class T> bool operator<=(const T&, const T&);
    template<class T> bool operator>=(const T&, const T&);
}
```

- ² To avoid redundant definitions of `operator!=` out of `operator==` and operators `>`, `<=`, and `>=` out of `operator<`, the library provides the following:

```
template<class T> bool operator!=(const T& x, const T& y);
```

- ³ *Requires:* Type T is *Cpp17EqualityComparable* ([Table 28](#)).

- ⁴ *Returns:* !(`x == y`).

```
template<class T> bool operator>(const T& x, const T& y);
```

- ⁵ *Requires:* Type T is *Cpp17LessThanComparable* ([Table 29](#)).

- ⁶ *Returns:* `y < x`.

```

template<class T> bool operator<=(const T& x, const T& y);
7   Requires: Type T is Cpp17LessThanComparable (Table 29).
8   Returns: !(y < x).

template<class T> bool operator>=(const T& x, const T& y);
9   Requires: Type T is Cpp17LessThanComparable (Table 29).
10  Returns: !(x < y).

```

D.15 char* streams

[depr.str.strstreams]

D.15.1 Header <strstream> synopsis

- ¹ The header <strstream> defines types that associate stream buffers with character array objects and assist reading and writing such objects.

```

namespace std {
    class strstreambuf;
    class istrstream;
    class ostrstream;
    class strstream;
}

```

D.15.2 Class strstreambuf

[depr.strstreambuf]

D.15.2.1 General

[depr.strstreambuf.general]

```

namespace std {
    class strstreambuf : public basic_streambuf<char> {
        public:
            strstreambuf() : strstreambuf(0) {}
            explicit strstreambuf(streamsize alsize_arg);
            strstreambuf(void* (*palloc_arg)(size_t), void (*pfree_arg)(void*));
            strstreambuf(char* gnex_arg, streamsize n, char* pbeg_arg = nullptr);
            strstreambuf(const char* gnex_arg, streamsize n);

            strstreambuf(signed char* gnex_arg, streamsize n,
                        signed char* pbeg_arg = nullptr);
            strstreambuf(const signed char* gnex_arg, streamsize n,
                        unsigned char* gnex_arg, streamsize n,
                        unsigned char* pbeg_arg = nullptr);
            strstreambuf(const unsigned char* gnex_arg, streamsize n);

            virtual ~strstreambuf();

            void freeze(bool freezefl = true);
            char* str();
            int pcount();

        protected:
            int_type overflow (int_type c = EOF) override;
            int_type pbackfail(int_type c = EOF) override;
            int_type underflow() override;
            pos_type seekoff(off_type off, ios_base::seekdir way,
                            ios_base::openmode which = ios_base::in | ios_base::out) override;
            pos_type seekpos(pos_type sp,
                            ios_base::openmode which = ios_base::in | ios_base::out) override;
            streambuf* setbuf(char* s, streamsize n) override;

        private:
            using strstate = T1; // exposition only
            static const strstate allocated; // exposition only
            static const strstate constant; // exposition only
            static const strstate dynamic; // exposition only
            static const strstate frozen; // exposition only
            strstate strmode; // exposition only

```

```

    streamsize alsiz;
    void* (*palloc)(size_t);           // exposition only
    void (*pfree)(void*);             // exposition only
};

}

```

- ¹ The class **strstreambuf** associates the input sequence, and possibly the output sequence, with an object of some *character array type*, whose elements store arbitrary values. The array object has several attributes.
- ² NOTE 1: For the sake of exposition, these are represented as elements of a bitmask type (indicated here as T1) called **strstate**. The elements are:
 - (2.1) — **allocated**, set when a dynamic array object has been allocated, and hence will be freed by the destructor for the **strstreambuf** object;
 - (2.2) — **constant**, set when the array object has **const** elements, so the output sequence cannot be written;
 - (2.3) — **dynamic**, set when the array object is allocated (or reallocated) as necessary to hold a character sequence that can change in length;
 - (2.4) — **frozen**, set when the program has requested that the array object not be altered, reallocated, or freed.
- ³ NOTE 2: For the sake of exposition, the maintained data is presented here as:
 - (3.1) — **strstate** **strmode**, the attributes of the array object associated with the **strstreambuf** object;
 - (3.2) — **int** **alsiz**, the suggested minimum size for a dynamic array object;
 - (3.3) — **void* (*palloc)(size_t)**, points to the function to call to allocate a dynamic array object;
 - (3.4) — **void (*pfree)(void*)**, points to the function to call to free a dynamic array object.
- ⁴ Each object of class **strstreambuf** has a *seekable area*, delimited by the pointers **seeklow** and **seekhigh**. If **gnext** is a null pointer, the seekable area is undefined. Otherwise, **seeklow** equals **gbeg** and **seekhigh** is either **pend**, if **pend** is not a null pointer, or **gend**.

D.15.2.2 strstreambuf constructors

[depr.strstreambuf.cons]

```
explicit strstreambuf(streamsize alsiz_arg);
```

- ¹ Effects: Initializes the base class with **streambuf()**. The postconditions of this function are indicated in [Table 147](#).

Table 147: **strstreambuf(streamsize)** effects [tab:depr.strstreambuf.cons.sz]

Element	Value
strmode	dynamic
alsiz	alsiz_arg
palloc	a null pointer
pfree	a null pointer

```
strstreambuf(void* (*palloc_arg)(size_t), void (*pfree_arg)(void*));
```

- ² Effects: Initializes the base class with **streambuf()**. The postconditions of this function are indicated in [Table 148](#).

Table 148: **strstreambuf(void* (*)(size_t), void (*)(void*))** effects
[tab:depr.strstreambuf.cons.alloc]

Element	Value
strmode	dynamic
alsiz	an unspecified value
palloc	palloc_arg
pfree	pfree_arg

```

strstreambuf(char* gnex_arg, streamsize n, char* pbeg_arg = nullptr);
strstreambuf(signed char* gnex_arg, streamsize n,
            signed char* pbeg_arg = nullptr);

```

```
strstreambuf(unsigned char* gnext_arg, streamsize n,
            unsigned char* pbeg_arg = nullptr);
```

- 3 *Effects:* Initializes the base class with `streambuf()`. The postconditions of this function are indicated in [Table 149](#).

Table 149: `strstreambuf(charT*, streamsize, charT*)` effects [tab:depr.strstreambuf.cons.ptr]

Element	Value
<code>strmode</code>	0
<code>alsize</code>	an unspecified value
<code>palloc</code>	a null pointer
<code>pfree</code>	a null pointer

- 4 `gnext_arg` shall point to the first element of an array object whose number of elements `N` is determined as follows:

- (4.1) — If `n > 0`, `N` is `n`.
- (4.2) — If `n == 0`, `N` is `std::strlen(gnext_arg)`.
- (4.3) — If `n < 0`, `N` is `INT_MAX`.³⁰⁷

- 5 If `pbeg_arg` is a null pointer, the function executes:

```
setg(gnext_arg, gnext_arg, gnext_arg + N);
```

- 6 Otherwise, the function executes:

```
setg(gnext_arg, gnext_arg, pbeg_arg);
setp(pbeg_arg, pbeg_arg + N);
```

```
strstreambuf(const char* gnext_arg, streamsize n);
strstreambuf(const signed char* gnext_arg, streamsize n);
strstreambuf(const unsigned char* gnext_arg, streamsize n);
```

- 7 *Effects:* Behaves the same as `strstreambuf((char*)gnext_arg,n)`, except that the constructor also sets `constant` in `strmode`.

```
virtual ~strstreambuf();
```

- 8 *Effects:* Destroys an object of class `strstreambuf`. The function frees the dynamically allocated array object only if `(strmode & allocated) != 0` and `(strmode & frozen) == 0`. ([D.15.2.4](#) describes how a dynamically allocated array object is freed.)

D.15.2.3 Member functions

[depr.strstreambuf.members]

```
void freeze(bool freezefl = true);
```

- 1 *Effects:* If `strmode & dynamic` is nonzero, alters the freeze status of the dynamic array object as follows:

- (1.1) — If `freezefl` is `true`, the function sets `frozen` in `strmode`.
- (1.2) — Otherwise, it clears `frozen` in `strmode`.

```
char* str();
```

- 2 *Effects:* Calls `freeze()`, then returns the beginning pointer for the input sequence, `gbeg`.

- 3 *Remarks:* The return value can be a null pointer.

```
int pcount() const;
```

- 4 *Effects:* If the next pointer for the output sequence, `pnext`, is a null pointer, returns zero. Otherwise, returns the current effective length of the array object as the next pointer minus the beginning pointer for the output sequence, `pnext - pbeg`.

³⁰⁷) The function signature `strlen(const char*)` is declared in `<cstring>` ([23.5.3](#)). The macro `INT_MAX` is defined in `<climits>` ([17.3.6](#)).

D.15.2.4 strstreambuf overridden virtual functions**[depr.strstreambuf.virtuals]**

```
int_type overflow(int_type c = EOF) override;
```

1 *Effects:* Appends the character designated by *c* to the output sequence, if possible, in one of two ways:

- (1.1) — If *c* != EOF and if either the output sequence has a write position available or the function makes a write position available (as described below), assigns *c* to **pnext*++.

 Returns (unsigned char)*c*.

- (1.2) — If *c* == EOF, there is no character to append.

 Returns a value other than EOF.

2 Returns EOF to indicate failure.

3 *Remarks:* The function can alter the number of write positions available as a result of any call.

4 To make a write position available, the function reallocates (or initially allocates) an array object with a sufficient number of elements *n* to hold the current array object (if any), plus at least one additional write position. How many additional write positions are made available is otherwise unspecified. If *palloc* is not a null pointer, the function calls (**palloc*)(*n*) to allocate the new dynamic array object. Otherwise, it evaluates the expression *new charT[n]*. In either case, if the allocation fails, the function returns EOF. Otherwise, it sets *allocated* in *strmode*.

5 To free a previously existing dynamic array object whose first element address is *p*: If *pfree* is not a null pointer, the function calls (**pfree*)(*p*). Otherwise, it evaluates the expression *delete[]p*.

6 If (*strmode* & *dynamic*) == 0, or if (*strmode* & *frozen*) != 0, the function cannot extend the array (reallocate it with greater length) to make a write position available.

7 *Recommended practice:* An implementation should consider *alsize* in making the decision how many additional write positions to make available.

