<code>template<class T, class U> struct is_assignable;</code>	The expression <code>declval<T>() =</code> <code>declval<U>()</code> is well-formed when treated as an unevaluated operand (7.2.3). Access checking is performed as if in a context unrelated to T and U. Only the validity of the immediate context of the assignment expression is considered. NOTE 3: The compilation of the expression can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the “immediate context” and can result in the program being ill-formed.	T and U shall be complete types, <i>cv void</i> , or arrays of unknown bound.
<code>template<class T> struct is_copyAssignable;</code>	For a referenceable type T, the same result as <code>is_assignable_v<T&,</code> <code>const T&></code> , otherwise <code>false</code> .	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.
<code>template<class T> struct is_moveAssignable;</code>	For a referenceable type T, the same result as <code>is_assignable_v<T&,</code> <code>T&&></code> , otherwise <code>false</code> .	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.

Table 47: Type property predicates (continued)

Template	Condition	Preconditions
<code>template<class T, class U> struct is_swappable_with;</code>	The expressions <code>swap(declval<T>(), declval<U>())</code> and <code>swap(declval<U>(), declval<T>())</code> are each well-formed when treated as an unevaluated operand (7.2.3) in an overload-resolution context for swappable values (16.4.4.3). Access checking is performed as if in a context unrelated to T and U. Only the validity of the immediate context of the <code>swap</code> expressions is considered. NOTE 4: The compilation of the expressions can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the “immediate context” and can result in the program being ill-formed.	T and U shall be complete types, <i>cv void</i> , or arrays of unknown bound.
<code>template<class T> struct is_swappable;</code>	For a referenceable type T, the same result as <code>is_swappable_with_v<T&, T&></code> , otherwise <code>false</code> .	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.
<code>template<class T> struct is_destructible;</code>	Either T is a reference type, or T is a complete object type for which the expression <code>declval<U&>().~U()</code> is well-formed when treated as an unevaluated operand (7.2.3), where U is <code>remove_all_extents_t<T></code> .	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.
<code>template<class T, class... Args> struct is_trivially_constructible;</code>	<code>is_constructible_v<T, Args...></code> is <code>true</code> and the variable definition for <code>is_constructible</code> , as defined below, is known to call no operation that is not trivial (6.8.1, 11.4.4).	T and all types in the template parameter pack <code>Args</code> shall be complete types, <i>cv void</i> , or arrays of unknown bound.
<code>template<class T> struct is_trivially_default_constructible;</code>	<code>is_trivially_constructible_v<T></code> is <code>true</code> .	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.

Table 47: Type property predicates (continued)

Template	Condition	Preconditions
<code>template<class T> struct is_trivially_copy_constructible;</code>	For a referenceable type T, the same result as <code>is_trivially_copy_constructible_v<T, const T&></code> , otherwise <code>false</code> .	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.
<code>template<class T> struct is_trivially_move_constructible;</code>	For a referenceable type T, the same result as <code>is_trivially_move_constructible_v<T, T&&></code> , otherwise <code>false</code> .	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.
<code>template<class T, class U> struct is_triviallyAssignable;</code>	<code>is_assignable_v<T, U></code> is true and the assignment, as defined by <code>is_assignable</code> , is known to call no operation that is not trivial (6.8.1, 11.4.4).	T and U shall be complete types, <i>cv void</i> , or arrays of unknown bound.
<code>template<class T> struct is_trivially_copyAssignable;</code>	For a referenceable type T, the same result as <code>is_trivially_copyAssignable_v<T&, const T&></code> , otherwise <code>false</code> .	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.
<code>template<class T> struct is_trivially_moveAssignable;</code>	For a referenceable type T, the same result as <code>is_trivially_moveAssignable_v<T&, T&&></code> , otherwise <code>false</code> .	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.
<code>template<class T> struct is_trivially_destructible;</code>	<code>is_destructible_v<T></code> is true and <code>remove_all_extents_t<T></code> is either a non-class type or a class type with a trivial destructor.	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.
<code>template<class T, class... Args> struct is_nothrow_constructible;</code>	<code>is_constructible_v<T, Args...></code> is true and the variable definition for <code>is_constructible</code> , as defined below, is known not to throw any exceptions (7.6.2.7).	T and all types in the template parameter pack <code>Args</code> shall be complete types, <i>cv void</i> , or arrays of unknown bound.
<code>template<class T> struct is_nothrow_defaultConstructible;</code>	<code>is_nothrow_constructible_v<T></code> is true.	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.
<code>template<class T> struct is_nothrow_copyConstructible;</code>	For a referenceable type T, the same result as <code>is_nothrow_copyConstructible_v<T, const T&></code> , otherwise <code>false</code> .	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.
<code>template<class T> struct is_nothrowMoveConstructible;</code>	For a referenceable type T, the same result as <code>is_nothrowMoveConstructible_v<T, T&&></code> , otherwise <code>false</code> .	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.

Table 47: Type property predicates (continued)

Template	Condition	Preconditions
<code>template<class T, class U> struct is_nothrow_assignable;</code>	<code>is assignable_v<T, U></code> is true and the assignment is known not to throw any exceptions (7.6.2.7).	T and U shall be complete types, <i>cv void</i> , or arrays of unknown bound.
<code>template<class T> struct is_nothrow_copy_assignable;</code>	For a referenceable type T, the same result as <code>is_nothrow_assignable_v<T&, const T&></code> , otherwise <code>false</code> .	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.
<code>template<class T> struct is_nothrow_move_assignable;</code>	For a referenceable type T, the same result as <code>is_nothrow_assignable_v<T&, T&&></code> , otherwise <code>false</code> .	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.
<code>template<class T, class U> struct is_nothrow_swappable_with;</code>	<code>is_swappable_with_v<T, U></code> is true and each swap expression of the definition of <code>is_swappable_with<T, U></code> is known not to throw any exceptions (7.6.2.7).	T and U shall be complete types, <i>cv void</i> , or arrays of unknown bound.
<code>template<class T> struct is_nothrow_swappable;</code>	For a referenceable type T, the same result as <code>is_nothrow_swappable_with_v<T&, T&></code> , otherwise <code>false</code> .	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.
<code>template<class T> struct is_nothrow_destructible;</code>	<code>is_destructible_v<T></code> is true and the indicated destructor is known not to throw any exceptions (7.6.2.7).	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.
<code>template<class T> struct is_implicit_lifetime;</code>	T is an implicit-lifetime type (6.8.1).	T shall be an array type, a complete type, or <i>cv void</i> .
<code>template<class T> struct has_virtual_destructor;</code>	T has a virtual destructor (11.4.7)	If T is a non-union class type, T shall be a complete type.
<code>template<class T> struct has_unique_object_representations;</code>	For an array type T, the same result as <code>has_unique_object_representations_v<remove_all_extents_t<T>></code> , otherwise see below.	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.

Table 47: Type property predicates (continued)

Template	Condition	Preconditions
<code>template<class T, class U> struct reference_constructs_from_- temporary;</code>	T is a reference type, and the initialization T <code>t(VAL<U>);</code> is well-formed and binds t to a temporary object whose lifetime is extended (6.7.7). Access checking is performed as if in a context unrelated to T and U. Only the validity of the immediate context of the variable initialization is considered. NOTE 5: The initialization can result in effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such effects are not in the “immediate context” and can result in the program being ill-formed.	T and U shall be complete types, <i>cv void</i> , or arrays of unknown bound.
<code>template<class T, class U> struct reference Converts_from_temporary;</code>	T is a reference type, and the initialization T <code>t =</code> <code>VAL<U>;</code> is well-formed and binds t to a temporary object whose lifetime is extended (6.7.7). Access checking is performed as if in a context unrelated to T and U. Only the validity of the immediate context of the variable initialization is considered. NOTE 6: The initialization can result in effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such effects are not in the “immediate context” and can result in the program being ill-formed.	T and U shall be complete types, <i>cv void</i> , or arrays of unknown bound.

⁶ EXAMPLE 1:

```

is_const_v<const volatile int>           // true
is_const_v<const int*>                  // false
is_const_v<const int&>                  // false
is_const_v<int[3]>                      // false
is_const_v<const int[3]>                 // true

```

7 EXAMPLE 2:

```
remove_const_t<const volatile int> // volatile int
remove_const_t<const int* const> // const int*
remove_const_t<const int&> // const int&
remove_const_t<const int[3]> // int[3]
```

8 EXAMPLE 3:

```
// Given:
struct P final { };
union U1 { };
union U2 final { };

// the following assertions hold:
static_assert(!is_final_v<int>);
static_assert(is_final_v<P>);
static_assert(!is_final_v<U1>);
static_assert(is_final_v<U2>);
```

9 The predicate condition for a template specialization `is_constructible<T, Args...>` shall be satisfied if and only if the following variable definition would be well-formed for some invented variable `t`:

```
T t(declval<Args>()...);
```

NOTE 7: These tokens are never interpreted as a function declaration.

Access checking is performed as if in a context unrelated to `T` and any of the `Args`. Only the validity of the immediate context of the variable initialization is considered.

NOTE 8: The evaluation of the initialization can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the “immediate context” and can result in the program being ill-formed.

10 The predicate condition for a template specialization `has_unique_object_representations<T>` shall be satisfied if and only if:

- (10.1) — `T` is trivially copyable, and
- (10.2) — any two objects of type `T` with the same value have the same object representation, where two objects of array or non-union class type are considered to have the same value if their respective sequences of direct subobjects have the same values, and two objects of union type are considered to have the same value if they have the same active member and the corresponding members have the same value.

The set of scalar types for which this condition holds is implementation-defined.

NOTE 9: If a type has padding bits, the condition does not hold; otherwise, the condition holds true for integral types.

21.3.6 Type property queries

[meta.unary.prop.query]

¹ This subclause contains templates that may be used to query properties of types at compile time.

Table 48: Type property queries [tab:meta.unary.prop.query]

Template	Value
<code>template<class T></code> <code>struct alignment_of;</code>	<code>alignof(T).</code> <i>Mandates:</i> <code>alignof(T)</code> is a valid expression (7.6.2.6)
<code>template<class T></code> <code>struct rank;</code>	If <code>T</code> is an array type, an integer value representing the number of dimensions of <code>T</code> ; otherwise, 0.
<code>template<class T,</code> <code>unsigned I = 0></code> <code>struct extent;</code>	If <code>T</code> is not an array type, or if it has rank less than or equal to <code>I</code> , or if <code>I</code> is 0 and <code>T</code> has type “array of unknown bound of <code>U</code> ”, then 0; otherwise, the bound (9.3.4.5) of the <code>I</code> th dimension of <code>T</code> , where indexing of <code>I</code> is zero-based

² Each of these templates shall be a *Cpp17UnaryTypeTrait* (21.3.2) with a base characteristic of `integral_constant<size_t, Value>`.

³ EXAMPLE 1:

```
// the following assertions hold:
assert(rank_v<int> == 0);
```

```
assert(rank_v<int[2]> == 1);
assert(rank_v<int[] [4]> == 2);
```

⁴ EXAMPLE 2:

```
// the following assertions hold:
assert(extent_v<int> == 0);
assert(extent_v<int[2]> == 2);
assert(extent_v<int[2] [4]> == 2);
assert(extent_v<int[] [4]> == 0);
assert((extent_v<int, 1>) == 0);
assert((extent_v<int[2], 1>) == 0);
assert((extent_v<int[2] [4], 1>) == 4);
assert((extent_v<int[] [4], 1>) == 4);
```

21.3.7 Relationships between types

[meta.rel]

- ¹ This subclause contains templates that may be used to query relationships between types at compile time.
- ² Each of these templates shall be a *Cpp17BinaryTypeTrait* (21.3.2) with a base characteristic of `true_type` if the corresponding condition is true, otherwise `false_type`.

Table 49: Type relationship predicates [tab:meta.rel]

Template	Condition	Comments
<code>template<class T, class U></code> <code>struct is_same;</code>	T and U name the same type with the same cv-qualifications	
<code>template<class Base, class Derived></code> <code>struct is_base_of;</code>	Base is a base class of Derived (11.7) without regard to cv-qualifiers or Base and Derived are not unions and name the same class type without regard to cv-qualifiers	If Base and Derived are non-union class types and are not (possibly cv-qualified versions of) the same type, Derived shall be a complete type. NOTE 1: Base classes that are private, protected, or ambiguous are, nonetheless, base classes.
<code>template<class From, class To></code> <code>struct is_convertible;</code>	<i>see below</i>	From and To shall be complete types, cv void, or arrays of unknown bound.
<code>template<class From, class To></code> <code>struct is_nothrow_convertible;</code>	is_convertible_v<From, To> is true and the conversion, as defined by is_convertible, is known not to throw any exceptions (7.6.2.7)	From and To shall be complete types, cv void, or arrays of unknown bound.
<code>template<class T, class U></code> <code>struct is_layout_compatible;</code>	T and U are layout-compatible (6.8.1)	T and U shall be complete types, cv void, or arrays of unknown bound.
<code>template<class Base, class Derived></code> <code>struct is_pointer_</code> <code>interconvertible_base_of;</code>	Derived is unambiguously derived from Base without regard to cv-qualifiers, and each object of type Derived is pointer-interconvertible (6.8.4) with its Base subobject, or Base and Derived are not unions and name the same class type without regard to cv-qualifiers.	If Base and Derived are non-union class types and are not (possibly cv-qualified versions of) the same type, Derived shall be a complete type.

Table 49: Type relationship predicates (continued)

Template	Condition	Comments
<code>template<class Fn, class... ArgTypes> struct is_invocable;</code>	The expression <code>INVOKER(declval<Fn>(), declval<ArgTypes>()...)</code> (22.10.4) is well-formed when treated as an unevaluated operand (7.2.3)	<code>Fn</code> and all types in the template parameter pack <code>ArgTypes</code> shall be complete types, <i>cv void</i> , or arrays of unknown bound.
<code>template<class R, class Fn, class... ArgTypes> struct is_invocable_r;</code>	The expression <code>INVOKER(declval<Fn>(), declval<ArgTypes>()...)</code> is well-formed when treated as an unevaluated operand	<code>R</code> , <code>Fn</code> , and all types in the template parameter pack <code>ArgTypes</code> shall be complete types, <i>cv void</i> , or arrays of unknown bound.
<code>template<class Fn, class... ArgTypes> struct is_nothrow_invocable;</code>	<code>is_invocable_v<Fn, ArgTypes...></code> is true and the expression <code>INVOKER(declval<Fn>(), declval<ArgTypes>()...)</code> is known not to throw any exceptions (7.6.2.7)	<code>Fn</code> and all types in the template parameter pack <code>ArgTypes</code> shall be complete types, <i>cv void</i> , or arrays of unknown bound.
<code>template<class R, class Fn, class... ArgTypes> struct is_nothrow_invocable_r;</code>	<code>is_invocable_r_v<R, Fn, ArgTypes...></code> is true and the expression <code>INVOKER(declval<Fn>(), declval<ArgTypes>()...)</code> is known not to throw any exceptions (7.6.2.7)	<code>R</code> , <code>Fn</code> , and all types in the template parameter pack <code>ArgTypes</code> shall be complete types, <i>cv void</i> , or arrays of unknown bound.

³ For the purpose of defining the templates in this subclause, a function call expression `declval<T>()` for any type `T` is considered to be a trivial (6.8.1, 11.4.4) function call that is not an odr-use (6.3) of `declval` in the context of the corresponding definition notwithstanding the restrictions of 22.2.6.

⁴ EXAMPLE:

```
struct B {};
struct B1 : B {};
struct B2 : B {};
struct D : private B1, private B2 {};

is_base_of_v<B, D>           // true
is_base_of_v<const B, D>       // true
is_base_of_v<B, const D>       // true
is_base_of_v<B, const B>       // true
is_base_of_v<D, B>             // false
is_base_of_v<B&, D>           // false
is_base_of_v<B[3], D[3]>       // false
is_base_of_v<int, int>         // false
```

⁵ The predicate condition for a template specialization `is_convertible<From, To>` shall be satisfied if and only if the return expression in the following code would be well-formed, including any implicit conversions to the return type of the function:

```
To test() {
    return declval<From>();
}
```

NOTE 2: This requirement gives well-defined results for reference types, array types, function types, and *cv void*.

Access checking is performed in a context unrelated to `To` and `From`. Only the validity of the immediate context of the *expression* of the `return` statement (8.7.4) (including initialization of the returned object or reference) is considered.

NOTE 3: The initialization can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the “immediate context” and can result in the program being ill-formed.

21.3.8 Transformations between types

[meta.trans]

21.3.8.1 General

[meta.trans.general]

- ¹ Subclause 21.3.8 contains templates that may be used to transform one type to another following some predefined rule.
- ² Each of the templates in 21.3.8 shall be a *Cpp17TransformationTrait* (21.3.2).

21.3.8.2 Const-volatile modifications

[meta.trans.cv]

Table 50: Const-volatile modifications [tab:meta.trans.cv]

Template	Comments
<code>template<class T> struct remove_const;</code>	The member typedef <code>type</code> denotes the type formed by removing any top-level const-qualifier from <code>T</code> . EXAMPLE 1: <code>remove_const_t<const volatile int></code> evaluates to <code>volatile int</code> , whereas <code>remove_const_t<const int*></code> evaluates to <code>const int*</code> .
<code>template<class T> struct remove_volatile;</code>	The member typedef <code>type</code> denotes the type formed by removing any top-level volatile-qualifier from <code>T</code> . EXAMPLE 2: <code>remove_volatile_t<const volatile int></code> evaluates to <code>const int</code> , whereas <code>remove_volatile_t<volatile int*></code> evaluates to <code>volatile int*</code> .
<code>template<class T> struct remove_cv;</code>	The member typedef <code>type</code> denotes the type formed by removing any top-level cv-qualifiers from <code>T</code> . EXAMPLE 3: <code>remove_cv_t<const volatile int></code> evaluates to <code>int</code> , whereas <code>remove_cv_t<const volatile int*></code> evaluates to <code>const volatile int*</code> .
<code>template<class T> struct add_const;</code>	If <code>T</code> is a reference, function, or top-level const-qualified type, then <code>type</code> denotes <code>T</code> , otherwise <code>T const</code> .
<code>template<class T> struct add_volatile;</code>	If <code>T</code> is a reference, function, or top-level volatile-qualified type, then <code>type</code> denotes <code>T</code> , otherwise <code>T volatile</code> .
<code>template<class T> struct add_cv;</code>	The member typedef <code>type</code> denotes <code>add_const_t<add_volatile_t<T>></code> .

21.3.8.3 Reference modifications

[meta.trans.ref]

Table 51: Reference modifications [tab:meta.trans.ref]

Template	Comments
<code>template<class T> struct remove_reference;</code>	If <code>T</code> has type “reference to <code>T1</code> ” then the member typedef <code>type</code> denotes <code>T1</code> ; otherwise, <code>type</code> denotes <code>T</code> .
<code>template<class T> struct add_lvalue_reference;</code>	If <code>T</code> is a referenceable type (3.45) then the member typedef <code>type</code> denotes <code>T&</code> ; otherwise, <code>type</code> denotes <code>T</code> . NOTE 1: This rule reflects the semantics of reference collapsing (9.3.4.3).
<code>template<class T> struct add_rvalue_reference;</code>	If <code>T</code> is a referenceable type then the member typedef <code>type</code> denotes <code>T&&</code> ; otherwise, <code>type</code> denotes <code>T</code> . NOTE 2: This rule reflects the semantics of reference collapsing (9.3.4.3). For example, when a type <code>T</code> is a reference type <code>T1&</code> , the type <code>add_rvalue_reference_t<T></code> is not an rvalue reference.

21.3.8.4 Sign modifications

[meta.trans.sign]

Table 52: Sign modifications [tab:meta.trans.sign]

Template	Comments
<code>template<class T> struct make_signed;</code>	If T is a (possibly cv-qualified) signed integer type (6.8.2) then the member typedef <code>type</code> denotes T; otherwise, if T is a (possibly cv-qualified) unsigned integer type then <code>type</code> denotes the corresponding signed integer type, with the same cv-qualifiers as T; otherwise, <code>type</code> denotes the signed integer type with smallest rank (6.8.6) for which <code>sizeof(T) == sizeof(type)</code> , with the same cv-qualifiers as T. <i>Mandates:</i> T is an integral or enumeration type other than <code>cv bool</code> .
<code>template<class T> struct make_unsigned;</code>	If T is a (possibly cv-qualified) unsigned integer type (6.8.2) then the member typedef <code>type</code> denotes T; otherwise, if T is a (possibly cv-qualified) signed integer type then <code>type</code> denotes the corresponding unsigned integer type, with the same cv-qualifiers as T; otherwise, <code>type</code> denotes the unsigned integer type with smallest rank (6.8.6) for which <code>sizeof(T) == sizeof(type)</code> , with the same cv-qualifiers as T. <i>Mandates:</i> T is an integral or enumeration type other than <code>cv bool</code> .

21.3.8.5 Array modifications

[meta.trans.arr]

Table 53: Array modifications [tab:meta.trans.arr]

Template	Comments
<code>template<class T> struct remove_extent;</code>	If T is a type “array of U”, the member typedef <code>type</code> denotes U, otherwise T. NOTE: For multidimensional arrays, only the first array dimension is removed. For a type “array of <code>const U</code> ”, the resulting type is <code>const U</code> .
<code>template<class T> struct remove_all_extents;</code>	If T is “multidimensional array of U”, the resulting member typedef <code>type</code> denotes U, otherwise T.

¹ EXAMPLE 1:

```
// the following assertions hold:  
assert((is_same_v<remove_extent_t<int>, int>));  
assert((is_same_v<remove_extent_t<int[2]>, int>));  
assert((is_same_v<remove_extent_t<int[2][3]>, int[3]>));  
assert((is_same_v<remove_extent_t<int[]>, int[3]>));
```

² EXAMPLE 2:

```
// the following assertions hold:  
assert((is_same_v<remove_all_extents_t<int>, int>));  
assert((is_same_v<remove_all_extents_t<int[2]>, int>));  
assert((is_same_v<remove_all_extents_t<int[2][3]>, int>));  
assert((is_same_v<remove_all_extents_t<int[]>, int>));
```

21.3.8.6 Pointer modifications

[meta.trans.ptr]

Table 54: Pointer modifications [tab:meta.trans.ptr]

Template	Comments
<code>template<class T> struct remove_pointer;</code>	If T has type “(possibly cv-qualified) pointer to T1” then the member typedef <code>type</code> denotes T1; otherwise, it denotes T.
<code>template<class T> struct add_pointer;</code>	If T is a referenceable type (3.45) or a <code>cv void</code> type then the member typedef <code>type</code> denotes <code>remove_reference_t<T>*</code> ; otherwise, <code>type</code> denotes T.

21.3.8.7 Other transformations

[meta.trans.other]

Table 55: Other transformations [tab:meta.trans.other]

Template	Comments
<code>template<class T> struct type_identity;</code>	The member <code>typedef type</code> denotes <code>T</code> .
<code>template<class T> struct remove_cvref;</code>	The member <code>typedef type</code> denotes <code>remove_cv_t<remove_reference_t<T>></code> .
<code>template<class T> struct decay;</code>	Let <code>U</code> be <code>remove_reference_t<T></code> . If <code>is_array_v<U></code> is <code>true</code> , the member <code>typedef type</code> denotes <code>remove_extent_t<U>*</code> . If <code>is_function_v<U></code> is <code>true</code> , the member <code>typedef type</code> denotes <code>add_pointer_t<U></code> . Otherwise the member <code>typedef type</code> denotes <code>remove_cv_t<U></code> . <i>NOTE 1:</i> This behavior is similar to the lvalue-to-rvalue (7.3.2), array-to-pointer (7.3.3), and function-to-pointer (7.3.4) conversions applied when an lvalue is used as an rvalue, but also strips cv-qualifiers from class types in order to more closely model by-value argument passing.
<code>template<bool B, class T = void> struct enable_if;</code>	If <code>B</code> is <code>true</code> , the member <code>typedef type</code> denotes <code>T</code> ; otherwise, there shall be no member <code>type</code> .
<code>template<bool B, class T, class F> struct conditional;</code>	If <code>B</code> is <code>true</code> , the member <code>typedef type</code> denotes <code>T</code> . If <code>B</code> is <code>false</code> , the member <code>typedef type</code> denotes <code>F</code> .
<code>template<class... T> struct common_type;</code>	Unless this trait is specialized (as specified in Note B, below), the member <code>type</code> is defined or omitted as specified in Note A, below. If it is omitted, there shall be no member <code>type</code> . Each type in the template parameter pack <code>T</code> shall be complete, <code>cv void</code> , or an array of unknown bound.
<code>template<class, class, template<class> class, template<class> class> struct basic_common_reference;</code>	Unless this trait is specialized (as specified in Note D, below), there shall be no member <code>type</code> .
<code>template<class... T> struct common_reference;</code>	The member <code>typedef-name type</code> is defined or omitted as specified in Note C, below. Each type in the parameter pack <code>T</code> shall be complete or <code>cv void</code> .
<code>template<class T> struct underlying_type;</code>	If <code>T</code> is an enumeration type, the member <code>typedef type</code> denotes the underlying type of <code>T</code> (9.7.1); otherwise, there is no member <code>type</code> . <i>Mandates:</i> <code>T</code> is not an incomplete enumeration type.
<code>template<class Fn, class... ArgTypes> struct invoke_result;</code>	If the expression <code>INVOKE(declval<Fn>(), declval<ArgTypes>()...)</code> (22.10.4) is well-formed when treated as an unevaluated operand (7.2.3), the member <code>typedef type</code> denotes the type <code>decltype(INVOKE(declval<Fn>(), declval<ArgTypes>()...))</code> ; otherwise, there shall be no member <code>type</code> . Access checking is performed as if in a context unrelated to <code>Fn</code> and <code>ArgTypes</code> . Only the validity of the immediate context of the expression is considered. <i>NOTE 2:</i> The compilation of the expression can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the “immediate context” and can result in the program being ill-formed. <i>Preconditions:</i> <code>Fn</code> and all types in the template parameter pack <code>ArgTypes</code> are complete types, <code>cv void</code> , or arrays of unknown bound.
<code>template<class T> struct unwrap_reference;</code>	If <code>T</code> is a specialization <code>reference_wrapper<X></code> for some type <code>X</code> , the member <code>typedef type</code> of <code>unwrap_reference<T></code> denotes <code>X&</code> , otherwise <code>type</code> denotes <code>T</code> .
<code>template<class T> unwrap_ref_decay;</code>	The member <code>typedef type</code> of <code>unwrap_ref_decay<T></code> denotes the type <code>unwrap_reference_t<decay_t<T>></code> .

¹ In addition to being available via inclusion of the `<type_traits>` header, the templates `unwrap_reference`, `unwrap_ref_decay`, `unwrap_reference_t`, and `unwrap_ref_decay_t` are available when the header `<functional>` (22.10.2) is included.

² Let:

- (2.1) — `CREF(A)` be `add_lvalue_reference_t<const remove_reference_t<A>>`,
- (2.2) — `XREF(A)` denote a unary alias template `T` such that `T<U>` denotes the same type as `U` with the addition of `A`'s cv and reference qualifiers, for a non-reference cv-unqualified type `U`,
- (2.3) — `COPYCV(FROM, TO)` be an alias for type `TO` with the addition of `FROM`'s top-level cv-qualifiers,
EXAMPLE 1: `COPYCV(const int, volatile short)` is an alias for `const volatile short`.
- (2.4) — `COND-RES(X, Y)` be `decltype(false ? declval<X(&)()>() : declval<Y(&)()>())`.

Given types `A` and `B`, let `X` be `remove_reference_t<A>`, let `Y` be `remove_reference_t`, and let `COMMON-REF(A, B)` be:

- (2.5) — If `A` and `B` are both lvalue reference types, `COMMON-REF(A, B)` is `COND-RES(COPYCV(X, Y) &, COPYCV(Y, X) &)` if that type exists and is a reference type.
- (2.6) — Otherwise, let `C` be `remove_reference_t<COMMON-REF(X&, Y&)>&&`. If `A` and `B` are both rvalue reference types, `C` is well-formed, and `is_convertible_v<A, C> && is_convertible_v<B, C>` is `true`, then `COMMON-REF(A, B)` is `C`.
- (2.7) — Otherwise, let `D` be `COMMON-REF(const X&, Y&)`. If `A` is an rvalue reference and `B` is an lvalue reference and `D` is well-formed and `is_convertible_v<A, D>` is `true`, then `COMMON-REF(A, B)` is `D`.
- (2.8) — Otherwise, if `A` is an lvalue reference and `B` is an rvalue reference, then `COMMON-REF(A, B)` is `COMMON-REF(B, A)`.
- (2.9) — Otherwise, `COMMON-REF(A, B)` is ill-formed.

If any of the types computed above is ill-formed, then `COMMON-REF(A, B)` is ill-formed.

³ Note A: For the `common_type` trait applied to a template parameter pack `T` of types, the member `type` shall be either defined or not present as follows:

- (3.1) — If `sizeof...(T)` is zero, there shall be no member `type`.
- (3.2) — If `sizeof...(T)` is one, let `T0` denote the sole type constituting the pack `T`. The member `typedef-name` `type` shall denote the same type, if any, as `common_type_t<T0, T0>`; otherwise there shall be no member `type`.
- (3.3) — If `sizeof...(T)` is two, let the first and second types constituting `T` be denoted by `T1` and `T2`, respectively, and let `D1` and `D2` denote the same types as `decay_t<T1>` and `decay_t<T2>`, respectively.
 - (3.3.1) — If `is_same_v<T1, D1>` is `false` or `is_same_v<T2, D2>` is `false`, let `C` denote the same type, if any, as `common_type_t<D1, D2>`.
 - (3.3.2) — NOTE 3: None of the following will apply if there is a specialization `common_type<D1, D2>`.
 - (3.3.3) — Otherwise, if

```
decay_t<decltype(false ? declval<D1>() : declval<D2>())>
```

 denotes a valid type, let `C` denote that type.

(3.3.4) — Otherwise, if `COND-RES(CREF(D1), CREF(D2))` denotes a type, let `C` denote the type `decay_t<COND-RES(CREF(D1), CREF(D2))>`.

In either case, the member `typedef-name` `type` shall denote the same type, if any, as `C`. Otherwise, there shall be no member `type`.

- (3.4) — If `sizeof...(T)` is greater than two, let `T1`, `T2`, and `R`, respectively, denote the first, second, and (pack of) remaining types constituting `T`. Let `C` denote the same type, if any, as `common_type_t<T1, T2>`. If there is such a type `C`, the member `typedef-name` `type` shall denote the same type, if any, as `common_type_t<C, R...>`. Otherwise, there shall be no member `type`.

- ⁴ Note B: Notwithstanding the provisions of 21.3.3, and pursuant to 16.4.5.2.1, a program may specialize `common_type<T1, T2>` for types `T1` and `T2` such that `is_same_v<T1, decay_t<T1>>` and `is_same_v<T2, decay_t<T2>>` are each `true`.

NOTE 4: Such specializations are needed when only explicit conversions are desired between the template arguments. Such a specialization need not have a member named `type`, but if it does, the *qualified-id* `common_type<T1, T2>::type` shall denote a cv-unqualified non-reference type to which each of the types `T1` and `T2` is explicitly convertible. Moreover, `common_type_t<T1, T2>` shall denote the same type, if any, as does `common_type_t<T2, T1>`. No diagnostic is required for a violation of this Note's rules.

- ⁵ Note C: For the `common_reference` trait applied to a parameter pack `T` of types, the member `type` shall be either defined or not present as follows:

- (5.1) — If `sizeof...(T)` is zero, there shall be no member `type`.
- (5.2) — Otherwise, if `sizeof...(T)` is one, let `T0` denote the sole type in the pack `T`. The member `typedef type` shall denote the same type as `T0`.
- (5.3) — Otherwise, if `sizeof...(T)` is two, let `T1` and `T2` denote the two types in the pack `T`. Then
 - (5.3.1) — Let `R` be `COMMON-REF(T1, T2)`. If `T1` and `T2` are reference types, `R` is well-formed, and `is_convertible_v<add_pointer_t<T1>, add_pointer_t<R>> && is_convertible_v<add_pointer_t<T2>, add_pointer_t<R>>` is `true`, then the member `typedef type` denotes `R`.
 - (5.3.2) — Otherwise, if `basic_common_reference<remove_cvref_t<T1>, remove_cvref_t<T2>, XREF(T1), XREF(T2)>::type` is well-formed, then the member `typedef type` denotes that type.
 - (5.3.3) — Otherwise, if `COND-RES(T1, T2)` is well-formed, then the member `typedef type` denotes that type.
 - (5.3.4) — Otherwise, if `common_type_t<T1, T2>` is well-formed, then the member `typedef type` denotes that type.
 - (5.3.5) — Otherwise, there shall be no member `type`.
- (5.4) — Otherwise, if `sizeof...(T)` is greater than two, let `T1`, `T2`, and `Rest`, respectively, denote the first, second, and (pack of) remaining types comprising `T`. Let `C` be the type `common_reference_t<T1, T2>`. Then:
 - (5.4.1) — If there is such a type `C`, the member `typedef type` shall denote the same type, if any, as `common_reference_t<C, Rest...>`.
 - (5.4.2) — Otherwise, there shall be no member `type`.

- ⁶ Note D: Notwithstanding the provisions of 21.3.3, and pursuant to 16.4.5.2.1, a program may partially specialize `basic_common_reference<T, U, TQual, UQual>` for types `T` and `U` such that `is_same_v<T, decay_t<T>>` and `is_same_v<U, decay_t<U>>` are each `true`.

NOTE 5: Such specializations can be used to influence the result of `common_reference`, and are needed when only explicit conversions are desired between the template arguments.

Such a specialization need not have a member named `type`, but if it does, the *qualified-id* `basic_common_reference<T, U, TQual, UQual>::type` shall denote a type to which each of the types `TQual<T>` and `UQual<U>` is convertible. Moreover, `basic_common_reference<T, U, TQual, UQual>::type` shall denote the same type, if any, as does `basic_common_reference<U, T, UQual, TQual>::type`. No diagnostic is required for a violation of these rules.

- ⁷ EXAMPLE 2: Given these definitions:

```
using PF1 = bool (&());
using PF2 = short (*)(long);

struct S {
    operator PF2() const;
    double operator()(char, int&);
    void fn(long) const;
    char data;
};

using PMF = void (S::*)(long) const;
using PMD = char S::*;

the following assertions will hold:
```

```
static_assert(is_same_v<invoke_result_t<S, int>, short>);
static_assert(is_same_v<invoke_result_t<S&, unsigned char, int&>, double>);
static_assert(is_same_v<invoke_result_t<PF1>, bool>);
static_assert(is_same_v<invoke_result_t<PMF, unique_ptr<S>, int>, void>);
static_assert(is_same_v<invoke_result_t<PMD, S>, char&&>);
static_assert(is_same_v<invoke_result_t<PMD, const S*>, const char&>);
```

21.3.9 Logical operator traits

[meta.logical]

- ¹ This subclause describes type traits for applying logical operators to other type traits.

```
template<class... B> struct conjunction : see below { };
```

- ² The class template `conjunction` forms the logical conjunction of its template type arguments.

- ³ For a specialization `conjunction<B1, ..., BN>`, if there is a template type argument B_i for which `bool(Bi::value)` is `false`, then instantiating `conjunction<B1, ..., BN>::value` does not require the instantiation of $B_j::value$ for $j > i$.

NOTE 1: This is analogous to the short-circuiting behavior of the built-in operator `&&`.