```
int_type pbackfail(int_type c = EOF) override;
```

8 Puts back the character designated by *c* to the input sequence, if possible, in one of three ways:

- (8.1) — If *c* != EOF, if the input sequence has a putback position available, and if (char)*c* == *gnext*[-1], assigns *gnext* - 1 to *gnext*.

 Returns *c*.

- (8.2) — If *c* != EOF, if the input sequence has a putback position available, and if *strmode* & *constant* is zero, assigns *c* to --*gnext*.

 Returns *c*.

- (8.3) — If *c* == EOF and if the input sequence has a putback position available, assigns *gnext* - 1 to *gnext*.

 Returns a value other than EOF.

9 Returns EOF to indicate failure.

10 *Remarks:* If the function can succeed in more than one of these ways, it is unspecified which way is chosen. The function can alter the number of putback positions available as a result of any call.

```
int_type underflow() override;
```

11 *Effects:* Reads a character from the *input sequence*, if possible, without moving the stream position past it, as follows:

- (11.1) — If the input sequence has a read position available, the function signals success by returning (unsigned char)**gnext*.

- (11.2) — Otherwise, if the current write next pointer *pnext* is not a null pointer and is greater than the current read end pointer *gend*, makes a *read position* available by assigning to *gend* a value greater than *gnext* and no greater than *pnext*.

 Returns (unsigned char)**gnext*.

12 Returns EOF to indicate failure.

13 *Remarks:* The function can alter the number of read positions available as a result of any call.

`pos_type seekoff(off_type off, seekdir way, openmode which = in | out) override;`

14 *Effects:* Alters the stream position within one of the controlled sequences, if possible, as indicated in [Table 150](#).

Table 150: `seekoff` positioning [tab:depr.strstreambuf.seekoff.pos]

Conditions	Result
<code>(which & ios::in) != 0</code>	positions the input sequence
<code>(which & ios::out) != 0</code>	positions the output sequence
<code>(which & (ios::in ios::out)) == (ios::in ios::out)</code> and either <code>way == ios::beg</code> or <code>way == ios::end</code>	positions both the input and the output sequences
Otherwise	the positioning operation fails.

15 For a sequence to be positioned, if its next pointer is a null pointer, the positioning operation fails. Otherwise, the function determines `newoff` as indicated in [Table 151](#).

Table 151: `newoff` values [tab:depr.strstreambuf.seekoff.newoff]

Condition	<code>newoff</code> Value
<code>way == ios::beg</code>	0
<code>way == ios::cur</code>	the next pointer minus the beginning pointer (<code>xnext - xbeg</code>).
<code>way == ios::end</code>	<code>seekhigh</code> minus the beginning pointer (<code>seekhigh - xbeg</code>).

16 If $(\text{newoff} + \text{off}) < (\text{seeklow} - \text{xbeg})$ or $(\text{seekhigh} - \text{xbeg}) < (\text{newoff} + \text{off})$, the positioning operation fails. Otherwise, the function assigns `xbeg + newoff + off` to the next pointer `xnext`.

17 *Returns:* `pos_type(newoff)`, constructed from the resultant offset `newoff` (of type `off_type`), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is `pos_type(off_type(-1))`.

`pos_type seekpos(pos_type sp, ios_base::openmode which = ios_base::in | ios_base::out) override;`

18 *Effects:* Alters the stream position within one of the controlled sequences, if possible, to correspond to the stream position stored in `sp` (as described below).

(18.1) — If `(which & ios::in) != 0`, positions the input sequence.

(18.2) — If `(which & ios::out) != 0`, positions the output sequence.

(18.3) — If the function positions neither sequence, the positioning operation fails.

19 For a sequence to be positioned, if its next pointer is a null pointer, the positioning operation fails. Otherwise, the function determines `newoff` from `sp.offset()`:

(19.1) — If `newoff` is an invalid stream position, has a negative value, or has a value greater than $(\text{seekhigh} - \text{seeklow})$, the positioning operation fails

(19.2) — Otherwise, the function adds `newoff` to the beginning pointer `xbeg` and stores the result in the next pointer `xnext`.

20 *Returns:* `pos_type(newoff)`, constructed from the resultant offset `newoff` (of type `off_type`), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is `pos_type(off_type(-1))`.

`streambuf<char>* setbuf(char* s, streamsize n) override;`

21 *Effects:* Behavior is implementation-defined, except that `setbuf(0, 0)` has no effect.

D.15.3 Class `istrstream`[depr.`istrstream`]**D.15.3.1 General**[depr.`istrstream.general`]

```
namespace std {
    class istrstream : public basic_istream<char> {
public:
    explicit istrstream(const char* s);
    explicit istrstream(char* s);
    istrstream(const char* s, streamsize n);
    istrstream(char* s, streamsize n);
    virtual ~istrstream();

    strstreambuf* rdbuf() const;
    char* str();
private:
    strstreambuf sb;           // exposition only
};
```

- ¹ The class `istrstream` supports the reading of objects of class `strstreambuf`. It supplies a `strstreambuf` object to control the associated array object. For the sake of exposition, the maintained data is presented here as:

- (1.1) — `sb`, the `strstreambuf` object.

D.15.3.2 `istrstream` constructors[depr.`istrstream.cons`]

```
explicit istrstream(const char* s);
explicit istrstream(char* s);
```

- ¹ *Effects:* Initializes the base class with `istream(&sb)` and `sb` with `strstreambuf(s, 0)`. `s` shall designate the first element of an NTBS.

```
istrstream(const char* s, streamsize n);
istrstream(char* s, streamsize n);
```

- ² *Effects:* Initializes the base class with `istream(&sb)` and `sb` with `strstreambuf(s, n)`. `s` shall designate the first element of an array whose length is `n` elements, and `n` shall be greater than zero.

D.15.3.3 Member functions[depr.`istrstream.members`]

```
strstreambuf* rdbuf() const;
1   Returns: const_cast<strstreambuf*>(&sb).
char* str();
2   Returns: rdbuf()->str().
```

D.15.4 Class `ostrstream`[depr.`ostrstream`]**D.15.4.1 General**[depr.`ostrstream.general`]

```
namespace std {
    class ostrstream : public basic_oostream<char> {
public:
    ostrstream();
    ostrstream(char* s, int n, ios_base::openmode mode = ios_base::out);
    virtual ~ostrstream();

    strstreambuf* rdbuf() const;
    void freeze(bool freezefl = true);
    char* str();
    int pcount() const;
private:
    strstreambuf sb;           // exposition only
};
```

¹ The class `ostrstream` supports the writing of objects of class `strstreambuf`. It supplies a `strstreambuf` object to control the associated array object. For the sake of exposition, the maintained data is presented here as:

- (1.1) — `sb`, the `strstreambuf` object.

D.15.4.2 `ostrstream` constructors

[depr.ostrstream.cons]

`ostrstream();`

- ¹ *Effects*: Initializes the base class with `ostream(&sb)` and `sb` with `strstreambuf()`.

`ostrstream(char* s, int n, ios_base::openmode mode = ios_base::out);`

- ² *Effects*: Initializes the base class with `ostream(&sb)`, and `sb` with one of two constructors:

- (2.1) — If `(mode & app) == 0`, then `s` shall designate the first element of an array of `n` elements.

The constructor is `strstreambuf(s, n, s)`.

- (2.2) — If `(mode & app) != 0`, then `s` shall designate the first element of an array of `n` elements that contains an NTBS whose first element is designated by `s`. The constructor is `strstreambuf(s, n, s + std::strlen(s))`.³⁰⁸

D.15.4.3 Member functions

[depr.ostrstream.members]

`strstreambuf* rdbuf() const;`

- ¹ *Returns*: `(strstreambuf*)&sb`.

`void freeze(bool freezefl = true);`

- ² *Effects*: Calls `rdbuf()->freeze(freezefl)`.

`char* str();`

- ³ *Returns*: `rdbuf()->str()`.

`int pcount() const;`

- ⁴ *Returns*: `rdbuf()->pcount()`.

D.15.5 Class `strstream`

[depr.strstream]

D.15.5.1 General

[depr.strstream.general]

```
namespace std {
    class strstream
        : public basic_iostream<char> {
    public:
        // types
        using char_type = char;
        using int_type = char_traits<char>::int_type;
        using pos_type = char_traits<char>::pos_type;
        using off_type = char_traits<char>::off_type;

        // constructors/destructor
        strstream();
        strstream(char* s, int n,
                  ios_base::openmode mode = ios_base::in|ios_base::out);
        virtual ~strstream();

        // members
        strstreambuf* rdbuf() const;
        void freeze(bool freezefl = true);
        int pcount() const;
        char* str();
```

³⁰⁸ The function signature `strlen(const char*)` is declared in `<cstring>` (23.5.3).

```

private:
    strstreambuf sb;           // exposition only
};

}

```

- ¹ The class `strstream` supports reading and writing from objects of class `strstreambuf`. It supplies a `strstreambuf` object to control the associated array object. For the sake of exposition, the maintained data is presented here as:

- (1.1) — `sb`, the `strstreambuf` object.

D.15.5.2 `strstream` constructors

[depr.strstream.cons]

```
strstream();
```

- ¹ *Effects*: Initializes the base class with `iostream(&sb)`.

```
strstream(char* s, int n,
         ios_base::openmode mode = ios_base::in|ios_base::out);
```

- ² *Effects*: Initializes the base class with `iostream(&sb)`, and `sb` with one of the two constructors:

- (2.1) — If `(mode & app) == 0`, then `s` shall designate the first element of an array of `n` elements. The constructor is `strstreambuf(s,n,s)`.
- (2.2) — If `(mode & app) != 0`, then `s` shall designate the first element of an array of `n` elements that contains an NTBS whose first element is designated by `s`. The constructor is `strstreambuf(s,n,s + std::strlen(s))`.

D.15.5.3 `strstream` destructor

[depr.strstream.dest]

```
virtual ~strstream();
```

- ¹ *Effects*: Destroys an object of class `strstream`.

D.15.5.4 `strstream` operations

[depr.strstream.oper]

```
strstreambuf* rdbuf() const;
```

- ¹ *Returns*: `const_cast<strstreambuf*>(&sb)`.

```
void freeze(bool freezefl = true);
```

- ² *Effects*: Calls `rdbuf()->freeze(freezefl)`.

```
char* str();
```

- ³ *Returns*: `rdbuf()->str()`.

```
int pcount() const;
```

- ⁴ *Returns*: `rdbuf()->pcount()`.

D.16 Deprecated error numbers

[depr.cerrno]

- ¹ The following macros are defined in addition to those specified in 19.4.2:

```

#define ENODATA see below
#define ENOSR see below
#define ENOSTR see below
#define ETIME see below

```

- ² The meaning of these macros is defined by the POSIX standard.

- ³ The following enum `errc` enumerators are defined in addition to those specified in 19.5.2:

```

no_message_available,          // ENODATA
no_stream_resources,          // ENOSR
not_a_stream,                 // ENOSTR
stream_timeout,               // ETIME

```

- ⁴ The value of each enum `errc` enumerator above is the same as the value of the `<cerrno>` macro shown in the above synopsis.

D.17 The default allocator

[depr.default_allocator]

- ¹ The following member is defined in addition to those specified in 20.2.10:

```
namespace std {
    template<class T> class allocator {
        public:
            using is_always_equal = true_type;
    };
}
```

D.18 Deprecated polymorphic_allocator member function
[depr.mem.poly_allocator.mem]

- ¹ The following member is declared in addition to those members specified in 20.4.3.3:

```
namespace std::pmr {
    template<class Tp = byte>
    class polymorphic_allocator {
        public:
            template <class T>
            void destroy(T* p);
    };
}

template<class T>
void destroy(T* p);
```

- ² *Effects:* As if by `p->~T()`.

D.19 Deprecated type traits

[depr.meta.types]

- ¹ The header `<type_traits>` (21.3.3) has the following addition:

```
namespace std {
    template<class T> struct is_pod;
    template<class T> constexpr bool is_pod_v = is_pod<T>::value;
    template<size_t Len, size_t Align = default_alignment> // see below
        struct aligned_storage;
    template<size_t Len, size_t Align = default_alignment> // see below
        using aligned_storage_t = typename aligned_storage<Len, Align>::type;
    template<size_t Len, class... Types>
        struct aligned_union;
    template<size_t Len, class... Types>
        using aligned_union_t = typename aligned_union<Len, Types...>::type;
}
```

- ² The behavior of a program that adds specializations for any of the templates defined in this subclause is undefined, unless explicitly permitted by the specification of the corresponding template.

`template<class T> struct is_pod;`

- ³ *Requires:* `remove_all_extents_t<T>` shall be a complete type or *cv void*.

- ⁴ `is_pod<T>` is a *Cpp17UnaryTypeTrait* (21.3.2) with a base characteristic of `true_type` if `T` is a POD type, and `false_type` otherwise. A POD class is a class that is both a trivial class and a standard-layout class, and has no non-static data members of type non-POD class (or array thereof). A POD type is a scalar type, a POD class, an array of such a type, or a cv-qualified version of one of these types.

- ⁵ NOTE 1: It is unspecified whether a closure type (7.5.5.2) is a POD type.

`template<size_t Len, size_t Align = default_alignment>`
`struct aligned_storage;`

- ⁶ The value of `default_alignment` is the most stringent alignment requirement for any object type whose size is no greater than `Len` (6.8).

- ⁷ *Mandates:* `Len` is not zero. `Align` is equal to `alignof(T)` for some type `T` or to `default_alignment`.

- ⁸ The member typedef `type` denotes a trivial standard-layout type suitable for use as uninitialized storage for any object whose size is at most `Len` and whose alignment is a divisor of `Align`.

9 NOTE 2: Uses of `aligned_storage<Len, Align>::type` can be replaced by an array `std::byte[Len]` declared with `alignas(Align)`.

10 NOTE 3: A typical implementation would define `aligned_storage` as:

```
template<size_t Len, size_t Alignment>
struct aligned_storage {
    typedef struct {
        alignas(Alignment) unsigned char __data[Len];
    } type;
};

template<size_t Len, class... Types>
struct aligned_union;
```

11 *Mandates*: At least one type is provided. Each type in the template parameter pack `Types` is a complete object type.

12 The member `typedef type` denotes a trivial standard-layout type suitable for use as uninitialized storage for any object whose type is listed in `Types`; its size shall be at least `Len`. The static member `alignment_value` is an integral constant of type `size_t` whose value is the strictest alignment of all types listed in `Types`.

D.20 Tuple

[depr.tuple]

1 The header `<tuple>` (22.4.2) has the following additions:

```
namespace std {
    template<class T> struct tuple_size<volatile T>;
    template<class T> struct tuple_size<const volatile T>;

    template<size_t I, class T> struct tuple_element<I, volatile T>;
    template<size_t I, class T> struct tuple_element<I, const volatile T>;
}

template<class T> struct tuple_size<volatile T>;
template<class T> struct tuple_size<const volatile T>;
```

2 Let `TS` denote `tuple_size<T>` of the cv-unqualified type `T`. If the expression `TS::value` is well-formed when treated as an unevaluated operand (7.2.3), then specializations of each of the two templates meet the *Cpp17TransformationTrait* requirements with a base characteristic of `integral_constant<size_t, TS::value>`. Otherwise, they have no member `value`.

3 Access checking is performed as if in a context unrelated to `TS` and `T`. Only the validity of the immediate context of the expression is considered.

4 In addition to being available via inclusion of the `<tuple>` (22.4.2) header, the two templates are available when any of the headers `<array>` (24.3.2), `<ranges>` (26.2), or `<utility>` (22.2.1) are included.

```
template<size_t I, class T> struct tuple_element<I, volatile T>;
template<size_t I, class T> struct tuple_element<I, const volatile T>;
```

5 Let `TE` denote `tuple_element_t<I, T>` of the cv-unqualified type `T`. Then specializations of each of the two templates meet the *Cpp17TransformationTrait* requirements with a member `typedef type` that names the following type:

- (5.1) — for the first specialization, `add_volatile_t<TE>`, and
- (5.2) — for the second specialization, `add_cv_t<TE>`.

6 In addition to being available via inclusion of the `<tuple>` (22.4.2) header, the two templates are available when any of the headers `<array>` (24.3.2), `<ranges>` (26.2), or `<utility>` (22.2.1) are included.

D.21 Variant

[depr.variant]

1 The header `<variant>` (22.6.2) has the following additions:

```
namespace std {
    template<class T> struct variant_size<volatile T>;
    template<class T> struct variant_size<const volatile T>;
```

- ```

template<size_t I, class T> struct variant_alternative<I, volatile T>;
template<size_t I, class T> struct variant_alternative<I, const volatile T>;
}

template<class T> struct variant_size<volatile T>;
template<class T> struct variant_size<const volatile T>;

```
- 2 Let VS denote `variant_size<T>` of the cv-unqualified type T. Then specializations of each of the two templates meet the *Cpp17UnaryTypeTrait* requirements with a base characteristic of `integral_constant<size_t, VS::value>`.
- ```

template<size_t I, class T> struct variant_alternative<I, volatile T>;
template<size_t I, class T> struct variant_alternative<I, const volatile T>;

```
- 3 Let VA denote `variant_alternative<I, T>` of the cv-unqualified type T. Then specializations of each of the two templates meet the *Cpp17TransformationTrait* requirements with a member `typedef type` that names the following type:
- (3.1) — for the first specialization, `add_volatile_t<VA::type>`, and
- (3.2) — for the second specialization, `add_cv_t<VA::type>`.

D.22 Deprecated iterator class template

[depr.iterator]

- 1 The header `<iterator>` (25.2) has the following addition:

```

namespace std {
    template<class Category, class T, class Distance = ptrdiff_t,
             class Pointer = T*, class Reference = T&>
    struct iterator {
        using iterator_category = Category;
        using value_type = T;
        using difference_type = Distance;
        using pointer = Pointer;
        using reference = Reference;
    };
}

```

- 2 The `iterator` template may be used as a base class to ease the definition of required types for new iterators.
- 3 NOTE: If the new iterator type is a class template, then these aliases will not be visible from within the iterator class's template definition, but only to callers of that class.
- 4 EXAMPLE: If a C++ program wants to define a bidirectional iterator for some data structure containing `double` and such that it works on a large memory model of the implementation, it can do so with:

```

class MyIterator :
    public iterator<bidirectional_iterator_tag, double, long, T*, T&> {
    // code implementing ++, etc.
};

```

D.23 Deprecated move_iterator access

[depr.move.iter.elem]

- 1 The following member is declared in addition to those members specified in 25.5.4.6:

```

namespace std {
    template<class Iterator>
    class move_iterator {
    public:
        constexpr pointer operator->() const;
    };
}

constexpr pointer operator->() const;

```

2 *Returns:* current.

D.24 Deprecated shared_ptr atomic access

[depr.util.smartptr.shared.atomic]

- 1 The header `<memory>` (20.2.2) has the following additions:

```

namespace std {
    template<class T>
    bool atomic_is_lock_free(const shared_ptr<T>* p);

    template<class T>
    shared_ptr<T> atomic_load(const shared_ptr<T>* p);
    template<class T>
    shared_ptr<T> atomic_load_explicit(const shared_ptr<T>* p, memory_order mo);

    template<class T>
    void atomic_store(shared_ptr<T>* p, shared_ptr<T> r);
    template<class T>
    void atomic_store_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);

    template<class T>
    shared_ptr<T> atomic_exchange(shared_ptr<T>* p, shared_ptr<T> r);
    template<class T>
    shared_ptr<T> atomic_exchange_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);

    template<class T>
    bool atomic_compare_exchange_weak(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);
    template<class T>
    bool atomic_compare_exchange_strong(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);
    template<class T>
    bool atomic_compare_exchange_weak_explicit(
        shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w,
        memory_order success, memory_order failure);
    template<class T>
    bool atomic_compare_exchange_strong_explicit(
        shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w,
        memory_order success, memory_order failure);
}

```

2 Concurrent access to a `shared_ptr` object from multiple threads does not introduce a data race if the access is done exclusively via the functions in this subclause and the instance is passed as their first argument.

3 The meaning of the arguments of type `memory_order` is explained in [33.5.4](#).

`template<class T> bool atomic_is_lock_free(const shared_ptr<T>* p);`

4 *Requires:* `p` shall not be null.

5 *Returns:* `true` if atomic access to `*p` is lock-free, `false` otherwise.

6 *Throws:* Nothing.

`template<class T> shared_ptr<T> atomic_load(const shared_ptr<T>* p);`

7 *Requires:* `p` shall not be null.

8 *Returns:* `atomic_load_explicit(p, memory_order::seq_cst)`.

9 *Throws:* Nothing.

`template<class T> shared_ptr<T> atomic_load_explicit(const shared_ptr<T>* p, memory_order mo);`

10 *Requires:* `p` shall not be null.

11 *Requires:* `mo` shall not be `memory_order::release` or `memory_order::acq_rel`.

12 *Returns:* `*p`.

13 *Throws:* Nothing.

`template<class T> void atomic_store(shared_ptr<T>* p, shared_ptr<T> r);`

14 *Requires:* `p` shall not be null.

15 *Effects:* As if by `atomic_store_explicit(p, r, memory_order::seq_cst)`.

16 *Throws:* Nothing.