- ⁴ Every template type argument for which $B_i::value$ is instantiated shall be usable as a base class and shall have a member `value` which is convertible to `bool`, is not hidden, and is unambiguously available in the type.

⁵ The specialization `conjunction<B1, ..., BN>` has a public and unambiguous base that is either

- (5.1) — the first type B_i in the list `true_type`, B_1 , ..., B_N for which `bool(Bi::value)` is `false`, or
 (5.2) — if there is no such B_i , the last type in the list.

NOTE 2: This means a specialization of `conjunction` does not necessarily inherit from either `true_type` or `false_type`.

- ⁶ The member names of the base class, other than `conjunction` and `operator=`, shall not be hidden and shall be unambiguously available in `conjunction`.

```
template<class... B> struct disjunction : see below { };
```

- ⁷ The class template `disjunction` forms the logical disjunction of its template type arguments.

- ⁸ For a specialization `disjunction<B1, ..., BN>`, if there is a template type argument B_i for which `bool(Bi::value)` is `true`, then instantiating `disjunction<B1, ..., BN>::value` does not require the instantiation of $B_j::value$ for $j > i$.

NOTE 3: This is analogous to the short-circuiting behavior of the built-in operator `||`.

- ⁹ Every template type argument for which $B_i::value$ is instantiated shall be usable as a base class and shall have a member `value` which is convertible to `bool`, is not hidden, and is unambiguously available in the type.

¹⁰ The specialization `disjunction<B1, ..., BN>` has a public and unambiguous base that is either

- (10.1) — the first type B_i in the list `false_type`, B_1 , ..., B_N for which `bool(Bi::value)` is `true`, or
 (10.2) — if there is no such B_i , the last type in the list.

NOTE 4: This means a specialization of `disjunction` does not necessarily inherit from either `true_type` or `false_type`.

- ¹¹ The member names of the base class, other than `disjunction` and `operator=`, shall not be hidden and shall be unambiguously available in `disjunction`.

```
template<class B> struct negation : see below { };
```

- ¹² The class template `negation` forms the logical negation of its template type argument. The type `negation` is a *Cpp17UnaryTypeTrait* with a base characteristic of `bool_constant<!bool(B::value)>`.

21.3.10 Member relationships

[meta.member]

```
template<class S, class M>
constexpr bool is_pointer_interconvertible_with_class(M S::*m) noexcept;
```

- ¹ *Mandates:* S is a complete type.

- 2 >Returns: `true` if and only if `S` is a standard-layout type, `M` is an object type, `m` is not null, and each object `s` of type `S` is pointer-interconvertible (6.8.4) with its subobject `s.*m`.

```
template<class S1, class S2, class M1, class M2>
constexpr bool is_corresponding_member(M1 S1::*m1, M2 S2::*m2) noexcept;
```

- 3 >Mandates: `S1` and `S2` are complete types.

- 4 >Returns: `true` if and only if `S1` and `S2` are standard-layout struct (11.2) types, `M1` and `M2` are object types, `m1` and `m2` are not null, and `m1` and `m2` point to corresponding members of the common initial sequence (11.4) of `S1` and `S2`.

- 5 NOTE: The type of a pointer-to-member expression `&C::b` is not always a pointer to member of `C`, leading to potentially surprising results when using these functions in conjunction with inheritance.

EXAMPLE:

```
struct A { int a; }; // a standard-layout class
struct B { int b; }; // a standard-layout class
struct C: public A, public B { }; // not a standard-layout class

static_assert( is_pointer_interconvertible_with_class( &C::b ) );
// Succeeds because, despite its appearance, &C::b has type
// "pointer to member of B of type int".
static_assert( is_pointer_interconvertible_with_class<C>( &C::b ) );
// Forces the use of class C, and fails.

static_assert( is_corresponding_member( &C::a, &C::b ) );
// Succeeds because, despite its appearance, &C::a and &C::b have types
// "pointer to member of A of type int" and
// "pointer to member of B of type int", respectively.
static_assert( is_corresponding_member<C>( &C::a, &C::b ) );
// Forces the use of class C, and fails.
```

21.3.11 Constant evaluation context

[meta.const.eval]

```
constexpr bool is_constant_evaluated() noexcept;
```

- 1 >Effects: Equivalent to:

```
if consteval {
    return true;
} else {
    return false;
}
```

- 2 EXAMPLE:

```
constexpr void f(unsigned char *p, int n) {
    if (std::is_constant_evaluated()) { // should not be a constexpr if statement
        for (int k = 0; k < n; ++k) p[k] = 0;
    } else {
        memset(p, 0, n); // not a core constant expression
    }
}
```

21.4 Compile-time rational arithmetic

[ratio]

21.4.1 In general

[ratio.general]

- 1 Subclause 21.4 describes the ratio library. It provides a class template `ratio` which exactly represents any finite rational number with a numerator and denominator representable by compile-time constants of type `intmax_t`.
- 2 Throughout subclause 21.4, the names of template parameters are used to express type requirements. If a template parameter is named `R1` or `R2`, and the template argument is not a specialization of the `ratio` template, the program is ill-formed.

21.4.2 Header <ratio> synopsis

[ratio.syn]

```
// all freestanding
namespace std {
    // 21.4.3, class template ratio
    template<intmax_t N, intmax_t D = 1> class ratio;

    // 21.4.4, ratio arithmetic
    template<class R1, class R2> using ratio_add = see below;
    template<class R1, class R2> using ratio_subtract = see below;
    template<class R1, class R2> using ratio_multiply = see below;
    template<class R1, class R2> using ratio_divide = see below;

    // 21.4.5, ratio comparison
    template<class R1, class R2> struct ratio_equal;
    template<class R1, class R2> struct ratio_not_equal;
    template<class R1, class R2> struct ratio_less;
    template<class R1, class R2> struct ratio_less_equal;
    template<class R1, class R2> struct ratio_greater;
    template<class R1, class R2> struct ratio_greater_equal;

    template<class R1, class R2>
        constexpr bool ratio_equal_v = ratio_equal<R1, R2>::value;
    template<class R1, class R2>
        constexpr bool ratio_not_equal_v = ratio_not_equal<R1, R2>::value;
    template<class R1, class R2>
        constexpr bool ratio_less_v = ratio_less<R1, R2>::value;
    template<class R1, class R2>
        constexpr bool ratio_less_equal_v = ratio_less_equal<R1, R2>::value;
    template<class R1, class R2>
        constexpr bool ratio_greater_v = ratio_greater<R1, R2>::value;
    template<class R1, class R2>
        constexpr bool ratio_greater_equal_v = ratio_greater_equal<R1, R2>::value;

    // 21.4.6, convenience SI typedefs
    using yocto = ratio<1, 1'000'000'000'000'000'000'000>; // see below
    using zepto = ratio<1, 1'000'000'000'000'000'000'000>; // see below
    using atto = ratio<1, 1'000'000'000'000'000'000'000>;
    using femto = ratio<1, 1'000'000'000'000'000'000>;
    using pico = ratio<1, 1'000'000'000'000>;
    using nano = ratio<1, 1'000'000'000>;
    using micro = ratio<1, 1'000'000>;
    using milli = ratio<1, 1'000>;
    using centi = ratio<1, 100>;
    using deci = ratio<1, 10>;
    using deca = ratio<10, 1>;
    using hecto = ratio<100, 1>;
    using kilo = ratio<1'000, 1>;
    using mega = ratio<1'000'000, 1>;
    using giga = ratio<1'000'000'000, 1>;
    using tera = ratio<1'000'000'000'000, 1>;
    using peta = ratio<1'000'000'000'000'000, 1>;
    using exa = ratio<1'000'000'000'000'000'000, 1>;
    using zetta = ratio<1'000'000'000'000'000'000'000, 1>; // see below
    using yotta = ratio<1'000'000'000'000'000'000'000'000, 1>; // see below
}
```

21.4.3 Class template ratio

[ratio.ratio]

```
namespace std {
    template<intmax_t N, intmax_t D = 1> class ratio {
        public:
            static constexpr intmax_t num;
            static constexpr intmax_t den;
            using type = ratio<num, den>;
```

```
};  
}
```

- ¹ If the template argument D is zero or the absolute values of either of the template arguments N and D is not representable by type `intmax_t`, the program is ill-formed.

NOTE: These rules ensure that infinite ratios are avoided and that for any negative input, there exists a representable value of its absolute value which is positive. This excludes the most negative value.

- ² The static data members `num` and `den` shall have the following values, where `gcd` represents the greatest common divisor of the absolute values of N and D:

- (2.1) — `num` shall have the value $\text{sgn}(N) * \text{sgn}(D) * \text{abs}(N) / \text{gcd}$.
- (2.2) — `den` shall have the value $\text{abs}(D) / \text{gcd}$.

21.4.4 Arithmetic on ratios

[ratio.arithmetic]

- ¹ Each of the alias templates `ratio_add`, `ratio_subtract`, `ratio_multiply`, and `ratio_divide` denotes the result of an arithmetic computation on two ratios R1 and R2. With X and Y computed (in the absence of arithmetic overflow) as specified by Table 56, each alias denotes a `ratio<U, V>` such that U is the same as `ratio<X, Y>::num` and V is the same as `ratio<X, Y>::den`.
- ² If it is not possible to represent U or V with `intmax_t`, the program is ill-formed. Otherwise, an implementation should yield correct values of U and V. If it is not possible to represent X or Y with `intmax_t`, the program is ill-formed unless the implementation yields correct values of U and V.

Table 56: Expressions used to perform ratio arithmetic [tab:ratio.arithmetic]

Type	Value of X	Value of Y
<code>ratio_add<R1, R2></code>	$R1::\text{num} * R2::\text{den} + R1::\text{den} * R2::\text{den}$ $R2::\text{num} * R1::\text{den}$	
<code>ratio_subtract<R1, R2></code>	$R1::\text{num} * R2::\text{den} - R1::\text{den} * R2::\text{den}$ $R2::\text{num} * R1::\text{den}$	
<code>ratio_multiply<R1, R2></code>	$R1::\text{num} * R2::\text{num}$	$R1::\text{den} * R2::\text{den}$
<code>ratio_divide<R1, R2></code>	$R1::\text{num} * R2::\text{den}$	$R1::\text{den} * R2::\text{num}$

- ³ EXAMPLE:

```
static_assert(ratio_add<ratio<1, 3>, ratio<1, 6>>::num == 1, "1/3+1/6 == 1/2");  
static_assert(ratio_add<ratio<1, 3>, ratio<1, 6>>::den == 2, "1/3+1/6 == 1/2");  
static_assert(ratio_multiply<ratio<1, 3>, ratio<3, 2>>::num == 1, "1/3*3/2 == 1/2");  
static_assert(ratio_multiply<ratio<1, 3>, ratio<3, 2>>::den == 2, "1/3*3/2 == 1/2");  
  
// The following cases may cause the program to be ill-formed under some implementations  
static_assert(ratio_add<ratio<1, INT_MAX>, ratio<1, INT_MAX>>::num == 2,  
    "1/MAX+1/MAX == 2/MAX");  
static_assert(ratio_add<ratio<1, INT_MAX>, ratio<1, INT_MAX>>::den == INT_MAX,  
    "1/MAX+1/MAX == 2/MAX");  
static_assert(ratio_multiply<ratio<1, INT_MAX>, ratio<INT_MAX, 2>>::num == 1,  
    "1/MAX * MAX/2 == 1/2");  
static_assert(ratio_multiply<ratio<1, INT_MAX>, ratio<INT_MAX, 2>>::den == 2,  
    "1/MAX * MAX/2 == 1/2");
```

21.4.5 Comparison of ratios

[ratio.comparison]

```
template<class R1, class R2>  
struct ratio_equal : bool_constant<R1::num == R2::num && R1::den == R2::den> { };  
  
template<class R1, class R2>  
struct ratio_not_equal : bool_constant<!ratio_equal_v<R1, R2>> { };  
  
template<class R1, class R2>  
struct ratio_less : bool_constant<see below> { };
```

- ¹ If $R1::\text{num} * R2::\text{den}$ is less than $R2::\text{num} * R1::\text{den}$, `ratio_less<R1, R2>` shall be derived from `bool_constant<true>`; otherwise it shall be derived from `bool_constant<false>`. Implementations

may use other algorithms to compute this relationship to avoid overflow. If overflow occurs, the program is ill-formed.

```
template<class R1, class R2>
struct ratio_less_equal : bool_constant<!ratio_less_v<R2, R1>> { };

template<class R1, class R2>
struct ratio_greater : bool_constant<ratio_less_v<R2, R1>> { };

template<class R1, class R2>
struct ratio_greater_equal : bool_constant<!ratio_less_v<R1, R2>> { };
```

21.4.6 SI types for ratio

[ratio.si]

- ¹ For each of the *typedef-names* `yocto`, `zepto`, `zetta`, and `yotta`, if both of the constants used in its specification are representable by `intmax_t`, the *typedef* is defined; if either of the constants is not representable by `intmax_t`, the *typedef* is not defined.

22 General utilities library [utilities]

22.1 General [utilities.general]

- ¹ This Clause describes utilities that are generally useful in C++ programs; some of these utilities are used by other elements of the C++ standard library. These utilities are summarized in [Table 57](#).

Table 57: General utilities library summary [tab:utilities.summary]

Subclause	Header
22.2 Utility components	<utility>
22.3 Pairs	
22.4 Tuples	<tuple>
22.5 Optional objects	<optional>
22.6 Variants	<variant>
22.7 Storage for any type	<any>
22.8 Expected objects	<expected>
22.9 Fixed-size sequences of bits	<bitset>
22.10 Function objects	<functional>
22.11 Type indexes	<typeindex>
22.12 Execution policies	<execution>
22.13 Primitive numeric conversions	<charconv>
22.14 Formatting	<format>
22.15 Bit manipulation	<bit>

22.2 Utility components [utility]

22.2.1 Header <utility> synopsis [utility.syn]

- ¹ The header <utility> contains some basic function and class templates that are used throughout the rest of the library.

```
// all freestanding
#include <compare>           // see 17.11.1
#include <initializer_list>    // see 17.10.2

namespace std {
    // 22.2.2, swap
    template<class T>
        constexpr void swap(T& a, T& b) noexcept(see below);
    template<class T, size_t N>
        constexpr void swap(T (&a)[N], T (&b)[N]) noexcept(is_nothrow_swappable_v<T>);

    // 22.2.3, exchange
    template<class T, class U = T>
        constexpr T exchange(T& obj, U&& new_val) noexcept(see below);

    // 22.2.4, forward/move
    template<class T>
        constexpr T&& forward(remove_reference_t<T>& t) noexcept;
    template<class T>
        constexpr T&& forward(remove_reference_t<T>&& t) noexcept;
    template<class T, class U>
        [[nodiscard]] constexpr auto forward_like(U&& x) noexcept -> see below;
    template<class T>
        constexpr remove_reference_t<T>&& move(T&&) noexcept;
```

```

template<class T>
constexpr conditional_t<
    !is_nothrow_move_constructible_v<T> && is_copy_constructible_v<T>, const T&, T&>
move_if_noexcept(T& x) noexcept;

// 22.2.5, as_const
template<class T>
constexpr add_const_t<T>& as_const(T& t) noexcept;
template<class T>
void as_const(const T&&) = delete;

// 22.2.6, declval
template<class T>
add_rvalue_reference_t<T> declval() noexcept; // as unevaluated operand

// 22.2.7, integer comparison functions

template<class T1, class T2>
constexpr T1&& get(pair<T1, T2>&& p) noexcept;
template<class T1, class T2>
constexpr const T1&& get(const pair<T1, T2>&& p) noexcept;
template<class T2, class T1>
constexpr T2& get(pair<T1, T2>& p) noexcept;
template<class T2, class T1>
constexpr const T2& get(const pair<T1, T2>& p) noexcept;
template<class T2, class T1>
constexpr T2&& get(pair<T1, T2>&& p) noexcept;
template<class T2, class T1>
constexpr const T2&& get(const pair<T1, T2>&& p) noexcept;

// 22.3.5, pair piecewise construction
struct piecewise_construct_t {
    explicit piecewise_construct_t() = default;
};

```

```

inline constexpr piecewise_construct_t piecewise_construct{};
template<class... Types> class tuple; // defined in <tuple> (22.4.2)

// in-place construction
struct in_place_t {
    explicit in_place_t() = default;
};
inline constexpr in_place_t in_place{};

template<class T>
struct in_place_type_t {
    explicit in_place_type_t() = default;
};
template<class T> constexpr in_place_type_t<T> in_place_type{};

template<size_t I>
struct in_place_index_t {
    explicit in_place_index_t() = default;
};
template<size_t I> constexpr in_place_index_t<I> in_place_index{};

}

```

22.2.2 swap

[utility.swap]

```
template<class T>
constexpr void swap(T& a, T& b) noexcept(see below);
```

1 Constraints: `is_move_constructible_v<T>` is true and `is_move_assignable_v<T>` is true.

2 Preconditions: Type `T` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

3 Effects: Exchanges values stored in two locations.

4 Remarks: The exception specification is equivalent to:

```
is_nothrow_move_constructible_v<T> && is_nothrow_move_assignable_v<T>
```

```
template<class T, size_t N>
constexpr void swap(T (&a)[N], T (&b)[N]) noexcept(is_nothrow_swappable_v<T>);
```

5 Constraints: `is_swappable_v<T>` is true.

6 Preconditions: `a[i]` is swappable with (16.4.4.3) `b[i]` for all `i` in the range `[0, N)`.

7 Effects: As if by `swap_ranges(a, a + N, b)`.

22.2.3 exchange

[utility.exchange]

```
template<class T, class U = T>
constexpr T exchange(T& obj, U&& new_val) noexcept(see below);
```

1 Effects: Equivalent to:

```
T old_val = std::move(obj);
obj = std::forward<U>(new_val);
return old_val;
```

2 Remarks: The exception specification is equivalent to:

```
is_nothrow_move_constructible_v<T> && is_nothrow_assignable_v<T&, U>
```

22.2.4 Forward/move helpers

[forward]

1 The library provides templated helper functions to simplify applying move semantics to an lvalue and to simplify the implementation of forwarding functions. All functions specified in this subclause are signal-safe (17.13.5).

```
template<class T> constexpr T&& forward(remove_reference_t<T>& t) noexcept;
template<class T> constexpr T&& forward(remove_reference_t<T>&& t) noexcept;
```

2 Mandates: For the second overload, `is_lvalue_reference_v<T>` is false.

3 >Returns: static_cast<T&&>(t).

4 EXAMPLE 1:

```
template<class T, class A1, class A2>
shared_ptr<T> factory(A1&& a1, A2&& a2) {
    return shared_ptr<T>(new T(std::forward<A1>(a1), std::forward<A2>(a2)));
}

struct A {
    A(int&, const double&);
};

void g() {
    shared_ptr<A> sp1 = factory<A>(2, 1.414); // error: 2 will not bind to int&
    int i = 2;
    shared_ptr<A> sp2 = factory<A>(i, 1.414); // OK
}
```

In the first call to `factory`, `A1` is deduced as `int`, so `2` is forwarded to `A`'s constructor as an rvalue. In the second call to `factory`, `A1` is deduced as `int&`, so `i` is forwarded to `A`'s constructor as an lvalue. In both cases, `A2` is deduced as `double`, so `1.414` is forwarded to `A`'s constructor as an rvalue.

```
template<class T, class U>
[[nodiscard]] constexpr auto forward_like(U&& x) noexcept -> see below;
```

5 >Mandates: `T` is a referenceable type ([3.45](#)).

(5.1) — Let `COPY_CONST(A, B)` be `const B` if `A` is a const type, otherwise `B`.

(5.2) — Let `OVERRIDE_REF(A, B)` be `remove_reference_t&&` if `A` is an rvalue reference type, otherwise `B&`.

(5.3) — Let `V` be

```
OVERRIDE_REF(T&&, COPY_CONST(remove_reference_t<T>, remove_reference_t<U>))
```

6 >Returns: static_cast<V>(x).

7 Remarks: The return type is `V`.

8 EXAMPLE 2:

```
struct accessor {
    vector<string>* container;
    decltype(auto) operator[](this auto&& self, size_t i) {
        return std::forward_like<decltype(self)>((*container)[i]);
    }
};
void g() {
    vector v{"a"s, "b"s};
    accessor a{&v};
    string& x = a[0]; // OK, binds to lvalue reference
    string&& y = std::move(a)[0]; // OK, is rvalue reference
    string const&& z = std::move(as_const(a))[1]; // OK, is const&&
    string& w = as_const(a)[1]; // error: will not bind to non-const
}
```

```
template<class T> constexpr remove_reference_t<T>&& move(T&& t) noexcept;
```

9 >Returns: static_cast<remove_reference_t<T>&&>(t).

10 EXAMPLE 3:

```
template<class T, class A1>
shared_ptr<T> factory(A1&& a1) {
    return shared_ptr<T>(new T(std::forward<A1>(a1)));
}

struct A {
    A();
    A(const A&); // copies from lvalues
}
```

```

    A(A&&);           // moves from rvalues
};

void g() {
    A a;
    shared_ptr<A> sp1 = factory<A>(a);           // "a" binds to A(const A&)
    shared_ptr<A> sp2 = factory<A>(std::move(a)); // "a" binds to A(A&&)
}

```

In the first call to `factory`, `A1` is deduced as `A&`, so `a` is forwarded as a non-const lvalue. This binds to the constructor `A(const A&)`, which copies the value from `a`. In the second call to `factory`, because of the call `std::move(a)`, `A1` is deduced as `A`, so `a` is forwarded as an rvalue. This binds to the constructor `A(A&&)`, which moves the value from `a`.

```

template<class T> constexpr conditional_t<
    !is_nothrow_move_constructible_v<T> && is_copy_constructible_v<T>, const T&, T&&>
move_if_noexcept(T& x) noexcept;
11   Returns: std::move(x).

```

22.2.5 Function template `as_const`

[utility.as.const]

```

template<class T> constexpr add_const_t<T>& as_const(T& t) noexcept;
1     Returns: t.

```

22.2.6 Function template `declval`

[declval]

- 1 The library provides the function template `declval` to simplify the definition of expressions which occur as unevaluated operands (7.2.3).

```

template<class T> add_rvalue_reference_t<T> declval() noexcept; // as unevaluated operand

```

- 2 *Mandates:* This function is not odr-used (6.3).

- 3 *Remarks:* The template parameter `T` of `declval` may be an incomplete type.

- 4 *EXAMPLE:*

```

template<class To, class From> decltype(static_cast<To>(declval<From>())) convert(From&&);

declares a function template convert which only participates in overload resolution if the type From can be explicitly converted to type To. For another example see class template common_type (21.3.8.7).

```

22.2.7 Integer comparison functions

[utility.intcmp]

```

template<class T, class U>
constexpr bool cmp_equal(T t, U u) noexcept;

```

- 1 *Mandates:* Both `T` and `U` are standard integer types or extended integer types (6.8.2).

- 2 *Effects:* Equivalent to:

```

using UT = make_unsigned_t<T>;
using UU = make_unsigned_t<U>;
if constexpr (is_signed_v<T> == is_signed_v<U>)
    return t == u;
else if constexpr (is_signed_v<T>)
    return t < 0 ? false : UT(t) == u;
else
    return u < 0 ? false : t == UU(u);

```

```

template<class T, class U>
constexpr bool cmp_not_equal(T t, U u) noexcept;

```

- 3 *Effects:* Equivalent to: `return !cmp_equal(t, u);`

```

template<class T, class U>
constexpr bool cmp_less(T t, U u) noexcept;

```

- 4 *Mandates:* Both `T` and `U` are standard integer types or extended integer types (6.8.2).

- 5 *Effects:* Equivalent to:

```

using UT = make_unsigned_t<T>;
using UU = make_unsigned_t<U>;
if constexpr (is_signed_v<T> == is_signed_v<U>)
    return t < u;
else if constexpr (is_signed_v<T>)
    return t < 0 ? true : UT(t) < u;
else
    return u < 0 ? false : t < UU(u);

template<class T, class U>
constexpr bool cmp_greater(T t, U u) noexcept;
6   Effects: Equivalent to: return cmp_less(u, t);

template<class T, class U>
constexpr bool cmp_less_equal(T t, U u) noexcept;
7   Effects: Equivalent to: return !cmp_greater(t, u);

template<class T, class U>
constexpr bool cmp_greater_equal(T t, U u) noexcept;
8   Effects: Equivalent to: return !cmp_less(t, u);

template<class R, class T>
constexpr bool in_range(T t) noexcept;
9   Mandates: Both T and R are standard integer types or extended integer types (6.8.2).
10  Effects: Equivalent to:
        return cmp_greater_equal(t, numeric_limits<R>::min()) &&
               cmp_less_equal(t, numeric_limits<R>::max());
11  NOTE: These function templates cannot be used to compare byte, char, char8_t, char16_t, char32_t, wchar_t, and
      bool.

```

22.2.8 Function template `to_underlying`

[utility.underlying]

```

template<class T>
constexpr underlying_type_t<T> to_underlying(T value) noexcept;
1   Returns: static_cast<underlying_type_t<T>>(value).

```

22.2.9 Function `unreachable`

[utility.unreachable]

```

[[noreturn]] void unreachable();
1   Preconditions: false is true.
NOTE: This precondition cannot be satisfied, thus the behavior of calling unreachable is undefined.
2   EXAMPLE:

```

```

int f(int x) {
    switch (x) {
    case 0:
    case 1:
        return x;
    default:
        std::unreachable();
    }
}
int a = f(1);           // OK, a has value 1
int b = f(3);           // undefined behavior

```

22.3 Pairs

[pairs]

22.3.1 In general

[pairs.general]

- The library provides a template for heterogeneous pairs of values. The library also provides a matching function template to simplify their construction and several templates that provide access to `pair` objects as if they were `tuple` objects (see 22.4.7 and 22.4.8).

[pairs.pair]

22.3.2 Class template pair

```

namespace std {
    template<class T1, class T2>
    struct pair {
        using first_type = T1;
        using second_type = T2;

        T1 first;
        T2 second;

        pair(const pair&) = default;
        pair(pair&&) = default;
        constexpr explicit(see below) pair();
        constexpr explicit(see below) pair(const T1& x, const T2& y);
        template<class U1 = T1, class U2 = T2>
            constexpr explicit(see below) pair(U1&& x, U2&& y);
        template<class U1, class U2>
            constexpr explicit(see below) pair(pair<U1, U2>& p);
        template<class U1, class U2>
            constexpr explicit(see below) pair(const pair<U1, U2>& p);
        template<class U1, class U2>
            constexpr explicit(see below) pair(pair<U1, U2>&& p);
        template<class U1, class U2>
            constexpr explicit(see below) pair(const pair<U1, U2>&& p);
        template<pair-like P>
            constexpr explicit(see below) pair(P&& p);
        template<class... Args1, class... Args2>
            constexpr pair(piecewise_construct_t,
                           tuple<Args1...> first_args, tuple<Args2...> second_args);

        constexpr pair& operator=(const pair& p);
        constexpr const pair& operator=(const pair& p) const;
        template<class U1, class U2>
            constexpr pair& operator=(const pair<U1, U2>& p);
        template<class U1, class U2>
            constexpr const pair& operator=(const pair<U1, U2>& p) const;
        constexpr pair& operator=(pair&& p) noexcept(see below);
        constexpr const pair& operator=(pair&& p) const;
        template<class U1, class U2>
            constexpr pair& operator=(pair<U1, U2>&& p);
        template<class U1, class U2>
            constexpr const pair& operator=(pair<U1, U2>&& p) const;
        template<pair-like P>
            constexpr pair& operator=(P&& p);
        template<pair-like P>
            constexpr const pair& operator=(P&& p) const;

        constexpr void swap(pair& p) noexcept(see below);
        constexpr void swap(const pair& p) const noexcept(see below);
    };
}

template<class T1, class T2>
pair(T1, T2) -> pair<T1, T2>;
}

```

- ¹ Constructors and member functions of `pair` do not throw exceptions unless one of the element-wise operations specified to be called for that operation throws an exception.
- ² The defaulted move and copy constructor, respectively, of `pair` is a `constexpr` function if and only if all required element-wise initializations for move and copy, respectively, would be `constexpr`-suitable (9.2.6).
- ³ If (`is_trivially_destructible_v<T1> && is_trivially_destructible_v<T2>`) is `true`, then the destructor of `pair` is trivial.

⁴ `pair<T, U>` is a structural type (13.2) if `T` and `U` are both structural types. Two values `p1` and `p2` of type `pair<T, U>` are template-argument-equivalent (13.6) if and only if `p1.first` and `p2.first` are template-argument-equivalent and `p1.second` and `p2.second` are template-argument-equivalent.

5 `constexpr explicit(see below) pair();`

5 *Constraints:*

- (5.1) — `is_default_constructible_v<T1>` is true and
- (5.2) — `is_default_constructible_v<T2>` is true.

6 *Effects:* Value-initializes `first` and `second`.

7 *Remarks:* The expression inside `explicit` evaluates to `true` if and only if either `T1` or `T2` is not implicitly default-constructible.

NOTE 1: This behavior can be implemented with a trait that checks whether a `const T1&` or a `const T2&` can be initialized with {}.

8 `constexpr explicit(see below) pair(const T1& x, const T2& y);`

8 *Constraints:*

- (8.1) — `is_copy_constructible_v<T1>` is true and
- (8.2) — `is_copy_constructible_v<T2>` is true.

9 *Effects:* Initializes `first` with `x` and `second` with `y`.

10 *Remarks:* The expression inside `explicit` is equivalent to:

`!is_convertible_v<const T1&, T1> || !is_convertible_v<const T2&, T2>`

11 `template<class U1 = T1, class U2 = T2> constexpr explicit(see below) pair(U1&& x, U2&& y);`

11 *Constraints:*

- (11.1) — `is_constructible_v<T1, U1>` is true and
- (11.2) — `is_constructible_v<T2, U2>` is true.

12 *Effects:* Initializes `first` with `std::forward<U1>(x)` and `second` with `std::forward<U2>(y)`.

13 *Remarks:* The expression inside `explicit` is equivalent to:

`!is_convertible_v<U1, T1> || !is_convertible_v<U2, T2>`

This constructor is defined as deleted if `reference_constructs_from_temporary_v<first_type, U1&&>` is true or `reference_constructs_from_temporary_v<second_type, U2&&>` is true.

`template<class U1, class U2> constexpr explicit(see below) pair(pair<U1, U2>& p);`
`template<class U1, class U2> constexpr explicit(see below) pair(const pair<U1, U2>& p);`
`template<class U1, class U2> constexpr explicit(see below) pair(pair<U1, U2>&& p);`
`template<class U1, class U2> constexpr explicit(see below) pair(const pair<U1, U2>&& p);`
`template<pair-like P> constexpr explicit(see below) pair(P&& p);`

14 Let `FWD(u)` be `static_cast<decltype(u)>(u)`.

15 *Constraints:*

- (15.1) — For the last overload, `remove_cvref_t<P>` is not a specialization of `ranges::subrange`,
- (15.2) — `is_constructible_v<T1, decltype(get<0>(FWD(p)))>` is true, and
- (15.3) — `is_constructible_v<T2, decltype(get<1>(FWD(p)))>` is true.

16 *Effects:* Initializes `first` with `get<0>(FWD(p))` and `second` with `get<1>(FWD(p))`.

17 *Remarks:* The expression inside `explicit` is equivalent to:

`!is_convertible_v<decltype(get<0>(FWD(p))), T1> ||`
`!is_convertible_v<decltype(get<1>(FWD(p))), T2>`

The constructor is defined as deleted if

`reference_constructs_from_temporary_v<first_type, decltype(get<0>(FWD(p)))> ||`

`reference_constructs_from_temporary_v<second_type, decltype(get<1>(FWD(p)))>`

is true.

```

template<class... Args1, class... Args2>
constexpr pair(piecewise_construct_t,
              tuple<Args1...> first_args, tuple<Args2...> second_args);

```

18 *Mandates:*

(18.1) — `is_constructible_v<T1, Args1...>` is true and

(18.2) — `is_constructible_v<T2, Args2...>` is true.

19 *Effects:* Initializes `first` with arguments of types `Args1...` obtained by forwarding the elements of `first_args` and initializes `second` with arguments of types `Args2...` obtained by forwarding the elements of `second_args`. (Here, forwarding an element `x` of type `U` within a `tuple` object means calling `std::forward<U>(x)`.) This form of construction, whereby constructor arguments for `first` and `second` are each provided in a separate `tuple` object, is called *piecewise construction*.

NOTE 2: If a data member of `pair` is of reference type and its initialization binds it to a temporary object, the program is ill-formed (11.9.3).

```

constexpr pair& operator=(const pair& p);

```

20 *Effects:* Assigns `p.first` to `first` and `p.second` to `second`.

21 *Returns:* `*this`.

22 *Remarks:* This operator is defined as deleted unless `is_copy_assignable_v<T1>` is true and `is_copy_assignable_v<T2>` is true.

```

constexpr const pair& operator=(const pair& p) const;

```

23 *Constraints:*

(23.1) — `is_copy_assignable_v<const T1>` is true and

(23.2) — `is_copy_assignable_v<const T2>` is true.

24 *Effects:* Assigns `p.first` to `first` and `p.second` to `second`.

25 *Returns:* `*this`.

```

template<class U1, class U2> constexpr pair& operator=(const pair<U1, U2>& p);

```

26 *Constraints:*

(26.1) — `is assignable_v<T1&, const U1&>` is true and

(26.2) — `is assignable_v<T2&, const U2&>` is true.

27 *Effects:* Assigns `p.first` to `first` and `p.second` to `second`.

28 *Returns:* `*this`.

```

template<class U1, class U2> constexpr const pair& operator=(const pair<U1, U2>& p) const;

```

29 *Constraints:*

(29.1) — `is assignable_v<const T1&, const U1&>` is true, and

(29.2) — `is assignable_v<const T2&, const U2&>` is true.

30 *Effects:* Assigns `p.first` to `first` and `p.second` to `second`.

31 *Returns:* `*this`.

```

constexpr pair& operator=(pair&& p) noexcept(see below);

```

32 *Constraints:*

(32.1) — `is move assignable_v<T1>` is true and

(32.2) — `is move assignable_v<T2>` is true.

33 *Effects:* Assigns to `first` with `std::forward<T1>(p.first)` and to `second` with `std::forward<T2>(p.second)`.

34 *Returns:* `*this`.