```

template<class T> void atomic_store_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);
17   Requires: p shall not be null.
18   Requires: mo shall not be memory_order::acquire or memory_order::acq_rel.
19   Effects: As if by p->swap(r).
20   Throws: Nothing.

template<class T> shared_ptr<T> atomic_exchange(shared_ptr<T>* p, shared_ptr<T> r);
21   Requires: p shall not be null.
22   Returns: atomic_exchange_explicit(p, r, memory_order::seq_cst).
23   Throws: Nothing.

template<class T>
shared_ptr<T> atomic_exchange_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);
24   Requires: p shall not be null.
25   Effects: As if by p->swap(r).
26   Returns: The previous value of *p.
27   Throws: Nothing.

template<class T>
bool atomic_compare_exchange_weak(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);
28   Requires: p shall not be null and v shall not be null.
29   Returns:
30     atomic_compare_exchange_weak_explicit(p, v, w, memory_order::seq_cst, memory_order::seq_cst)
30   Throws: Nothing.

template<class T>
bool atomic_compare_exchange_strong(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);
31   Returns:
32     atomic_compare_exchange_strong_explicit(p, v, w, memory_order::seq_cst,
32                                         memory_order::seq_cst)

template<class T>
bool atomic_compare_exchange_weak_explicit(
    shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w,
    memory_order success, memory_order failure);
template<class T>
bool atomic_compare_exchange_strong_explicit(
    shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w,
    memory_order success, memory_order failure);

32   Requires: p shall not be null and v shall not be null. The failure argument shall not be memory_order::release nor memory_order::acq_rel.
33   Effects: If *p is equivalent to *v, assigns w to *p and has synchronization semantics corresponding to the value of success, otherwise assigns *p to *v and has synchronization semantics corresponding to the value of failure.
34   Returns: true if *p was equivalent to *v, false otherwise.
35   Throws: Nothing.

36   Remarks: Two shared_ptr objects are equivalent if they store the same pointer value and share ownership. The weak form may fail spuriously. See 33.5.8.2.

```

D.25 Deprecated `basic_string` capacity

[depr.string.capacity]

¹ The following member is declared in addition to those members specified in 23.4.3.5:

```

namespace std {
    template<class charT, class traits = char_traits<charT>,
              class Allocator = allocator<charT>>
    class basic_string {
        public:
            void reserve();
    };
}

void reserve();

```

- ² *Effects:* After this call, `capacity()` has an unspecified value greater than or equal to `size()`.
 NOTE: This is a non-binding shrink to fit request.

D.26 Deprecated standard code conversion facets

[depr.locale.stdcvf]

D.26.1 General

[depr.locale.stdcvf.general]

- ¹ The header <codecvf> provides code conversion facets for various character encodings.

D.26.2 Header <codecvf> synopsis

[depr.codecvf.syn]

```

namespace std {
    enum codecvf_mode {
        consume_header = 4,
        generate_header = 2,
        little_endian = 1
    };

    template<class Elem, unsigned long Maxcode = 0x10ffff, codecvf_mode Mode = (codecvf_mode)0>
    class codecvf_utf8 : public codecvf<Elem, char, mbstate_t> {
        public:
            explicit codecvf_utf8(size_t refs = 0);
            ~codecvf_utf8();
    };

    template<class Elem, unsigned long Maxcode = 0x10ffff, codecvf_mode Mode = (codecvf_mode)0>
    class codecvf_utf16 : public codecvf<Elem, char, mbstate_t> {
        public:
            explicit codecvf_utf16(size_t refs = 0);
            ~codecvf_utf16();
    };

    template<class Elem, unsigned long Maxcode = 0x10ffff, codecvf_mode Mode = (codecvf_mode)0>
    class codecvf_utf8_utf16 : public codecvf<Elem, char, mbstate_t> {
        public:
            explicit codecvf_utf8_utf16(size_t refs = 0);
            ~codecvf_utf8_utf16();
    };
}

```

D.26.3 Requirements

[depr.locale.stdcvf.req]

- ¹ For each of the three code conversion facets `codecvf_utf8`, `codecvf_utf16`, and `codecvf_utf8_utf16`:
- (1.1) — `Elem` is the wide-character type, such as `wchar_t`, `char16_t`, or `char32_t`.
 - (1.2) — `Maxcode` is the largest wide-character code that the facet will read or write without reporting a conversion error.
 - (1.3) — If `(Mode & consume_header)`, the facet shall consume an initial header sequence, if present, when reading a multibyte sequence to determine the endianness of the subsequent multibyte sequence to be read.
 - (1.4) — If `(Mode & generate_header)`, the facet shall generate an initial header sequence when writing a multibyte sequence to advertise the endianness of the subsequent multibyte sequence to be written.
 - (1.5) — If `(Mode & little_endian)`, the facet shall generate a multibyte sequence in little-endian order, as opposed to the default big-endian order.

- (1.6) — UCS-2 is the same encoding as UTF-16, except that it encodes scalar values in the range U+0000–U+FFFF (Basic Multilingual Plane) only.
- 2 For the facet `codecvt_utf8`:
- (2.1) — The facet shall convert between UTF-8 multibyte sequences and UCS-2 or UTF-32 (depending on the size of `Elem`).
 - (2.2) — Endianness shall not affect how multibyte sequences are read or written.
 - (2.3) — The multibyte sequences may be written as either a text or a binary file.
- 3 For the facet `codecvt_utf16`:
- (3.1) — The facet shall convert between UTF-16 multibyte sequences and UCS-2 or UTF-32 (depending on the size of `Elem`).
 - (3.2) — Multibyte sequences shall be read or written according to the `Mode` flag, as set out above.
 - (3.3) — The multibyte sequences may be written only as a binary file. Attempting to write to a text file produces undefined behavior.
- 4 For the facet `codecvt_utf8_utf16`:
- (4.1) — The facet shall convert between UTF-8 multibyte sequences and UTF-16 (one or two 16-bit codes) within the program.
 - (4.2) — Endianness shall not affect how multibyte sequences are read or written.
 - (4.3) — The multibyte sequences may be written as either a text or a binary file.

D.27 Deprecated convenience conversion interfaces

[depr.conversions]

D.27.1 General

[depr.conversions.general]

- ¹ The header <locale> (30.2) has the following additions:

```
namespace std {
    template<class Codecvt, class Elem = wchar_t,
              class WideAlloc = allocator<Elem>,
              class ByteAlloc = allocator<char>>
    class wstring_convert;

    template<class Codecvt, class Elem = wchar_t,
              class Tr = char_traits<Elem>>
    class wbuffer_convert;
}
```

D.27.2 Class template `wstring_convert`

[depr.conversions.string]

- ¹ Class template `wstring_convert` performs conversions between a wide string and a byte string. It lets you specify a code conversion facet (like class template `codecvt`) to perform the conversions, without affecting any streams or locales.

EXAMPLE: If you want to use the code conversion facet `codecvt_utf8` to output to `cout` a UTF-8 multibyte sequence corresponding to a wide string, but you don't want to alter the locale for `cout`, you can write something like:

```
wstring_convert<std::codecvt_utf8<wchar_t>> myconv;
std::string mbstring = myconv.to_bytes(L"Hello\n");
std::cout << mbstring;

namespace std {
    template<class Codecvt, class Elem = wchar_t,
              class WideAlloc = allocator<Elem>,
              class ByteAlloc = allocator<char>>
    class wstring_convert {
public:
    using byte_string = basic_string<char, char_traits<char>, ByteAlloc>;
    using wide_string = basic_string<Elem, char_traits<Elem>, WideAlloc>;
    using state_type = typename Codecvt::state_type;
    using int_type = typename wide_string::traits_type::int_type;
}
```

```
wstring_convert() : wstring_convert(new Codecvt) {}
explicit wstring_convert(Codecvt* pcvt);
wstring_convert(Codecvt* pcvt, state_type state);
explicit wstring_convert(const byte_string& byte_err,
                        const wide_string& wide_err = wide_string());
~wstring_convert();

wstring_convert(const wstring_convert&) = delete;
wstring_convert& operator=(const wstring_convert&) = delete;

wide_string from_bytes(char byte);
wide_string from_bytes(const char* ptr);
wide_string from_bytes(const byte_string& str);
wide_string from_bytes(const char* first, const char* last);

byte_string to_bytes(Elem wchar);
byte_string to_bytes(const Elem* wptr);
byte_string to_bytes(const wide_string& wstr);
byte_string to_bytes(const Elem* first, const Elem* last);

size_t converted() const noexcept;
state_type state() const;

private:
byte_string byte_err_string; // exposition only
wide_string wide_err_string; // exposition only
Codecvt* cvtptr; // exposition only
state_type cvtstate; // exposition only
size_t cvtcount; // exposition only
};

}
```

- 2 The class template describes an object that controls conversions between wide string objects of class `basic_string<Elem, char_traits<Elem>, WideAlloc>` and byte string objects of class `basic_string<char, char_traits<char>, ByteAlloc>`. The class template defines the types `wide_string` and `byte_string` as synonyms for these two types. Conversion between a sequence of `Elem` values (stored in a `wide_string` object) and multibyte sequences (stored in a `byte_string` object) is performed by an object of class `Codecvt`, which meets the requirements of the standard code-conversion facet `codecvt<Elem, char, mbstate_t>`.

- 3 An object of this class template stores:

- (3.1) — `byte_err_string` — a byte string to display on errors
- (3.2) — `wide_err_string` — a wide string to display on errors
- (3.3) — `cvtptr` — a pointer to the allocated conversion object (which is freed when the `wstring_convert` object is destroyed)
- (3.4) — `cvtstate` — a conversion state object
- (3.5) — `cvtcount` — a conversion count

`size_t converted() const noexcept;`

- 4 *Returns:* `cvtcount`.

```
wide_string from_bytes(char byte);
wide_string from_bytes(const char* ptr);
wide_string from_bytes(const byte_string& str);
wide_string from_bytes(const char* first, const char* last);
```

- 5 *Effects:* The first member function shall convert the single-element sequence `byte` to a wide string. The second member function shall convert the null-terminated sequence beginning at `ptr` to a wide string. The third member function shall convert the sequence stored in `str` to a wide string. The fourth member function shall convert the sequence defined by the range `[first, last)` to a wide string.

- 6 In all cases:

- (6.1) — If the `cvtstate` object was not constructed with an explicit value, it shall be set to its default value (the initial conversion state) before the conversion begins. Otherwise it shall be left unchanged.
- (6.2) — The number of input elements successfully converted shall be stored in `cvtcount`.

7 *Returns:* If no conversion error occurs, the member function shall return the converted wide string. Otherwise, if the object was constructed with a wide-error string, the member function shall return the wide-error string. Otherwise, the member function throws an object of class `range_error`.

```
state_type state() const;
8   Returns: cvtstate.

byte_string to_bytes(Elem wchar);
byte_string to_bytes(const Elem* wptr);
byte_string to_bytes(const wide_string& wstr);
byte_string to_bytes(const Elem* first, const Elem* last);
```

9 *Effects:* The first member function shall convert the single-element sequence `wchar` to a byte string. The second member function shall convert the null-terminated sequence beginning at `wptr` to a byte string. The third member function shall convert the sequence stored in `wstr` to a byte string. The fourth member function shall convert the sequence defined by the range `[first, last)` to a byte string.

10 In all cases:

- (10.1) — If the `cvtstate` object was not constructed with an explicit value, it shall be set to its default value (the initial conversion state) before the conversion begins. Otherwise it shall be left unchanged.
- (10.2) — The number of input elements successfully converted shall be stored in `cvtcount`.

11 *Returns:* If no conversion error occurs, the member function shall return the converted byte string. Otherwise, if the object was constructed with a byte-error string, the member function shall return the byte-error string. Otherwise, the member function shall throw an object of class `range_error`.

```
explicit wstring_convert(Codecvt* pcvt);
wstring_convert(Codecvt* pcvt, state_type state);
explicit wstring_convert(const byte_string& byte_err,
    const wide_string& wide_err = wide_string());
```

12 *Requires:* For the first and second constructors, `pcvt != nullptr`.

13 *Effects:* The first constructor shall store `pcvt` in `cvtptr` and default values in `cvtstate`, `byte_err_string`, and `wide_err_string`. The second constructor shall store `pcvt` in `cvtptr`, `state` in `cvtstate`, and default values in `byte_err_string` and `wide_err_string`; moreover the stored state shall be retained between calls to `from_bytes` and `to_bytes`. The third constructor shall store `new Codecvt` in `cvtptr`, `state_type()` in `cvtstate`, `byte_err` in `byte_err_string`, and `wide_err` in `wide_err_string`.

`~wstring_convert();`

14 *Effects:* The destructor shall delete `cvtptr`.

D.27.3 Class template `wbuffer_convert`

[depr.conversions.buffer]

1 Class template `wbuffer_convert` looks like a wide stream buffer, but performs all its I/O through an underlying byte stream buffer that you specify when you construct it. Like class template `wstring_convert`, it lets you specify a code conversion facet to perform the conversions, without affecting any streams or locales.

```
namespace std {
    template<class Codecvt, class Elem = wchar_t, class Tr = char_traits<Elem>>
        class wbuffer_convert : public basic_streambuf<Elem, Tr> {
    public:
        using state_type = typename Codecvt::state_type;

        wbuffer_convert() : wbuffer_convert(nullptr) {}
        explicit wbuffer_convert(streambuf* bytebuf,
            Codecvt* pcvt = new Codecvt,
            state_type state = state_type());
        ~wbuffer_convert();
```

```
wbuffer_convert(const wbuffer_convert&) = delete;
wbuffer_convert& operator=(const wbuffer_convert&) = delete;

streambuf* rdbuf() const;
streambuf* rdbuf(streambuf* bytebuf);

state_type state() const;

private:
    streambuf* bufptr;           // exposition only
    Codecvt* cvtptr;           // exposition only
    state_type cvtstate;        // exposition only
};

}
```

- 2 The class template describes a stream buffer that controls the transmission of elements of type `Elem`, whose character traits are described by the class `Tr`, to and from a byte stream buffer of type `streambuf`. Conversion between a sequence of `Elem` values and multibyte sequences is performed by an object of class `Codecvt`, which shall meet the requirements of the standard code-conversion facet `codecvt<Elem, char, mbstate_t>`.

- 3 An object of this class template stores:

- (3.1) — `bufptr` — a pointer to its underlying byte stream buffer
- (3.2) — `cvtptr` — a pointer to the allocated conversion object (which is freed when the `wbuffer_convert` object is destroyed)
- (3.3) — `cvtstate` — a conversion state object

`state_type state() const;`

4 *Returns:* `cvtstate`.

`streambuf* rdbuf() const;`

5 *Returns:* `bufptr`.

`streambuf* rdbuf(streambuf* bytebuf);`

6 *Effects:* Stores `bytebuf` in `bufptr`.

7 *Returns:* The previous value of `bufptr`.

```
explicit wbuffer_convert(
    streambuf* bytebuf,
    Codecvt* pcvt = new Codecvt,
    state_type state = state_type());
```

8 *Requires:* `pcvt != nullptr`.

9 *Effects:* The constructor constructs a stream buffer object, initializes `bufptr` to `bytebuf`, initializes `cvtptr` to `pcvt`, and initializes `cvtstate` to `state`.

`~wbuffer_convert();`

10 *Effects:* The destructor shall delete `cvtptr`.

D.28 Deprecated locale category facets

[depr.locale.category]

- 1 The `ctype` locale category includes the following facets as if they were specified in table [Table 104](#) of [30.3.1.2.1](#).

```
codecvt<char16_t, char, mbstate_t>
codecvt<char32_t, char, mbstate_t>
```
- 2 The `ctype` locale category includes the following facets as if they were specified in table [Table 105](#) of [30.3.1.2.1](#).

```
codecvt_byname<char16_t, char, mbstate_t>
codecvt_byname<char32_t, char, mbstate_t>
```
- 3 The following class template specializations are required in addition to those specified in [30.4.2.5](#). The specialization `codecvt<char16_t, char, mbstate_t>` converts between the UTF-16 and UTF-8 encoding forms, and the specialization `codecvt<char32_t, char, mbstate_t>` converts between the UTF-32 and UTF-8 encoding forms.

D.29 Deprecated filesystem path factory functions

[depr.fs.path.factory]

```
template<class Source>
path u8path(const Source& source);
template<class InputIterator>
path u8path(InputIterator first, InputIterator last);
```

¹ *Requires:* The source and [first, last) sequences are UTF-8 encoded. The value type of Source and InputIterator is char or char8_t. Source meets the requirements specified in [31.12.6.4](#).

² *Returns:*

- (2.1) — If value_type is char and the current native narrow encoding ([31.12.6.3.2](#)) is UTF-8, return path(source) or path(first, last); otherwise,
- (2.2) — if value_type is wchar_t and the native wide encoding is UTF-16, or if value_type is char16_t or char32_t, convert source or [first, last) to a temporary, tmp, of type string_type and return path(tmp); otherwise,
- (2.3) — convert source or [first, last) to a temporary, tmp, of type u32string and return path(tmp).

³ *Remarks:* Argument format conversion ([31.12.6.3.1](#)) applies to the arguments for these functions. How Unicode encoding conversions are performed is unspecified.

⁴ EXAMPLE: A string is to be read from a database that is encoded in UTF-8, and used to create a directory using the native encoding for filenames:

```
namespace fs = std::filesystem;
std::string utf8_string = read_utf8_data();
fs::create_directory(fs::u8path(utf8_string));
```

For POSIX-based operating systems with the native narrow encoding set to UTF-8, no encoding or type conversion occurs.

For POSIX-based operating systems with the native narrow encoding not set to UTF-8, a conversion to UTF-32 occurs, followed by a conversion to the current native narrow encoding. Some Unicode characters may have no native character set representation.

For Windows-based operating systems a conversion from UTF-8 to UTF-16 occurs.

NOTE: The example above is representative of a historical use of filesystem::u8path. To indicate a UTF-8 encoding, passing a std::u8string to path's constructor is preferred as it is consistent with path's handling of other encodings.

D.30 Deprecated atomic operations

[depr.atomics]

D.30.1 General

[depr.atomics.general]

¹ The header <atomic> ([33.5.2](#)) has the following additions.

```
namespace std {
    template<class T>
        void atomic_init(volatile atomic<T>*, typename atomic<T>::value_type) noexcept;
    template<class T>
        void atomic_init(atomic<T>*, typename atomic<T>::value_type) noexcept;

    #define ATOMIC_VAR_INIT(value) see below
}
```

D.30.2 Volatile access

[depr.atomics.volatle]

¹ If an atomic ([33.5.8](#)) specialization has one of the following overloads, then that overload participates in overload resolution even if atomic<T>::is_always_lock_free is false:

```
void store(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
T operator=(T desired) volatile noexcept;
T load(memory_order order = memory_order::seq_cst) const volatile noexcept;
operator T() const volatile noexcept;
T exchange(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,
                           memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
                           memory_order success, memory_order failure) volatile noexcept;
```

```

bool compare_exchange_weak(T& expected, T desired,
                           memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
                             memory_order order = memory_order::seq_cst) volatile noexcept;
T fetch_key(T operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T operator op=(T operand) volatile noexcept;
T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) volatile noexcept;

```

D.30.3 Non-member functions

[depr.atomics.nonmembers]

```

template<class T>
void atomic_init(volatile atomic<T>* object, typename atomic<T>::value_type desired) noexcept;
template<class T>
void atomic_init(atomic<T>* object, typename atomic<T>::value_type desired) noexcept;

```

¹ *Effects:* Equivalent to: `atomic_store_explicit(object, desired, memory_order::relaxed);`

D.30.4 Operations on atomic types

[depr.atomics.types.operations]

```
#define ATOMIC_VAR_INIT(value) see below
```

¹ The macro expands to a token sequence suitable for constant initialization of an atomic variable of static storage duration of a type that is initialization-compatible with `value`.

NOTE: This operation possibly needs to initialize locks.

Concurrent access to the variable being initialized, even via an atomic operation, constitutes a data race.

EXAMPLE:

```
atomic<int> v = ATOMIC_VAR_INIT(5);
```

Annex E (informative) Conformance with UAX #31 [uaxid]

E.1 General [uaxid.general]

- ¹ This Annex describes the choices made in application of UAX #31 (“Unicode Identifier and Pattern Syntax”) to C++ in terms of the requirements from UAX #31 and how they do or do not apply to C++. In terms of UAX #31, C++ conforms by meeting the requirements R1 “Default Identifiers” and R4 “Equivalent Normalized Identifiers”. The other requirements, also listed below, are either alternatives not taken or do not apply to C++.

E.2 R1 Default identifiers [uaxid.def]

E.2.1 General [uaxid.def.general]

- ¹ UAX #31 specifies a default syntax for identifiers based on properties from the Unicode Character Database, UAX #44. The general syntax is

```
<Identifier> := <Start> <Continue>* (<Medial> <Continue>+)*
```

where `<Start>` has the XID_Start property, `<Continue>` has the XID_Continue property, and `<Medial>` is a list of characters permitted between continue characters. For C++ we add the character U+005F LOW LINE, or `_`, to the set of permitted `<Start>` characters, the `<Medial>` set is empty, and the `<Continue>` characters are unmodified. In the grammar used in UAX #31, this is