35 *Remarks:* The exception specification is equivalent to:

`is_nothrow_move assignable_v<T1> && is_nothrow_move assignable_v<T2>`

```

  constexpr const pair& operator=(pair&& p) const;
36   Constraints:
36.1) — is_assignable_v<const T1&, T1> is true and
36.2) — is_assignable_v<const T2&, T2> is true.
37   Effects: Assigns std::forward<T1>(p.first) to first and std::forward<T2>(p.second) to second.
38   Returns: *this.

  template<class U1, class U2> constexpr pair& operator=(pair<U1, U2>&& p);
39   Constraints:
39.1) — is_assignable_v<T1&, U1> is true and
39.2) — is_assignable_v<T2&, U2> is true.
40   Effects: Assigns to first with std::forward<U1>(p.first) and to second with
        std::forward<U2>(p.second).
41   Returns: *this.

  template<pair-like P> constexpr pair& operator=(P&& p);
42   Constraints:
42.1) — different-from<P, pair> (26.5.2) is true,
42.2) — remove_cvref_t<P> is not a specialization of ranges::subrange,
42.3) — is_assignable_v<T1&, decltype(get<0>(std::forward<P>(p)))> is true, and
42.4) — is_assignable_v<T2&, decltype(get<1>(std::forward<P>(p)))> is true.
43   Effects: Assigns get<0>(std::forward<P>(p)) to first and get<1>(std::forward<P>(p)) to second.
44   Returns: *this.

  template<pair-like P> constexpr const pair& operator=(P&& p) const;
45   Constraints:
45.1) — different-from<P, pair> (26.5.2) is true,
45.2) — remove_cvref_t<P> is not a specialization of ranges::subrange,
45.3) — is_assignable_v<const T1&, decltype(get<0>(std::forward<P>(p)))> is true, and
45.4) — is_assignable_v<const T2&, decltype(get<1>(std::forward<P>(p)))> is true.
46   Effects: Assigns get<0>(std::forward<P>(p)) to first and get<1>(std::forward<P>(p)) to second.
47   Returns: *this.

  template<class U1, class U2> constexpr const pair& operator=(pair<U1, U2>&& p) const;
48   Constraints:
48.1) — is_assignable_v<const T1&, U1> is true, and
48.2) — is_assignable_v<const T2&, U2> is true.
49   Effects: Assigns std::forward<U1>(p.first) to first and std::forward<U2>(p.second) to second.
50   Returns: *this.

  constexpr void swap(pair& p) noexcept(see below);
  constexpr void swap(const pair& p) const noexcept(see below);
51   Mandates:
51.1) — For the first overload, is_swappable_v<T1> is true and is_swappable_v<T2> is true.
51.2) — For the second overload, is_swappable_v<const T1> is true and is_swappable_v<const T2>
        is true.

```

52 *Preconditions:* `first` is swappable with (16.4.4.3) `p.first` and `second` is swappable with `p.second`.
 53 *Effects:* Swaps `first` with `p.first` and `second` with `p.second`.
 54 *Remarks:* The exception specification is equivalent to:
 (54.1) — `is_nothrow_swappable_v<T1> && is_nothrow_swappable_v<T2>` for the first overload, and
 (54.2) — `is_nothrow_swappable_v<const T1> && is_nothrow_swappable_v<const T2>` for the second
 overload.

22.3.3 Specialized algorithms

[pairs.spec]

```
template<class T1, class T2, class U1, class U2>
constexpr bool operator==(const pair<T1, T2>& x, const pair<U1, U2>& y);
```

1 *Preconditions:* Each of `decltype(x.first == y.first)` and `decltype(x.second == y.second)`
 models *boolean-testable*.
 2 *Returns:* `x.first == y.first && x.second == y.second`.

```
template<class T1, class T2, class U1, class U2>
constexpr common_comparison_category_t<synth-three-way-result<T1, U1>,
                                         synth-three-way-result<T2, U2>>
operator<=>(const pair<T1, T2>& x, const pair<U1, U2>& y);
```

3 *Effects:* Equivalent to:
`if (auto c = synth-three-way(x.first, y.first); c != 0) return c;`
`return synth-three-way(x.second, y.second);`

```
template<class T1, class T2>
constexpr void swap(pair<T1, T2>& x, pair<T1, T2>& y) noexcept(noexcept(x.swap(y)));
```

```
template<class T1, class T2>
constexpr void swap(const pair<T1, T2>& x, const pair<T1, T2>& y) noexcept(noexcept(x.swap(y)));
```

4 *Constraints:*

- (4.1) — For the first overload, `is_swappable_v<T1>` is true and `is_swappable_v<T2>` is true.
 (4.2) — For the second overload, `is_swappable_v<const T1>` is true and `is_swappable_v<const T2>` is true.

5 *Effects:* Equivalent to `x.swap(y)`.

```
template<class T1, class T2>
constexpr pair<unwrap_ref_decay_t<T1>, unwrap_ref_decay_t<T2>> make_pair(T1&& x, T2&& y);
```

6 *Returns:*
`pair<unwrap_ref_decay_t<T1>,`
`unwrap_ref_decay_t<T2>>(std::forward<T1>(x), std::forward<T2>(y))`

7 EXAMPLE: In place of:

```
return pair<int, double>(5, 3.1415926);       // explicit types
```

a C++ program may contain:

```
return make_pair(5, 3.1415926);                  // types are deduced
```

22.3.4 Tuple-like access to pair

[pair.astuple]

```
template<class T1, class T2>
struct tuple_size<pair<T1, T2>> : integral_constant<size_t, 2> { };
```

```
template<size_t I, class T1, class T2>
struct tuple_element<I, pair<T1, T2>> {
    using type = see below ;
};
```

1 *Mandates:* `I < 2`.

2 *Type:* The type `T1` if `I` is 0, otherwise the type `T2`.

```
template<size_t I, class T1, class T2>
    constexpr tuple_element_t<I, pair<T1, T2>>& get(pair<T1, T2>& p) noexcept;
template<size_t I, class T1, class T2>
    constexpr const tuple_element_t<I, pair<T1, T2>>& get(const pair<T1, T2>& p) noexcept;
template<size_t I, class T1, class T2>
    constexpr tuple_element_t<I, pair<T1, T2>>&& get(pair<T1, T2>&& p) noexcept;
template<size_t I, class T1, class T2>
    constexpr const tuple_element_t<I, pair<T1, T2>>&& get(const pair<T1, T2>&& p) noexcept;
```

3 *Mandates:* I < 2.

4 *Returns:*

(4.1) — If I is 0, returns a reference to p.first.

(4.2) — If I is 1, returns a reference to p.second.

```
template<class T1, class T2>
    constexpr T1& get(pair<T1, T2>& p) noexcept;
template<class T1, class T2>
    constexpr const T1& get(const pair<T1, T2>& p) noexcept;
template<class T1, class T2>
    constexpr T1&& get(pair<T1, T2>&& p) noexcept;
template<class T1, class T2>
    constexpr const T1&& get(const pair<T1, T2>&& p) noexcept;
```

5 *Mandates:* T1 and T2 are distinct types.

6 *Returns:* A reference to p.first.

```
template<class T2, class T1>
    constexpr T2& get(pair<T1, T2>& p) noexcept;
template<class T2, class T1>
    constexpr const T2& get(const pair<T1, T2>& p) noexcept;
template<class T2, class T1>
    constexpr T2&& get(pair<T1, T2>&& p) noexcept;
template<class T2, class T1>
    constexpr const T2&& get(const pair<T1, T2>&& p) noexcept;
```

7 *Mandates:* T1 and T2 are distinct types.

8 *Returns:* A reference to p.second.

22.3.5 Piecewise construction

[pair.piecewise]

```
struct piecewise_construct_t {
    explicit piecewise_construct_t() = default;
};

inline constexpr piecewise_construct_t piecewise_construct{};
```

¹ The struct `piecewise_construct_t` is an empty class type used as a unique type to disambiguate constructor and function overloading. Specifically, `pair` has a constructor with `piecewise_construct_t` as the first argument, immediately followed by two `tuple` (22.4) arguments used for piecewise construction of the elements of the `pair` object.

22.4 Tuples

[tuple]

22.4.1 In general

[tuple.general]

¹ Subclause 22.4 describes the tuple library that provides a tuple type as the class template `tuple` that can be instantiated with any number of arguments. Each template argument specifies the type of an element in the `tuple`. Consequently, tuples are heterogeneous, fixed-size collections of values. An instantiation of `tuple` with two arguments is similar to an instantiation of `pair` with the same two arguments. See 22.3.

22.4.2 Header <tuple> synopsis

[tuple.syn]

```
// all freestanding
#include <compare>           // see 17.11.1
```

```

namespace std {
    // 22.4.4, class template tuple
    template<class... Types>
        class tuple;

    // 22.4.3, concept tuple-like
    template<class T>
        concept tuple-like = see below;           // exposition only
    template<class T>
        concept pair-like =                      // exposition only
            tuple-like<T> && tuple_size_v<remove_cvref_t<T>> == 2;

    // 22.4.10, common_reference related specializations
    template<tuple-like TTuple, tuple-like UTuple,
              template<class> class TQual, template<class> class UQual>
        struct basic_common_reference<TTuple, UTuple, TQual, UQual>;
    template<tuple-like TTuple, tuple-like UTuple>
        struct common_type<TTuple, UTuple>;

    // 22.4.5, tuple creation functions
    inline constexpr unspecified ignore;

    template<class... TTypes>
        constexpr tuple<unwrap_ref_decay_t<TTypes>...> make_tuple(TTypes&&...);

    template<class... TTypes>
        constexpr tuple<TTypes&&...> forward_as_tuple(TTypes&&...) noexcept;

    template<class... TTypes>
        constexpr tuple<TTypes&&...> tie(TTypes&&...) noexcept;

    template<tuple-like... Tuples>
        constexpr tuple<CTypes...> tuple_cat(Tuples&&...);

    // 22.4.6, calling a function with a tuple of arguments
    template<class F, tuple-like Tuple>
        constexpr decltype(auto) apply(F&& f, Tuple&& t) noexcept(see below);

    template<class T, tuple-like Tuple>
        constexpr T make_from_tuple(Tuple&& t);

    // 22.4.7, tuple helper classes
    template<class T> struct tuple_size;                  // not defined
    template<class T> struct tuple_size<const T>; 

    template<class... Types> struct tuple_size<tuple<Types...>>; 

    template<size_t I, class T> struct tuple_element;      // not defined
    template<size_t I, class T> struct tuple_element<I, const T>; 

    template<size_t I, class... Types>
        struct tuple_element<I, tuple<Types...>>; 

    template<size_t I, class T>
        using tuple_element_t = typename tuple_element<I, T>::type;

    // 22.4.8, element access
    template<size_t I, class... Types>
        constexpr tuple_element_t<I, tuple<Types...>>& get(tuple<Types...>&) noexcept;
    template<size_t I, class... Types>
        constexpr tuple_element_t<I, tuple<Types...>>&& get(tuple<Types...>&&) noexcept;
    template<size_t I, class... Types>
        constexpr const tuple_element_t<I, tuple<Types...>>& get(const tuple<Types...>&) noexcept;
}

```

```

template<size_t I, class... Types>
    constexpr const tuple_element_t<I, tuple<Types...>>&& get(const tuple<Types...>&&) noexcept;
template<class T, class... Types>
    constexpr T& get(tuple<Types...>& t) noexcept;
template<class T, class... Types>
    constexpr T&& get(tuple<Types...>&& t) noexcept;
template<class T, class... Types>
    constexpr const T& get(const tuple<Types...>& t) noexcept;
template<class T, class... Types>
    constexpr const T&& get(const tuple<Types...>&& t) noexcept;

// 22.4.9, relational operators
template<class... TTypes, class... UTypes>
    constexpr bool operator==(const tuple<TTypes...>&, const tuple<UTypes...>&);
template<class... TTypes, tuple-like UTuple>
    constexpr bool operator==(const tuple<TTypes...>&, const UTuple&);
template<class... TTypes, class... UTypes>
    constexpr common_comparison_category_t<synth-three-way-result<TTypes, UTypes>...>
        operator<=>(const tuple<TTypes...>&, const tuple<UTypes...>&);
template<class... TTypes, tuple-like UTuple>
    constexpr see below operator<=>(const tuple<TTypes...>&, const UTuple&);

// 22.4.11, allocator-related traits
template<class... Types, class Alloc>
    struct uses_allocator<tuple<Types...>, Alloc>;

// 22.4.12, specialized algorithms
template<class... Types>
    constexpr void swap(tuple<Types...>& x, tuple<Types...>& y) noexcept(see below);
template<class... Types>
    constexpr void swap(const tuple<Types...>& x, const tuple<Types...>& y) noexcept(see below);

// 22.4.7, tuple helper classes
template<class T>
    constexpr size_t tuple_size_v = tuple_size<T>::value;
}

```

22.4.3 Concept tuple-like

[tuple.like]

```

template<class T>
concept tuple-like = see below;           // exposition only

```

- ¹ A type T models and satisfies the exposition-only concept *tuple-like* if `remove_cvref_t<T>` is a specialization of `array`, `pair`, `tuple`, or `ranges::subrange`.

22.4.4 Class template tuple

[tuple.tuple]

```

namespace std {
    template<class... Types>
    class tuple {
    public:
        // 22.4.4.1, tuple construction
        constexpr explicit(see below) tuple();
        constexpr explicit(see below) tuple(const Types&...);           // only if sizeof...(Types) >= 1
        template<class... UTypes>
            constexpr explicit(see below) tuple(UTypes&&...);          // only if sizeof...(Types) >= 1

        tuple(const tuple&) = default;
        tuple(tuple&&) = default;

        template<class... UTypes>
            constexpr explicit(see below) tuple(tuple<UTypes...>&);
        template<class... UTypes>
            constexpr explicit(see below) tuple(const tuple<UTypes...>&);
    }
}

```

```

template<class... UTypes>
    constexpr explicit(see below) tuple(tuple<UTypes...>&&);
template<class... UTypes>
    constexpr explicit(see below) tuple(const tuple<UTypes...>&&);

template<class U1, class U2>
    constexpr explicit(see below) tuple(pair<U1, U2>&);           // only if sizeof...(Types) == 2
template<class U1, class U2>
    constexpr explicit(see below) tuple(const pair<U1, U2>&);     // only if sizeof...(Types) == 2
template<class U1, class U2>
    constexpr explicit(see below) tuple(pair<U1, U2>&&);        // only if sizeof...(Types) == 2
template<class U1, class U2>
    constexpr explicit(see below) tuple(const pair<U1, U2>&&);   // only if sizeof...(Types) == 2

template<tuple-like UTuple>
    constexpr explicit(see below) tuple(UTuple&&);

// allocator-extended constructors
template<class Alloc>
    constexpr explicit(see below)
        tuple(allocator_arg_t, const Alloc& a);
template<class Alloc>
    constexpr explicit(see below)
        tuple(allocator_arg_t, const Alloc& a, const Types&...);
template<class Alloc, class... UTypes>
    constexpr explicit(see below)
        tuple(allocator_arg_t, const Alloc& a, UTypes&&...);
template<class Alloc>
    constexpr tuple(allocator_arg_t, const Alloc& a, const tuple&);
template<class Alloc>
    constexpr tuple(allocator_arg_t, const Alloc& a, tuple&&);
template<class Alloc, class... UTypes>
    constexpr explicit(see below)
        tuple(allocator_arg_t, const Alloc& a, tuple<UTypes...>&);
template<class Alloc, class... UTypes>
    constexpr explicit(see below)
        tuple(allocator_arg_t, const Alloc& a, const tuple<UTypes...>&);
template<class Alloc, class... UTypes>
    constexpr explicit(see below)
        tuple(allocator_arg_t, const Alloc& a, tuple<UTypes...>&&);
template<class Alloc, class... UTypes>
    constexpr explicit(see below)
        tuple(allocator_arg_t, const Alloc& a, const tuple<UTypes...>&&);

template<class Alloc, class U1, class U2>
    constexpr explicit(see below)
        tuple(allocator_arg_t, const Alloc& a, pair<U1, U2>&);
template<class Alloc, class U1, class U2>
    constexpr explicit(see below)
        tuple(allocator_arg_t, const Alloc& a, const pair<U1, U2>&);
template<class Alloc, class U1, class U2>
    constexpr explicit(see below)
        tuple(allocator_arg_t, const Alloc& a, pair<U1, U2>&&);
template<class Alloc, class U1, class U2>
    constexpr explicit(see below)
        tuple(allocator_arg_t, const Alloc& a, const pair<U1, U2>&&);

// 22.4.4.2, tuple assignment
constexpr tuple& operator=(const tuple&);
constexpr const tuple& operator=(const tuple&) const;
constexpr tuple& operator=(tuple&&) noexcept(see below);
constexpr const tuple& operator=(tuple&&) const;

```

```

template<class... UTypes>
    constexpr tuple& operator=(const tuple<UTypes...>&);
template<class... UTypes>
    constexpr const tuple& operator=(const tuple<UTypes...>&) const;
template<class... UTypes>
    constexpr tuple& operator=(tuple<UTypes...>&&);
template<class... UTypes>
    constexpr const tuple& operator=(tuple<UTypes...>&&) const;

template<class U1, class U2>
    constexpr tuple& operator=(const pair<U1, U2>&);           // only if sizeof...(Types) == 2
template<class U1, class U2>
    constexpr const tuple& operator=(const pair<U1, U2>&) const;           // only if sizeof...(Types) == 2
template<class U1, class U2>

template<class U1, class U2>
    constexpr const tuple& operator=(pair<U1, U2>&&) const;           // only if sizeof...(Types) == 2

template<tuple-like UTuple>
    constexpr tuple& operator=(UTuple&&);
template<tuple-like UTuple>
    constexpr const tuple& operator=(UTuple&&) const;

// 22.4.4.3, tuple swap
constexpr void swap(tuple& noexcept(see below));
constexpr void swap(const tuple&) const noexcept(see below);
};

template<class... UTypes>
    tuple(UTypes...) -> tuple<UTypes...>;
template<class T1, class T2>
    tuple(pair<T1, T2>) -> tuple<T1, T2>;
template<class Alloc, class... UTypes>
    tuple(allocator_arg_t, Alloc, UTypes...) -> tuple<UTypes...>;
template<class Alloc, class T1, class T2>
    tuple(allocator_arg_t, Alloc, pair<T1, T2>) -> tuple<T1, T2>;
template<class Alloc, class... UTypes>
    tuple(allocator_arg_t, Alloc, tuple<UTypes...>) -> tuple<UTypes...>;
}

```

22.4.4.1 Construction

[tuple.cnstr]

- In the descriptions that follow, let i be in the range $[0, \text{sizeof}...(Types)]$ in order, T_i be the i^{th} type in Types , and U_i be the i^{th} type in a template parameter pack named $UTypes$, where indexing is zero-based.
- For each `tuple` constructor, an exception is thrown only if the construction of one of the types in Types throws an exception.
- The defaulted move and copy constructor, respectively, of `tuple` is a `constexpr` function if and only if all required element-wise initializations for move and copy, respectively, would be `constexpr`-suitable (9.2.6). The defaulted move and copy constructor of `tuple<>` are `constexpr` functions.
- If `is_trivially_destructible_v<Ti>` is `true` for all T_i , then the destructor of `tuple` is trivial.
- The default constructor of `tuple<>` is trivial.

`constexpr explicit(see below) tuple();`

6 *Constraints:* `is_default_constructible_v<Ti>` is `true` for all i .

7 *Effects:* Value-initializes each element.

8 *Remarks:* The expression inside `explicit` evaluates to `true` if and only if T_i is not copy-list-initializable from an empty list for at least one i .

NOTE: This behavior can be implemented with a trait that checks whether a `const Ti&` can be initialized with `{}`.

```

constexpr explicit(see below) tuple(const Types&...);
9   Constraints: sizeof...(Types) ≥ 1 and is_copy_constructible_v<Ti> is true for all i.
10  Effects: Initializes each element with the value of the corresponding parameter.
11  Remarks: The expression inside explicit is equivalent to:
    !conjunction_v<is_convertible<const Types&, Types>...>

template<class... UTypes> constexpr explicit(see below) tuple(UTypes&&... u);
12 Let disambiguating-constraint be:
12.1 — negation<is_same<remove_cvref_t<U0>, tuple>> if sizeof...(Types) is 1;
12.2 — otherwise, bool_constant<!is_same_v<remove_cvref_t<U0>, allocator_arg_t> || is-
    same_v<remove_cvref_t<T0>, allocator_arg_t>> if sizeof...(Types) is 2 or 3;
12.3 — otherwise, true_type.

13 Constraints:
13.1 — sizeof...(Types) equals sizeof...(UTypes),
13.2 — sizeof...(Types) ≥ 1, and
13.3 — conjunction_v<disambiguating-constraint, is_constructible<Types, UTypes>...> is
    true.

14 Effects: Initializes the elements in the tuple with the corresponding value in std::forward<UTypes>(u).
15 Remarks: The expression inside explicit is equivalent to:
    !conjunction_v<is_convertible<UTypes, Types>...>

This constructor is defined as deleted if
    (reference_constructs_from_temporary_v<Types, UTypes&&> || ...)
is true.

tuple(const tuple& u) = default;
16 Mandates: is_copy_constructible_v<Ti> is true for all i.
17 Effects: Initializes each element of *this with the corresponding element of u.

tuple(tuple&& u) = default;
18 Constraints: is_move_constructible_v<Ti> is true for all i.
19 Effects: For all i, initializes the ith element of *this with std::forward<Ti>(get<i>(u)).

template<class... UTypes> constexpr explicit(see below) tuple(tuple<UTypes...>& u);
template<class... UTypes> constexpr explicit(see below) tuple(const tuple<UTypes...>& u);
template<class... UTypes> constexpr explicit(see below) tuple(tuple<UTypes...>&& u);
template<class... UTypes> constexpr explicit(see below) tuple(const tuple<UTypes...>&& u);

20 Let I be the pack 0, 1, ..., (sizeof...(Types) - 1).
Let FWD(u) be static_cast<decltype(u)>(u).

21 Constraints:
21.1 — sizeof...(Types) equals sizeof...(UTypes), and
21.2 — (is_constructible_v<Types, decltype(get<I>(FWD(u)))> && ...) is true, and
21.3 — either sizeof...(Types) is not 1, or (when Types... expands to T and UTypes... expands to U)
    is_convertible_v<decltype(u), T>, is_constructible_v<T, decltype(u)>, and is_same-
    v<T, U> are all false.

22 Effects: For all i, initializes the ith element of *this with get<i>(FWD(u)).
23 Remarks: The expression inside explicit is equivalent to:
    !(is_convertible_v<decltype(get<I>(FWD(u))), Types> && ...)

The constructor is defined as deleted if
    (reference_constructs_from_temporary_v<Types, decltype(get<I>(FWD(u)))> || ...)

```

is true.

```
template<class U1, class U2> constexpr explicit(see below) tuple(pair<U1, U2>& u);
template<class U1, class U2> constexpr explicit(see below) tuple(const pair<U1, U2>& u);
template<class U1, class U2> constexpr explicit(see below) tuple(pair<U1, U2>&& u);
template<class U1, class U2> constexpr explicit(see below) tuple(const pair<U1, U2>&& u);
```

24 Let *FWD*(*u*) be `static_cast<decltype(u)>(u)`.

25 *Constraints*:

(25.1) — `sizeof...(Types)` is 2,

(25.2) — `is_constructible_v<T0, decltype(get<0>(FWD(u)))>` is true, and

(25.3) — `is_constructible_v<T1, decltype(get<1>(FWD(u)))>` is true.

26 *Effects*: Initializes the first element with `get<0>(FWD(u))` and the second element with `get<1>(FWD(u))`.

27 *Remarks*: The expression inside `explicit` is equivalent to:

```
!is_convertible_v<decltype(get<0>(FWD(u))), T0> ||
!is_convertible_v<decltype(get<1>(FWD(u))), T1>
```

The constructor is defined as deleted if

```
reference_constructs_from_temporary_v<T0, decltype(get<0>(FWD(u)))> ||
reference_constructs_from_temporary_v<T1, decltype(get<1>(FWD(u)))>
```

is true.

```
template<tuple-like UTuple>
constexpr explicit(see below) tuple(UTuple&& u);
```

28 Let *I* be the pack 0, 1, ..., `(sizeof...(Types) - 1)`.

29 *Constraints*:

(29.1) — `different-from<UTuple, tuple>` (26.5.2) is true,

(29.2) — `remove_cvref_t<UTuple>` is not a specialization of `ranges::subrange`,

(29.3) — `sizeof...(Types)` equals `tuple_size_v<remove_cvref_t<UTuple>>`,

(29.4) — `(is_constructible_v<Types, decltype(get<I>(std::forward<UTuple>(u)))> && ...)` is true, and

(29.5) — either `sizeof...(Types)` is not 1, or (when `Types...` expands to *T*) `is_convertible_v<UTuple, T>` and `is_constructible_v<T, UTuple>` are both false.

30 *Effects*: For all *i*, initializes the *i*th element of `*this` with `get<i>(std::forward<UTuple>(u))`.

31 *Remarks*: The expression inside `explicit` is equivalent to:

```
!(is_convertible_v<decltype(get<I>(std::forward<UTuple>(u))), Types> && ...)
```

```
template<class Alloc>
constexpr explicit(see below)
tuple(allocator_arg_t, const Alloc& a);
template<class Alloc>
constexpr explicit(see below)
tuple(allocator_arg_t, const Alloc& a, const Types&...);
template<class Alloc, class... UTypes>
constexpr explicit(see below)
tuple(allocator_arg_t, const Alloc& a, UTypes&&...);
template<class Alloc>
constexpr tuple(allocator_arg_t, const Alloc& a, const tuple&);
template<class Alloc>
constexpr tuple(allocator_arg_t, const Alloc& a, tuple&&);
template<class Alloc, class... UTypes>
constexpr explicit(see below)
tuple(allocator_arg_t, const Alloc& a, tuple<UTypes...>&);
```

```

template<class Alloc, class... UTypes>
constexpr explicit(see below)
    tuple(allocator_arg_t, const Alloc& a, const tuple<UTypes...>&);
template<class Alloc, class... UTypes>
constexpr explicit(see below)
    tuple(allocator_arg_t, const Alloc& a, tuple<UTypes...>&&);
template<class Alloc, class... UTypes>
constexpr explicit(see below)
    tuple(allocator_arg_t, const Alloc& a, const tuple<UTypes...>&&&);
template<class Alloc, class U1, class U2>
constexpr explicit(see below)
    tuple(allocator_arg_t, const Alloc& a, pair<U1, U2>&);
template<class Alloc, class U1, class U2>
constexpr explicit(see below)
    tuple(allocator_arg_t, const Alloc& a, const pair<U1, U2>&);
template<class Alloc, class U1, class U2>
constexpr explicit(see below)
    tuple(allocator_arg_t, const Alloc& a, pair<U1, U2>&&);
template<class Alloc, class U1, class U2>
constexpr explicit(see below)
    tuple(allocator_arg_t, const Alloc& a, const pair<U1, U2>&&&);

32   Preconditions: Alloc meets the Cpp17Allocator requirements (16.4.4.6.1).

33   Effects: Equivalent to the preceding constructors except that each element is constructed with uses-allocator construction (20.2.8.2).

```

22.4.4.2 Assignment

[tuple.assign]

- For each tuple assignment operator, an exception is thrown only if the assignment of one of the types in Types throws an exception. In the function descriptions that follow, let i be in the range $[0, \text{sizeof...}(Types)]$ in order, T_i be the i^{th} type in Types, and U_i be the i^{th} type in a template parameter pack named UTypes, where indexing is zero-based.

```

constexpr tuple& operator=(const tuple& u);

2     Effects: Assigns each element of u to the corresponding element of *this.

3     Returns: *this.

4     Remarks: This operator is defined as deleted unless is_copy_assignable_v<Ti> is true for all  $i$ .

constexpr const tuple& operator=(const tuple& u) const;
5     Constraints: (is_copy_assignable_v<const Types> && ...) is true.

6     Effects: Assigns each element of u to the corresponding element of *this.

7     Returns: *this.

constexpr tuple& operator=(tuple&& u) noexcept(see below);
8     Constraints: is_move_assignable_v<Ti> is true for all  $i$ .
9     Effects: For all  $i$ , assigns std::forward<Ti>(get< $i$ >(u)) to get< $i$ >(*this).
10    Returns: *this.

11   Remarks: The exception specification is equivalent to the logical AND of the following expressions:
        is_nothrow_move_assignable_v<Ti>
        where  $T_i$  is the  $i^{\text{th}}$  type in Types.

constexpr const tuple& operator=(tuple&& u) const;
12    Constraints: (is assignable_v<const Types&, Types> && ...) is true.
13    Effects: For all  $i$ , assigns std::forward<Ti>(get< $i$ >(u)) to get< $i$ >(*this).
14    Returns: *this.

```

```

template<class... UTypes> constexpr tuple& operator=(const tuple<UTypes...>& u);
15   Constraints:
(15.1)   — sizeof...(Types) equals sizeof...(UTypes) and
(15.2)   — is_assignable_v<Ti&, const Ui&> is true for all i.
16   Effects: Assigns each element of u to the corresponding element of *this.
17   Returns: *this.

template<class... UTypes> constexpr const tuple& operator=(const tuple<UTypes...>& u) const;
18   Constraints:
(18.1)   — sizeof...(Types) equals sizeof...(UTypes) and
(18.2)   — (is_assignable_v<const Types&, const UTypes&> && ...) is true.
19   Effects: Assigns each element of u to the corresponding element of *this.
20   Returns: *this.

template<class... UTypes> constexpr tuple& operator=(tuple<UTypes...>&& u);
21   Constraints:
(21.1)   — sizeof...(Types) equals sizeof...(UTypes) and
(21.2)   — is_assignable_v<Ti&, Ui> is true for all i.
22   Effects: For all i, assigns std::forward<Ui>(get<i>(u)) to get<i>(*this).
23   Returns: *this.

template<class... UTypes> constexpr const tuple& operator=(tuple<UTypes...>&& u) const;
24   Constraints:
(24.1)   — sizeof...(Types) equals sizeof...(UTypes) and
(24.2)   — (is_assignable_v<const Types&, UTypes> && ...) is true.
25   Effects: For all i, assigns std::forward<Ui>(get<i>(u)) to get<i>(*this).
26   Returns: *this.

template<class U1, class U2> constexpr tuple& operator=(const pair<U1, U2>& u);
27   Constraints:
(27.1)   — sizeof...(Types) is 2 and
(27.2)   — is_assignable_v<T0&, const U1&> is true, and
(27.3)   — is_assignable_v<T1&, const U2&> is true.
28   Effects: Assigns u.first to the first element of *this and u.second to the second element of *this.
29   Returns: *this.

template<class U1, class U2> constexpr const tuple& operator=(const pair<U1, U2>& u) const;
30   Constraints:
(30.1)   — sizeof...(Types) is 2,
(30.2)   — is_assignable_v<const T0&, const U1&> is true, and
(30.3)   — is_assignable_v<const T1&, const U2&> is true.
31   Effects: Assigns u.first to the first element and u.second to the second element.
32   Returns: *this.

template<class U1, class U2> constexpr tuple& operator=(pair<U1, U2>&& u);
33   Constraints:
(33.1)   — sizeof...(Types) is 2 and
(33.2)   — is_assignable_v<T0&, U1> is true, and

```

(33.3) — `is_assignable_v<T1&, U2>` is true.

34 *Effects:* Assigns `std::forward<U1>(u.first)` to the first element of `*this` and `std::forward<U2>(u.second)` to the second element of `*this`.

35 *Returns:* `*this`.

```
template<class U1, class U2> constexpr const tuple& operator=(pair<U1, U2>&& u) const;
```

36 *Constraints:*

(36.1) — `sizeof...(Types)` is 2,

(36.2) — `is_assignable_v<const T0&, U1>` is true, and

(36.3) — `is_assignable_v<const T1&, U2>` is true.

37 *Effects:* Assigns `std::forward<U1>(u.first)` to the first element and `std::forward<U2>(u.second)` to the second element.

38 *Returns:* `*this`.

```
template<tuple-like UTuple>
constexpr tuple& operator=(UTuple&& u);
```

39 *Constraints:*

(39.1) — `different-from<UTuple, tuple>` ([26.5.2](#)) is true,

(39.2) — `remove_cvref_t<UTuple>` is not a specialization of `ranges::subrange`,

(39.3) — `sizeof...(Types)` equals `tuple_size_v<remove_cvref_t<UTuple>>`, and,

(39.4) — `is_assignable_v<Ti&, decltype(get<i>(std::forward<UTuple>(u)))>` is true for all *i*.

40 *Effects:* For all *i*, assigns `get<i>(std::forward<UTuple>(u))` to `get<i>(*this)`.

41 *Returns:* `*this`.

```
template<tuple-like UTuple>
constexpr const tuple& operator=(UTuple&& u) const;
```

42 *Constraints:*

(42.1) — `different-from<UTuple, tuple>` ([26.5.2](#)) is true,

(42.2) — `remove_cvref_t<UTuple>` is not a specialization of `ranges::subrange`,

(42.3) — `sizeof...(Types)` equals `tuple_size_v<remove_cvref_t<UTuple>>`, and,

(42.4) — `is_assignable_v<const Ti&, decltype(get<i>(std::forward<UTuple>(u)))>` is true for all *i*.

43 *Effects:* For all *i*, assigns `get<i>(std::forward<UTuple>(u))` to `get<i>(*this)`.

44 *Returns:* `*this`.

22.4.4.3 swap

[tuple.swap]

```
constexpr void swap(tuple& rhs) noexcept(see below);
constexpr void swap(const tuple& rhs) const noexcept(see below);
```

1 Let *i* be in the range `[0, sizeof...(Types)]` in order.

2 *Mandates:*

- (2.1) — For the first overload, `(is_swappable_v<Types> && ...)` is true.
- (2.2) — For the second overload, `(is_swappable_v<const Types> && ...)` is true.

3 *Preconditions:* For all *i*, `get<i>(*this)` is swappable with ([16.4.4.3](#)) `get<i>(rhs)`.

4 *Effects:* For each *i*, calls `swap` for `get<i>(*this)` with `get<i>(rhs)`.

5 *Throws:* Nothing unless one of the element-wise `swap` calls throws an exception.

6 *Remarks:* The exception specification is equivalent to

- (6.1) — `(is_nothrow_swappable_v<Types> && ...)` for the first overload and
- (6.2) — `(is_nothrow_swappable_v<const Types> && ...)` for the second overload.

22.4.5 Tuple creation functions

[tuple.creation]

```
template<class... TTypes>
constexpr tuple<unwrap_ref_decay_t<TTypes>...> make_tuple(TTypes&&... t);

1   Returns: tuple<unwrap_ref_decay_t<TTypes>...>(std::forward<TTypes>(t)...).

2   EXAMPLE 1:
    int i; float j;
    make_tuple(1, ref(i), cref(j));
    creates a tuple of type tuple<int, int&, const float&>.

template<class... TTypes>
constexpr tuple<TTypes&&...> forward_as_tuple(TTypes&&... t) noexcept;

3   Effects: Constructs a tuple of references to the arguments in t suitable for forwarding as arguments to a function. Because the result may contain references to temporary objects, a program shall ensure that the return value of this function does not outlive any of its arguments (e.g., the program should typically not store the result in a named variable).
4   Returns: tuple<TTypes&&...>(std::forward<TTypes>(t)...).

template<class... TTypes>
constexpr tuple<TTypes&&...> tie(TTypes&&... t) noexcept;

5   Returns: tuple<TTypes&&...>(t...). When an argument in t is ignore, assigning any value to the corresponding tuple element has no effect.
6   EXAMPLE 2: tie functions allow one to create tuples that unpack tuples into variables. ignore can be used for elements that are not needed:
    int i; std::string s;
    tie(i, ignore, s) = make_tuple(42, 3.14, "C++");
    // i == 42, s == "C++"

template<tuple-like... Tuples>
constexpr tuple<CTypes...> tuple_cat(Tuples&&... tpls);

7   Let n be sizeof...(Tuples). For every integer  $0 \leq i < n$ :
    — Let  $T_i$  be the  $i^{\text{th}}$  type in Tuples.
    — Let  $U_i$  be remove_cvref_t< $T_i$ >.
    — Let  $\text{tp}_i$  be the  $i^{\text{th}}$  element in the function parameter pack tpls.
    — Let  $S_i$  be tuple_size_v< $U_i$ >.
    — Let  $E_i^k$  be tuple_element_t< $k$ ,  $U_i$ >.
    — Let  $e_i^k$  be get< $k$ >(std::forward< $T_i$ >( $\text{tp}_i$ )).
    — Let  $\text{Elems}_i$  be a pack of the types  $E_i^0, \dots, E_i^{S_i-1}$ .
    — Let  $\text{elems}_i$  be a pack of the expressions  $e_i^0, \dots, e_i^{S_i-1}$ .
The types in CTypes are equal to the ordered sequence of the expanded packs of types  $\text{Elems}_0, \dots, \text{Elems}_1, \dots, \text{Elems}_{n-1}$ . Let celems be the ordered sequence of the expanded packs of expressions  $\text{elems}_0, \dots, \text{elems}_1, \dots, \text{elems}_{n-1}$ .
8   Mandates: (is_constructible_v<CTypes, decltype(celems)> && ...) is true.
9   Returns: tuple<CTypes...>(celems...).
```

22.4.6 Calling a function with a tuple of arguments

[tuple.apply]

```
template<class F, tuple-like Tuple>
constexpr decltype(auto) apply(F&& f, Tuple&& t) noexcept(see below);

1   Effects: Given the exposition-only function:
    namespace std {
        template<class F, tuple-like Tuple, size_t... I>
        constexpr decltype(auto) apply-impl(F&& f, Tuple&& t, index_sequence<I...>) {
            // exposition only
    }
```

```

        return (INVOKE(std::forward<F>(f), get<I>(std::forward<Tuple>(t))...); // see 22.10.4
    }
}

```

Equivalent to:

```

return apply-impl(std::forward<F>(f), std::forward<Tuple>(t),
    make_index_sequence<tuple_size_v<remove_reference_t<Tuple>>>{});

```

² *Remarks:* Let I be the pack 0, 1, ..., (tuple_size_v<remove_reference_t<Tuple>> - 1). The exception specification is equivalent to:

```

noexcept(invoke(std::forward<F>(f), get<I>(std::forward<Tuple>(t))...))