```
<Identifier> := <Start> <Continue>*
<Start> := XID_Start + U+005F
<Continue> := <Start> + XID_Continue
```

- ² This is described in the C++ grammar in 5.10, where *identifier* is formed from *identifier-start* or *identifier* followed by *identifier-continue*.

E.2.2 R1a Restricted format characters [uaxid.def.rfmt]

- ¹ If an implementation of UAX #31 wishes to allow format characters such as U+200D ZERO WIDTH JOINER or U+200C ZERO WIDTH NON-JOINER it must define a profile allowing them, or describe precisely which combinations are permitted.
- ² C++ does not allow format characters in identifiers, so this does not apply.

E.2.3 R1b Stable identifiers [uaxid.def.stable]

- ¹ An implementation of UAX #31 may choose to guarantee that identifiers are stable across versions of the Unicode Standard. Once a string qualifies as an identifier it does so in all future versions.
- ² C++ does not make this guarantee, except to the extent that UAX #31 guarantees the stability of the XID_Start and XID_Continue properties.

E.3 R2 Immutable identifiers [uaxid.immutable]

- ¹ An implementation may choose to guarantee that the set of identifiers will never change by fixing the set of code points allowed in identifiers forever.
- ² C++ does not choose to make this guarantee. As scripts are added to Unicode, additional characters in those scripts may become available for use in identifiers.

E.4 R3 PatternWhiteSpace and PatternSyntax characters [uaxid.pattern]

- ¹ UAX #31 describes how formal languages such as computer languages should describe and implement their use of whitespace and syntactically significant characters during the processes of lexing and parsing.
- ² C++ does not claim conformance with this requirement.

E.5 R4 Equivalent normalized identifiers

[uaxid.eqn]

- ¹ UAX #31 requires that implementations describe how identifiers are compared and considered equivalent.
- ² C++ requires that identifiers be in Normalization Form C and therefore identifiers that compare the same under NFC are equivalent. This is described in [5.10](#).

E.6 R5 Equivalent case-insensitive identifiers

[uaxid.eqci]

- ¹ C++ considers case to be significant in identifier comparison, and does not do any case folding. This requirement does not apply to C++.

E.7 R6 Filtered normalized identifiers

[uaxid.filter]

- ¹ If any characters are excluded from normalization, UAX #31 requires a precise specification of those exclusions.
- ² C++ does not make any such exclusions.

E.8 R7 Filtered case-insensitive identifiers

[uaxid.filterci]

- ¹ C++ identifiers are case sensitive, and therefore this requirement does not apply.

E.9 R8 Hashtag identifiers

[uaxid.hashtag]

- ¹ There are no hashtags in C++, so this requirement does not apply.

Index of grammar productions

The first bold page number for each entry is the page in the general text where the grammar production is defined. The second bold page number is the corresponding page in the Grammar summary (Annex A). Other page numbers refer to pages where the grammar production is mentioned in the general text.

Index of library concepts

The bold page number for each entry is the page where the concept is defined. Other page numbers refer to pages where the concept is mentioned in the general text. Concepts whose name appears in *italics* are for exposition only.

- advanceable*, **1127**, **1128**, 1128–1132
- all-bidirectional*, **1196**, 1197, 1198
- all-forward*, **1196**, 1197, 1198
- all-random-access*, **1196**, 1197–1199, 1241, **1244**
- assignable_from*, **541**, **544**, 544, 545, 550, 863, 1053, 1062, 1063, 1066, 1069, 1081, 1084–1086, 1089, 1090, 1266
- bidirectional-common*, **1165**, 1168, 1170, **1171**
- bidirectional_iterator*, **1037**, 1039, 1043, **1055**, 1055, 1066–1068, 1076–1078, 1081, 1089, 1091, 1092, 1111, 1112, 1116, 1120–1122, 1252, 1266, 1268, 1269, **1275**, 1283, 1285, 1294, 1311, 1314, 1315, 1325, 1329, 1337, 1338, 1340, 1354, 1355, 1752, 1754
- bidirectional_range*, **1106**, **1116**, 1116, 1118, 1119, 1145, 1146, 1149, 1150, 1162, 1164, 1165, 1168, 1170, 1171, 1182, 1186–1188, 1191–1193, 1195, 1196, 1202, 1204, **1207**, 1208, 1213, 1214, 1221–1223, 1225, **1227**, 1228, 1231–1237, 1239, 1266, 1268, 1269, 1275, 1283, 1285, 1294, 1311, 1314, 1315, 1325, 1338, 1341, 1354, 1355
- boolean-testable*, 463, 471, 472, 474, 527, 529, 530, **547**, **548**, 548, 549, 551, 670, 684, **1057**, 1060, 1252, 1764
- boolean-testable-impl*, **547**, **547**, **548**
- borrowed_range*, **1011**, **1114**, 1114, 1120–1122, 1661, 1662
- can-reference*, **1035**, 1035, 1036, **1046**, 1053, 1087, 1105, 1108, 1147, 1148, 1151, **1201**, 1202, 1204, 1211, 1212, 1215
- cartesian-is-sized-sentinel*, **1239**, 1241, 1244, 1245
- cartesian-product-common-arg*, **1239**, 1239
- cartesian-product-is-bidirectional*, **1239**, 1241–1243
- cartesian-product-is-common*, **1239**, 1239, 1240
- cartesian-product-is-random-access*, **1239**, 1241–1244
- cartesian-product-is-sized*, **1239**, 1240
- common_range*, **1106**, **1116**, 1116, 1118, 1119, 1124, 1143, 1144, 1147, 1148, 1161–1166, 1168, 1173, 1178, 1181–1183, 1185, 1190, 1195, 1198, 1201, 1206, 1212, 1221, 1225, 1226, 1231, 1234, 1239
- common_reference_with*, **541**, **543**, 543–545, 1028, 1050, 1061, 1165, 1246, 1884
- common_with*, **541**, **543**, 544, 1040, 1090, 1092, **1093**, 1165
- compares-as*, **527**, 527, **528**
- comparison-common-type-with*, **528**, **548**, 549
- comparison-common-type-with-impl*, **548**, 548
- compatible-joinable-ranges*, **1106**, **1165**, 1165, 1167, 1171
- const-formattable-range*, **775**, 775
- constant_iterator*, 1111
- constant_iterator*, 1040, **1075**, 1075, 1111, 1112, 1117
- constant_range*, **1107**, **1117**, 1117, 1183
- constructible_from*, **541**, **546**, 546, 547, 575–577, 1028, 1047, 1062, 1063, 1087, 1117, 1119, 1124, 1126, 1133, 1134, 1166, 1167, 1172, 1173, 1178, 1247, 1248, 1266, 1267, 1311, 1312, 1371–1373, 1772
- container-compatible-range*, 824–826, 830, 835–837, 840, **853**, 861, 869, 878, 894–897, 899, 901, 902, 905–908, 911–913, 915–917, 922, 923, 925, 927, 928, 930–932, 934–937, 941, 942, 945, 948, 949, 952–954, 957–959, 962, 966–969, 971–974, 977, 979, 982, 984, 989, 990, 993, 995, 996, 999, 1000, **1002**, 1003, 1006
- contiguous_iterator*, 814, 857, 1010, 1012, 1013, 1037, 1043, **1056**, 1056, 1077, 1078, 1089–1091, 1113, 1116, 1118, 1180, 1443
- contiguous_range*, 814, 1011, 1012, **1116**, 1116, 1141, 1142
- convertible-to-non-slicing*, **1119**, 1119–1121
- convertible_to*, **115**, 388, 463, 540, **543**, 543, 547, 548, 747, 782, 853, 1047, 1069, 1075, 1077, 1081, 1084–1086, 1089, 1090, 1119–1121, 1124, 1128, 1141, 1149, 1150, 1152, 1153, 1155, 1157, 1162, 1163, 1165, 1168, 1170, 1171, 1174, 1180, 1186, 1187, 1189, 1191, 1192, 1194, 1196, 1197, 1199, 1200, 1202, 1203, 1205, 1207, 1208, 1210, 1213, 1215, 1222, 1223, 1227, 1228, 1235, 1236, 1241, 1243, 1247–1249, 1266, 1294–1297, 1661, 1662
- copy_constructible*, **541**, **547**, 547, 550, 695, 1061, 1115, 1126, 1133, 1134, 1139, 1143, 1144, 1147, 1153, 1156, 1158–1160, 1166, 1172, 1178, 1181, 1182, 1184, 1185, 1191,

1206, 1212, 1217, 1220, 1225, 1231, 1233, 1246, 1266, 1270, 1272, 1299, 1300, 1317, 1321
copyable, 550, 550, 1018, 1028, 1031, 1041, 1046, 1063, 1085, 1103, 1104, 1106, 1115, 1120–1122, 1127, 1129, 1132, 1139, 1145, 1146, 1162, 1163, 1181, 1290, 1291, 1349–1351
cpp17-bidirectional-iterator, 1047, 1047, 1048
cpp17-forward-iterator, 1047, 1047, 1048
cpp17-input-iterator, 1046, 1047
cpp17-iterator, 1046, 1046, 1048
cpp17-random-access-iterator, 1047, 1048

decrementable, 1127, 1127, 1128, 1130, 1131
default_initializable, 541, 547, 550, 574, 575, 1075, 1085, 1089, 1119, 1126, 1127, 1129, 1133, 1137, 1139, 1142–1145, 1147, 1149, 1153, 1156, 1158–1160, 1166, 1172, 1178, 1181, 1182, 1184–1186, 1190, 1191, 1206, 1231, 1235, 1247, 1249, 1369, 1370
dereferenceable, 1035, 1035, 1036, 1085, 1086, 1089, 1091
derived_from, 540, 542, 542, 1054–1056, 1068, 1081, 1086, 1116, 1119, 1124, 1136, 1138, 1145, 1150, 1163, 1168, 1176, 1187, 1203, 1213, 1236
destructible, 461, 541, 546, 546, 577, 1373, 1374, 1772
different_from, 669, 677, 680, 1075–1077, 1079, 1117, 1120, 1121, 1141

equality_comparable, 541, 549, 549, 550, 1018, 1046, 1051, 1052, 1054, 1130, 1131, 1145, 1146, 1149, 1151, 1162, 1164, 1168, 1171, 1186, 1188, 1197, 1198, 1202, 1204, 1235, 1237, 1241, 1244
equality_comparable_with, 549, 549, 550, 752, 1085, 1088, 1883
equivalence_relation, 542, 551, 551, 1061

floating_point, 544, 1457
formattable, 775, 776, 786, 786, 791–793, 799, 800, 1007
formattable-with, 786, 786, 796, 797
forward_iterator, 1036, 1043, 1054, 1054, 1055, 1063, 1076–1078, 1081, 1082, 1086, 1087, 1089, 1091, 1112–1116, 1120, 1121, 1168, 1170, 1252, 1257, 1259–1261, 1263–1265, 1275, 1276, 1280–1283, 1291, 1292, 1298, 1301–1304, 1308–1310, 1324, 1326, 1327, 1333, 1335, 1336, 1339, 1351, 1352, 1369
forward_range, 861, 863, 914, 1106, 1108, 1109, 1116, 1116–1119, 1144–1146, 1149, 1150, 1159–1181, 1186–1188, 1191–1193, 1196, 1202, 1203, 1206, 1207, 1210–1212, 1215, 1220, 1221, 1225, 1226, 1230–1232, 1234–1236, 1238, 1239, 1241–1243, 1257, 1259–1261, 1264, 1265, 1273, 1274, 1276, 1277, 1280–1283, 1291, 1292, 1298, 1301–1304, 1308–1311, 1321, 1323, 1326–1328, 1333, 1335–1337, 1339, 1351, 1352

has-arrow, 1117, 1145, 1146, 1162, 1163
has-elem-type, 581, 581
has-member-element-type, 1045, 1046
has-member-value-type, 1045, 1045, 1046
has-tuple-element, 1185, 1185, 1186, 1189

incrementable, 1036, 1052, 1052–1054, 1127, 1129–1131
indirect_binary_predicate, 1061, 1063, 1109, 1231, 1232, 1257–1259, 1261, 1270, 1271, 1273, 1298, 1300, 1301, 1304, 1318, 1319, 1321, 1322
indirect_equivalence_relation, 1061, 1263, 1264, 1274, 1275, 1308, 1323, 1324
indirect_strict_weak_order, 1061, 1064, 1279–1282, 1285, 1290–1293, 1332, 1333, 1335, 1336, 1341, 1348–1353
indirect Unary_predicate, 1061, 1084, 1105, 1144, 1146, 1156, 1159, 1257, 1259, 1261, 1268, 1271, 1273, 1274, 1282, 1283, 1297, 1298, 1301, 1304, 1305, 1313, 1314, 1318, 1319, 1321, 1322, 1337–1339
indirectly-binary-left-foldable, 1266, 1266, 1267, 1311, 1312
indirectly-binary-left-foldable-impl, 1266, 1266
indirectly-binary-right-foldable, 1266, 1266, 1311
indirectly-readable-impl, 1050, 1050
indirectly_comparable, 1038, 1062, 1063, 1063, 1106, 1172, 1173, 1175, 1177, 1179, 1180, 1257, 1260, 1262–1265, 1298, 1302, 1303, 1306, 1307, 1309–1311
indirectly_copyable, 1037, 1062, 1063, 1063, 1064, 1267, 1268, 1271, 1273–1276, 1279, 1283, 1312–1314, 1319, 1322, 1324–1327, 1332, 1338
indirectly_copyable_storable, 1063, 1063, 1275, 1290, 1291, 1324, 1349–1351
indirectly_movable, 1037, 1062, 1062, 1084, 1268, 1269, 1315
indirectly_movable_storable, 1049, 1062, 1062, 1063
indirectly_readable, 1036, 1037, 1040, 1045, 1046, 1049, 1050, 1050, 1054, 1061–1063, 1075, 1087, 1089, 1246, 1266
indirectly_regular_unary_invocable, 1037, 1061, 1062
indirectly_swappable, 1037, 1062, 1063, 1063, 1068, 1071, 1080, 1083, 1085, 1088, 1090, 1093, 1145, 1146, 1162, 1164, 1168, 1176, 1177, 1197, 1199, 1208, 1210, 1219, 1220, 1236, 1238, 1242, 1245, 1269, 1316

indirectly_unary_invocable, 1061, 1258, 1299, 1300
indirectly_writable, 1036, 1043, 1050, 1050, 1051, 1054, 1062, 1063, 1270–1272, 1317, 1318, 1321, 1358, 1367
input_iterator, 575, 576, 1036, 1040, 1041, 1043, 1048, 1054, 1054, 1064, 1075, 1081, 1084–1086, 1088, 1090, 1093, 1111, 1112, 1116, 1117, 1246, 1257–1263, 1265–1271, 1273–1276, 1279, 1282–1288, 1293, 1297–1301, 1303, 1304, 1306, 1307, 1310–1313, 1315–1319, 1322, 1324, 1327, 1332, 1337, 1338, 1340–1345, 1353, 1368, 1371, 1372
input_or_output_iterator, 1036, 1038, 1039, 1041, 1043, 1053, 1053, 1054, 1066, 1067, 1085, 1089, 1103, 1110–1112, 1114, 1119, 1120, 1272, 1321, 1358, 1367
input_range, 575, 576, 775, 776, 791–796, 828, 853, 896, 900, 907, 913, 919, 924, 929, 930, 933, 937, 944, 950, 951, 956, 960, 961, 967, 970, 973, 974, 981, 992, 998, 1005, 1103, 1105–1109, 1116, 1116–1118, 1123, 1124, 1136, 1143, 1144, 1146–1148, 1151, 1156, 1159–1161, 1164–1167, 1171–1173, 1175, 1184–1186, 1189, 1195, 1196, 1199, 1201, 1202, 1204, 1216–1219, 1233, 1234, 1239, 1241, 1246–1248, 1257–1263, 1265–1271, 1273–1276, 1279, 1282–1288, 1290, 1291, 1293, 1297–1301, 1303–1307, 1310–1319, 1322, 1324, 1327, 1332, 1337, 1338, 1340–1345, 1349–1351, 1353, 1371, 1372
integer-like-with-usable-difference-type, 1133, 1133, 1134
integral, 329, 330, 544, 544, 802, 1045, 1051
invocable, 466, 542, 550, 550, 551, 695, 1037, 1061, 1265, 1266, 1272, 1321, 1387, 1772
is-derived-from-optional, 685, 686, 698
layout-mapping-alike, 1025, 1026, 1026, 1027
mergeable, 1038, 1062, 1063, 1064, 1284, 1286–1288, 1340, 1342–1345
movable, 550, 550, 1051, 1062, 1104, 1115, 1117, 1137, 1139, 1142, 1266
move_constructible, 541, 545, 547, 547, 550, 695, 1087, 1104, 1105, 1108, 1117, 1126, 1133, 1134, 1139, 1147, 1148, 1151, 1185, 1200–1202, 1204, 1211, 1212, 1215
not-a-const-iterator, 1075, 1076, 1077, 1077, 1079

Index of implementation-defined behavior

The entries in this index are rough descriptions; exact specifications are at the indicated page in the general text.

- #pragma, 455
- additional execution policies supported by parallel algorithms, 771, 1255
- additional `file_type` enumerators for file systems supporting additional types of file, 1702
- additional formats for `time_get::do_get_date`, 1578
- additional supported forms of preprocessing directive, 443
- algorithms for producing the standard random number distributions, 1404
- alignment, 68
 - alignment additional values, 68
 - alignment of bit-fields within a class object, 279
 - allocation of bit-fields within a class object, 279
 - any use of an invalid pointer other than to perform indirection or deallocate, 65
- argument values to construct `ios_base::failure`, 1605
- assignability of placeholder objects, 758
- barrier phrase completion without `wait`, 1842
- behavior of iostream classes when `traits::pos_type` is not `streampos` or when `traits::off_type` is not `streamoff`, 1588
- behavior of non-standard attributes, 239
- behavior of `strstreambuf::setbuf`, 1921
- bits in a byte, 59
- choice of larger or smaller value of *floating-point-literal*, 26
- code unit sequence for *conditional-escape-sequence*, 28
- code unit sequence for non-representable *string-literal*, 28
- column value of `source_location::current`, 516
- conversions between pointers and integers, 126
- converting function pointer to object pointer and vice versa, 126
- default configuration of a pool, 624
- default `next_buffer_size` for a `monotonic_buffer_resource`, 625
- default number of buckets in `unordered_map`, 945
- default number of buckets in `unordered_multimap`, 951, 952
- default number of buckets in `unordered_multiset`, 961, 962
- default number of buckets in `unordered_set`, 957
- default value for `least_max_value` template parameter of `counting_semaphore`, 1838
- defining `main` in freestanding environment, 87
- definition and meaning of `__STDC__`, 457, 1911
- definition and meaning of `__STDC_VERSION__`, 457
- definition of `NULL`, 491, 1912
- derived type for `typeid`, 123
- determination of kind of input file, 13
- diagnostic message, 4
- dynamic initialization of static inline variables before `main`, 89
- dynamic initialization of static variables before `main`, 89
- dynamic initialization of thread-local variables before entry, 89
- effect of calling associated Laguerre polynomials with $n \geq 128$ or $m \geq 128$, 1451
- effect of calling associated Legendre polynomials with $l \geq 128$, 1452
- effect of calling `basic_filebuf::setbuf` with nonzero arguments, 1669
- effect of calling `basic_filebuf::sync` when a get area exists, 1670
- effect of calling `basic_streambuf::setbuf` with nonzero arguments, 1649
- effect of calling cylindrical Bessel functions of the first kind with $nu \geq 128$, 1453
- effect of calling cylindrical Neumann functions with $nu \geq 128$, 1454
- effect of calling Hermite polynomials with $n \geq 128$, 1455
- effect of calling `ios_base::sync_with_stdio` after any input or output operation on standard streams, 1599
- effect of calling irregular modified cylindrical Bessel functions with $nu \geq 128$, 1453
- effect of calling Laguerre polynomials with $n \geq 128$, 1455
- effect of calling Legendre polynomials with $l \geq 128$, 1455
- effect of calling regular modified cylindrical Bessel functions with $nu \geq 128$, 1453
- effect of calling spherical associated Legendre functions with $l \geq 128$, 1456
- effect of calling spherical Bessel functions with $n \geq 128$, 1456

effect of calling spherical Neumann functions with $n \geq 128$, 1456
 effect of *conditional-escape-sequence* on encoding state, 28
 effect of `filesystem::copy`, 1715
 effect on C locale of calling `locale::global`, 1554
 encoding assumption for format width computation, 780
`error_category` for errors originating outside the operating system, 488
 exception type when `random_device` constructor fails, 1402
 exception type when
 `random_device::operator()` fails, 1402
 exception type when `shared_ptr` constructor fails, 601, 602
 exceptions thrown by standard library functions that have a potentially-throwing exception specification, 488
 exit status, 506
 extended signed integer types, 74
 file type of the file argument of
 `filesystem::status`, 1725
 floating-point conversion subrank, 79
 formatted character sequence generated by
 `time_put::do_put` in C locale, 1580
 forward progress guarantees for implicit threads of parallel algorithms (if not defined for `thread`), 1254
 growth factor for `monotonic_buffer_resource`, 625
 headers for freestanding implementation, 470
 how `random_device::operator()` generates values, 1402
 how the set of importable headers is determined, 250
 interactive device, 11
 interpretation of the path character sequence with format `path::auto_format`, 1702
 largest supported value to configure the largest allocation satisfied directly by a pool, 623
 largest supported value to configure the maximum number of blocks to replenish a pool, 623
 last enumerator of `launch`, 1843
 linkage of `main`, 87
 linkage of names from C standard library, 471
 linkage of objects between C++ and other languages, 238
 locale names, 1553
 locales with Unicode support for chrono types, 1539
 lvalue-to-rvalue conversion of an invalid pointer value, 96
 manner of search for included source file, 446
 mapping from name to catalog when calling `messages::do_open`, 1586
 mapping header name to header or external source file, 19
 mapping input source file characters to translation character set, 1893
 mapping of pointer to integer, 126
 mapping physical source file characters to translation character set, 13
 mapping to message when calling `messages::do_get`, 1586
 maximum depth of recursive template instantiations, 406
 maximum size of an allocated object, 133, 512
 meaning of ', \, /*, or // in a *q-char-sequence* or an *h-char-sequence*, 19
 meaning of `asm` declaration, 235
 meaning of attribute declaration, 169
 meaning of dot-dot in *root-directory*, 1690
 nesting limit for `#include` directives, 447
 NTCTS in `basic_ostream<charT, traits>& operator<<(nullptr_t)`, 1635
 number of placeholders for bind expressions, 743, 758
 number of threads in a program under a freestanding implementation, 82
 operating system on which implementation depends, 1682
`operator<<` for large extended floating-point types, 1634