```

```

template<class T, tuple-like Tuple>
constexpr T make_from_tuple(Tuple&& t);

```

³ *Mandates:* If tuple_size_v<remove_reference_t<Tuple>> is 1, then reference_constructs_from_-temporary_v<T, decltype(get<0>(declval<Tuple>()))> is false.

⁴ *Effects:* Given the exposition-only function:

```

namespace std {
    template<class T, tuple-like Tuple, size_t... I>
        requires is_constructible_v<T, decltype(get<I>(declval<Tuple>()))...>
    constexpr T make-from-tuple-impl(Tuple&& t, index_sequence<I...>) { // exposition only
        return T(get<I>(std::forward<Tuple>(t))...);
    }
}

```

Equivalent to:

```

return make-from-tuple-impl<T>(
    std::forward<Tuple>(t),
    make_index_sequence<tuple_size_v<remove_reference_t<Tuple>>>{});

```

NOTE: The type of T must be supplied as an explicit template parameter, as it cannot be deduced from the argument list.

22.4.7 Tuple helper classes

[tuple.helper]

```
template<class T> struct tuple_size;
```

¹ All specializations of tuple_size meet the *Cpp17UnaryTypeTrait* requirements (21.3.2) with a base characteristic of integral_constant<size_t, N> for some N.

```
template<class... Types>
struct tuple_size<tuple<Types...>> : public integral_constant<size_t, sizeof...(Types)> { };

template<size_t I, class... Types>
struct tuple_element<I, tuple<Types...>> {
    using type = TI;
};

```

² *Mandates:* I < sizeof...(Types).

³ *Type:* TI is the type of the Ith element of Types, where indexing is zero-based.

```
template<class T> struct tuple_size<const T>;
```

⁴ Let TS denote tuple_size<T> of the cv-unqualified type T. If the expression TS::value is well-formed when treated as an unevaluated operand (7.2.3), then each specialization of the template meets the *Cpp17UnaryTypeTrait* requirements (21.3.2) with a base characteristic of

```
integral_constant<size_t, TS::value>
```

Otherwise, it has no member value.

⁵ Access checking is performed as if in a context unrelated to TS and T. Only the validity of the immediate context of the expression is considered.

NOTE: The compilation of the expression can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the “immediate context” and can result in the program being ill-formed.

6 In addition to being available via inclusion of the `<tuple>` header, the template is available when any
of the headers `<array>` (24.3.2), `<ranges>` (26.2), or `<utility>` (22.2.1) are included.

```
template<size_t I, class T> struct tuple_element<I, const T>;
```

7 Let `TE` denote `tuple_element_t<I, T>` of the cv-unqualified type `T`. Then each specialization of the
template meets the *Cpp17TransformationTrait* requirements (21.3.2) with a member `typedef type` that
names the type `add_const_t<TE>`.

8 In addition to being available via inclusion of the `<tuple>` header, the template is available when any
of the headers `<array>` (24.3.2), `<ranges>` (26.2), or `<utility>` (22.2.1) are included.

22.4.8 Element access

[tuple.elem]

```
template<size_t I, class... Types>
constexpr tuple_element_t<I, tuple<Types...>>&
    get(tuple<Types...>& t) noexcept;
template<size_t I, class... Types>
constexpr tuple_element_t<I, tuple<Types...>>&&
    get(tuple<Types...>&& t) noexcept; // Note A
template<size_t I, class... Types>
constexpr const tuple_element_t<I, tuple<Types...>>&
    get(const tuple<Types...>& t) noexcept; // Note B
template<size_t I, class... Types>
constexpr const tuple_element_t<I, tuple<Types...>>&& get(const tuple<Types...>&& t) noexcept;
```

1 *Mandates:* `I < sizeof...(Types)`.

2 *Returns:* A reference to the `Ith` element of `t`, where indexing is zero-based.

3 NOTE 1: [Note A] If a type `T` in `Types` is some reference type `X&`, the return type is `X&`, not `X&&`. However, if the
element type is a non-reference type `T`, the return type is `T&&`.

4 NOTE 2: [Note B] Constness is shallow. If a type `T` in `Types` is some reference type `X&`, the return type is `X&`,
not `const X&`. However, if the element type is a non-reference type `T`, the return type is `const T&`. This is
consistent with how constness is defined to work for non-static data members of reference type.

```
template<class T, class... Types>
constexpr T& get(tuple<Types...>& t) noexcept;
template<class T, class... Types>
constexpr T&& get(tuple<Types...>&& t) noexcept;
template<class T, class... Types>
constexpr const T& get(const tuple<Types...>& t) noexcept;
template<class T, class... Types>
constexpr const T&& get(const tuple<Types...>&& t) noexcept;
```

5 *Mandates:* The type `T` occurs exactly once in `Types`.

6 *Returns:* A reference to the element of `t` corresponding to the type `T` in `Types`.

7 EXAMPLE:

```
const tuple<int, const int, double, double> t(1, 2, 3.4, 5.6);
const int& i1 = get<int>(t); // OK, i1 has value 1
const int& i2 = get<const int>(t); // OK, i2 has value 2
const double& d = get<double>(t); // error: type double is not unique within t
```

8 NOTE 3: The reason `get` is a non-member function is that if this functionality had been provided as a member function,
code where the type depended on a template parameter would have required using the `template` keyword.

22.4.9 Relational operators

[tuple.rel]

```
template<class... TTypes, class... UTypes>
constexpr bool operator==(const tuple<TTypes...>& t, const tuple<UTypes...>& u);
template<class... TTypes, tuple-like UTuple>
constexpr bool operator==(const tuple<TTypes...>& t, const UTuple& u);
```

1 For the first overload let `UTuple` be `tuple<UTypes...>`.

2 *Mandates:* For all `i`, where $0 \leq i < \text{sizeof...}(TTypes)$, `get<i>(t) == get<i>(u)` is a valid expres-
sion. `sizeof... (TTypes)` equals `tuple_size_v<UTuple>`.

- 3 *Preconditions:* For all i , `decltype(get<i>(t) == get<i>(u))` models *boolean-testable*.
 4 *Returns:* `true` if `get<i>(t) == get<i>(u)` for all i , otherwise `false`.
 NOTE 1: If `sizeof...(TTypes)` equals zero, returns `true`.
 5 *Remarks:*
 (5.1) — The elementary comparisons are performed in order from the zeroth index upwards. No comparisons or element accesses are performed after the first equality comparison that evaluates to `false`.
 (5.2) — The second overload is to be found via argument-dependent lookup (6.5.4) only.

```
template<class... TTypes, class... UTypes>
constexpr common_comparison_category_t<synth-three-way-result<TTypes, UTypes>...>
operator<=>(const tuple<TTypes...>& t, const tuple<UTypes...>& u);
template<class... TTypes, tuple-like UTuple>
constexpr common_comparison_category_t<synth-three-way-result<TTypes, Elms>...>
operator<=>(const tuple<TTypes...>& t, const UTuple& u);
```

6 For the second overload, `Elms` denotes the pack of types `tuple_element_t<0, UTuple>, tuple_element_t<1, UTuple>, ..., tuple_element_t<tuple_size_v<UTuple> - 1, UTuple>`.

7 *Effects:* Performs a lexicographical comparison between t and u . If `sizeof...(TTypes)` equals zero, returns `strong_ordering::equal`. Otherwise, equivalent to:

```
if (auto c = synth-three-way(get<0>(t), get<0>(u)); c != 0) return c;
return t_tail <= u_tail;
```

where r_{tail} for some r is a tuple containing all but the first element of r .

8 *Remarks:* The second overload is to be found via argument-dependent lookup (6.5.4) only.

9 NOTE 2: The above definition does not require t_{tail} (or u_{tail}) to be constructed; this is impossible if t or u is not copy-constructible. Also, all comparison operator functions are short circuited; they do not perform element accesses beyond what is required to determine the result of the comparison.

22.4.10 common_reference related specializations

[tuple.common.ref]

1 In the descriptions that follow:

- (1.1) — Let `TTypes` be a pack formed by the sequence of `tuple_element_t< i , TTuple>` for every integer $0 \leq i < \text{tuple_size_v}<\text{TTuple}>$.
 (1.2) — Let `UTypes` be a pack formed by the sequence of `tuple_element_t< i , UTuple>` for every integer $0 \leq i < \text{tuple_size_v}<\text{UTuple}>$.

```
template<tuple-like TTuple, tuple-like UTuple,
        template<class> class TQual, template<class> class UQual>
struct basic_common_reference<TTuple, UTuple, TQual, UQual> {
    using type = see below;
};
```

2 *Constraints:*

- (2.1) — `TTuple` is a specialization of `tuple` or `UTuple` is a specialization of `tuple`.
 (2.2) — `is_same_v<TTuple, decay_t<TTuple>>` is `true`.
 (2.3) — `is_same_v<UTuple, decay_t<UTuple>>` is `true`.
 (2.4) — `tuple_size_v<TTuple>` equals `tuple_size_v<UTuple>`.
 (2.5) — `tuple<common_reference_t<TQual<TTypes>, UQual<UTypes>>...>` denotes a type.

The member `typedef-name` type denotes the type `tuple<common_reference_t<TQual<TTypes>, UQual<UTypes>>...>`.

```
template<tuple-like TTuple, tuple-like UTuple>
struct common_type<TTuple, UTuple> {
    using type = see below;
};
```

3 *Constraints:*

- (3.1) — `TTuple` is a specialization of `tuple` or `UTuple` is a specialization of `tuple`.

- (3.2) — `is_same_v<TTuple, decay_t<TTuple>>` is true.
 (3.3) — `is_same_v<UTuple, decay_t<UTuple>>` is true.
 (3.4) — `tuple_size_v<TTuple>` equals `tuple_size_v<UTuple>`.
 (3.5) — `tuple<common_type_t<TTypes, UTypes>...>` denotes a type.

The member `typedef-name` type denotes the type `tuple<common_type_t<TTypes, UTypes>...>`.

22.4.11 Tuple traits

[tuple.traits]

```
template<class... Types, class Alloc>
struct uses_allocator<tuple<Types...>, Alloc> : true_type { };
```

¹ *Preconditions:* Alloc meets the Cpp17Allocator requirements (16.4.4.6.1).

² *NOTE:* Specialization of this trait informs other library components that tuple can be constructed with an allocator, even though it does not have a nested allocator_type.

22.4.12 Tuple specialized algorithms

[tuple.special]

```
template<class... Types>
constexpr void swap(tuple<Types...>& x, tuple<Types...>& y) noexcept(see below);
template<class... Types>
constexpr void swap(const tuple<Types...>& x, const tuple<Types...>& y) noexcept(see below);
```

¹ *Constraints:*

- (1.1) — For the first overload, `(is_swappable_v<Types> && ...)` is true.
 (1.2) — For the second overload, `(is_swappable_v<const Types> && ...)` is true.

² *Effects:* As if by `x.swap(y)`.

³ *Remarks:* The exception specification is equivalent to:

```
noexcept(x.swap(y))
```

22.5 Optional objects

[optional]

22.5.1 In general

[optional.general]

¹ Subclause 22.5 describes class template optional that represents optional objects. An optional object is an object that contains the storage for another object and manages the lifetime of this contained object, if any. The contained object may be initialized after the optional object has been initialized, and may be destroyed before the optional object has been destroyed. The initialization state of the contained object is tracked by the optional object.

22.5.2 Header <optional> synopsis

[optional.syn]

```
#include <compare> // see 17.11.1

namespace std {
  // 22.5.3, class template optional
  template<class T>
  class optional;

  template<class T>
  concept is-derived-from-optional = requires(const T& t) { // exposition only
    []<class U>(const optional<U>&){ }(t);
  };

  // 22.5.4, no-value state indicator
  struct nullopt_t{see below};
  inline constexpr nullopt_t nullopt(unspecified);

  // 22.5.5, class bad_optional_access
  class bad_optional_access;
```

```

// 22.5.6, relational operators
template<class T, class U>
    constexpr bool operator==(const optional<T>&, const optional<U>&);
template<class T, class U>
    constexpr bool operator!=(const optional<T>&, const optional<U>&);
template<class T, class U>
    constexpr bool operator<(const optional<T>&, const optional<U>&);
template<class T, class U>
    constexpr bool operator>(const optional<T>&, const optional<U>&);
template<class T, class U>
    constexpr bool operator<=(const optional<T>&, const optional<U>&);
template<class T, class U>
    constexpr bool operator>=(const optional<T>&, const optional<U>&);

template<class T, three_way_comparable_with<T> U>
    constexpr compare_three_way_result_t<T, U>
        operator<=>(const optional<T>&, const optional<U>&);

// 22.5.7, comparison with nullopt
template<class T> constexpr bool operator==(const optional<T>&, nullopt_t) noexcept;
template<class T>
    constexpr strong_ordering operator<=>(const optional<T>&, nullopt_t) noexcept;

// 22.5.8, comparison with T
template<class T, class U> constexpr bool operator==(const optional<T>&, const U&);
template<class T, class U> constexpr bool operator==(const T&, const optional<U>&);
template<class T, class U> constexpr bool operator!=(const optional<T>&, const U&);
template<class T, class U> constexpr bool operator!=(const T&, const optional<U>&);
template<class T, class U> constexpr bool operator<(const optional<T>&, const U&);
template<class T, class U> constexpr bool operator<(const T&, const optional<U>&);
template<class T, class U> constexpr bool operator>(const optional<T>&, const U&);
template<class T, class U> constexpr bool operator>(const T&, const optional<U>&);
template<class T, class U> constexpr bool operator<=(const optional<T>&, const U&);
template<class T, class U> constexpr bool operator<=(const T&, const optional<U>&);
template<class T, class U> constexpr bool operator>=(const optional<T>&, const U&);
template<class T, class U> constexpr bool operator>=(const T&, const optional<U>&);

template<class T, class U>
    requires (!is-derived-from-optional<U>) && three_way_comparable_with<T, U>
    constexpr compare_three_way_result_t<T, U>
        operator<=>(const optional<T>&, const U&);

// 22.5.9, specialized algorithms
template<class T>
    constexpr void swap(optional<T>&, optional<T>&) noexcept(see below);

template<class T>
    constexpr optional<see below> make_optional(T&&);
template<class T, class... Args>
    constexpr optional<T> make_optional(Args&&... args);
template<class T, class U, class... Args>
    constexpr optional<T> make_optional(initializer_list<U> il, Args&&... args);

// 22.5.10, hash support
template<class T> struct hash;
template<class T> struct hash<optional<T>>;
}

```

22.5.3 Class template optional

[optional.optional]

22.5.3.1 General

[optional.optional.general]

```

namespace std {
    template<class T>
    class optional {
    public:
        using value_type = T;

```

```

// 22.5.3.2, constructors
constexpr optional() noexcept;
constexpr optional(nullopt_t) noexcept;
constexpr optional(const optional&);
constexpr optional(optional&&) noexcept(see below);
template<class... Args>
constexpr explicit optional(in_place_t, Args&&...);
template<class U, class... Args>
constexpr explicit optional(in_place_t, initializer_list<U>, Args&&...);
template<class U = T>
constexpr explicit(see below) optional(U&&);
template<class U>
constexpr explicit(see below) optional(const optional<U>&);
template<class U>
constexpr explicit(see below) optional(optional<U>&&);

// 22.5.3.3, destructor
constexpr ~optional();

// 22.5.3.4, assignment
constexpr optional& operator=(nullopt_t) noexcept;
constexpr optional& operator=(const optional&);
constexpr optional& operator=(optional&&) noexcept(see below);
template<class U = T> constexpr optional& operator=(U&&);
template<class U> constexpr optional& operator=(const optional<U>&);
template<class U> constexpr optional& operator=(optional<U>&&);
template<class... Args> constexpr T& emplace(Args&&...);
template<class U, class... Args> constexpr T& emplace(initializer_list<U>, Args&&...);

// 22.5.3.5, swap
constexpr void swap(optional&) noexcept(see below);

// 22.5.3.6, observers
constexpr const T* operator->() const noexcept;
constexpr T* operator->() noexcept;
constexpr const T& operator*() const & noexcept;
constexpr T& operator*() & noexcept;
constexpr T&& operator*() && noexcept;
constexpr const T&& operator*() const && noexcept;
constexpr explicit operator bool() const noexcept;
constexpr bool has_value() const noexcept;
constexpr const T& value() const &;
constexpr T& value() &;
constexpr T&& value() &&;
constexpr const T&& value() const &&;
template<class U> constexpr T value_or(U&&) const &;
template<class U> constexpr T value_or(U&&) &&;

// 22.5.3.7, monadic operations
template<class F> constexpr auto and_then(F&& f) &;
template<class F> constexpr auto and_then(F&& f) &&;
template<class F> constexpr auto and_then(F&& f) const &;
template<class F> constexpr auto and_then(F&& f) const &&;
template<class F> constexpr auto transform(F&& f) &;
template<class F> constexpr auto transform(F&& f) &&;
template<class F> constexpr auto transform(F&& f) const &;
template<class F> constexpr auto transform(F&& f) const &&;
template<class F> constexpr optional or_else(F&& f) &&;
template<class F> constexpr optional or_else(F&& f) const &;

// 22.5.3.8, modifiers
constexpr void reset() noexcept;

```

```

private:
    T *val;           // exposition only
};

template<class T>
optional(T) -> optional<T>;
}

```

- ¹ Any instance of `optional<T>` at any given time either contains a value or does not contain a value. When an instance of `optional<T>` *contains a value*, it means that an object of type `T`, referred to as the optional object's *contained value*, is allocated within the storage of the optional object. Implementations are not permitted to use additional storage, such as dynamic memory, to allocate its contained value. When an object of type `optional<T>` is contextually converted to `bool`, the conversion returns `true` if the object contains a value; otherwise the conversion returns `false`.
- ² When an `optional<T>` object contains a value, member `val` points to the contained value.
- ³ `T` shall be a type other than `cv in_place_t` or `cv nullopt_t` that meets the *Cpp17Destructible* requirements ([Table 35](#)).

22.5.3.2 Constructors

[[optional.ctor](#)]

- The exposition-only variable template *converts-from-any-curef* is used by some constructors for `optional`.

```

template<class T, class W>
constexpr bool converts-from-any-curef = // exposition only
    disjunction_v<is_constructible<T, W&>, is_convertible<W&, T>,
        is_constructible<T, W>, is_convertible<W, T>,
        is_constructible<T, const W&>, is_convertible<const W&, T>,
        is_constructible<T, const W>, is_convertible<const W, T>>;

```

`constexpr optional() noexcept;`
`constexpr optional(nullopt_t) noexcept;`

² *Postconditions*: `*this` does not contain a value.

³ *Remarks*: No contained value is initialized. For every object type `T` these constructors are `constexpr` constructors ([9.2.6](#)).

```

constexpr optional(const optional& rhs);

```

⁴ *Effects*: If `rhs` contains a value, direct-non-list-initializes the contained value with `*rhs`.
⁵ *Postconditions*: `rhs.has_value() == this->has_value()`.
⁶ *Throws*: Any exception thrown by the selected constructor of `T`.
⁷ *Remarks*: This constructor is defined as deleted unless `is_copy_constructible_v<T>` is `true`. If `is_trivially_copy_constructible_v<T>` is `true`, this constructor is trivial.

```

constexpr optional(optional&& rhs) noexcept(see below);

```

⁸ *Constraints*: `is_move_constructible_v<T>` is `true`.
⁹ *Effects*: If `rhs` contains a value, direct-non-list-initializes the contained value with `std::move(*rhs)`.
`rhs.has_value()` is unchanged.
¹⁰ *Postconditions*: `rhs.has_value() == this->has_value()`.
¹¹ *Throws*: Any exception thrown by the selected constructor of `T`.
¹² *Remarks*: The exception specification is equivalent to `is_nothrow_move_constructible_v<T>`. If `is_trivially_move_constructible_v<T>` is `true`, this constructor is trivial.

```

template<class... Args> constexpr explicit optional(in_place_t, Args&&... args);

```

¹³ *Constraints*: `is_constructible_v<T, Args...>` is `true`.
¹⁴ *Effects*: Direct-non-list-initializes the contained value with `std::forward<Args>(args)....`
¹⁵ *Postconditions*: `*this` contains a value.
¹⁶ *Throws*: Any exception thrown by the selected constructor of `T`.

17 *Remarks:* If T's constructor selected for the initialization is a constexpr constructor, this constructor is
a constexpr constructor.

```
template<class U, class... Args>
constexpr explicit optional(in_place_t, initializer_list<U> il, Args&&... args);
```

18 *Constraints:* `is_constructible_v<T, initializer_list<U>&, Args...>` is true.

19 *Effects:* Direct-non-list-initializes the contained value with `il, std::forward<Args>(args)`....

20 *Postconditions:* `*this` contains a value.

21 *Throws:* Any exception thrown by the selected constructor of T.

22 *Remarks:* If T's constructor selected for the initialization is a constexpr constructor, this constructor is
a constexpr constructor.

```
template<class U = T> constexpr explicit(see below) optional(U&& v);
```

23 *Constraints:*

- (23.1) — `is_constructible_v<T, U>` is true,
- (23.2) — `is_same_v<remove_cvref_t<U>, in_place_t>` is false,
- (23.3) — `is_same_v<remove_cvref_t<U>, optional>` is false, and
- (23.4) — if T is cv bool, `remove_cvref_t<U>` is not a specialization of optional.

24 *Effects:* Direct-non-list-initializes the contained value with `std::forward<U>(v)`.

25 *Postconditions:* `*this` contains a value.

26 *Throws:* Any exception thrown by the selected constructor of T.

27 *Remarks:* If T's selected constructor is a constexpr constructor, this constructor is a constexpr
constructor. The expression inside `explicit` is equivalent to:

```
!is_convertible_v<U, T>
```

```
template<class U> constexpr explicit(see below) optional(const optional<U>& rhs);
```

28 *Constraints:*

- (28.1) — `is_constructible_v<T, const U&>` is true, and
- (28.2) — if T is not cv bool, `converts-from-any-cvref<T, optional<U>>` is false.

29 *Effects:* If rhs contains a value, direct-non-list-initializes the contained value with `*rhs`.

30 *Postconditions:* `rhs.has_value() == this->has_value()`.

31 *Throws:* Any exception thrown by the selected constructor of T.

32 *Remarks:* The expression inside `explicit` is equivalent to:

```
!is_convertible_v<const U&, T>
```

```
template<class U> constexpr explicit(see below) optional(optional<U>&& rhs);
```

33 *Constraints:*

- (33.1) — `is_constructible_v<T, U>` is true, and
- (33.2) — if T is not cv bool, `converts-from-any-cvref<T, optional<U>>` is false.

34 *Effects:* If rhs contains a value, direct-non-list-initializes the contained value with `std::move(*rhs)`.
`rhs.has_value()` is unchanged.

35 *Postconditions:* `rhs.has_value() == this->has_value()`.

36 *Throws:* Any exception thrown by the selected constructor of T.

37 *Remarks:* The expression inside `explicit` is equivalent to:

```
!is_convertible_v<U, T>
```

22.5.3.3 Destructor

[optional.dtor]

```
constexpr ~optional();
```

1 *Effects:* If `is_trivially_destructible_v<T> != true` and `*this` contains a value, calls

`val->T::~T()`

2 *Remarks:* If `is_trivially_destructible_v<T>` is true, then this destructor is trivial.

22.5.3.4 Assignment

[optional.assign]

`constexpr optional<T>& operator=(nullopt_t) noexcept;`

1 *Effects:* If `*this` contains a value, calls `val->T::~T()` to destroy the contained value; otherwise no effect.

2 *Postconditions:* `*this` does not contain a value.

3 *Returns:* `*this`.

`constexpr optional<T>& operator=(const optional& rhs);`

4 *Effects:* See [Table 58](#).

Table 58: `optional::operator=(const optional&)` effects [tab:optional.assign.copy]

	<code>*this</code> contains a value	<code>*this</code> does not contain a value
<code>rhs</code> contains a value	assigns <code>*rhs</code> to the contained value	direct-non-list-initializes the contained value with <code>*rhs</code>
<code>rhs</code> does not contain a value	destroys the contained value by calling <code>val->T::~T()</code>	no effect

5 *Postconditions:* `rhs.has_value() == this->has_value()`.

6 *Returns:* `*this`.

7 *Remarks:* If any exception is thrown, the result of the expression `this->has_value()` remains unchanged. If an exception is thrown during the call to T's copy constructor, no effect. If an exception is thrown during the call to T's copy assignment, the state of its contained value is as defined by the exception safety guarantee of T's copy assignment. This operator is defined as deleted unless `is_copy_constructible_v<T>` is true and `is_copy_assignable_v<T>` is true. If `is_trivially_copy_constructible_v<T> && is_trivially_copy_assignable_v<T> && is_trivially_destructible_v<T>` is true, this assignment operator is trivial.

`constexpr optional& operator=(optional&& rhs) noexcept(see below);`

8 *Constraints:* `is_move_constructible_v<T>` is true and `is_move_assignable_v<T>` is true.

9 *Effects:* See [Table 59](#). The result of the expression `rhs.has_value()` remains unchanged.

Table 59: `optional::operator=(optional&&)` effects [tab:optional.assign.move]

	<code>*this</code> contains a value	<code>*this</code> does not contain a value
<code>rhs</code> contains a value	assigns <code>std::move(*rhs)</code> to the contained value	direct-non-list-initializes the contained value with <code>std::move(*rhs)</code>
<code>rhs</code> does not contain a value	destroys the contained value by calling <code>val->T::~T()</code>	no effect

10 *Postconditions:* `rhs.has_value() == this->has_value()`.

11 *Returns:* `*this`.

12 *Remarks:* The exception specification is equivalent to:

`is_nothrow_move_assignable_v<T> && is_nothrow_move_constructible_v<T>`

13 If any exception is thrown, the result of the expression `this->has_value()` remains unchanged. If an exception is thrown during the call to T's move constructor, the state of `*rhs.val` is determined by the exception safety guarantee of T's move constructor. If an exception is thrown during the call to T's move

assignment, the state of `*val` and `*rhs.val` is determined by the exception safety guarantee of T's move assignment. If `is_trivially_move_constructible_v<T> && is_trivially_move_assignable_v<T> && is_trivially_destructible_v<T>` is true, this assignment operator is trivial.

```
template<class U = T> constexpr optional<T>& operator=(U&& v);
```

14 *Constraints:* `is_same_v<remove_cvref_t<U>, optional>` is false, `conjunction_v<is_scalar<T>, is_same<T, decay_t<U>>>` is false, `is_constructible_v<T, U>` is true, and `is_assignable_v<T&, U>` is true.

15 *Effects:* If `*this` contains a value, assigns `std::forward<U>(v)` to the contained value; otherwise direct-non-list-initializes the contained value with `std::forward<U>(v)`.

16 *Postconditions:* `*this` contains a value.

17 *Returns:* `*this`.

18 *Remarks:* If any exception is thrown, the result of the expression `this->has_value()` remains unchanged. If an exception is thrown during the call to T's constructor, the state of `v` is determined by the exception safety guarantee of T's constructor. If an exception is thrown during the call to T's assignment, the state of `*val` and `v` is determined by the exception safety guarantee of T's assignment.

```
template<class U> constexpr optional<T>& operator=(const optional<U>& rhs);
```

19 *Constraints:*

- (19.1) — `is_constructible_v<T, const U&>` is true,
- (19.2) — `is_assignable_v<T&, const U&>` is true,
- (19.3) — `converts-from-any-cvref<T, optional<U>>` is false,
- (19.4) — `is_assignable_v<T&, optional<U>&>` is false,
- (19.5) — `is_assignable_v<T&, optional<U>&&>` is false,
- (19.6) — `is_assignable_v<T&, const optional<U>&>` is false, and
- (19.7) — `is_assignable_v<T&, const optional<U>&&>` is false.

20 *Effects:* See [Table 60](#).

Table 60: `optional::operator=(const optional<U>&)` effects [tab(optional.assign.copy.temp)]

	<code>*this</code> contains a value	<code>*this</code> does not contain a value
<code>rhs</code> contains a value	assigns <code>*rhs</code> to the contained value	direct-non-list-initializes the contained value with <code>*rhs</code>
<code>rhs</code> does not contain a value	destroys the contained value by calling <code>val->T::~T()</code>	no effect

21 *Postconditions:* `rhs.has_value() == this->has_value()`.

22 *Returns:* `*this`.

23 *Remarks:* If any exception is thrown, the result of the expression `this->has_value()` remains unchanged. If an exception is thrown during the call to T's constructor, the state of `*rhs.val` is determined by the exception safety guarantee of T's constructor. If an exception is thrown during the call to T's assignment, the state of `*val` and `*rhs.val` is determined by the exception safety guarantee of T's assignment.

```
template<class U> constexpr optional<T>& operator=(optional<U>&& rhs);
```

24 *Constraints:*

- (24.1) — `is_constructible_v<T, U>` is true,
- (24.2) — `is_assignable_v<T&, U>` is true,
- (24.3) — `converts-from-any-cvref<T, optional<U>>` is false,
- (24.4) — `is_assignable_v<T&, optional<U>&>` is false,

- (24.5) — `is_assignable_v<T&, optional<U>&&>` is false,
 (24.6) — `is_assignable_v<T&, const optional<U>&>` is false, and
 (24.7) — `is_assignable_v<T&, const optional<U>&&>` is false.

25 *Effects:* See [Table 61](#). The result of the expression `rhs.has_value()` remains unchanged.

Table 61: `optional::operator=(optional<U>&&)` effects [tab:optional.assign.move.templ]

	<code>*this contains a value</code>	<code>*this does not contain a value</code>
<code>rhs contains a value</code>	assigns <code>std::move(*rhs)</code> to the contained value	direct-non-list-initializes the contained value with <code>std::move(*rhs)</code>
<code>rhs does not contain a value</code>	destroys the contained value by calling <code>val->T::~T()</code>	no effect

26 *Postconditions:* `rhs.has_value() == this->has_value()`.

27 *Returns:* `*this`.

28 *Remarks:* If any exception is thrown, the result of the expression `this->has_value()` remains unchanged. If an exception is thrown during the call to T's constructor, the state of `*rhs.val` is determined by the exception safety guarantee of T's constructor. If an exception is thrown during the call to T's assignment, the state of `*val` and `*rhs.val` is determined by the exception safety guarantee of T's assignment.

template<class... Args> constexpr T& emplace(Args&&... args);

29 *Mandates:* `is_constructible_v<T, Args...>` is true.

30 *Effects:* Calls `*this = nullopt`. Then direct-non-list-initializes the contained value with `std::forward<Args>(args)....`

31 *Postconditions:* `*this` contains a value.

32 *Returns:* A reference to the new contained value.

33 *Throws:* Any exception thrown by the selected constructor of T.

34 *Remarks:* If an exception is thrown during the call to T's constructor, `*this` does not contain a value, and the previous `*val` (if any) has been destroyed.

template<class U, class... Args> constexpr T& emplace(initializer_list<U> il, Args&&... args);

35 *Constraints:* `is_constructible_v<T, initializer_list<U>&, Args...>` is true.

36 *Effects:* Calls `*this = nullopt`. Then direct-non-list-initializes the contained value with `il, std::forward<Args>(args)....`

37 *Postconditions:* `*this` contains a value.

38 *Returns:* A reference to the new contained value.

39 *Throws:* Any exception thrown by the selected constructor of T.

40 *Remarks:* If an exception is thrown during the call to T's constructor, `*this` does not contain a value, and the previous `*val` (if any) has been destroyed.

22.5.3.5 Swap

[[optional.swap](#)]

constexpr void swap(optional& rhs) noexcept(*see below*);

1 *Mandates:* `is_move_constructible_v<T>` is true.

2 *Preconditions:* T meets the Cpp17Swappable requirements ([16.4.4.3](#)).

3 *Effects:* See [Table 62](#).

4 *Throws:* Any exceptions thrown by the operations in the relevant part of [Table 62](#).

5 *Remarks:* The exception specification is equivalent to:

Table 62: optional::swap(optional&) effects [tab:optional.swap]

	*this contains a value	*this does not contain a value
rhs contains a value	calls swap(*(*this), *rhs)	direct-non-list-initializes the contained value of *this with std::move(*rhs), followed by rhs.val->T::~T(); postcondition is that *this contains a value and rhs does not contain a value
rhs does not contain a value	direct-non-list-initializes the contained value of rhs with std::move(*(*this)), followed by val->T::~T(); postcondition is that *this does not contain a value and rhs contains a value	no effect

`is_nothrow_move_constructible_v<T> && is_nothrow_swappable_v<T>`

6 If any exception is thrown, the results of the expressions `this->has_value()` and `rhs.has_value()` remain unchanged. If an exception is thrown during the call to function `swap`, the state of `*val` and `*rhs.val` is determined by the exception safety guarantee of `swap` for lvalues of `T`. If an exception is thrown during the call to `T`'s move constructor, the state of `*val` and `*rhs.val` is determined by the exception safety guarantee of `T`'s move constructor.

22.5.3.6 Observers

[optional.observe]

`constexpr const T* operator->() const noexcept;`
`constexpr T* operator->() noexcept;`

1 *Preconditions:* *this contains a value.

2 *Returns:* `val`.

3 *Remarks:* These functions are `constexpr` functions.

`constexpr const T& operator*() const & noexcept;`
`constexpr T& operator*() & noexcept;`

4 *Preconditions:* *this contains a value.

5 *Returns:* `*val`.

6 *Remarks:* These functions are `constexpr` functions.

`constexpr T&& operator*() && noexcept;`
`constexpr const T&& operator*() const && noexcept;`

7 *Preconditions:* *this contains a value.

8 *Effects:* Equivalent to: `return std::move(*val);`

`constexpr explicit operator bool() const noexcept;`

9 *Returns:* `true` if and only if *this contains a value.

10 *Remarks:* This function is a `constexpr` function.

`constexpr bool has_value() const noexcept;`

11 *Returns:* `true` if and only if *this contains a value.

12 *Remarks:* This function is a `constexpr` function.

`constexpr const T& value() const &;`

```

constexpr T& value() &;
13   Effects: Equivalent to:
      return has_value() ? *val : throw bad_optional_access();

constexpr T&& value() &&;
constexpr const T&& value() const &&;
14   Effects: Equivalent to:
      return has_value() ? std::move(*val) : throw bad_optional_access();

template<class U> constexpr T value_or(U&& v) const &;
15   Mandates: is_copy_constructible_v<T> && is_convertible_v<U&&, T> is true.
16   Effects: Equivalent to:
      return has_value() ? **this : static_cast<T>(std::forward<U>(v));

template<class U> constexpr T value_or(U&& v) &&;
17   Mandates: is_move_constructible_v<T> && is_convertible_v<U&&, T> is true.
18   Effects: Equivalent to:
      return has_value() ? std::move(**this) : static_cast<T>(std::forward<U>(v));

```

22.5.3.7 Monadic operations

[optional.monadic]

```

template<class F> constexpr auto and_then(F&& f) &;
template<class F> constexpr auto and_then(F&& f) const &;
1   Let U be invoke_result_t<F, decltype(value())>.
2   Mandates: remove_cvref_t<U> is a specialization of optional.
3   Effects: Equivalent to:
      if (*this) {
          return invoke(std::forward<F>(f), value());
      } else {
          return remove_cvref_t<U>();
      }

template<class F> constexpr auto and_then(F&& f) &&;
template<class F> constexpr auto and_then(F&& f) const &&;
4   Let U be invoke_result_t<F, decltype(std::move(value()))>.
5   Mandates: remove_cvref_t<U> is a specialization of optional.
6   Effects: Equivalent to:
      if (*this) {
          return invoke(std::forward<F>(f), std::move(value()));
      } else {
          return remove_cvref_t<U>();
      }

template<class F> constexpr auto transform(F&& f) &;
template<class F> constexpr auto transform(F&& f) const &;
7   Let U be remove_cv_t<invoke_result_t<F, decltype(value())>>.
8   Mandates: U is a non-array object type other than in_place_t or nullopt_t. The declaration
      U u(invoke(std::forward<F>(f), value()));
is well-formed for some invented variable u.

NOTE 1: There is no requirement that U is movable (9.4.1).

9   Returns: If *this contains a value, an optional<U> object whose contained value is direct-non-list-
initialized with invoke(std::forward<F>(f), value()); otherwise, optional<U>().

```

```

template<class F> constexpr auto transform(F&& f) &&;
template<class F> constexpr auto transform(F&& f) const &&;
10   Let U be remove_cv_t<invoke_result_t<F, decltype(std::move(value()))>>.
11   Mandates: U is a non-array object type other than in_place_t or nullopt_t. The declaration
      U u(invoker(std::forward<F>(f), std::move(value())));
is well-formed for some invented variable u.
NOTE 2: There is no requirement that U is movable (9.4.1).
12   Returns: If *this contains a value, an optional<U> object whose contained value is direct-non-list-
initialized with invoker(std::forward<F>(f), std::move(value())); otherwise, optional<U>().
template<class F> constexpr optional or_else(F&& f) const &;
13   Constraints: F models invocable<> and T models copy_constructible.
14   Mandates: is_same_v<remove_cvref_t<invoke_result_t<F>>, optional> is true.
15   Effects: Equivalent to:
      if (*this) {
          return *this;
      } else {
          return std::forward<F>(f)();
      }

template<class F> constexpr optional or_else(F&& f) &&;
16   Constraints: F models invocable<> and T models move_constructible.
17   Mandates: is_same_v<remove_cvref_t<invoke_result_t<F>>, optional> is true.
18   Effects: Equivalent to:
      if (*this) {
          return std::move(*this);
      } else {
          return std::forward<F>(f)();
      }

```

22.5.3.8 Modifiers

[optional.mod]

```
constexpr void reset() noexcept;
```

- Effects:* If *this contains a value, calls val->T::~T() to destroy the contained value; otherwise no effect.
- Postconditions:* *this does not contain a value.

22.5.4 No-value state indicator

[optional.nullopt]

```
struct nullopt_t{see below;};
inline constexpr nullopt_t nullopt(unspecified);
```

- The struct nullopt_t is an empty class type used as a unique type to indicate the state of not containing a value for optional objects. In particular, optional<T> has a constructor with nullopt_t as a single argument; this indicates that an optional object not containing a value shall be constructed.
- Type nullopt_t shall not have a default constructor or an initializer-list constructor, and shall not be an aggregate.

22.5.5 Class bad_optional_access

[optional.bad.access]

```
namespace std {
    class bad_optional_access : public exception {
    public:
        // see 17.9.3 for the specification of the special member functions
        const char* what() const noexcept override;
    };
}
```

- ¹ The class `bad_optional_access` defines the type of objects thrown as exceptions to report the situation where an attempt is made to access the value of an optional object that does not contain a value.

```
const char* what() const noexcept override;
```

- ² *Returns:* An implementation-defined NTBS.

22.5.6 Relational operators

[optional.relops]

```
template<class T, class U> constexpr bool operator==(const optional<T>& x, const optional<U>& y);
```

- ¹ *Mandates:* The expression `*x == *y` is well-formed and its result is convertible to `bool`.

NOTE: `T` need not be *Cpp17EqualityComparable*.

- ² *Returns:* If `x.has_value() != y.has_value()`, `false`; otherwise if `x.has_value() == false`, `true`; otherwise `*x == *y`.

- ³ *Remarks:* Specializations of this function template for which `*x == *y` is a core constant expression are `constexpr` functions.

```
template<class T, class U> constexpr bool operator!=(const optional<T>& x, const optional<U>& y);
```

- ⁴ *Mandates:* The expression `*x != *y` is well-formed and its result is convertible to `bool`.

Returns: If `x.has_value() != y.has_value()`, `true`; otherwise, if `x.has_value() == false`, `false`; otherwise `*x != *y`.

- ⁶ *Remarks:* Specializations of this function template for which `*x != *y` is a core constant expression are `constexpr` functions.

```
template<class T, class U> constexpr bool operator<(const optional<T>& x, const optional<U>& y);
```

- ⁷ *Mandates:* `*x < *y` is well-formed and its result is convertible to `bool`.

Returns: If `!y`, `false`; otherwise, if `!x`, `true`; otherwise `*x < *y`.

- ⁹ *Remarks:* Specializations of this function template for which `*x < *y` is a core constant expression are `constexpr` functions.

```
template<class T, class U> constexpr bool operator>(const optional<T>& x, const optional<U>& y);
```

- ¹⁰ *Mandates:* The expression `*x > *y` is well-formed and its result is convertible to `bool`.

Returns: If `!x`, `false`; otherwise, if `!y`, `true`; otherwise `*x > *y`.

- ¹² *Remarks:* Specializations of this function template for which `*x > *y` is a core constant expression are `constexpr` functions.

```
template<class T, class U> constexpr bool operator<=(const optional<T>& x, const optional<U>& y);
```

- ¹³ *Mandates:* The expression `*x <= *y` is well-formed and its result is convertible to `bool`.

Returns: If `!x`, `true`; otherwise, if `!y`, `false`; otherwise `*x <= *y`.

- ¹⁵ *Remarks:* Specializations of this function template for which `*x <= *y` is a core constant expression are `constexpr` functions.

```
template<class T, class U> constexpr bool operator>=(const optional<T>& x, const optional<U>& y);
```

- ¹⁶ *Mandates:* The expression `*x >= *y` is well-formed and its result is convertible to `bool`.

Returns: If `!y`, `true`; otherwise, if `!x`, `false`; otherwise `*x >= *y`.

- ¹⁸ *Remarks:* Specializations of this function template for which `*x >= *y` is a core constant expression are `constexpr` functions.

```
template<class T, three_way_comparable_with<T> U>
constexpr compare_three_way_result_t<T, U>
operator<=>(const optional<T>& x, const optional<U>& y);
```

- ¹⁹ *Returns:* If `x && y`, `*x <= *y`; otherwise `x.has_value() <= y.has_value()`.

- ²⁰ *Remarks:* Specializations of this function template for which `*x <= *y` is a core constant expression are `constexpr` functions.

22.5.7 Comparison with nullopt

[optional.nullops]

```
template<class T> constexpr bool operator==(const optional<T>& x, nullopt_t) noexcept;
1   Returns: !x.

template<class T> constexpr strong_ordering operator<=(const optional<T>& x, nullopt_t) noexcept;
2   Returns: x.has_value() <= false.
```

22.5.8 Comparison with T

[optional.comp.with.t]

```
template<class T, class U> constexpr bool operator==(const optional<T>& x, const U& v);
```

1 Mandates: The expression $*x == v$ is well-formed and its result is convertible to `bool`.

NOTE: T need not be *Cpp17EqualityComparable*.

2 Effects: Equivalent to: `return x.has_value() ? *x == v : false;`

```
template<class T, class U> constexpr bool operator==(const T& v, const optional<U>& x);
```

3 Mandates: The expression $v == *x$ is well-formed and its result is convertible to `bool`.

4 Effects: Equivalent to: `return x.has_value() ? v == *x : false;`

```
template<class T, class U> constexpr bool operator!=(const optional<T>& x, const U& v);
```

5 Mandates: The expression $*x != v$ is well-formed and its result is convertible to `bool`.

6 Effects: Equivalent to: `return x.has_value() ? *x != v : true;`

```
template<class T, class U> constexpr bool operator!=(const T& v, const optional<U>& x);
```

7 Mandates: The expression $v != *x$ is well-formed and its result is convertible to `bool`.

8 Effects: Equivalent to: `return x.has_value() ? v != *x : true;`

```
template<class T, class U> constexpr bool operator<(const optional<T>& x, const U& v);
```

9 Mandates: The expression $*x < v$ is well-formed and its result is convertible to `bool`.

10 Effects: Equivalent to: `return x.has_value() ? *x < v : true;`

```
template<class T, class U> constexpr bool operator<(const T& v, const optional<U>& x);
```

11 Mandates: The expression $v < *x$ is well-formed and its result is convertible to `bool`.

12 Effects: Equivalent to: `return x.has_value() ? v < *x : false;`

```
template<class T, class U> constexpr bool operator>(const optional<T>& x, const U& v);
```

13 Mandates: The expression $*x > v$ is well-formed and its result is convertible to `bool`.

14 Effects: Equivalent to: `return x.has_value() ? *x > v : false;`

```
template<class T, class U> constexpr bool operator>(const T& v, const optional<U>& x);
```

15 Mandates: The expression $v > *x$ is well-formed and its result is convertible to `bool`.

16 Effects: Equivalent to: `return x.has_value() ? v > *x : true;`

```
template<class T, class U> constexpr bool operator<=(const optional<T>& x, const U& v);
```

17 Mandates: The expression $*x <= v$ is well-formed and its result is convertible to `bool`.

18 Effects: Equivalent to: `return x.has_value() ? *x <= v : true;`

```
template<class T, class U> constexpr bool operator<=(const T& v, const optional<U>& x);
```

19 Mandates: The expression $v <= *x$ is well-formed and its result is convertible to `bool`.

20 Effects: Equivalent to: `return x.has_value() ? v <= *x : false;`

```
template<class T, class U> constexpr bool operator>=(const optional<T>& x, const U& v);
```

21 Mandates: The expression $*x >= v$ is well-formed and its result is convertible to `bool`.

22 Effects: Equivalent to: `return x.has_value() ? *x >= v : false;`

```

template<class T, class U> constexpr bool operator>=(const T& v, const optional<U>& x);
23   Mandates: The expression v >= *x is well-formed and its result is convertible to bool.
24   Effects: Equivalent to: return x.has_value() ? v >= *x : true;

template<class T, class U>
    requires (!is-derived-from-optional<U>) && three_way_comparable_with<T, U>
constexpr compare_three_way_result_t<T, U>
    operator<=>(const optional<T>& x, const U& v);
25   Effects: Equivalent to: return x.has_value() ? *x <= v : strong_ordering::less;

```

22.5.9 Specialized algorithms

[optional.specalg]

```

template<class T>
constexpr void swap(optional<T>& x, optional<T>& y) noexcept(noexcept(x.swap(y)));

```

1 Constraints: `is_move_constructible_v<T>` is true and `is_swappable_v<T>` is true.

2 Effects: Calls `x.swap(y)`.

```

template<class T> constexpr optional<decay_t<T>> make_optional(T&& v);

```

3 Returns: `optional<decay_t<T>>(std::forward<T>(v))`.

```

template<class T, class... Args>
constexpr optional<T> make_optional(Args&&... args);

```

4 Effects: Equivalent to: `return optional<T>(in_place, std::forward<Args>(args)...);`

```

template<class T, class U, class... Args>
constexpr optional<T> make_optional(initializer_list<U> il, Args&&... args);

```

5 Effects: Equivalent to: `return optional<T>(in_place, il, std::forward<Args>(args)...);`

22.5.10 Hash support

[optional.hash]

```

template<class T> struct hash<optional<T>>;

```

1 The specialization `hash<optional<T>>` is enabled (22.10.19) if and only if `hash<remove_const_t<T>>` is enabled. When enabled, for an object `o` of type `optional<T>`, if `o.has_value() == true`, then `hash<optional<T>>()(o)` evaluates to the same value as `hash<remove_const_t<T>>()(o)`; otherwise it evaluates to an unspecified value. The member functions are not guaranteed to be `noexcept`.

22.6 Variants

[variant]

22.6.1 In general

[variant.general]

1 A variant object holds and manages the lifetime of a value. If the variant holds a value, that value's type has to be one of the template argument types given to variant. These template arguments are called alternatives.

22.6.2 Header <variant> synopsis

[variant.syn]

```

#include <compare> // see 17.11.1

namespace std {
    // 22.6.3, class template variant
    template<class... Types>
        class variant;

    // 22.6.4, variant helper classes
    template<class T> struct variant_size; // not defined
    template<class T> struct variant_size<const T>;
    template<class T>
        constexpr size_t variant_size_v = variant_size<T>::value;

    template<class... Types>
        struct variant_size<variant<Types...>>;
}

```

```

        constexpr variant& operator=(const variant&);
        constexpr variant& operator=(variant&&) noexcept(see below);

        template<class T> constexpr variant& operator=(T&&) noexcept(see below);

        // 22.6.3.5, modifiers
        template<class T, class... Args>
            constexpr T& emplace(Args&&...);
}

```

```

template<class T, class U, class... Args>
    constexpr T& emplace(initializer_list<U>, Args&&...);
template<size_t I, class... Args>
    constexpr variant_alternative_t<I, variant<Types...>>& emplace(Args&&...);
template<size_t I, class U, class... Args>
    constexpr variant_alternative_t<I, variant<Types...>>&
        emplace(initializer_list<U>, Args&&...);

// 22.6.3.6, value status
constexpr bool valueless_by_exception() const noexcept;
constexpr size_t index() const noexcept;

// 22.6.3.7, swap
constexpr void swap(variant&) noexcept(see below);
};

}

```

- 1 Any instance of **variant** at any given time either holds a value of one of its alternative types or holds no value. When an instance of **variant** holds a value of alternative type **T**, it means that a value of type **T**, referred to as the **variant** object's *contained value*, is allocated within the storage of the **variant** object. Implementations are not permitted to use additional storage, such as dynamic memory, to allocate the contained value.
- 2 All types in **Types** shall meet the *Cpp17Destructible* requirements (Table 35).
- 3 A program that instantiates the definition of **variant** with no template arguments is ill-formed.

22.6.3.2 Constructors

[**variant.ctor**]

- 1 In the descriptions that follow, let *i* be in the range [0, **sizeof...**(**Types**)), and **T_i** be the *i*th type in **Types**.

constexpr variant() noexcept(see below);

- 2 *Constraints*: **is_default_constructible_v<T₀>** is **true**.

- 3 *Effects*: Constructs a **variant** holding a value-initialized value of type **T₀**.

- 4 *Postconditions*: **valueless_by_exception()** is **false** and **index()** is 0.

- 5 *Throws*: Any exception thrown by the value-initialization of **T₀**.

- 6 *Remarks*: This function is **constexpr** if and only if the value-initialization of the alternative type **T₀** would be **constexpr**-suitable (9.2.6). The exception specification is equivalent to **is_nothrow_default_constructible_v<T₀>**.

NOTE 1: See also class **monostate**.

constexpr variant(const variant& w);

- 7 *Effects*: If **w** holds a value, initializes the **variant** to hold the same alternative as **w** and direct-initializes the contained value with **get<j>(w)**, where *j* is **w.index()**. Otherwise, initializes the **variant** to not hold a value.

- 8 *Throws*: Any exception thrown by direct-initializing any **T_i** for all *i*.

- 9 *Remarks*: This constructor is defined as deleted unless **is_copy_constructible_v<T_i>** is **true** for all *i*. If **is_trivially_copy_constructible_v<T_i>** is **true** for all *i*, this constructor is trivial.

constexpr variant(variant&& w) noexcept(see below);

- 10 *Constraints*: **is_move_constructible_v<T_i>** is **true** for all *i*.

- 11 *Effects*: If **w** holds a value, initializes the **variant** to hold the same alternative as **w** and direct-initializes the contained value with **get<j>(std::move(w))**, where *j* is **w.index()**. Otherwise, initializes the **variant** to not hold a value.

- 12 *Throws*: Any exception thrown by move-constructing any **T_i** for all *i*.

- 13 *Remarks*: The exception specification is equivalent to the logical AND of **is_nothrow_move_constructible_v<T_i>** for all *i*. If **is_trivially_move_constructible_v<T_i>** is **true** for all *i*, this constructor is trivial.

```
template<class T> constexpr variant(T&& t) noexcept(see below);
```

14 Let T_j be a type that is determined as follows: build an imaginary function $FUN(T_i)$ for each alternative type T_i for which $T_i \ x[] = \{\text{std}::\text{forward}\langle T\rangle(t)\}$; is well-formed for some invented variable x . The overload $FUN(T_j)$ selected by overload resolution for the expression $FUN(\text{std}::\text{forward}\langle T\rangle(t))$ defines the alternative T_j which is the type of the contained value after construction.

15 *Constraints:*

- (15.1) — `sizeof... (Types)` is nonzero,
- (15.2) — `is_same_v<remove_cvref_t<T>, variant>` is `false`,
- (15.3) — `remove_cvref_t<T>` is neither a specialization of `in_place_type_t` nor a specialization of `in_place_index_t`,
- (15.4) — `is_constructible_v<Tj, T>` is `true`, and
- (15.5) — the expression $FUN(\text{std}::\text{forward}\langle T\rangle(t))$ (with FUN being the above-mentioned set of imaginary functions) is well-formed.

NOTE 2:

```
variant<string, string> v("abc");
```

is ill-formed, as both alternative types have an equally viable constructor for the argument.

16 *Effects:* Initializes `*this` to hold the alternative type T_j and direct-non-list-initializes the contained value with $\text{std}::\text{forward}\langle T\rangle(t)$.

17 *Postconditions:* `holds_alternative<Tj>(*this)` is `true`.

18 *Throws:* Any exception thrown by the initialization of the selected alternative T_j .

19 *Remarks:* The exception specification is equivalent to `is_nothrow_constructible_v<Tj, T>`. If T_j 's selected constructor is a `constexpr` constructor, this constructor is a `constexpr` constructor.

```
template<class T, class... Args> constexpr explicit variant(in_place_type_t<T>, Args&&... args);
```

20 *Constraints:*

- (20.1) — There is exactly one occurrence of T in `Types...` and
- (20.2) — `is_constructible_v<T, Args...>` is `true`.

21 *Effects:* Direct-non-list-initializes the contained value of type T with $\text{std}::\text{forward}\langle \text{Args}\rangle(\text{args})\dots$

22 *Postconditions:* `holds_alternative<T>(*this)` is `true`.

23 *Throws:* Any exception thrown by calling the selected constructor of T .

24 *Remarks:* If T 's selected constructor is a `constexpr` constructor, this constructor is a `constexpr` constructor.

```
template<class T, class U, class... Args>
constexpr explicit variant(in_place_type_t<T>, initializer_list<U> il, Args&&... args);
```

25 *Constraints:*

- (25.1) — There is exactly one occurrence of T in `Types...` and
- (25.2) — `is_constructible_v<T, initializer_list<U>&, Args...>` is `true`.

26 *Effects:* Direct-non-list-initializes the contained value of type T with `il, std::forward<Args>(args)....`

27 *Postconditions:* `holds_alternative<T>(*this)` is `true`.

28 *Throws:* Any exception thrown by calling the selected constructor of T .

29 *Remarks:* If T 's selected constructor is a `constexpr` constructor, this constructor is a `constexpr` constructor.

```
template<size_t I, class... Args> constexpr explicit variant(in_place_index_t<I>, Args&&... args);
```

30 *Constraints:*

- (30.1) — I is less than `sizeof... (Types)` and
- (30.2) — `is_constructible_v<TI, Args...>` is `true`.

31 *Effects:* Direct-non-list-initializes the contained value of type T_I with `std::forward<Args>(args)....`
 32 *Postconditions:* `index()` is I .
 33 *Throws:* Any exception thrown by calling the selected constructor of T_I .
 34 *Remarks:* If T_I 's selected constructor is a `constexpr` constructor, this constructor is a `constexpr` constructor.

```
template<size_t I, class U, class... Args>
constexpr explicit variant(in_place_index_t<I>, initializer_list<U> il, Args&&... args);
```

35 *Constraints:*

- (35.1) — I is less than `sizeof...(Types)` and
- (35.2) — `is_constructible_v<T_I, initializer_list<U>&, Args...>` is `true`.

36 *Effects:* Direct-non-list-initializes the contained value of type T_I with `il`, `std::forward<Args>(args)....`
 37 *Postconditions:* `index()` is I .
 38 *Remarks:* If T_I 's selected constructor is a `constexpr` constructor, this constructor is a `constexpr` constructor.

22.6.3.3 Destructor

[variant.dtor]

```
constexpr ~variant();
```

1 *Effects:* If `valueless_by_exception()` is `false`, destroys the currently contained value.

2 *Remarks:* If `is_trivially_destructible_v<T_i>` is `true` for all T_i , then this destructor is trivial.

22.6.3.4 Assignment

[variant.assign]

```
constexpr variant& operator=(const variant& rhs);
```

1 Let j be `rhs.index()`.

2 *Effects:*

- (2.1) — If neither `*this` nor `rhs` holds a value, there is no effect.
- (2.2) — Otherwise, if `*this` holds a value but `rhs` does not, destroys the value contained in `*this` and sets `*this` to not hold a value.
- (2.3) — Otherwise, if `index() == j`, assigns the value contained in `rhs` to the value contained in `*this`.
- (2.4) — Otherwise, if either `is_nothrow_copy_constructible_v<T_j>` is `true` or `is_nothrow_move_constructible_v<T_j>` is `false`, equivalent to `emplace<j>(get<j>(rhs))`.
- (2.5) — Otherwise, equivalent to `operator=(variant(rhs))`.

3 *Postconditions:* `index() == rhs.index()`.

4 *Returns:* `*this`.

5 *Remarks:* This operator is defined as deleted unless `is_copy_constructible_v<T_i> && is_copy_assignable_v<T_i>` is `true` for all i . If `is_trivially_copy_constructible_v<T_i> && is_trivially_copy_assignable_v<T_i>` && `is_trivially_destructible_v<T_i>` is `true` for all i , this assignment operator is trivial.

```
constexpr variant& operator=(variant&& rhs) noexcept(see below);
```

6 Let j be `rhs.index()`.

7 *Constraints:* `is_move_constructible_v<T_i> && is_move_assignable_v<T_i>` is `true` for all i .

8 *Effects:*

- (8.1) — If neither `*this` nor `rhs` holds a value, there is no effect.
- (8.2) — Otherwise, if `*this` holds a value but `rhs` does not, destroys the value contained in `*this` and sets `*this` to not hold a value.
- (8.3) — Otherwise, if `index() == j`, assigns `get<j>(std::move(rhs))` to the value contained in `*this`.
- (8.4) — Otherwise, equivalent to `emplace<j>(get<j>(std::move(rhs)))`.

9 >Returns: `*this`.

10 Remarks: If `is_trivially_move_constructible_v<Ti>` && `is_trivially_move_assignable_v<Ti>` && `is_trivially_destructible_v<Ti>` is true for all *i*, this assignment operator is trivial. The exception specification is equivalent to `is_nothrow_move_constructible_v<Ti>` && `is_nothrow_move_assignable_v<Ti>` for all *i*.

(10.1) — If an exception is thrown during the call to T_j 's move construction (with *j* being `rhs.index()`), the `variant` will hold no value.

(10.2) — If an exception is thrown during the call to T_j 's move assignment, the state of the contained value is as defined by the exception safety guarantee of T_j 's move assignment; `index()` will be *j*.

```
template<class T> constexpr variant& operator=(T&& t) noexcept(see below);
```

11 Let T_j be a type that is determined as follows: build an imaginary function `FUN(Ti)` for each alternative type T_i for which T_i `x[] = {std::forward<T>(t)}`; is well-formed for some invented variable `x`. The overload `FUN(Tj)` selected by overload resolution for the expression `FUN(std::forward<T>(t))` defines the alternative T_j which is the type of the contained value after assignment.

12 Constraints:

(12.1) — `is_same_v<remove_cvref_t<T>, variant>` is `false`,

(12.2) — `is_assignable_v<Tj&, T>` && `is_constructible_v<Tj, T>` is `true`, and

(12.3) — the expression `FUN(std::forward<T>(t))` (with `FUN` being the above-mentioned set of imaginary functions) is well-formed.

NOTE:

```
variant<string, string> v;
v = "abc";
```

is ill-formed, as both alternative types have an equally viable constructor for the argument.

13 Effects:

(13.1) — If `*this` holds a T_j , assigns `std::forward<T>(t)` to the value contained in `*this`.

(13.2) — Otherwise, if `is_nothrow_constructible_v<Tj, T>` || `!is_nothrow_move_constructible_v<Tj>` is `true`, equivalent to `emplace<j>(std::forward<T>(t))`.

(13.3) — Otherwise, equivalent to `emplace<j>(Tj(std::forward<T>(t)))`.

14 Postconditions: `holds_alternative<Tj is true, with T_j selected by the imaginary function overload resolution described above.`

15 Returns: `*this`.

16 Remarks: The exception specification is equivalent to:

```
is_nothrow_assignable_v<Tj&, T> && is_nothrow_constructible_v<Tj, T>
```

(16.1) — If an exception is thrown during the assignment of `std::forward<T>(t)` to the value contained in `*this`, the state of the contained value and `t` are as defined by the exception safety guarantee of the assignment expression; `valueless_by_exception()` will be `false`.

(16.2) — If an exception is thrown during the initialization of the contained value, the `variant` object is permitted to not hold a value.

22.6.3.5 Modifiers

[variant.mod]

```
template<class T, class... Args> constexpr T& emplace(Args&&... args);
```

1 Constraints: `is_constructible_v<T, Args...>` is `true`, and `T` occurs exactly once in `Types`.

2 Effects: Equivalent to:

```
return emplace<I>(std::forward<Args>(args)...);
```

where *I* is the zero-based index of `T` in `Types`.

```
template<class T, class U, class... Args>
```

`constexpr T& emplace(initializer_list<U> il, Args&&... args);`

3 *Constraints:* `is_constructible_v<T, initializer_list<U>&, Args...>` is `true`, and `T` occurs exactly once in `Types`.

4 *Effects:* Equivalent to:

```
    return emplace<I>(il, std::forward<Args>(args)...);
```

where `I` is the zero-based index of `T` in `Types`.

`template<size_t I, class... Args>`
`constexpr variant_alternative_t<I, variant<Types...>>& emplace(Args&&... args);`

5 *Mandates:* `I < sizeof...(Types)`.

6 *Constraints:* `is_constructible_v<T_I, Args...>` is `true`.

7 *Effects:* Destroys the currently contained value if `valueless_by_exception()` is `false`. Then direct-non-list-initializes the contained value of type `T_I` with the arguments `std::forward<Args>(args)...`.

8 *Postconditions:* `index() is I`.

9 *Returns:* A reference to the new contained value.

10 *Throws:* Any exception thrown during the initialization of the contained value.

11 *Remarks:* If an exception is thrown during the initialization of the contained value, the `variant` is permitted to not hold a value.

`template<size_t I, class U, class... Args>`
`constexpr variant_alternative_t<I, variant<Types...>>&`
`emplace(initializer_list<U> il, Args&&... args);`

12 *Mandates:* `I < sizeof...(Types)`.

13 *Constraints:* `is_constructible_v<T_I, initializer_list<U>&, Args...>` is `true`.

14 *Effects:* Destroys the currently contained value if `valueless_by_exception()` is `false`. Then direct-non-list-initializes the contained value of type `T_I` with `il, std::forward<Args>(args)...`.

15 *Postconditions:* `index() is I`.

16 *Returns:* A reference to the new contained value.

17 *Throws:* Any exception thrown during the initialization of the contained value.

18 *Remarks:* If an exception is thrown during the initialization of the contained value, the `variant` is permitted to not hold a value.

22.6.3.6 Value status

[variant.status]

`constexpr bool valueless_by_exception() const noexcept;`

1 *Effects:* Returns `false` if and only if the `variant` holds a value.

2 *NOTE:* It is possible for a `variant` to hold no value if an exception is thrown during a type-changing assignment or emplacement. The latter means that even a `variant<float, int>` can become `valueless_by_exception()`, for instance by

```
struct S { operator int() { throw 42; } };
variant<float, int> v{12.f};
v.emplace<1>(S());
```

`constexpr size_t index() const noexcept;`

3 *Effects:* If `valueless_by_exception()` is `true`, returns `variant_npos`. Otherwise, returns the zero-based index of the alternative of the contained value.

22.6.3.7 Swap

[variant.swap]

`constexpr void swap(variant& rhs) noexcept(see below);`

1 *Mandates:* `is_move_constructible_v<T_i>` is `true` for all `i`.

2 *Preconditions:* Each `T_i` meets the *Cpp17Swappable* requirements (16.4.4.3).

3 *Effects:*

- (3.1) — If `valueless_by_exception() && rhs.valueless_by_exception()` no effect.
- (3.2) — Otherwise, if `index() == rhs.index()`, calls `swap(get<i>(*this), get<i>(rhs))` where i is `index()`.
- (3.3) — Otherwise, exchanges values of `rhs` and `*this`.
- 4 *Throws:* If `index() == rhs.index()`, any exception thrown by `swap(get<i>(*this), get<i>(rhs))` with i being `index()`. Otherwise, any exception thrown by the move constructor of T_i or T_j with i being `index()` and j being `rhs.index()`.
- 5 *Remarks:* If an exception is thrown during the call to function `swap(get<i>(*this), get<i>(rhs))`, the states of the contained values of `*this` and of `rhs` are determined by the exception safety guarantee of `swap` for lvalues of T_i with i being `index()`. If an exception is thrown during the exchange of the values of `*this` and `rhs`, the states of the values of `*this` and of `rhs` are determined by the exception safety guarantee of `variant`'s move constructor. The exception specification is equivalent to the logical AND of `is_nothrow_move_constructible_v<Ti> && is_nothrow_swappable_v<Ti>` for all i .

22.6.4 variant helper classes

[**variant.helper**]

```
template<class T> struct variant_size;
```

- 1 All specializations of `variant_size` meet the *Cpp17UnaryTypeTrait* requirements (21.3.2) with a base characteristic of `integral_constant<size_t, N>` for some N .

```
template<class T> struct variant_size<const T>;
```

- 2 Let VS denote `variant_size<T>` of the cv-unqualified type T . Then each specialization of the template meets the *Cpp17UnaryTypeTrait* requirements (21.3.2) with a base characteristic of `integral_constant<size_t, VS::value>`.

```
template<class... Types>
struct variant_size<variant<Types...>> : integral_constant<size_t, sizeof...(Types)> { };
```

```
template<size_t I, class T> struct variant_alternative<I, const T>;
```

- 3 Let VA denote `variant_alternative<I, T>` of the cv-unqualified type T . Then each specialization of the template meets the *Cpp17TransformationTrait* requirements (21.3.2) with a member `typedef type` that names the type `add_const_t<VA::type>`.

```
variant_alternative<I, variant<Types...>>::type
```

- 4 *Mandates:* $I < \text{sizeof...}(Types)$.

- 5 *Type:* The type T_I .

22.6.5 Value access

[**variant.get**]

```
template<class T, class... Types>
constexpr bool holds_alternative(const variant<Types...>& v) noexcept;
```

- 1 *Mandates:* The type T occurs exactly once in $Types$.

- 2 *Returns:* `true` if `index()` is equal to the zero-based index of T in $Types$.

```
template<size_t I, class... Types>
```

```
constexpr variant_alternative_t<I, variant<Types...>>& get(variant<Types...>& v);
```

```
template<size_t I, class... Types>
```

```
constexpr variant_alternative_t<I, variant<Types...>>&& get(variant<Types...>&& v);
```

```
template<size_t I, class... Types>
```

```
constexpr const variant_alternative_t<I, variant<Types...>>& get(const variant<Types...>& v);
```

```
template<size_t I, class... Types>
```

```
constexpr const variant_alternative_t<I, variant<Types...>>&& get(const variant<Types...>&& v);
```

- 3 *Mandates:* $I < \text{sizeof...}(Types)$.

- 4 *Effects:* If `v.index()` is I , returns a reference to the object stored in the `variant`. Otherwise, throws an exception of type `bad_variant_access`.

```

template<class T, class... Types> constexpr T& get(variant<Types...>& v);
template<class T, class... Types> constexpr T&& get(variant<Types...>&& v);
template<class T, class... Types> constexpr const T& get(const variant<Types...>& v);
template<class T, class... Types> constexpr const T&& get(const variant<Types...>&& v);

5   Mandates: The type T occurs exactly once in Types.
6   Effects: If v holds a value of type T, returns a reference to that value. Otherwise, throws an exception
     of type bad_variant_access.

template<size_t I, class... Types>
  constexpr add_pointer_t<variant_alternative_t<I, variant<Types...>>>
    get_if(variant<Types...>* v) noexcept;
template<size_t I, class... Types>
  constexpr add_pointer_t<const variant_alternative_t<I, variant<Types...>>>
    get_if(const variant<Types...>* v) noexcept;

7   Mandates: I < sizeof...(Types).
8   Returns: A pointer to the value stored in the variant, if v != nullptr and v->index() == I.
     Otherwise, returns nullptr.

template<class T, class... Types>
  constexpr add_pointer_t<T>
    get_if(variant<Types...>* v) noexcept;
template<class T, class... Types>
  constexpr add_pointer_t<const T>
    get_if(const variant<Types...>* v) noexcept;

9   Mandates: The type T occurs exactly once in Types.
10  Effects: Equivalent to: return get_if<i>(v); with i being the zero-based index of T in Types.