`operator>>` for large extended floating-point types, 1622
 ordinary and wide literal encodings, 16
 parameters to `main`, 87
 passing argument of class type through ellipsis, 120
 presence and meaning of `native_handle_type` and `native_handle`, 1764
 presence and value of `_STDC_ISO_10646_-`, 457
 rank of extended signed integer type, 79
 representation of floating-point types, 75
 required alignment for `atomic_ref` type's operations, 1787, 1790–1792
 resource limits on a message catalog, 1587
 result of `filesystem::file_size`, 1720
 result of inexact floating-point conversion, 98, 125
 resuming a coroutine on a different execution agent, 533
 return type of `cartesian_product_view::size`, 1240
 return value of `bad_alloc::what`, 512
 return value of `bad_any_cast::what`, 710
 return value of `bad_array_new_length::what`, 512

return value of `bad_cast::what`, 515
 return value of `bad_exception::what`, 518
 return value of `bad_function_call::what`, 759
 return value of `bad_optional_access::what`,
 696
 return value of `bad_typeid::what`, 515
 return value of `bad_variant_access::what`, 709
 return value of `bad_weak_ptr::what`, 599
 return value of `char_traits<char16_t>::eof`,
 809
 return value of `char_traits<char32_t>::eof`,
 809
 return value of `char_traits<char8_t>::eof`,
 808
 return value of `exception::what`, 518
 return value of `source_location::current`, 516
 return value of `type_info::name()`, 514

 search locations for "" header, 447
 search locations for <> header, 446
 semantics of an access through a volatile glvalue,
 177
 semantics of linkage specifiers, 236
 semantics of parallel algorithms invoked with
 implementation-defined execution
 policies, 1255
 semantics of
 `stacktrace_entry::native_handle`,
 567
 semantics of `token` parameter and default token
 value used by `random_device`
 constructors, 1402
 sequence of places searched for a header, 446
 set of character types that iostreams templates
 can be instantiated for, 1551, 1588
 set of integer-class types, 1051
 signedness of `char`, 179
`sizeof` applied to fundamental types other than
 `char`, `signed char`, and `unsigned char`, 131
 stack unwinding before invocation of
 `std::terminate`, 437, 441
`stacktrace_entry::native_handle_type`, 566
 startup and termination in freestanding
 environment, 87
 strict total order over pointer values, 5
 string resulting from `__func__`, 217
 support for extended alignments, 68
 support for *module-import-declarations* with
 non-C++ language linkage, 236
 supported input files, 13
 supported multibyte character encoding rules, 808
 supported *root-names* in addition to any operating
 system dependent *root-names*, 1689, 1690

 text of `__DATE__` when date of translation is not
 available, 455
 text of `__TIME__` when time of translation is not
 available, 456

threads and program points at which deferred
 dynamic initialization is performed, 89
 type of a directory-like file, 1709, 1711
 type of `array::const_iterator`, 892
 type of `array::iterator`, 892
 type of `basic_stacktrace::const_iterator`,
 567
 type of `basic_stacktrace::difference_type`,
 567
 type of `basic_stacktrace::size_type`, 567
 type of `basic_string::const_iterator`, 824
 type of `basic_string::iterator`, 824
 type of `basic_string_view::const_iterator`,
 811, 814
 type of `default_random_engine`, 1401
 type of `deque::const_iterator`, 894
 type of `deque::difference_type`, 894
 type of `deque::iterator`, 894
 type of `deque::size_type`, 894
 type of `flat_map::const_iterator`, 976
 type of `flat_map::iterator`, 976
 type of `flat_multimap::const_iterator`, 988
 type of `flat_multimap::iterator`, 988
 type of `flat_multiset::const_iterator`, 1001
 type of `flat_multiset::iterator`, 1001
 type of `flat_set::const_iterator`, 995
 type of `flat_set::iterator`, 995
 type of `forward_list::const_iterator`, 898
 type of `forward_list::difference_type`, 898
 type of `forward_list::iterator`, 898
 type of `forward_list::size_type`, 898
 type of `list::const_iterator`, 905
 type of `list::difference_type`, 905
 type of `list::iterator`, 905
 type of `list::size_type`, 905
 type of `map::const_iterator`, 921
 type of `map::difference_type`, 921
 type of `map::iterator`, 921
 type of `map::size_type`, 921
 type of `match_results::const_iterator`, 1748
 type of `multimap::const_iterator`, 927
 type of `multimap::difference_type`, 927
 type of `multimap::iterator`, 927
 type of `multimap::size_type`, 927
 type of `multiset::const_iterator`, 935
 type of `multiset::difference_type`, 935
 type of `multiset::iterator`, 935
 type of `multiset::size_type`, 935
 type of `ptrdiff_t`, 141, 492
 type of `ranges::cartesian_product_-view::iterator::difference_type`,
 1242
 type of `regex_constants::error_type`, 1738
 type of `regex_constants::match_flag_type`,
 1736
 type of `set::const_iterator`, 931
 type of `set::difference_type`, 931
 type of `set::iterator`, 931
 type of `set::size_type`, 931

type of `size_t`, 492
 type of `span::iterator`, 1009, 1013
 type of `std::bfloating_t`, 506
 type of `std::float128_t`, 506
 type of `std::float16_t`, 505
 type of `std::float32_t`, 505
 type of `std::float64_t`, 505
 type of `streamoff`, 1588
 type of `syntax_option_type`, 1736
 type of `unordered_map::const_iterator`, 941
 type of `unordered_map::const_local_iterator`, 941
 type of `unordered_map::difference_type`, 941
 type of `unordered_map::iterator`, 941
 type of `unordered_map::local_iterator`, 941
 type of `unordered_map::size_type`, 941
 type of `unordered_multimap::const_iterator`, 947
 type of `unordered_multimap::const_local_iterator`, 948
 type of `unordered_multimap::difference_type`, 947
 type of `unordered_multimap::iterator`, 947
 type of `unordered_multimap::local_iterator`, 948
 type of `unordered_multimap::size_type`, 947
 type of `unordered_multiset::const_iterator`, 958
 type of `unordered_multiset::const_local_iterator`, 958
 type of `unordered_multiset::difference_type`, 958
 type of `unordered_multiset::iterator`, 958
 type of `unordered_multiset::local_iterator`, 958
 type of `unordered_multiset::size_type`, 958
 type of `unordered_set::const_iterator`, 953
 type of `unordered_set::const_local_iterator`, 953
 type of `unordered_set::difference_type`, 953
 type of `unordered_set::iterator`, 953
 type of `vector::const_iterator`, 911
 type of `vector::difference_type`, 911
 type of `vector::iterator`, 911
 type of `vector::size_type`, 911
 type of `vector<bool>::const_iterator`, 916
 type of `vector<bool>::const_pointer`, 916
 type of `vector<bool>::difference_type`, 916
 type of `vector<bool>::iterator`, 916
 type of `vector<bool>::pointer`, 916
 type of `vector<bool>::size_type`, 916
 underlying type for enumeration, 225
 underlying type of `bool`, 75
 underlying type of `char`, 75
 underlying type of `wchar_t`, 75
 unit suffix when `Period::type` is `micro`, 1480
 value of bit-field that cannot represent assigned value, 148
 incremented value, 122
 initializer, 204
 value of *conditional-escape-sequence*, 25
 value of `ctype<char>::table_size`, 1559
 value of `future_errc::broken_promised`, 1843
 value of `future_errc::future_already_retrieved`, 1843
 value of `future_errc::no_state`, 1843
 value of `future_errc::promise_already_satisfied`, 1843
 value of *has-attribute-expression* for non-standard attributes, 445
 value of non-encodable character literal or multicharacter literal, 24
 value of `pow(0,0)`, 1382
 value of result of inexact integer to floating-point conversion, 98
 value representation of pointer types, 77
 values of a trivially copyable type, 72
 values of various `ATOMIC_..._LOCK_FREE` macros, 1786
 whether `<cfenv>` functions can be used to manage floating-point status, 1376
 whether a given `atomic` type's operations are always lock free, 1793, 1795, 1798, 1800, 1801, 1804, 1806
 whether a given `atomic_ref` type's operations are always lock free, 1787, 1790–1792
 whether `basic_spanbuf`'s move source is empty after a move, 1659
 whether functions from Annex K of the C standard library are declared when C++ headers are included, 469
 whether locale object is global or per-thread, 1551
 whether pragma `FENV_ACCESS` is supported, 1376
 whether `rand` may introduce a data race, 1425
 whether sequence pointers are copied by `basic_filebuf` move constructor, 1666
 whether sequence pointers are copied by `basic_stringbuf` move constructor, 1646
 whether sequence pointers are initialized to null pointers, 1645
 whether source file inclusion of importable header is replaced with `import` directive, 447
 whether source of translation units must be available to locate template definitions, 14
 whether stack is unwound before invoking the function `std::terminate` when a `noexcept` specification is violated, 441
 whether the implementation is hosted or freestanding, 470
 whether the lifetime of a parameter ends when the callee returns or at the end of the enclosing full-expression, 119

- whether the sources for module units and header units on which the current translation unit has an interface dependency are required to be available during translation, [14](#)
- whether the thread that executes `main` and the threads created by `std::thread` or `std::jthread` provide concurrent forward progress guarantees, [86](#)
- whether `time_get::do_get_year` accepts two-digit year numbers, [1578](#)
- whether values are rounded or truncated to the required precision when converting between `time_t` values and `time_point` objects, [1484](#)
- which functions in the C++ standard library may be recursively reentered, [487](#)
- which non-standard-layout objects containing no data are considered empty, [60](#)
- which scalar types have unique object representations, [646](#)
- width of integral type, [74](#)