```

22.6.6 Relational operators

[`variant.relops`]

```

template<class... Types>
  constexpr bool operator==(const variant<Types...>& v, const variant<Types...>& w);

1   Mandates: get<i>(v) == get<i>(w) is a valid expression that is convertible to bool, for all i.
2   Returns: If v.index() != w.index(), false; otherwise if v.valueless_by_exception(), true; otherwise get<i>(v) == get<i>(w) with i being v.index().

template<class... Types>
  constexpr bool operator!=(const variant<Types...>& v, const variant<Types...>& w);

3   Mandates: get<i>(v) != get<i>(w) is a valid expression that is convertible to bool, for all i.
4   Returns: If v.index() != w.index(), true; otherwise if v.valueless_by_exception(), false; otherwise get<i>(v) != get<i>(w) with i being v.index().

template<class... Types>
  constexpr bool operator<(const variant<Types...>& v, const variant<Types...>& w);

5   Mandates: get<i>(v) < get<i>(w) is a valid expression that is convertible to bool, for all i.
6   Returns: If w.valueless_by_exception(), false; otherwise if v.valueless_by_exception(), true; otherwise, if v.index() < w.index(), true; otherwise if v.index() > w.index(), false; otherwise get<i>(v) < get<i>(w) with i being v.index().

template<class... Types>
  constexpr bool operator>(const variant<Types...>& v, const variant<Types...>& w);

7   Mandates: get<i>(v) > get<i>(w) is a valid expression that is convertible to bool, for all i.
8   Returns: If v.valueless_by_exception(), false; otherwise if w.valueless_by_exception(), true; otherwise, if v.index() > w.index(), true; otherwise if v.index() < w.index(), false; otherwise get<i>(v) > get<i>(w) with i being v.index().

```

template<class... Types>
 constexpr bool operator<=(const variant<Types...>& v, const variant<Types...>& w);

9 *Mandates:* get<i>(v) <= get<i>(w) is a valid expression that is convertible to bool, for all *i*.

10 *Returns:* If v.valueless_by_exception(), true; otherwise if w.valueless_by_exception(), false; otherwise, if v.index() < w.index(), true; otherwise if v.index() > w.index(), false; otherwise get<i>(v) <= get<i>(w) with *i* being v.index().

template<class... Types>
 constexpr bool operator>=(const variant<Types...>& v, const variant<Types...>& w);

11 *Mandates:* get<i>(v) >= get<i>(w) is a valid expression that is convertible to bool, for all *i*.

12 *Returns:* If w.valueless_by_exception(), true; otherwise if v.valueless_by_exception(), false; otherwise, if v.index() > w.index(), true; otherwise if v.index() < w.index(), false; otherwise get<i>(v) >= get<i>(w) with *i* being v.index().

template<class... Types> requires (three_way_comparable<Types> && ...)
 constexpr common_comparison_category_t<compare_three_way_result_t<Types>...>
 operator<=>(const variant<Types...>& v, const variant<Types...>& w);

13 *Effects:* Equivalent to:

```
if (v.valueless_by_exception() && w.valueless_by_exception())
    return strong_ordering::equal;
if (v.valueless_by_exception()) return strong_ordering::less;
if (w.valueless_by_exception()) return strong_ordering::greater;
if (auto c = v.index() <= w.index(); c != 0) return c;
return get<i>(v) <= get<i>(w);
```

with *i* being v.index().

22.6.7 Visitation

[variant.visit]

template<class Visitor, class... Variants>
 constexpr see below visit(Visitor&& vis, Variants&&... vars);
 template<class R, class Visitor, class... Variants>
 constexpr R visit(Visitor&& vis, Variants&&... vars);

- 1 Let *as-variant* denote the following exposition-only function templates:

```
template<class... Ts>
  auto&& as-variant(variant<Ts...>& var) { return var; }
template<class... Ts>
  auto&& as-variant(const variant<Ts...>& var) { return var; }
template<class... Ts>
  auto&& as-variant(variant<Ts...>&& var) { return std::move(var); }
template<class... Ts>
  auto&& as-variant(const variant<Ts...>&& var) { return std::move(var); }
```

Let *n* be sizeof...(Variants). For each $0 \leq i < n$, let V_i denote the type decltype(as-variant(std::forward<Variants>(vars_i))).

- 2 *Constraints:* V_i is a valid type for all $0 \leq i < n$.

- 3 Let V denote the pack of types V_i .

- 4 Let *m* be a pack of *n* values of type size_t. Such a pack is valid if $0 \leq m_i < \text{variant_size_v}\langle\text{remove_reference_t}\langle V_i \rangle\rangle$ for all $0 \leq i < n$. For each valid pack *m*, let *e(m)* denote the expression:

INVOKE(std::forward<Visitor>(vis), get<m>(std::forward<V>(vars))...) // see 22.10.4

for the first form and

INVOKE<R>(std::forward<Visitor>(vis), get<m>(std::forward<V>(vars))...) // see 22.10.4

for the second form.

- 5 *Mandates:* For each valid pack *m*, *e(m)* is a valid expression. All such expressions are of the same type and value category.

- 6 *Returns*: $e(m)$, where m is the pack for which m_i is $\text{as-variant}(\text{vars}_i).\text{index}()$ for all $0 \leq i < n$.
 The return type is $\text{decltype}(e(m))$ for the first form.
- 7 *Throws*: `bad_variant_access` if $(\text{as-variant}(\text{vars}).\text{valueless_by_exception}() \mid \dots)$ is true.
- 8 *Complexity*: For $n \leq 1$, the invocation of the callable object is implemented in constant time, i.e., for $n = 1$, it does not depend on the number of alternative types of V_0 . For $n > 1$, the invocation of the callable object has no complexity requirements.

22.6.8 Class monostate

[variant.monostate]

`struct monostate{};`

- 1 The class `monostate` can serve as a first alternative type for a `variant` to make the `variant` type default constructible.

22.6.9 monostate relational operators

[variant.monostate.relops]

```
constexpr bool operator==(monostate, monostate) noexcept { return true; }
constexpr strong_ordering operator<=(monostate, monostate) noexcept
{ return strong_ordering::equal; }
```

- 1 NOTE: `monostate` objects have only a single state; they thus always compare equal.

22.6.10 Specialized algorithms

[variant.specalg]

```
template<class... Types>
constexpr void swap(variant<Types...>& v, variant<Types...>& w) noexcept(see below);

1     Constraints: is_move_constructible_v<Ti> && is_swappable_v<Ti> is true for all  $i$ .
```

2 *Effects*: Equivalent to `v.swap(w)`.

3 *Remarks*: The exception specification is equivalent to `noexcept(v.swap(w))`.

22.6.11 Class bad_variant_access

[variant.bad.access]

```
namespace std {
    class bad_variant_access : public exception {
public:
    // see 17.9.3 for the specification of the special member functions
    const char* what() const noexcept override;
};
```

- 1 Objects of type `bad_variant_access` are thrown to report invalid accesses to the value of a `variant` object.
`const char* what() const noexcept override;`
- 2 *Returns*: An implementation-defined NTBS.

22.6.12 Hash support

[variant.hash]

`template<class... Types> struct hash<variant<Types...>>;`

- 1 The specialization `hash<variant<Types...>>` is enabled (22.10.19) if and only if every specialization in `hash<remove_const_t<Types>>...` is enabled. The member functions are not guaranteed to be `noexcept`.
- 2 *Template*: `template<> struct hash<monostate>;`
 The specialization is enabled (22.10.19).

22.7 Storage for any type

[any]

22.7.1 General

[any.general]

- 1 Subclause 22.7 describes components that C++ programs may use to perform operations on objects of a discriminated type.
- 2 NOTE: The discriminated type can contain values of different types but does not attempt conversion between them, i.e., `5` is held strictly as an `int` and is not implicitly convertible either to `"5"` or to `5.0`. This indifference to interpretation

but awareness of type effectively allows safe, generic containers of single values, with no scope for surprises from ambiguous conversions.

22.7.2 Header <any> synopsis

[any.synop]

```
namespace std {
    // 22.7.3, class bad_any_cast
    class bad_any_cast;

    // 22.7.4, class any
    class any;

    // 22.7.5, non-member functions
    void swap(any& x, any& y) noexcept;

    template<class T, class... Args>
        any make_any(Args&&... args);
    template<class T, class U, class... Args>
        any make_any(initializer_list<U> il, Args&&... args);

    template<class T>
        T any_cast(const any& operand);
    template<class T>
        T any_cast(any& operand);
    template<class T>
        T any_cast(any&& operand);

    template<class T>
        const T* any_cast(const any* operand) noexcept;
    template<class T>
        T* any_cast(any* operand) noexcept;
}
```

22.7.3 Class bad_any_cast

[any.bad.any.cast]

```
namespace std {
    class bad_any_cast : public bad_cast {
    public:
        // see 17.9.3 for the specification of the special member functions
        const char* what() const noexcept override;
    };
}
```

¹ Objects of type `bad_any_cast` are thrown by a failed `any_cast` (22.7.5).

`const char* what() const noexcept override;`

² *Returns:* An implementation-defined NTBS.

22.7.4 Class any

[any.class]

22.7.4.1 General

[any.class.general]

```
namespace std {
    class any {
    public:
        // 22.7.4.2, construction and destruction
        constexpr any() noexcept;

        any(const any& other);
        any(any&& other) noexcept;

        template<class T>
            any(T&& value);

        template<class T, class... Args>
            explicit any(in_place_type_t<T>, Args&&...);
```

```

template<class T, class U, class... Args>
    explicit any(in_place_type_t<T>, initializer_list<U>, Args&&...);

~any();

// 22.7.4.3, assignments
any& operator=(const any& rhs);
any& operator=(any&& rhs) noexcept;

template<class T>
any& operator=(T&& rhs);

// 22.7.4.4, modifiers
template<class T, class... Args>
decay_t<T>& emplace(Args&&...);
template<class T, class U, class... Args>
decay_t<T>& emplace(initializer_list<U>, Args&&...);
void reset() noexcept;
void swap(any& rhs) noexcept;

// 22.7.4.5, observers
bool has_value() const noexcept;
const type_info& type() const noexcept;
};

}

```

- ¹ An object of class `any` stores an instance of any type that meets the constructor requirements or it has no value, and this is referred to as the *state* of the class `any` object. The stored instance is called the *contained value*. Two states are equivalent if either they both have no value, or they both have a value and the contained values are equivalent.
- ² The non-member `any_cast` functions provide type-safe access to the contained value.
- ³ Implementations should avoid the use of dynamically allocated memory for a small contained value. However, any such small-object optimization shall only be applied to types `T` for which `is_nothrow_move_constructible_v<T>` is true.

EXAMPLE: A contained value of type `int` can be stored in an internal buffer, not in separately-allocated memory.

22.7.4.2 Construction and destruction

[`any.cons`]

`constexpr any() noexcept;`

- ¹ *Postconditions:* `has_value()` is `false`.

`any(const any& other);`

- ² *Effects:* If `other.has_value()` is `false`, constructs an object that has no value. Otherwise, equivalent to `any(in_place_type_t<T>, any_cast<const T&>(other))` where `T` is the type of the contained value.

- ³ *Throws:* Any exceptions arising from calling the selected constructor for the contained value.

`any(any&& other) noexcept;`

- ⁴ *Effects:* If `other.has_value()` is `false`, constructs an object that has no value. Otherwise, constructs an object of type `any` that contains either the contained value of `other`, or contains an object of the same type constructed from the contained value of `other` considering that contained value as an rvalue.

`template<class T>
any(T&& value);`

- ⁵ Let `VT` be `decay_t<T>`.

- ⁶ *Constraints:* `VT` is not the same type as `any`, `VT` is not a specialization of `in_place_type_t`, and `is_copy_constructible_v<VT>` is `true`.

- ⁷ *Preconditions:* `VT` meets the *Cpp17CopyConstructible* requirements.

- ⁸ *Effects:* Constructs an object of type `any` that contains an object of type `VT` direct-initialized with `std::forward<T>(value)`.

9 *Throws:* Any exception thrown by the selected constructor of VT.

```
template<class T, class... Args>
    explicit any(in_place_type_t<T>, Args&&... args);
```

10 Let VT be `decay_t<T>`.

11 *Constraints:* `is_copy_constructible_v<VT>` is true and `is_constructible_v<VT, Args...>` is true.

12 *Preconditions:* VT meets the *Cpp17CopyConstructible* requirements.

13 *Effects:* Direct-non-list-initializes the contained value of type VT with `std::forward<Args>(args)....`

14 *Postconditions:* `*this` contains a value of type VT.

15 *Throws:* Any exception thrown by the selected constructor of VT.

```
template<class T, class U, class... Args>
    explicit any(in_place_type_t<T>, initializer_list<U> il, Args&&... args);
```

16 Let VT be `decay_t<T>`.

17 *Constraints:* `is_copy_constructible_v<VT>` is true and `is_constructible_v<VT, initializer_list<U>&, Args...>` is true.

18 *Preconditions:* VT meets the *Cpp17CopyConstructible* requirements.

19 *Effects:* Direct-non-list-initializes the contained value of type VT with `il, std::forward<Args>(args)....`

20 *Postconditions:* `*this` contains a value.

21 *Throws:* Any exception thrown by the selected constructor of VT.

22 `~any();`

22 *Effects:* As if by `reset()`.

22.7.4.3 Assignment[`any.assign`]`any& operator=(const any& rhs);`

1 *Effects:* As if by `any(rhs).swap(*this)`. No effects if an exception is thrown.

2 *Returns:* `*this`.

3 *Throws:* Any exceptions arising from the copy constructor for the contained value.

`any& operator=(any&& rhs) noexcept;`

4 *Effects:* As if by `any(std::move(rhs)).swap(*this)`.

5 *Postconditions:* The state of `*this` is equivalent to the original state of `rhs`.

6 *Returns:* `*this`.

```
template<class T>
    any& operator=(T&& rhs);
```

7 Let VT be `decay_t<T>`.

8 *Constraints:* VT is not the same type as `any` and `is_copy_constructible_v<VT>` is true.

9 *Preconditions:* VT meets the *Cpp17CopyConstructible* requirements.

10 *Effects:* Constructs an object `tmp` of type `any` that contains an object of type VT direct-initialized with `std::forward<T>(rhs)`, and `tmp.swap(*this)`. No effects if an exception is thrown.

11 *Returns:* `*this`.

12 *Throws:* Any exception thrown by the selected constructor of VT.

22.7.4.4 Modifiers[`any.modifiers`]

```
template<class T, class... Args>
    decay_t<T>& emplace(Args&&... args);
```

1 Let VT be `decay_t<T>`.

2 *Constraints:* `is_copy_constructible_v<VT>` is `true` and `is_constructible_v<VT, Args...>` is `true`.

3 *Preconditions:* `VT` meets the *Cpp17CopyConstructible* requirements.

4 *Effects:* Calls `reset()`. Then direct-non-list-initializes the contained value of type `VT` with `std::forward<Args>(args)....`

5 *Postconditions:* `*this` contains a value.

6 *Returns:* A reference to the new contained value.

7 *Throws:* Any exception thrown by the selected constructor of `VT`.

8 *Remarks:* If an exception is thrown during the call to `VT`'s constructor, `*this` does not contain a value, and any previously contained value has been destroyed.

```
template<class T, class U, class... Args>
decay_t<T>& emplace(initializer_list<U> il, Args&&... args);
Let VT be decay_t<T>.
```

10 *Constraints:* `is_copy_constructible_v<VT>` is `true` and `is_constructible_v<VT, initializer_list<U>&, Args...>` is `true`.

11 *Preconditions:* `VT` meets the *Cpp17CopyConstructible* requirements.

12 *Effects:* Calls `reset()`. Then direct-non-list-initializes the contained value of type `VT` with `il, std::forward<Args>(args)....`

13 *Postconditions:* `*this` contains a value.

14 *Returns:* A reference to the new contained value.

15 *Throws:* Any exception thrown by the selected constructor of `VT`.

16 *Remarks:* If an exception is thrown during the call to `VT`'s constructor, `*this` does not contain a value, and any previously contained value has been destroyed.

```
void reset() noexcept;
Effects: If has_value() is true, destroys the contained value.
```

18 *Postconditions:* `has_value()` is `false`.

```
void swap(any& rhs) noexcept;
Effects: Exchanges the states of *this and rhs.
```

22.7.4.5 Observers

[any.observers]

```
bool has_value() const noexcept;
Returns: true if *this contains an object, otherwise false.
```

```
const type_info& type() const noexcept;
Returns: typeid(T) if *this has a contained value of type T, otherwise typeid(void).
```

3 NOTE: Useful for querying against types known either at compile time or only at runtime.

22.7.5 Non-member functions

[any.nonmembers]

```
void swap(any& x, any& y) noexcept;
Effects: Equivalent to x.swap(y).
```

```
template<class T, class... Args>
any make_any(Args&&... args);
Effects: Equivalent to: return any(in_place_type<T>, std::forward<Args>(args)...);
```

```
template<class T, class U, class... Args>
any make_any(initializer_list<U> il, Args&&... args);
Effects: Equivalent to: return any(in_place_type<T>, il, std::forward<Args>(args)...);
```

```

template<class T>
T any_cast(const any& operand);
template<class T>
T any_cast(any& operand);
template<class T>
T any_cast(any&& operand);

4   Let U be the type remove_cvref_t<T>.

5   Mandates: For the first overload, is_constructible_v<T, const U&> is true. For the second overload, is_constructible_v<T, U&> is true. For the third overload, is_constructible_v<T, U> is true.

6   Returns: For the first and second overload, static_cast<T>(*any_cast<U>(&operand)). For the third overload, static_cast<T>(std::move(*any_cast<U>(&operand))).

7   Throws: bad_any_cast if operand.type() != typeid(remove_reference_t<T>).

8   EXAMPLE 1:

any x(5);                                     // x holds int
assert(any_cast<int>(x) == 5);                 // cast to value
any_cast<int&>(x) = 10;                      // cast to reference
assert(any_cast<int>(x) == 10);

x = "Meow";                                    // x holds const char*
assert(strcmp(any_cast<const char*>(x), "Meow") == 0);
any_cast<const char*&>(x) = "Harry";
assert(strcmp(any_cast<const char*>(x), "Harry") == 0);

x = string("Meow");                           // x holds string
string s, s2("Jane");
s = move(any_cast<string&>(x));            // move from any
assert(s == "Meow");
any_cast<string&>(x) = move(s2);             // move to any
assert(any_cast<const string&>(x) == "Jane");

string cat("Meow");
const any y(cat);                            // const y holds string
assert(any_cast<const string&>(y) == cat);

any_cast<string&>(y);                      // error: cannot any_cast away const

template<class T>
const T* any_cast(const any* operand) noexcept;
template<class T>
T* any_cast(any* operand) noexcept;

9   Returns: If operand != nullptr && operand->type() == typeid(T), a pointer to the object contained by operand; otherwise, nullptr.

10  EXAMPLE 2:

bool is_string(const any& operand) {
    return any_cast<string>(&operand) != nullptr;
}

```

22.8 Expected objects

[expected]

22.8.1 In general

[expected.general]

¹ Subclause 22.8 describes the class template `expected` that represents expected objects. An `expected<T, E>` object holds an object of type `T` or an object of type `unexpected<E>` and manages the lifetime of the contained objects.

22.8.2 Header <expected> synopsis

[expected.syn]

```

namespace std {
// 22.8.3, class template unexpected
template<class E> class unexpected;

```

```

// 22.8.4, class template bad_expected_access
template<class E> class bad_expected_access;

// 22.8.5, specialization for void
template<> class bad_expected_access<void>;

// in-place construction of unexpected values
struct unexpect_t {
    explicit unexpect_t() = default;
};
inline constexpr unexpect_t unexpect{};

// 22.8.6, class template expected
template<class T, class E> class expected;

// 22.8.7, partial specialization of expected for void types
template<class T, class E> requires is_void_v<T> class expected<T, E>;
}

```

22.8.3 Class template unexpected

[expected.unexpected]

22.8.3.1 General

[expected.un.general]

- Subclause 22.8.3 describes the class template `unexpected` that represents unexpected objects stored in `expected` objects.

```

namespace std {
    template<class E>
    class unexpected {
        public:
            // 22.8.3.2, constructors
            constexpr unexpected(const unexpected&) = default;
            constexpr unexpected(unexpected&&) = default;
            template<class Err = E>
                constexpr explicit unexpected(Err&&);
            template<class... Args>
                constexpr explicit unexpected(in_place_t, Args&&...);
            template<class U, class... Args>
                constexpr explicit unexpected(in_place_t, initializer_list<U>, Args&&...);

            constexpr unexpected& operator=(const unexpected&) = default;
            constexpr unexpected& operator=(unexpected&&) = default;

            constexpr const E& error() const & noexcept;
            constexpr E& error() & noexcept;
            constexpr const E&& error() const && noexcept;
            constexpr E&& error() && noexcept;

            constexpr void swap(unexpected& other) noexcept(see below);
    };

    template<class E2>
        friend constexpr bool operator==(const unexpected&, const unexpected<E2>&);

    friend constexpr void swap(unexpected& x, unexpected& y) noexcept(noexcept(x.swap(y)));
}

private:
    E unex;           // exposition only
};

template<class E> unexpected(E) -> unexpected<E>;
}

```

- A program that instantiates the definition of `unexpected` for a non-object type, an array type, a specialization of `unexpected`, or a cv-qualified type is ill-formed.

22.8.3.2 Constructors

[expected.un.cons]

```
template<class Err = E>
    constexpr explicit unexpected(Err&& e);

1   Constraints:
(1.1) — is_same_v<remove_cvref_t<Err>, unexpected> is false; and
(1.2) — is_same_v<remove_cvref_t<Err>, in_place_t> is false; and
(1.3) — is_constructible_v<E, Err> is true.

2   Effects: Direct-non-list-initializes unex with std::forward<Err>(e).
3   Throws: Any exception thrown by the initialization of unex.
```

```
template<class... Args>
    constexpr explicit unexpected(in_place_t, Args&&... args);

4   Constraints: is_constructible_v<E, Args...> is true.

5   Effects: Direct-non-list-initializes unex with std::forward<Args>(args).....
6   Throws: Any exception thrown by the initialization of unex.
```

```
template<class U, class... Args>
    constexpr explicit unexpected(in_place_t, initializer_list<U> il, Args&&... args);

7   Constraints: is_constructible_v<E, initializer_list<U>&, Args...> is true.

8   Effects: Direct-non-list-initializes unex with il, std::forward<Args>(args).....
9   Throws: Any exception thrown by the initialization of unex.
```

22.8.3.3 Observers

[expected.un.obs]

```
constexpr const E& error() const & noexcept;
constexpr E& error() & noexcept;

1   Returns: unex.

constexpr E&& error() && noexcept;
constexpr const E&& error() const && noexcept;
2   Returns: std::move(unex).
```

22.8.3.4 Swap

[expected.un.swap]

```
constexpr void swap(unexpected& other) noexcept(is_nothrow_swappable_v<E>);

1   Mandates: is_swappable_v<E> is true.

2   Effects: Equivalent to: using std::swap; swap(unex, other.unex);

friend constexpr void swap(unexpected& x, unexpected& y) noexcept(noexcept(x.swap(y)));
3   Constraints: is_swappable_v<E> is true.
4   Effects: Equivalent to x.swap(y).
```

22.8.3.5 Equality operator

[expected.un.eq]

```
template<class E2>
    friend constexpr bool operator==(const unexpected& x, const unexpected<E2>& y);

1   Mandates: The expression x.error() == y.error() is well-formed and its result is convertible to bool.
2   Returns: x.error() == y.error().
```

22.8.4 Class template bad_expected_access

[expected.bad]

```
namespace std {
    template<class E>
    class bad_expected_access : public bad_expected_access<void> {
        public:
            explicit bad_expected_access(E);
```

```

    const char* what() const noexcept override;
    E& error() & noexcept;
    const E& error() const & noexcept;
    E&& error() && noexcept;
    const E&& error() const && noexcept;

private:
    E unex;           // exposition only
};

}

```

- ¹ The class template `bad_expected_access` defines the type of objects thrown as exceptions to report the situation where an attempt is made to access the value of an `expected<T, E>` object for which `has_value()` is false.

`explicit bad_expected_access(E e);`

- ² *Effects:* Initializes `unex` with `std::move(e)`.

`const E& error() const & noexcept;`
`E& error() & noexcept;`

- ³ *Returns:* `unex`.

`E&& error() && noexcept;`
`const E&& error() const && noexcept;`

- ⁴ *Returns:* `std::move(unex)`.

`const char* what() const noexcept override;`

- ⁵ *Returns:* An implementation-defined NTBS.

22.8.5 Class template specialization `bad_expected_access<void>` [expected.bad_void]

```

namespace std {
    template<>
    class bad_expected_access<void> : public exception {
protected:
    bad_expected_access() noexcept;
    bad_expected_access(const bad_expected_access&);
    bad_expected_access(bad_expected_access&&);
    bad_expected_access& operator=(const bad_expected_access&);
    bad_expected_access& operator=(bad_expected_access&&);
    ~bad_expected_access();

public:
    const char* what() const noexcept override;
};
}

```

`const char* what() const noexcept override;`

- ¹ *Returns:* An implementation-defined NTBS.

22.8.6 Class template `expected`

[expected.expected]

22.8.6.1 General

[expected.object.general]

```

namespace std {
    template<class T, class E>
    class expected {
public:
    using value_type = T;
    using error_type = E;
    using unexpected_type = unexpected<E>

    template<class U>
    using rebind = expected<U, error_type>;
}

```

```

// 22.8.6.2, constructors
constexpr expected();
constexpr expected(const expected&);
constexpr expected(expected&&) noexcept(see below);
template<class U, class G>
constexpr explicit(see below) expected(const expected<U, G>&);
template<class U, class G>
constexpr explicit(see below) expected(expected<U, G>&&);

template<class U = T>
constexpr explicit(see below) expected(U&& v);

template<class G>
constexpr explicit(see below) expected(const unexpected<G>&);
template<class G>
constexpr explicit(see below) expected(unexpected<G>&&);

template<class... Args>
constexpr explicit expected(in_place_t, Args&&...);
template<class U, class... Args>
constexpr explicit expected(in_place_t, initializer_list<U>, Args&&...);
template<class... Args>
constexpr explicit expected(unexpect_t, Args&&...);
template<class U, class... Args>
constexpr explicit expected(unexpect_t, initializer_list<U>, Args&&...);

// 22.8.6.3, destructor
constexpr ~expected();

// 22.8.6.4, assignment
constexpr expected& operator=(const expected&);
constexpr expected& operator=(expected&&) noexcept(see below);
template<class U = T> constexpr expected& operator=(U&&);
template<class G>
constexpr expected& operator=(const unexpected<G>&);
template<class G>

        E unex;            // exposition only
    };
};
}

```

- ¹ Any object of type `expected<T, E>` either contains a value of type `T` or a value of type `E` within its own storage. Implementations are not permitted to use additional storage, such as dynamic memory, to allocate the object of type `T` or the object of type `E`. Member `has_val` indicates whether the `expected<T, E>` object contains an object of type `T`.
- ² A type `T` is a *valid value type for expected*, if `remove_cv_t<T>` is `void` or a complete non-array object type that is not `in_place_t`, `unexpect_t`, or a specialization of `unexpected`. A program which instantiates class template `expected<T, E>` with an argument `T` that is not a valid value type for `expected` is ill-formed. A program that instantiates the definition of the template `expected<T, E>` with a type for the `E` parameter that is not a valid template argument for `unexpected` is ill-formed.
- ³ When `T` is not `cv void`, it shall meet the *Cpp17Destructible* requirements (Table 35). `E` shall meet the *Cpp17Destructible* requirements.

22.8.6.2 Constructors

[`expected.object.cons`]

- The exposition-only variable template `converts-from-any-cvref` defined in 22.5.3.2 is used by some constructors for `expected`.

```

constexpr expected();
Constraints: is_default_constructible_v<T> is true.
Effects: Value-initializes val.
Postconditions: has_value() is true.
Throws: Any exception thrown by the initialization of val.

```

```

constexpr expected(const expected& rhs);

6   Effects: If rhs.has_value() is true, direct-non-list-initializes val with *rhs. Otherwise, direct-non-
      list-initializes unex with rhs.error().
7   Postconditions: rhs.has_value() == this->has_value().
8   Throws: Any exception thrown by the initialization of val or unex.
9   Remarks: This constructor is defined as deleted unless
(9.1)   — is_copy_constructible_v<T> is true and
(9.2)   — is_copy_constructible_v<E> is true.
10  This constructor is trivial if
(10.1)  — is_trivially_copy_constructible_v<T> is true and
(10.2)  — is_trivially_copy_constructible_v<E> is true.

constexpr expected(expected&& rhs) noexcept(see below);

11  Constraints:
(11.1)  — is_move_constructible_v<T> is true and
(11.2)  — is_move_constructible_v<E> is true.
12  Effects: If rhs.has_value() is true, direct-non-list-initializes val with std::move(*rhs). Otherwise,
      direct-non-list-initializes unex with std::move(rhs.error()).
13  Postconditions: rhs.has_value() is unchanged; rhs.has_value() == this->has_value() is true.
14  Throws: Any exception thrown by the initialization of val or unex.
15  Remarks: The exception specification is equivalent to is_nothrow_move_constructible_v<T> &&
      is_nothrow_move_constructible_v<E>.
16  This constructor is trivial if
(16.1)  — is_trivially_move_constructible_v<T> is true and
(16.2)  — is_trivially_move_constructible_v<E> is true.

template<class U, class G>
constexpr explicit(see below) expected(const expected<U, G>& rhs);
template<class U, class G>
constexpr explicit(see below) expected(expected<U, G>&& rhs);

17  Let:
(17.1)  — UF be const U& for the first overload and U for the second overload.
(17.2)  — GF be const G& for the first overload and G for the second overload.

18  Constraints:
(18.1)  — is_constructible_v<T, UF> is true; and
(18.2)  — is_constructible_v<E, GF> is true; and
(18.3)  — if T is not cv bool, converts-from-any-cvref<T, expected<U, G>> is false; and
(18.4)  — is_constructible_v<unexpected<E>, expected<U, G>&> is false; and
(18.5)  — is_constructible_v<unexpected<E>, expected<U, G>> is false; and
(18.6)  — is_constructible_v<unexpected<E>, const expected<U, G>&> is false; and
(18.7)  — is_constructible_v<unexpected<E>, const expected<U, G>> is false.

19  Effects: If rhs.has_value(), direct-non-list-initializes val with std::forward<UF>(*rhs). Otherwise,
      direct-non-list-initializes unex with std::forward<GF>(rhs.error()).
20  Postconditions: rhs.has_value() is unchanged; rhs.has_value() == this->has_value() is true.
21  Throws: Any exception thrown by the initialization of val or unex.
22  Remarks: The expression inside explicit is equivalent to !is_convertible_v<UF, T> || !is_
      convertible_v<GF, E>.

```

```

template<class U = T>
constexpr explicit(!is_convertible_v<U, T>) expected(U&& v);

23   Constraints:
24     — is_same_v<remove_cvref_t<U>, in_place_t> is false; and
25     — is_same_v<expected, remove_cvref_t<U>> is false; and
26     — remove_cvref_t<U> is not a specialization of unexpected; and
27     — is_constructible_v<T, U> is true; and
28     — if T is cv bool, remove_cvref_t<U> is not a specialization of expected.
29   Effects: Direct-non-list-initializes val with std::forward<U>(v).
30   Postconditions: has_value() is true.
31   Throws: Any exception thrown by the initialization of val.

template<class G>
constexpr explicit(!is_convertible_v<const G&, E>) expected(const unexpected<G>& e);
template<class G>
constexpr explicit(!is_convertible_v<G, E>) expected(unexpected<G>&& e);

32   Let GF be const G& for the first overload and G for the second overload.
33   Constraints: is_constructible_v<E, GF> is true.
34   Effects: Direct-non-list-initializes unex with std::forward<GF>(e.error()).
35   Postconditions: has_value() is false.
36   Throws: Any exception thrown by the initialization of unex.

template<class... Args>
constexpr explicit expected(in_place_t, Args&&... args);
37   Constraints: is_constructible_v<T, Args...> is true.
38   Effects: Direct-non-list-initializes val with std::forward<Args>(args)....
39   Postconditions: has_value() is true.
40   Throws: Any exception thrown by the initialization of val.

template<class U, class... Args>
constexpr explicit expected(in_place_t, initializer_list<U> il, Args&&... args);
41   Constraints: is_constructible_v<T, initializer_list<U>&, Args...> is true.
42   Effects: Direct-non-list-initializes val with il, std::forward<Args>(args)....
43   Postconditions: has_value() is true.
44   Throws: Any exception thrown by the initialization of val.

template<class... Args>
constexpr explicit expected(unexpect_t, Args&&... args);
45   Constraints: is_constructible_v<E, Args...> is true.
46   Effects: Direct-non-list-initializes unex with std::forward<Args>(args)....
47   Postconditions: has_value() is false.
48   Throws: Any exception thrown by the initialization of unex.

```

22.8.6.3 Destructor

[expected.object.dtor]

```
constexpr ~expected();
```

1 *Effects:* If `has_value()` is true, destroys `val`, otherwise destroys `unex`.

2 *Remarks:* If `is_trivially_destructible_v<T>` is true, and `is_trivially_destructible_v<E>` is true, then this destructor is a trivial destructor.

22.8.6.4 Assignment

[expected.object.assign]

- 1 This subclause makes use of the following exposition-only function:

```
template<class T, class U, class... Args>
constexpr void reinit-expected(T& newval, U& oldval, Args&&... args) { // exposition only
    if constexpr (is_nothrow_constructible_v<T, Args...>) {
        destroy_at(addressof(oldval));
        construct_at(addressof(newval), std::forward<Args>(args)...);
    } else if constexpr (is_nothrow_move_constructible_v<T>) {
        T tmp(std::forward<Args>(args)...);
        destroy_at(addressof(oldval));
        construct_at(addressof(newval), std::move(tmp));
    } else {
        U tmp(std::move(oldval));
        destroy_at(addressof(oldval));
        try {
            construct_at(addressof(newval), std::forward<Args>(args)...);
        } catch (...) {
            construct_at(addressof(oldval), std::move(tmp));
            throw;
        }
    }
}
```

```
constexpr expected& operator=(const expected& rhs);
```

- 2 *Effects:*

- (2.1) — If `this->has_value() && rhs.has_value()` is true, equivalent to `val = *rhs`.
- (2.2) — Otherwise, if `this->has_value()` is true, equivalent to:

$$\text{reinit-expected}(\text{unex}, \text{val}, \text{rhs.error}())$$
- (2.3) — Otherwise, if `rhs.has_value()` is true, equivalent to:

$$\text{reinit-expected}(\text{val}, \text{unex}, \text{*rhs})$$
- (2.4) — Otherwise, equivalent to `unex = rhs.error()`.

Then, if no exception was thrown, equivalent to: `has_val = rhs.has_value(); return *this;`

3 *Returns:* `*this`.

4 *Remarks:* This operator is defined as deleted unless:

- (4.1) — `is_copy_assignable_v<T>` is true and
- (4.2) — `is_copy_constructible_v<T>` is true and
- (4.3) — `is_copy_assignable_v<E>` is true and
- (4.4) — `is_copy_constructible_v<E>` is true and
- (4.5) — `is_nothrow_move_constructible_v<T> || is_nothrow_move_constructible_v<E>` is true.

```
constexpr expected& operator=(expected&& rhs) noexcept(see below);
```

- 5 *Constraints:*

- (5.1) — `is_move_constructible_v<T>` is true and
- (5.2) — `is_move_assignable_v<T>` is true and
- (5.3) — `is_move_constructible_v<E>` is true and
- (5.4) — `is_move_assignable_v<E>` is true and

(5.5) — `is_nothrow_move_constructible_v<T>` || `is_nothrow_move_constructible_v<E>` is true.
 6 *Effects:*

- (6.1) — If `this->has_value() && rhs.has_value()` is true, equivalent to `val = std::move(*rhs)`.
- (6.2) — Otherwise, if `this->has_value()` is true, equivalent to:
`reinit-expected(unex, val, std::move(rhs.error()))`
- (6.3) — Otherwise, if `rhs.has_value()` is true, equivalent to:
`reinit-expected(val, unex, std::move(*rhs))`
- (6.4) — Otherwise, equivalent to `unex = std::move(rhs.error())`.

Then, if no exception was thrown, equivalent to: `has_val = rhs.has_value(); return *this;`

7 *Returns:* `*this`.

8 *Remarks:* The exception specification is equivalent to:

```
is_nothrow_move_assignable_v<T> && is_nothrow_move_constructible_v<T> &&
is_nothrow_move_assignable_v<E> && is_nothrow_move_constructible_v<E>
```

```
template<class U = T>
constexpr expected& operator=(U&& v);
```

9 *Constraints:*

- (9.1) — `is_same_v<expected, remove_cvref_t<U>>` is false; and
- (9.2) — `remove_cvref_t<U>` is not a specialization of `unexpected`; and
- (9.3) — `is_constructible_v<T, U>` is true; and
- (9.4) — `is_assignable_v<T&, U>` is true; and
- (9.5) — `is_nothrow_constructible_v<T, U>` || `is_nothrow_move_constructible_v<T>` || `is_nothrow_move_constructible_v<E>` is true.

10 *Effects:*

- (10.1) — If `has_value()` is true, equivalent to: `val = std::forward<U>(v);`
- (10.2) — Otherwise, equivalent to:
`reinit-expected(val, unex, std::forward<U>(v));`
`has_val = true;`

11 *Returns:* `*this`.

```
template<class G>
constexpr expected& operator=(const unexpected<G>& e);
template<class G>
constexpr expected& operator=(unexpected<G>&& e);
```

12 Let GF be `const G&` for the first overload and `G` for the second overload.

13 *Constraints:*

- (13.1) — `is_constructible_v<E, GF>` is true; and
- (13.2) — `is_assignable_v<E&, GF>` is true; and
- (13.3) — `is_nothrow_constructible_v<E, GF>` || `is_nothrow_move_constructible_v<T>` || `is_nothrow_move_constructible_v<E>` is true.

14 *Effects:*

- (14.1) — If `has_value()` is true, equivalent to:
`reinit-expected(unex, val, std::forward<GF>(e.error()));`
`has_val = false;`
- (14.2) — Otherwise, equivalent to: `unex = std::forward<GF>(e.error());`

15 *Returns:* `*this`.

```

template<class... Args>
constexpr T& emplace(Args&&... args) noexcept;

16   Constraints: is_nothrow_constructible_v<T, Args...> is true.

17   Effects: Equivalent to:
    if (has_value()) {
        destroy_at(addressof(val));
    } else {
        destroy_at(addressof(unex));
        has_val = true;
    }
    return *construct_at(addressof(val), std::forward<Args>(args)...);

template<class U, class... Args>
constexpr T& emplace(initializer_list<U> il, Args&&... args) noexcept;

18   Constraints: is_nothrow_constructible_v<T, initializer_list<U>&, Args...> is true.

19   Effects: Equivalent to:
    if (has_value()) {
        destroy_at(addressof(val));
    } else {
        destroy_at(addressof(unex));
        has_val = true;
    }
    return *construct_at(addressof(val), il, std::forward<Args>(args)...);

```

22.8.6.5 Swap

[expected.object.swap]

```
constexpr void swap(expected& rhs) noexcept(see below);
```

1 *Constraints:*

- (1.1) — `is_swappable_v<T>` is true and
- (1.2) — `is_swappable_v<E>` is true and
- (1.3) — `is_move_constructible_v<T> && is_move_constructible_v<E>` is true, and
- (1.4) — `is_nothrow_move_constructible_v<T> || is_nothrow_move_constructible_v<E>` is true.

2 *Effects:* See [Table 63](#).

Table 63: `swap(expected&)` effects [tab:expected.object.swap]

	<code>this->has_value()</code>	<code>!this->has_value()</code>
<code>rhs.has_value()</code>	equivalent to: using <code>std::swap</code> ; <code>swap(val, rhs.val);</code>	calls <code>rhs.swap(*this)</code>
<code>!rhs.has_value()</code>	<i>see below</i>	equivalent to: using <code>std::swap</code> ; <code>swap(unex, rhs.unex);</code>

For the case where `rhs.value()` is false and `this->has_value()` is true, equivalent to:

```

if constexpr (is_nothrow_move_constructible_v<E>) {
    E tmp(std::move(rhs.unex));
    destroy_at(addressof(rhs.unex));
    try {
        construct_at(addressof(rhs.val), std::move(val));
        destroy_at(addressof(val));
        construct_at(addressof(unex), std::move(tmp));
    } catch(...) {
        construct_at(addressof(rhs.unex), std::move(tmp));
        throw;
    }
} else {
    T tmp(std::move(val));
    destroy_at(addressof(val));
}

```

```

    try {
        construct_at(addressof(unex), std::move(rhs.unex));
        destroy_at(addressof(rhs.unex));
        construct_at(addressof(rhs.val), std::move(tmp));
    } catch (...) {
        construct_at(addressof(val), std::move(tmp));
        throw;
    }
}
has_val = false;
rhs.has_val = true;

```

3 *Throws:* Any exception thrown by the expressions in the *Effects*.

4 *Remarks:* The exception specification is equivalent to:

```

is_nothrow_move_constructible_v<T> && is_nothrow_swappable_v<T> &&
is_nothrow_move_constructible_v<E> && is_nothrow_swappable_v<E>

```

```
friend constexpr void swap(expected& x, expected& y) noexcept(noexcept(x.swap(y)));

```

5 *Effects:* Equivalent to `x.swap(y)`.

22.8.6.6 Observers

[`expected.object.obs`]

```

constexpr const T* operator->() const noexcept;
constexpr T* operator->() noexcept;

```

1 *Preconditions:* `has_value()` is true.

2 *Returns:* `addressof(val)`.

```

constexpr const T& operator*() const & noexcept;
constexpr T& operator*() & noexcept;

```

3 *Preconditions:* `has_value()` is true.

4 *Returns:* `val`.

```

constexpr T&& operator*() && noexcept;
constexpr const T&& operator*() const && noexcept;

```

5 *Preconditions:* `has_value()` is true.

6 *Returns:* `std::move(val)`.

```

constexpr explicit operator bool() const noexcept;
constexpr bool has_value() const noexcept;

```

7 *Returns:* `has_val`.

```

constexpr const T& value() const &;
constexpr T& value() &;

```

8 *Mandates:* `is_copy_constructible_v<E>` is true.

9 *Returns:* `val`, if `has_value()` is true.

10 *Throws:* `bad_expected_access(as_const(error()))` if `has_value()` is false.

```

constexpr T&& value() &&;
constexpr const T&& value() const &&;

```

11 *Mandates:* `is_copy_constructible_v<E>` is true and `is_constructible_v<E, decltype(std::move(error()))>` is true.

12 *Returns:* `std::move(val)`, if `has_value()` is true.

13 *Throws:* `bad_expected_access(std::move(error()))` if `has_value()` is false.

```

constexpr const E& error() const & noexcept;
constexpr E& error() & noexcept;

```

14 *Preconditions:* `has_value()` is false.

15 *Returns:* `unex`.

```

constexpr E&& error() && noexcept;
constexpr const E&& error() const && noexcept;

16   Preconditions: has_value() is false.
17   Returns: std::move(unex).

template<class U> constexpr T value_or(U&& v) const &;
18   Mandates: is_copy_constructible_v<T> is true and is_convertible_v<U, T> is true.
19   Returns: has_value() ? **this : static_cast<T>(std::forward<U>(v)).

template<class U> constexpr T value_or(U&& v) &&;
20   Mandates: is_move_constructible_v<T> is true and is_convertible_v<U, T> is true.
21   Returns: has_value() ? std::move(**this) : static_cast<T>(std::forward<U>(v)).

template<class G = E> constexpr E error_or(G&& e) const &;
22   Mandates: is_copy_constructible_v<E> is true and is_convertible_v<G, E> is true.
23   Returns: std::forward<G>(e) if has_value() is true, error() otherwise.

template<class G = E> constexpr E error_or(G&& e) &&;
24   Mandates: is_move_constructible_v<E> is true and is_convertible_v<G, E> is true.
25   Returns: std::forward<G>(e) if has_value() is true, std::move(error()) otherwise.

```

22.8.6.7 Monadic operations

[expected.object.monadic]

```

template<class F> constexpr auto and_then(F&& f) &;
template<class F> constexpr auto and_then(F&& f) const &;
1   Let U be remove_cvref_t<invoke_result_t<F, decltype(value())>>.
2   Constraints: is_constructible_v<E, decltype(error())> is true.
3   Mandates: U is a specialization of expected and is_same_v<U::error_type, E> is true.
4   Effects: Equivalent to:
    if (has_value())
        return invoke(std::forward<F>(f), value());
    else
        return U(unexpect, error());

template<class F> constexpr auto and_then(F&& f) &&;
template<class F> constexpr auto and_then(F&& f) const &&;
5   Let U be remove_cvref_t<invoke_result_t<F, decltype(std::move(value()))>>.
6   Constraints: is_constructible_v<E, decltype(std::move(error()))> is true.
7   Mandates: U is a specialization of expected and is_same_v<U::error_type, E> is true.
8   Effects: Equivalent to:
    if (has_value())
        return invoke(std::forward<F>(f), std::move(value()));
    else
        return U(unexpect, std::move(error()));

template<class F> constexpr auto or_else(F&& f) &;
template<class F> constexpr auto or_else(F&& f) const &;
9   Let G be remove_cvref_t<invoke_result_t<F, decltype(error())>>.
10  Constraints: is_constructible_v<T, decltype(value())> is true.
11  Mandates: G is a specialization of expected and is_same_v<G::value_type, T> is true.
12  Effects: Equivalent to:
    if (has_value())
        return G(in_place, value());

```

```

        else
            return invoke(std::forward<F>(f), error());

template<class F> constexpr auto or_else(F&& f) &&;
template<class F> constexpr auto or_else(F&& f) const &&;
13    Let G be remove_cvref_t<invoke_result_t<F, decltype(std::move(error()))>>.
14    Constraints: is_constructible_v<T, decltype(std::move(value()))> is true.
15    Mandates: G is a specialization of expected and is_same_v<G::value_type, T> is true.
16    Effects: Equivalent to:
        if (has_value())
            return G(in_place, std::move(value()));
        else
            return invoke(std::forward<F>(f), std::move(error()));

template<class F> constexpr auto transform(F&& f) &;
template<class F> constexpr auto transform(F&& f) const &;
17    Let U be remove_cv_t<invoke_result_t<F, decltype(value())>>.
18    Constraints: is_constructible_v<E, decltype(error())> is true.
19    Mandates: U is a valid value type for expected. If is_void_v<U> is false, the declaration
        U u(involve(std::forward<F>(f), value()));
is well-formed.
20    Effects:
(20.1)    — If has_value() is false, returns expected<U, E>(unexpect, error()).
(20.2)    — Otherwise, if is_void_v<U> is false, returns an expected<U, E> object whose has_val member
          is true and val member is direct-non-list-initialized with invoke(std::forward<F>(f),
          value()).
(20.3)    — Otherwise, evaluates invoke(std::forward<F>(f), value()) and then returns expected<U,
          E>().
template<class F> constexpr auto transform(F&& f) &&;
template<class F> constexpr auto transform(F&& f) const &&;
21    Let U be remove_cv_t<invoke_result_t<F, decltype(std::move(value()))>>.
22    Constraints: is_constructible_v<E, decltype(std::move(error()))> is true.
23    Mandates: U is a valid value type for expected. If is_void_v<U> is false, the declaration
        U u(involve(std::forward<F>(f), std::move(value())));
is well-formed for some invented variable u.
24    Effects:
(24.1)    — If has_value() is false, returns expected<U, E>(unexpect, std::move(error())).
(24.2)    — Otherwise, if is_void_v<U> is false, returns an expected<U, E> object whose has_val member
          is true and val member is direct-non-list-initialized with invoke(std::forward<F>(f),
          std::move(value())).
(24.3)    — Otherwise, evaluates invoke(std::forward<F>(f), std::move(value())) and then returns
          expected<U, E>().
template<class F> constexpr auto transform_error(F&& f) &;
template<class F> constexpr auto transform_error(F&& f) const &;
25    Let G be remove_cv_t<invoke_result_t<F, decltype(error())>>.
26    Constraints: is_constructible_v<T, decltype(value())> is true.
27    Mandates: G is a valid template argument for unexpected (22.8.3.1) and the declaration
        G g(involve(std::forward<F>(f), error()));
is well-formed.

```

28 *Returns:* If `has_value()` is `true`, `expected<T, G>(in_place, value())`; otherwise, an `expected<T, G>` object whose `has_val` member is `false` and `unex` member is direct-non-list-initialized with `invoke(std::forward<F>(f), error())`.

```
template<class F> constexpr auto transform_error(F&& f) &&;
template<class F> constexpr auto transform_error(F&& f) const &&;
```

29 Let `G` be `remove_cv_t<invoke_result_t<F, decltype(std::move(error()))>>`.

30 *Constraints:* `is_constructible_v<T, decltype(std::move(value()))>` is `true`.

31 *Mandates:* `G` is a valid template argument for `unexpected` (22.8.3.1) and the declaration

```
G g(invoke(std::forward<F>(f), std::move(error())));
```

is well-formed.

32 *Returns:* If `has_value()` is `true`, `expected<T, G>(in_place, std::move(value()))`; otherwise, an `expected<T, G>` object whose `has_val` member is `false` and `unex` member is direct-non-list-initialized with `invoke(std::forward<F>(f), std::move(error()))`.

22.8.6.8 Equality operators

[expected.object.eq]

```
template<class T2, class E2> requires (!is_void_v<T2>)
friend constexpr bool operator==(const expected& x, const expected<T2, E2>& y);
```

1 *Mandates:* The expressions `*x == *y` and `x.error() == y.error()` are well-formed and their results are convertible to `bool`.

2 *Returns:* If `x.has_value()` does not equal `y.has_value()`, `false`; otherwise if `x.has_value()` is `true`, `*x == *y`; otherwise `x.error() == y.error()`.

```
template<class T2> friend constexpr bool operator==(const expected& x, const T2& v);
```

3 *Mandates:* The expression `*x == v` is well-formed and its result is convertible to `bool`.

NOTE: `T` need not be *Cpp17EqualityComparable*.

4 *Returns:* `x.has_value() && static_cast<bool>(*x == v)`.

```
template<class E2> friend constexpr bool operator==(const expected& x, const unexpected<E2>& e);
```

5 *Mandates:* The expression `x.error() == e.error()` is well-formed and its result is convertible to `bool`.

6 *Returns:* `!x.has_value() && static_cast<bool>(x.error() == e.error())`.

22.8.7 Partial specialization of `expected` for void types

[expected.void]

22.8.7.1 General

[expected.void.general]

```
template<class T, class E> requires is_void_v<T>
class expected<T, E> {
public:
    using value_type = T;
    using error_type = E;
    using unexpected_type = unexpected<E>;

    template<class U>
    using rebind = expected<U, error_type>;

    // 22.8.7.2, constructors
    constexpr expected() noexcept;
    constexpr expected(const expected&);
    constexpr expected(expected&&) noexcept(see below);
    template<class U, class G>
        constexpr explicit(see below) expected(const expected<U, G>&);
    template<class U, class G>
        constexpr explicit(see below) expected(expected<U, G>&&);

    template<class G>
        constexpr explicit(see below) expected(const unexpected<G>&);
```

```

template<class G>
    constexpr explicit(see below) expected(unexpected<G>&&);

constexpr explicit expected(in_place_t) noexcept;
template<class... Args>
    constexpr explicit expected(unexpect_t, Args&&...);
template<class U, class... Args>
    constexpr explicit expected(unexpect_t, initializer_list<U>, Args&&...);

// 22.8.7.3, destructor
constexpr ~expected();

// 22.8.7.4, assignment
constexpr expected& operator=(const expected&);
constexpr expected& operator=(expected&&) noexcept(see below);
template<class G>
    constexpr expected& operator=(const unexpected<G>&);
template<class G>
    constexpr expected& operator=(unexpected<G>&&);
constexpr void emplace() noexcept;

// 22.8.7.5, swap
constexpr void swap(expected&) noexcept(see below);
friend constexpr void swap(expected& x, expected& y) noexcept(noexcept(x.swap(y)));

// 22.8.7.6, observers
constexpr explicit operator bool() const noexcept;
constexpr bool has_value() const noexcept;
constexpr void operator*() const noexcept;
constexpr void value() const &;
constexpr void value() &&;
constexpr const E& error() const & noexcept;
constexpr E& error() & noexcept;
constexpr const E&& error() const && noexcept;
constexpr E&& error() && noexcept;
template<class G = E> constexpr E error_or(G&&) const &;
template<class G = E> constexpr E error_or(G&&) &&;

// 22.8.7.7, monadic operations
template<class F> constexpr auto and_then(F&& f) &;
template<class F> constexpr auto and_then(F&& f) &&;
template<class F> constexpr auto and_then(F&& f) const &;
template<class F> constexpr auto and_then(F&& f) const &&;
template<class F> constexpr auto or_else(F&& f) &;
template<class F> constexpr auto or_else(F&& f) &&;
template<class F> constexpr auto or_else(F&& f) const &;
template<class F> constexpr auto or_else(F&& f) const &&;
template<class F> constexpr auto transform(F&& f) &;
template<class F> constexpr auto transform(F&& f) &&;
template<class F> constexpr auto transform(F&& f) const &;
template<class F> constexpr auto transform(F&& f) const &&;
template<class F> constexpr auto transform_error(F&& f) &;
template<class F> constexpr auto transform_error(F&& f) &&;
template<class F> constexpr auto transform_error(F&& f) const &;
template<class F> constexpr auto transform_error(F&& f) const &&;
```

```

// 22.8.7.8, equality operators
template<class T2, class E2> requires is_void_v<T2>
    friend constexpr bool operator==(const expected& x, const expected<T2, E2>& y);
template<class E2>
    friend constexpr bool operator==(const expected&, const unexpected<E2>&);
```

```

private:
    bool has_val;           // exposition only
    union {
        E unex;            // exposition only
    };
};

```

- 1 Any object of type `expected<T, E>` either represents a value of type `T`, or contains a value of type `E` within its own storage. Implementations are not permitted to use additional storage, such as dynamic memory, to allocate the object of type `E`. Member `has_val` indicates whether the `expected<T, E>` object represents a value of type `T`.
- 2 A program that instantiates the definition of the template `expected<T, E>` with a type for the `E` parameter that is not a valid template argument for `unexpected` is ill-formed.
- 3 `E` shall meet the requirements of *Cpp17Destructible* (Table 35).

22.8.7.2 Constructors

[expected.void.cons]

```
constexpr expected() noexcept;
```

1 *Postconditions*: `has_value()` is true.

```
constexpr expected(const expected& rhs);
```

2 *Effects*: If `rhs.has_value()` is false, direct-non-list-initializes `unex` with `rhs.error()`.

3 *Postconditions*: `rhs.has_value() == this->has_value()`.

4 *Throws*: Any exception thrown by the initialization of `unex`.

5 *Remarks*: This constructor is defined as deleted unless `is_copy_constructible_v<E>` is true.

6 This constructor is trivial if `is_trivially_copy_constructible_v<E>` is true.

```
constexpr expected(expected&& rhs) noexcept(is_nothrow_move_constructible_v<E>);
```

7 *Constraints*: `is_move_constructible_v<E>` is true.

8 *Effects*: If `rhs.has_value()` is false, direct-non-list-initializes `unex` with `std::move(rhs.error())`.

9 *Postconditions*: `rhs.has_value()` is unchanged; `rhs.has_value() == this->has_value()` is true.

10 *Throws*: Any exception thrown by the initialization of `unex`.

11 *Remarks*: This constructor is trivial if `is_trivially_move_constructible_v<E>` is true.

```
template<class U, class G>
```

```
    constexpr explicit(!is_convertible_v<const G&, E>) expected(const expected<U, G>& rhs);
```

```
template<class U, class G>
```

```
    constexpr explicit(!is_convertible_v<G, E>) expected(expected<U, G>&& rhs);
```

12 Let `GF` be `const G&` for the first overload and `G` for the second overload.

13 *Constraints*:

(13.1) — `is_void_v<U>` is true; and

(13.2) — `is_constructible_v<E, GF>` is true; and

(13.3) — `is_constructible_v<unexpected<E>, expected<U, G>&>` is false; and

(13.4) — `is_constructible_v<unexpected<E>, expected<U, G>>` is false; and

(13.5) — `is_constructible_v<unexpected<E>, const expected<U, G>&>` is false; and

(13.6) — `is_constructible_v<unexpected<E>, const expected<U, G>>` is false.

14 *Effects*: If `rhs.has_value()` is false, direct-non-list-initializes `unex` with `std::forward<GF>(rhs.error())`.

15 *Postconditions*: `rhs.has_value()` is unchanged; `rhs.has_value() == this->has_value()` is true.

16 *Throws*: Any exception thrown by the initialization of `unex`.

```
template<class G>
```

```
    constexpr explicit(!is_convertible_v<const G&, E>) expected(const unexpected<G>& e);
```

```

template<class G>
constexpr explicit(!is_convertible_v<G, E>) expected(unexpected<G>&& e);

17 Let GF be const G& for the first overload and G for the second overload.

18 Constraints: is_constructible_v<E, GF> is true.

19 Effects: Direct-non-list-initializes unex with std::forward<GF>(e.error()).

20 Postconditions: has_value() is false.

21 Throws: Any exception thrown by the initialization of unex.

constexpr explicit expected(in_place_t) noexcept;

22 Postconditions: has_value() is true.

template<class... Args>
constexpr explicit expected(unexpect_t, Args&&... args);

23 Constraints: is_constructible_v<E, Args...> is true.

24 Effects: Direct-non-list-initializes unex with std::forward<Args>(args).....

25 Postconditions: has_value() is false.

26 Throws: Any exception thrown by the initialization of unex.

template<class U, class... Args>
constexpr explicit expected(unexpect_t, initializer_list<U> il, Args&&... args);

27 Constraints: is_constructible_v<E, initializer_list<U>&, Args...> is true.

28 Effects: Direct-non-list-initializes unex with il, std::forward<Args>(args).....

29 Postconditions: has_value() is false.

30 Throws: Any exception thrown by the initialization of unex.

```

22.8.7.3 Destructor

[expected_void.dtor]

```

constexpr ~expected();

1 Effects: If has_value() is false, destroys unex.

2 Remarks: If is_trivially_destructible_v<E> is true, then this destructor is a trivial destructor.

```

22.8.7.4 Assignment

[expected_void.assign]

```
constexpr expected& operator=(const expected& rhs);
```

- 1 *Effects*:
 - (1.1) — If this->has_value() && rhs.has_value() is true, no effects.
 - (1.2) — Otherwise, if this->has_value() is true, equivalent to: construct_at(addressof(unex), rhs.unex); has_val = false;
 - (1.3) — Otherwise, if rhs.has_value() is true, destroys unex and sets has_val to true.
 - (1.4) — Otherwise, equivalent to unex = rhs.error().

2 *Returns*: *this.

- 3 *Remarks*: This operator is defined as deleted unless is_copy_assignable_v<E> is true and is_copy_constructible_v<E> is true.

```
constexpr expected& operator=(expected&& rhs) noexcept(see below);
```

- 4 *Effects*:
 - (4.1) — If this->has_value() && rhs.has_value() is true, no effects.
 - (4.2) — Otherwise, if this->has_value() is true, equivalent to:

```
construct_at(addressof(unex), std::move(rhs.unex));
has_val = false;
```
 - (4.3) — Otherwise, if rhs.has_value() is true, destroys unex and sets has_val to true.
 - (4.4) — Otherwise, equivalent to unex = std::move(rhs.error()).

5 >Returns: `*this`.
 6 Remarks: The exception specification is equivalent to `is_nothrow_move_constructible_v<E> &&`
 `is_nothrow_move_assignable_v<E>`.
 7 This operator is defined as deleted unless `is_move_constructible_v<E>` is true and `is_move_-`
 `assignable_v<E>` is true.

```
template<class G>
constexpr expected& operator=(const unexpected<G>& e);
template<class G>
constexpr expected& operator=(unexpected<G>&& e);
```

8 Let `GF` be `const G&` for the first overload and `G` for the second overload.

9 Constraints: `is_constructible_v<E, GF>` is true and `is_assignable_v<E&, GF>` is true.

10 Effects:

(10.1) — If `has_value()` is true, equivalent to:

```
construct_at(addressof(unex), std::forward<GF>(e.error()));
has_val = false;
```

(10.2) — Otherwise, equivalent to: `unex = std::forward<GF>(e.error());`

11 >Returns: `*this`.

```
constexpr void emplace() noexcept;
```

12 Effects: If `has_value()` is false, destroys `unex` and sets `has_val` to true.

22.8.7.5 Swap

[expected_void.swap]

```
constexpr void swap(expected& rhs) noexcept(see below);
```

1 Constraints: `is_swappable_v<E>` is true and `is_move_constructible_v<E>` is true.

2 Effects: See Table 64.

Table 64: `swap(expected&)` effects [tab:expected_void.swap]

	<code>this->has_value()</code>	<code>!this->has_value()</code>
<code>rhs.has_value()</code>	no effects	calls <code>rhs.swap(*this)</code>
<code>!rhs.has_value()</code>	<i>see below</i>	equivalent to: using <code>std::swap</code> ; <code>swap(unex, rhs.unex);</code>

For the case where `rhs.value()` is false and `this->has_value()` is true, equivalent to:

```
construct_at(addressof(unex), std::move(rhs.unex));
destroy_at(addressof(rhs.unex));
has_val = false;
rhs.has_val = true;
```

3 Throws: Any exception thrown by the expressions in the Effects.

4 Remarks: The exception specification is equivalent to `is_nothrow_move_constructible_v<E> &&`
 `is_nothrow_swappable_v<E>`.

```
friend constexpr void swap(expected& x, expected& y) noexcept(noexcept(x.swap(y)));
```

5 Effects: Equivalent to `x.swap(y)`.

22.8.7.6 Observers

[expected_void.obs]

```
constexpr explicit operator bool() const noexcept;
constexpr bool has_value() const noexcept;
```

1 >Returns: `has_val`.

```
constexpr void operator*() const noexcept;
```

2 Preconditions: `has_value()` is true.

```

constexpr void value() const &;
3     Throws: bad_expected_access(error()) if has_value() is false.

constexpr void value() &&;
4     Throws: bad_expected_access(std::move(error())) if has_value() is false.

constexpr const E& error() const & noexcept;
constexpr E& error() & noexcept;

5     Preconditions: has_value() is false.
6     Returns: unex.

constexpr E&& error() && noexcept;
constexpr const E&& error() const && noexcept;

7     Preconditions: has_value() is false.
8     Returns: std::move(unex).

template<class G = E> constexpr E error_or(G&& e) const &;
9     Mandates: is_copy_constructible_v<E> is true and is_convertible_v<G, E> is true.
10    Returns: std::forward<G>(e) if has_value() is true, error() otherwise.

template<class G = E> constexpr E error_or(G&& e) &&;
11   Mandates: is_move_constructible_v<E> is true and is_convertible_v<G, E> is true.
12   Returns: std::forward<G>(e) if has_value() is true, std::move(error()) otherwise.

```

22.8.7.7 Monadic operations

[expected_void.monadic]

```

template<class F> constexpr auto and_then(F&& f) &;
template<class F> constexpr auto and_then(F&& f) const &;
1     Let U be remove_cvref_t<invoke_result_t<F>>.
2     Constraints: is_constructible_v<E, decltype(error())>> is true.
3     Mandates: U is a specialization of expected and is_same_v<U::error_type, E> is true.
4     Effects: Equivalent to:
        if (has_value())
            return invoke(std::forward<F>(f));
        else
            return U(unexpect, error());

template<class F> constexpr auto and_then(F&& f) &&;
template<class F> constexpr auto and_then(F&& f) const &&;
5     Let U be remove_cvref_t<invoke_result_t<F>>.
6     Constraints: is_constructible_v<E, decltype(std::move(error()))> is true.
7     Mandates: U is a specialization of expected and is_same_v<U::error_type, E> is true.
8     Effects: Equivalent to:
        if (has_value())
            return invoke(std::forward<F>(f));
        else
            return U(unexpect, std::move(error()));

template<class F> constexpr auto or_else(F&& f) &;
template<class F> constexpr auto or_else(F&& f) const &;
9     Let G be remove_cvref_t<invoke_result_t<F, decltype(error())>>.
10    Mandates: G is a specialization of expected and is_same_v<G::value_type, T> is true.
11    Effects: Equivalent to:

```

```

    if (has_value())
        return G();
    else
        return invoke(std::forward<F>(f), error());

template<class F> constexpr auto or_else(F&& f) &&;
template<class F> constexpr auto or_else(F&& f) const &&;

```

12 Let G be `remove_cvref_t<invoke_result_t<F, decltype(std::move(error()))>>`.

13 *Mandates:* G is a specialization of `expected` and `is_same_v<G::value_type, T>` is true.

14 *Effects:* Equivalent to:

```

    if (has_value())
        return G();
    else
        return invoke(std::forward<F>(f), std::move(error()));

```

```

template<class F> constexpr auto transform(F&& f) &;
template<class F> constexpr auto transform(F&& f) const &;

```

15 Let U be `remove_cv_t<invoke_result_t<F>>`.

16 *Constraints:* `is_constructible_v<E, decltype(error())>` is true.

17 *Mandates:* U is a valid value type for `expected`. If `is_void_v<U>` is false, the declaration

```

    U u(invoke(std::forward<F>(f)));

```

is well-formed.

18 *Effects:*

(18.1) — If `has_value()` is false, returns `expected<U, E>(unexpect, error())`.

(18.2) — Otherwise, if `is_void_v<U>` is false, returns an `expected<U, E>` object whose `has_val` member is true and `val` member is direct-non-list-initialized with `invoke(std::forward<F>(f))`.

(18.3) — Otherwise, evaluates `invoke(std::forward<F>(f))` and then returns `expected<U, E>()`.

```

template<class F> constexpr auto transform(F&& f) &&;
template<class F> constexpr auto transform(F&& f) const &&;

```

19 Let U be `remove_cv_t<invoke_result_t<F>>`.

20 *Constraints:* `is_constructible_v<E, decltype(std::move(error()))>` is true.

21 *Mandates:* U is a valid value type for `expected`. If `is_void_v<U>` is false, the declaration

```

    U u(invoke(std::forward<F>(f)));

```

is well-formed.

22 *Effects:*

(22.1) — If `has_value()` is false, returns `expected<U, E>(unexpect, std::move(error()))`.

(22.2) — Otherwise, if `is_void_v<U>` is false, returns an `expected<U, E>` object whose `has_val` member is true and `val` member is direct-non-list-initialized with `invoke(std::forward<F>(f))`.

(22.3) — Otherwise, evaluates `invoke(std::forward<F>(f))` and then returns `expected<U, E>()`.

```

template<class F> constexpr auto transform_error(F&& f) &;
template<class F> constexpr auto transform_error(F&& f) const &;

```

23 Let G be `remove_cv_t<invoke_result_t<F, decltype(error())>>`.

24 *Mandates:* G is a valid template argument for `unexpected` (22.8.3.1) and the declaration

```

    G g(invoke(std::forward<F>(f), error()));

```

is well-formed.

25 *Returns:* If `has_value()` is true, `expected<T, G>()`; otherwise, an `expected<T, G>` object whose `has_val` member is false and `unex` member is direct-non-list-initialized with `invoke(std::forward<F>(f), error())`.

template<class F> constexpr auto transform_error(F&& f) &&;
 template<class F> constexpr auto transform_error(F&& f) const &&;

26 Let G be remove_cv_t<invoke_result_t<F, decltype(std::move(error()))>>.

27 *Mandates:* G is a valid template argument for unexpected (22.8.3.1) and the declaration
 G g(invoker(std::forward<F>(f), std::move(error())));
 is well-formed.

28 *Returns:* If has_value() is true, expected<T, G>(); otherwise, an expected<T, G> object whose
 has_val member is false and unex member is direct-non-list-initialized with invoker(std::for-
 ward<F>(f), std::move(error())).

22.8.7.8 Equality operators

[expected_void.eq]

```
template<class T2, class E2> requires is_void_v<T2>
friend constexpr bool operator==(const expected& x, const expected<T2, E2>& y);
```

1 *Mandates:* The expression x.error() == y.error() is well-formed and its result is convertible to
 bool.

2 *Returns:* If x.has_value() does not equal y.has_value(), false; otherwise x.has_value() ||
 static_cast<bool>(x.error() == y.error()).

```
template<class E2>
friend constexpr bool operator==(const expected& x, const unexpected<E2>& e);
```

3 *Mandates:* The expression x.error() == e.error() is well-formed and its result is convertible to
 bool.

4 *Returns:* !x.has_value() && static_cast<bool>(x.error() == e.error()).

22.9 Bitsets

[bitset]

22.9.1 Header <bitset> synopsis

[bitset.syn]

1 The header <bitset> defines a class template and several related functions for representing and manipulating
 fixed-size sequences of bits.

```
#include <string> // see 23.4.2
#include <iostream> // for istream (31.7.1), ostream (31.7.2), see 31.3.1
```

```
namespace std {
    template<size_t N> class bitset;

    // 22.9.4, bitset operators
    template<size_t N>
        constexpr bitset<N> operator&(const bitset<N>&, const bitset<N>&) noexcept;
    template<size_t N>
        constexpr bitset<N> operator|(const bitset<N>&, const bitset<N>&) noexcept;
    template<size_t N>
        constexpr bitset<N> operator^(const bitset<N>&, const bitset<N>&) noexcept;
    template<class charT, class traits, size_t N>
        basic_istream<charT, traits>&
            operator>>(basic_istream<charT, traits>& is, bitset<N>& x);
    template<class charT, class traits, size_t N>
        basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& os, const bitset<N>& x);
}
```

22.9.2 Class template bitset

[template.bitset]

22.9.2.1 General

[template.bitset.general]

```
namespace std {
    template<size_t N> class bitset {
        public:
            // bit reference
            class reference {
                friend class bitset;
```

```

    constexpr reference() noexcept;

public:
    constexpr reference(const reference&) = default;
    constexpr ~reference();
    constexpr reference& operator=(bool x) noexcept;           // for b[i] = x;
    constexpr reference& operator=(const reference&) noexcept; // for b[i] = b[j];
    constexpr bool operator~() const noexcept;                 // flips the bit
    constexpr operator bool() const noexcept;                  // for x = b[i];
    constexpr reference& flip() noexcept;                      // for b[i].flip();
};

// 22.9.2.2, constructors
constexpr bitset() noexcept;
constexpr bitset(unsigned long long val) noexcept;
template<class charT, class traits, class Allocator>
constexpr explicit bitset(
    const basic_string<charT, traits, Allocator>& str,
    typename basic_string<charT, traits, Allocator>::size_type pos = 0,
    typename basic_string<charT, traits, Allocator>::size_type n
        = basic_string<charT, traits, Allocator>::npos,
    charT zero = charT('0'),
    charT one = charT('1'));
template<class charT>

```

```

    constexpr bool any() const noexcept;
    constexpr bool none() const noexcept;
};

// 22.9.3, hash support
template<class T> struct hash;
template<size_t N> struct hash<bitset<N>>;
}

```

- 1 The class template `bitset<N>` describes an object that can store a sequence consisting of a fixed number of bits, `N`.
- 2 Each bit represents either the value zero (reset) or one (set). To *toggle* a bit is to change the value zero to one, or the value one to zero. Each bit has a non-negative position `pos`. When converting between an object of class `bitset<N>` and a value of some integral type, bit position `pos` corresponds to the *bit value* `1 << pos`. The integral value corresponding to two or more bits is the sum of their bit values.
- 3 The functions described in 22.9.2 can report three kinds of errors, each associated with a distinct exception:
 - (3.1) — an *invalid-argument* error is associated with exceptions of type `invalid_argument` (19.2.5);
 - (3.2) — an *out-of-range* error is associated with exceptions of type `out_of_range` (19.2.7);
 - (3.3) — an *overflow* error is associated with exceptions of type `overflow_error` (19.2.10).

22.9.2.2 Constructors

[`bitset.cons`]

```
constexpr bitset() noexcept;
```

- 1 *Effects:* Initializes all bits in `*this` to zero.

```
constexpr bitset(unsigned long long val) noexcept;
```

- 2 *Effects:* Initializes the first `M` bit positions to the corresponding bit values in `val`. `M` is the smaller of `N` and the number of bits in the value representation (6.8.1) of `unsigned long long`. If `M < N`, the remaining bit positions are initialized to zero.

```
template<class charT, class traits, class Allocator>
constexpr explicit bitset(
    const basic_string<charT, traits, Allocator>& str,
    typename basic_string<charT, traits, Allocator>::size_type pos = 0,
    typename basic_string<charT, traits, Allocator>::size_type n
        = basic_string<charT, traits, Allocator>::npos,
    charT zero = charT('0'),
    charT one = charT('1'));
```

- 3 *Effects:* Determines the effective length `rlen` of the initializing string as the smaller of `n` and `str.size() - pos`. Initializes the first `M` bit positions to values determined from the corresponding characters in the string `str`. `M` is the smaller of `N` and `rlen`.

- 4 An element of the constructed object has value zero if the corresponding character in `str`, beginning at position `pos`, is `zero`. Otherwise, the element has the value one. Character position `pos + M - 1` corresponds to bit position zero. Subsequent decreasing character positions correspond to increasing bit positions.

- 5 If `M < N`, remaining bit positions are initialized to zero.

- 6 The function uses `traits::eq` to compare the character values.

- 7 *Throws:* `out_of_range` if `pos > str.size()` or `invalid_argument` if any of the `rlen` characters in `str` beginning at position `pos` is other than `zero` or `one`.

```
template<class charT>
constexpr explicit bitset(
    const charT* str,
    typename basic_string<charT>::size_type n = basic_string<charT>::npos,
    charT zero = charT('0'),
    charT one = charT('1'));
```

- 8 *Effects:* As if by:

```

    bitset(n == basic_string<charT>::npos
        ? basic_string<charT>(str)
        : basic_string<charT>(str, n),
        0, n, zero, one)

```

22.9.2.3 Members [bitset.members]

```

constexpr bitset& operator&=(const bitset& rhs) noexcept;
1   Effects: Clears each bit in *this for which the corresponding bit in rhs is clear, and leaves all other bits unchanged.
2   Returns: *this.

```

```

constexpr bitset& operator|=(const bitset& rhs) noexcept;
3   Effects: Sets each bit in *this for which the corresponding bit in rhs is set, and leaves all other bits unchanged.
4   Returns: *this.

```

```

constexpr bitset& operator^=(const bitset& rhs) noexcept;
5   Effects: Toggles each bit in *this for which the corresponding bit in rhs is set, and leaves all other bits unchanged.
6   Returns: *this.

```

```

constexpr bitset& operator<<=(size_t pos) noexcept;
7   Effects: Replaces each bit at position I in *this with a value determined as follows:
(7.1) — If I < pos, the new value is zero;
(7.2) — If I >= pos, the new value is the previous value of the bit at position I - pos.
8   Returns: *this.

```

```

constexpr bitset& operator>>=(size_t pos) noexcept;
9   Effects: Replaces each bit at position I in *this with a value determined as follows:
(9.1) — If pos >= N - I, the new value is zero;
(9.2) — If pos < N - I, the new value is the previous value of the bit at position I + pos.
10  Returns: *this.

```

```

constexpr bitset operator<<(size_t pos) const noexcept;
11  Returns: bitset(*this) << pos.

```

```

constexpr bitset operator>>(size_t pos) const noexcept;
12  Returns: bitset(*this) >> pos.

```

```

constexpr bitset& set() noexcept;
13  Effects: Sets all bits in *this.
14  Returns: *this.

```

```

constexpr bitset& set(size_t pos, bool val = true);
15  Effects: Stores a new value in the bit at position pos in *this. If val is true, the stored value is one, otherwise it is zero.
16  Returns: *this.
17  Throws: out_of_range if pos does not correspond to a valid bit position.

```

```

constexpr bitset& reset() noexcept;
18  Effects: Resets all bits in *this.
19  Returns: *this.

```

```

constexpr bitset& reset(size_t pos);
20   Effects: Resets the bit at position pos in *this.
21   Returns: *this.
22   Throws: out_of_range if pos does not correspond to a valid bit position.

constexpr bitset operator~() const noexcept;
23   Effects: Constructs an object x of class bitset and initializes it with *this.
24   Returns: x.flip().

constexpr bitset& flip() noexcept;
25   Effects: Toggles all bits in *this.
26   Returns: *this.

constexpr bitset& flip(size_t pos);
27   Effects: Toggles the bit at position pos in *this.
28   Returns: *this.
29   Throws: out_of_range if pos does not correspond to a valid bit position.

constexpr bool operator[](size_t pos) const;
30   Preconditions: pos is valid.
31   Returns: true if the bit at position pos in *this has the value one, otherwise false.
32   Throws: Nothing.

constexpr bitset::reference operator[](size_t pos);
33   Preconditions: pos is valid.
34   Returns: An object of type bitset::reference such that (*this)[pos] == this->test(pos), and
            such that (*this)[pos] = val is equivalent to this->set(pos, val).
35   Throws: Nothing.

36   Remarks: For the purpose of determining the presence of a data race (6.9.2), any access or update
            through the resulting reference potentially accesses or modifies, respectively, the entire underlying
            bitset.

constexpr unsigned long to_ulong() const;
37   Returns: x.
38   Throws: overflow_error if the integral value x corresponding to the bits in *this cannot be represented
            as type unsigned long.

constexpr unsigned long long to_ullong() const;
39   Returns: x.
40   Throws: overflow_error if the integral value x corresponding to the bits in *this cannot be represented
            as type unsigned long long.

template<class charT = char,
         class traits = char_traits<charT>,
         class Allocator = allocator<charT>>
constexpr basic_string<charT, traits, Allocator>
to_string(charT zero = charT('0'), charT one = charT('1')) const;
41   Effects: Constructs a string object of the appropriate type and initializes it to a string of length
            N characters. Each character is determined by the value of its corresponding bit position in *this.
            Character position N - 1 corresponds to bit position zero. Subsequent decreasing character positions
            correspond to increasing bit positions. Bit value zero becomes the character zero, bit value one becomes
            the character one.
42   Returns: The created object.

```

```

constexpr size_t count() const noexcept;
43   Returns: A count of the number of bits set in *this.

constexpr size_t size() const noexcept;
44   Returns: N.

constexpr bool operator==(const bitset& rhs) const noexcept;
45   Returns: true if the value of each bit in *this equals the value of the corresponding bit in rhs.

constexpr bool test(size_t pos) const;
46   Returns: true if the bit at position pos in *this has the value one.

47   Throws: out_of_range if pos does not correspond to a valid bit position.

constexpr bool all() const noexcept;
48   Returns: count() == size().

constexpr bool any() const noexcept;
49   Returns: count() != 0.

constexpr bool none() const noexcept;
50   Returns: count() == 0.

```

22.9.3 bitset hash support

[bitset.hash]

```
template<size_t N> struct hash<bitset<N>>;
```

1 The specialization is enabled (22.10.19).

22.9.4 bitset operators

[bitset.operators]

```
template<size_t N>
constexpr bitset<N> operator&(const bitset<N>& lhs, const bitset<N>& rhs) noexcept;
```

1 Returns: bitset<N>(lhs) &= rhs.

```
template<size_t N>
constexpr bitset<N> operator|(const bitset<N>& lhs, const bitset<N>& rhs) noexcept;
```

2 Returns: bitset<N>(lhs) |= rhs.

```
template<size_t N>
constexpr bitset<N> operator^(const bitset<N>& lhs, const bitset<N>& rhs) noexcept;
```

3 Returns: bitset<N>(lhs) ^= rhs.

```
template<class charT, class traits, size_t N>
basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, bitset<N>& x);
```

4 A formatted input function (31.7.5.3).

5 Effects: Extracts up to N characters from is. Stores these characters in a temporary object str of type basic_string<charT, traits>, then evaluates the expression x = bitset<N>(str). Characters are extracted and stored until any of the following occurs:

- (5.1) — N characters have been extracted and stored;
- (5.2) — end-of-file occurs on the input sequence;
- (5.3) — the next input character is neither is.widen('0') nor is.widen('1') (in which case the input character is not extracted).

6 If N > 0 and no characters are stored in str, ios_base::failbit is set in the input function's local error state before setstate is called.

7 Returns: is.

```

template<class charT, class traits, size_t N>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const bitset<N>& x);

8   Returns:

    os << x.template to_string<charT, traits, allocator<charT>>(
        use_facet<ctype<charT>>(os.getloc()).widen('0'),
        use_facet<ctype<charT>>(os.getloc()).widen('1'))
    (see 31.7.6.3).

```

22.10 Function objects

[function.objects]

22.10.1 General

[function.objects.general]

- ¹ A *function object type* is an object type (6.8.1) that can be the type of the *postfix-expression* in a function call (7.6.1.3, 12.2.2.2).²⁰⁴ A *function object* is an object of a function object type. In the places where one would expect to pass a pointer to a function to an algorithmic template (Clause 27), the interface is specified to accept a function object. This not only makes algorithmic templates work with pointers to functions, but also enables them to work with arbitrary function objects.

22.10.2 Header <functional> synopsis

[functional.syn]

```

namespace std {
    // 22.10.5, invoke
    template<class F, class... Args>
    constexpr invoke_result_t<F, Args...> invoke(F&& f, Args&&... args)           // freestanding
        noexcept(is_nothrow_invocable_v<F, Args...>);

    template<class R, class F, class... Args>
    constexpr R invoke_r(F&& f, Args&&... args)                                     // freestanding
        noexcept(is_nothrow_invocable_r_v<R, F, Args...>);

    // 22.10.6, reference_wrapper

```

```

    }
}

```

- ¹ EXAMPLE 1: If a C++ program wants to have a by-element addition of two vectors **a** and **b** containing **double** and put the result into **a**, it can do:

```
transform(a.begin(), a.end(), b.begin(), a.begin(), plus<double>());
```

- ² EXAMPLE 2: To negate every element of **a**:

```
transform(a.begin(), a.end(), a.begin(), negate<double>());
```

22.10.3 Definitions

[func.def]

- ¹ The following definitions apply to this Clause:
- ² A *call signature* is the name of a return type followed by a parenthesized comma-separated list of zero or more argument types.
- ³ A *callable type* is a function object type (22.10) or a pointer to member.
- ⁴ A *callable object* is an object of a callable type.
- ⁵ A *call wrapper type* is a type that holds a callable object and supports a call operation that forwards to that object.
- ⁶ A *call wrapper* is an object of a call wrapper type.
- ⁷ A *target object* is the callable object held by a call wrapper.
- ⁸ A call wrapper type may additionally hold a sequence of objects and references that may be passed as arguments to the target object. These entities are collectively referred to as *bound argument entities*.
- ⁹ The target object and bound argument entities of the call wrapper are collectively referred to as *state entities*.

22.10.4 Requirements

[func.require]

- ¹ Define *INVOKE(f, t₁, t₂, ..., t_N)* as follows:
 - (1.1) — (t₁.*f)(t₂, ..., t_N) when f is a pointer to a member function of a class T and *is_same_v<T, remove_cvref_t<decltype(t1)>>* || *is_base_of_v<T, remove_cvref_t<decltype(t1)>>* is true;
 - (1.2) — (t₁.get().*f)(t₂, ..., t_N) when f is a pointer to a member function of a class T and *remove_cvref_t<decltype(t1)>* is a specialization of *reference_wrapper*;
 - (1.3) — ((*t₁).*f)(t₂, ..., t_N) when f is a pointer to a member function of a class T and t₁ does not satisfy the previous two items;
 - (1.4) — t₁.*f when N = 1 and f is a pointer to data member of a class T and *is_same_v<T, remove_cvref_t<decltype(t1)>>* || *is_base_of_v<T, remove_cvref_t<decltype(t1)>>* is true;
 - (1.5) — t₁.get().*f when N = 1 and f is a pointer to data member of a class T and *remove_cvref_t<decltype(t1)>* is a specialization of *reference_wrapper*;
 - (1.6) — (*t₁).*f when N = 1 and f is a pointer to data member of a class T and t₁ does not satisfy the previous two items;
 - (1.7) — f(t₁, t₂, ..., t_N) in all other cases.
- ² Define *INVOKE<R>(f, t₁, t₂, ..., t_N)* as *static_cast<void>(INVOKE(f, t₁, t₂, ..., t_N))* if R is cv void, otherwise *INVOKE(f, t₁, t₂, ..., t_N)* implicitly converted to R. If *reference Converts FromTemporary_v<R, decltype(INVOKE(f, t₁, t₂, ..., t_N))>* is true, *INVOKE<R>(f, t₁, t₂, ..., t_N)* is ill-formed.
- ³ Every call wrapper (22.10.3) meets the *Cpp17MoveConstructible* and *Cpp17Destructible* requirements. An *argument forwarding call wrapper* is a call wrapper that can be called with an arbitrary argument list and delivers the arguments to the target object as references. This forwarding step delivers rvalue arguments as rvalue references and lvalue arguments as lvalue references.

NOTE 1: In a typical implementation, argument forwarding call wrappers have an overloaded function call operator of the form

```
template<class... UnBoundArgs>
constexpr R operator()(UnBoundArgs&&... unbound_args) cv-qual;
```

- ⁴ A *perfect forwarding call wrapper* is an argument forwarding call wrapper that forwards its state entities to the underlying call expression. This forwarding step delivers a state entity of type T as *cv* T& when the call is performed on an lvalue of the call wrapper type and as *cv* T&& otherwise, where *cv* represents the cv-qualifiers of the call wrapper and where *cv* shall be neither volatile nor const volatile.
- ⁵ A *call pattern* defines the semantics of invoking a perfect forwarding call wrapper. A postfix call performed on a perfect forwarding call wrapper is expression-equivalent (3.21) to an expression e determined from its call pattern cp by replacing all occurrences of the arguments of the call wrapper and its state entities with references as described in the corresponding forwarding steps.
- ⁶ A *simple call wrapper* is a perfect forwarding call wrapper that meets the Cpp17CopyConstructible and Cpp17CopyAssignable requirements and whose copy constructor, move constructor, and assignment operators are constexpr functions that do not throw exceptions.
- ⁷ The copy/move constructor of an argument forwarding call wrapper has the same apparent semantics as if memberwise copy/move of its state entities were performed (11.4.5.3).
NOTE 2: This implies that each of the copy/move constructors has the same exception-specification as the corresponding implicit definition and is declared as constexpr if the corresponding implicit definition would be considered to be constexpr.
- ⁸ Argument forwarding call wrappers returned by a given standard library function template have the same type if the types of their corresponding state entities are the same.

22.10.5 invoke functions

[func.invoke]

```
template<class F, class... Args>
constexpr invoke_result_t<F, Args...> invoke(F&& f, Args&&... args)
    noexcept(is_nothrow_invocable_v<F, Args...>);

1   Constraints: is_invocable_v<F, Args...> is true.
2   Returns:(INVOKE(std::forward<F>(f), std::forward<Args>(args)...)) (22.10.4).
```

```
template<class R, class F, class... Args>
constexpr R invoke_r(F&& f, Args&&... args)
    noexcept(is_nothrow_invocable_r_v<R, F, Args...>);

3   Constraints: is_invocable_r_v<R, F, Args...> is true.
4   Returns:(INVOKE<R>(std::forward<F>(f), std::forward<Args>(args)...)) (22.10.4).
```

22.10.6 Class template reference_wrapper

[refwrap]

22.10.6.1 General

[refwrap.general]

```
namespace std {
    template<class T> class reference_wrapper {
        public:
            // types
            using type = T;

            // 22.10.6.2, constructors
            template<class U>
            constexpr reference_wrapper(U&&) noexcept(see below);
            constexpr reference_wrapper(const reference_wrapper& x) noexcept;

            // 22.10.6.3, assignment
            constexpr reference_wrapper& operator=(const reference_wrapper& x) noexcept;

            // 22.10.6.4, access
            constexpr operator T& () const noexcept;
            constexpr T& get() const noexcept;

            // 22.10.6.5, invocation
            template<class... ArgTypes>
            constexpr invoke_result_t<T&, ArgTypes...> operator()(ArgTypes&&...) const
                noexcept(is_nothrow_invocable_v<T&, ArgTypes...>);
    };
}
```

```
template<class T>
    reference_wrapper(T&) -> reference_wrapper<T>;
}
```

¹ `reference_wrapper<T>` is a *Cpp17CopyConstructible* and *Cpp17CopyAssignable* wrapper around a reference to an object or function of type `T`.

² `reference_wrapper<T>` is a trivially copyable type (6.8.1).

³ The template parameter `T` of `reference_wrapper` may be an incomplete type.

22.10.6.2 Constructors

[refwrap.const]

```
template<class U>
    constexpr reference_wrapper(U&& u) noexcept(see below);
```

¹ Let *FUN* denote the exposition-only functions

```
void FUN(T&) noexcept;
void FUN(T&&) = delete;
```

² *Constraints*: The expression `FUN(declval<U>())` is well-formed and `is_same_v<remove_cvref_t<U>, reference_wrapper>` is false.

³ *Effects*: Creates a variable `r` as if by `T& r = std::forward<U>(u)`, then constructs a `reference_wrapper` object that stores a reference to `r`.

⁴ *Remarks*: The exception specification is equivalent to `noexcept(FUN(declval<U>()))`.

```
constexpr reference_wrapper(const reference_wrapper& x) noexcept;
```

⁵ *Effects*: Constructs a `reference_wrapper` object that stores a reference to `x.get()`.

22.10.6.3 Assignment

[refwrap.assign]

```
constexpr reference_wrapper& operator=(const reference_wrapper& x) noexcept;
```

¹ *Postconditions*: `*this` stores a reference to `x.get()`.

22.10.6.4 Access

[refwrap.access]

```
constexpr operator T& () const noexcept;
```

¹ *Returns*: The stored reference.

```
constexpr T& get() const noexcept;
```

² *Returns*: The stored reference.

22.10.6.5 Invocation

[refwrap.invoke]

```
template<class... ArgTypes>
    constexpr invoke_result_t<T&, ArgTypes...>
        operator()(ArgTypes&&... args) const noexcept(is_nothrow_invocable_v<T&, ArgTypes...>);
```

¹ *Mandates*: `T` is a complete type.

² *Returns*: `INVOKE(get(), std::forward<ArgTypes>(args)...)`. (22.10.4)

22.10.6.6 Helper functions

[refwrap.helpers]

¹ The template parameter `T` of the following `ref` and `cref` function templates may be an incomplete type.

```
template<class T> constexpr reference_wrapper<T> ref(T& t) noexcept;
```

² *Returns*: `reference_wrapper<T>(t)`.

```
template<class T> constexpr reference_wrapper<T> ref(reference_wrapper<T> t) noexcept;
```

³ *Returns*: `t`.

```
template<class T> constexpr reference_wrapper<const T> cref(const T& t) noexcept;
```

⁴ *Returns*: `reference_wrapper<const T>(t)`.

template<class T> constexpr reference_wrapper<const T> cref(reference_wrapper<T> t) noexcept;
 5 >Returns: t.

22.10.6.7 common_reference related specializations

[refwrap.common.ref]

```
namespace std {
    template<class T>
    constexpr bool is-ref-wrapper = false; // exposition only

    template<class T>
    constexpr bool is-ref-wrapper<reference_wrapper<T>> = true;

    template<class R, class T, class RQ, class TQ>
    concept ref-wrap-common-reference-exists-with = // exposition only
        is-ref-wrapper<R> &&
        requires { typename common_reference_t<typename R::type&, TQ>; } &&
        convertible_to<RQ, common_reference_t<typename R::type&, TQ>;

    template<class R, class T, template<class> class RQual, template<class> class TQual>
    requires (ref-wrap-common-reference-exists-with<R, T, RQual<R>, TQual<T>> &&
              !ref-wrap-common-reference-exists-with<T, R, TQual<T>, RQual<R>>)
    struct basic_common_reference<R, T, RQual, TQual> {
        using type = common_reference_t<typename R::type&, TQual<T>>;
    };

    template<class T, class R, template<class> class TQual, template<class> class RQual>
    requires (ref-wrap-common-reference-exists-with<R, T, RQual<R>, TQual<T>> &&
              !ref-wrap-common-reference-exists-with<T, R, TQual<T>, RQual<R>>)
    struct basic_common_reference<T, R, TQual, RQual> {
        using type = common_reference_t<typename R::type&, TQual<T>>;
    };
}
```

22.10.7 Arithmetic operations

[arithmetic.operations]

22.10.7.1 General

[arithmetic.operations.general]

- ¹ The library provides basic function object classes for all of the arithmetic operators in the language (7.6.5, 7.6.6).

22.10.7.2 Class template plus

[arithmetic.operations.plus]

```
template<class T = void> struct plus {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;

1       >Returns: x + y.

template<> struct plus<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) + std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) + std::forward<U>(u));
2       >Returns: std::forward<T>(t) + std::forward<U>(u).
```

22.10.7.3 Class template minus

[arithmetic.operations.minus]

```
template<class T = void> struct minus {
    constexpr T operator()(const T& x, const T& y) const;
};
```

```

constexpr T operator()(const T& x, const T& y) const;
1   Returns: x - y.

template<> struct minus<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) - std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) - std::forward<U>(u));
2   Returns: std::forward<T>(t) - std::forward<U>(u).

```

22.10.7.4 Class template multiplies

[arithmetic.operations.multiplies]

```

template<class T = void> struct multiplies {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;
1   Returns: x * y.

template<> struct multiplies<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) * std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) * std::forward<U>(u));
2   Returns: std::forward<T>(t) * std::forward<U>(u).

```

22.10.7.5 Class template divides

[arithmetic.operations.divides]

```

template<class T = void> struct divides {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;
1   Returns: x / y.

template<> struct divides<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) / std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) / std::forward<U>(u));
2   Returns: std::forward<T>(t) / std::forward<U>(u).

```

22.10.7.6 Class template modulus

[arithmetic.operations.modulus]

```

template<class T = void> struct modulus {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;
1   Returns: x % y.

```

```

template<> struct modulus<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) % std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) % std::forward<U>(u));
2     Returns: std::forward<T>(t) % std::forward<U>(u).

```

22.10.7.7 Class template negate

[arithmetic.operations.negate]

```

template<class T = void> struct negate {
    constexpr T operator()(const T& x) const;
};

constexpr T operator()(const T& x) const;
1     Returns: -x.

template<> struct negate<void> {
    template<class T> constexpr auto operator()(T&& t) const
        -> decltype(-std::forward<T>(t));

    using is_transparent = unspecified;
};

template<class T> constexpr auto operator()(T&& t) const
    -> decltype(-std::forward<T>(t));
2     Returns: -std::forward<T>(t).

```

22.10.8 Comparisons

[comparisons]

22.10.8.1 General

[comparisons.general]

- 1 The library provides basic function object classes for all of the comparison operators in the language (7.6.9, 7.6.10).
- 2 For templates `less`, `greater`, `less_equal`, and `greater_equal`, the specializations for any pointer type yield a result consistent with the implementation-defined strict total order over pointers (3.27).

NOTE: If `a < b` is well-defined for pointers `a` and `b` of type `P`, then `(a < b) == less<P>()(a, b)`, `(a > b) == greater<P>()(a, b)`, and so forth.

For template specializations `less<void>`, `greater<void>`, `less_equal<void>`, and `greater_equal<void>`, if the call operator calls a built-in operator comparing pointers, the call operator yields a result consistent with the implementation-defined strict total order over pointers.

22.10.8.2 Class template equal_to

[comparisons.equal.to]

```

template<class T = void> struct equal_to {
    constexpr bool operator()(const T& x, const T& y) const;
};

constexpr bool operator()(const T& x, const T& y) const;
1     Returns: x == y.

template<> struct equal_to<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) == std::forward<U>(u));

    using is_transparent = unspecified;
};

```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) == std::forward<U>(u));
2     Returns: std::forward<T>(t) == std::forward<U>(u).
```

22.10.8.3 Class template not_equal_to

[comparisons.not.equal.to]

```
template<class T = void> struct not_equal_to {
    constexpr bool operator()(const T& x, const T& y) const;
};

constexpr bool operator()(const T& x, const T& y) const;
1     Returns: x != y.

template<> struct not_equal_to<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) != std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) != std::forward<U>(u));
2     Returns: std::forward<T>(t) != std::forward<U>(u).
```

22.10.8.4 Class template greater

[comparisons.greater]

```
template<class T = void> struct greater {
    constexpr bool operator()(const T& x, const T& y) const;
};

constexpr bool operator()(const T& x, const T& y) const;
1     Returns: x > y.

template<> struct greater<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) > std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) > std::forward<U>(u));
2     Returns: std::forward<T>(t) > std::forward<U>(u).
```

22.10.8.5 Class template less

[comparisons.less]

```
template<class T = void> struct less {
    constexpr bool operator()(const T& x, const T& y) const;
};

constexpr bool operator()(const T& x, const T& y) const;
1     Returns: x < y.

template<> struct less<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) < std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) < std::forward<U>(u));
2     Returns: std::forward<T>(t) < std::forward<U>(u).
```

22.10.8.6 Class template greater_equal

[comparisons.greater.equal]

```
template<class T = void> struct greater_equal {
    constexpr bool operator()(const T& x, const T& y) const;
};

constexpr bool operator()(const T& x, const T& y) const;

1   Returns: x >= y.

template<> struct greater_equal<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) >= std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) >= std::forward<U>(u));

2   Returns: std::forward<T>(t) >= std::forward<U>(u).
```

22.10.8.7 Class template less_equal

[comparisons.less.equal]

```
template<class T = void> struct less_equal {
    constexpr bool operator()(const T& x, const T& y) const;
};

constexpr bool operator()(const T& x, const T& y) const;

1   Returns: x <= y.

template<> struct less_equal<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) <= std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) <= std::forward<U>(u));

2   Returns: std::forward<T>(t) <= std::forward<U>(u).
```

22.10.8.8 Class compare_three_way

[comparisons.three.way]

```
namespace std {
    struct compare_three_way {
        template<class T, class U>
            constexpr auto operator()(T&& t, U&& u) const;

        using is_transparent = unspecified;
    };
}
```

```
template<class T, class U>
constexpr auto operator()(T&& t, U&& u) const;
```

1 *Constraints:* T and U satisfy three_way_comparable_with.

2 *Preconditions:* If the expression std::forward<T>(t) <=> std::forward<U>(u) results in a call to a built-in operator <=> comparing pointers of type P, the conversion sequences from both T and U to P are equality-preserving (18.2); otherwise, T and U model three_way_comparable_with.

3 *Effects:*

- (3.1) — If the expression std::forward<T>(t) <=> std::forward<U>(u) results in a call to a built-in operator <=> comparing pointers of type P, returns strong_ordering::less if (the converted value of) t precedes u in the implementation-defined strict total order over pointers (3.27), strong_ordering::greater if u precedes t, and otherwise strong_ordering::equal.

(3.2) — Otherwise, equivalent to: `return std::forward<T>(t) <=> std::forward<U>(u);`

22.10.9 Concept-constrained comparisons

[range.cmp]

```
struct ranges::equal_to {
    template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};
```

1 Constraints: T and U satisfy `equality_comparable_with`.

2 Preconditions: If the expression `std::forward<T>(t) == std::forward<U>(u)` results in a call to a built-in operator `==` comparing pointers of type P, the conversion sequences from both T and U to P are equality-preserving (18.2); otherwise, T and U model `equality_comparable_with`.

3 Effects:

(3.1) — If the expression `std::forward<T>(t) == std::forward<U>(u)` results in a call to a built-in operator `==` comparing pointers: returns `false` if either (the converted value of) t precedes u or u precedes t in the implementation-defined strict total order over pointers (3.27) and otherwise `true`.

(3.2) — Otherwise, equivalent to: `return std::forward<T>(t) == std::forward<U>(u);`

```
struct ranges::not_equal_to {
    template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};
```

4 Constraints: T and U satisfy `equality_comparable_with`.

5 Effects: Equivalent to:

```
    return !ranges::equal_to{}(std::forward<T>(t), std::forward<U>(u));
```

```
struct ranges::greater {
    template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};
```

6 Constraints: T and U satisfy `totally_ordered_with`.

7 Effects: Equivalent to:

```
    return ranges::less{}(std::forward<U>(u), std::forward<T>(t));
```

```
struct ranges::less {
    template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};
```

8 Constraints: T and U satisfy `totally_ordered_with`.

9 *Preconditions:* If the expression `std::forward<T>(t) < std::forward<U>(u)` results in a call to a built-in operator `<` comparing pointers of type P, the conversion sequences from both T and U to P are equality-preserving (18.2); otherwise, T and U model `totally_ordered_with`. For any expressions ET and EU such that `decltype((ET))` is T and `decltype((EU))` is U, exactly one of `ranges::less{}(ET, EU)`, `ranges::less{}(EU, ET)`, or `ranges::equal_to{}(ET, EU)` is `true`.

10 *Effects:*

- (10.1) — If the expression `std::forward<T>(t) < std::forward<U>(u)` results in a call to a built-in operator `<` comparing pointers: returns `true` if (the converted value of) t precedes u in the implementation-defined strict total order over pointers (3.27) and otherwise `false`.

- (10.2) — Otherwise, equivalent to: `return std::forward<T>(t) < std::forward<U>(u);`

```
struct ranges::greater_equal {
    template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};
```

template<class T, class U>
constexpr bool operator()(T&& t, U&& u) const;

11 *Constraints:* T and U satisfy `totally_ordered_with`.

12 *Effects:* Equivalent to:

```
return !ranges::less{}(std::forward<T>(t), std::forward<U>(u));
```

```
struct ranges::less_equal {
    template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};
```

template<class T, class U>
constexpr bool operator()(T&& t, U&& u) const;

13 *Constraints:* T and U satisfy `totally_ordered_with`.

14 *Effects:* Equivalent to:

```
return !ranges::less{}(std::forward<U>(u), std::forward<T>(t));
```

22.10.10 Logical operations

[logical.operations]

22.10.10.1 General

[logical.operations.general]

- ¹ The library provides basic function object classes for all of the logical operators in the language (7.6.14, 7.6.15, 7.6.2.2).

22.10.10.2 Class template logical_and

[logical.operations.and]

```
template<class T = void> struct logical_and {
    constexpr bool operator()(const T& x, const T& y) const;
};
```

```
constexpr bool operator()(const T& x, const T& y) const;
```

- 1 *Returns:* `x && y`.

```
template<> struct logical_and<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) && std::forward<U>(u));

    using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) && std::forward<U>(u));
2   Returns: std::forward<T>(t) && std::forward<U>(u).
```

22.10.10.3 Class template logical_or

[logical.operations.or]

```
template<class T = void> struct logical_or {
    constexpr bool operator()(const T& x, const T& y) const;
};

constexpr bool operator()(const T& x, const T& y) const;
1   Returns: x || y.

template<> struct logical_or<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) || std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) || std::forward<U>(u));
2   Returns: std::forward<T>(t) || std::forward<U>(u).
```

22.10.10.4 Class template logical_not

[logical.operations.not]

```
template<class T = void> struct logical_not {
    constexpr bool operator()(const T& x) const;
};

constexpr bool operator()(const T& x) const;
1   Returns: !x.

template<> struct logical_not<void> {
    template<class T> constexpr auto operator()(T&& t) const
        -> decltype(!std::forward<T>(t));

    using is_transparent = unspecified;
};

template<class T> constexpr auto operator()(T&& t) const
    -> decltype(!std::forward<T>(t));
2   Returns: !std::forward<T>(t).
```

22.10.11 Bitwise operations

[bitwise.operations]

22.10.11.1 General

[bitwise.operations.general]

- ¹ The library provides basic function object classes for all of the bitwise operators in the language (7.6.11, 7.6.13, 7.6.12, 7.6.2.2).

22.10.11.2 Class template bit_and

[bitwise.operations.and]

```
template<class T = void> struct bit_and {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;
1   Returns: x & y.

template<> struct bit_and<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) & std::forward<U>(u));
```

```

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) & std::forward<U>(u));
2     Returns: std::forward<T>(t) & std::forward<U>(u).

```

22.10.11.3 Class template bit_or

[bitwise.operations.or]

```

template<class T = void> struct bit_or {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;
1     Returns: x | y.

template<> struct bit_or<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) | std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) | std::forward<U>(u));
2     Returns: std::forward<T>(t) | std::forward<U>(u).

```

22.10.11.4 Class template bit_xor

[bitwise.operations.xor]

```

template<class T = void> struct bit_xor {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;
1     Returns: x ^ y.

template<> struct bit_xor<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) ^ std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) ^ std::forward<U>(u));
2     Returns: std::forward<T>(t) ^ std::forward<U>(u).

```

22.10.11.5 Class template bit_not

[bitwise.operations.not]

```

template<class T = void> struct bit_not {
    constexpr T operator()(const T& x) const;
};

constexpr T operator()(const T& x) const;
1     Returns: ~x.

template<> struct bit_not<void> {
    template<class T> constexpr auto operator()(T&& t) const
        -> decltype(~std::forward<T>(t));

    using is_transparent = unspecified;
};

```

```
template<class T> constexpr auto operator()(T&& t) const
    -> decltype(~std::forward<T>(t));
2   Returns: ~std::forward<T>(t).
```

22.10.12 Class identity

[func.identity]

```
struct identity {
    template<class T>
    constexpr T&& operator()(T&& t) const noexcept;

    using is_transparent = unspecified;
};

template<class T>
constexpr T&& operator()(T&& t) const noexcept;
```

1 Effects: Equivalent to: return std::forward<T>(t);

22.10.13 Function template not_fn

[func.not.fn]

```
template<class F> constexpr unspecified not_fn(F&& f);
```

1 In the text that follows:

- (1.1) — g is a value of the result of a not_fn invocation,
- (1.2) — FD is the type decay_t<F>,
- (1.3) — fd is the target object of g (22.10.3) of type FD, direct-non-list-initialized with std::forward<F>(f),
- (1.4) — call_args is an argument pack used in a function call expression (7.6.1.3) of g.

2 Mandates: is_constructible_v<FD, F> && is_move_constructible_v<FD> is true.

3 Preconditions: FD meets the Cpp17MoveConstructible requirements.

4 Returns: A perfect forwarding call wrapper (22.10.4) g with call pattern !invoke(fd, call_args...).

5 Throws: Any exception thrown by the initialization of fd.

22.10.14 Function templates bind_front and bind_back

[func.bind.partial]

```
template<class F, class... Args>
constexpr unspecified bind_front(F&& f, Args&&... args);
template<class F, class... Args>
constexpr unspecified bind_back(F&& f, Args&&... args);
```

1 Within this subclause:

- (1.1) — g is a value of the result of a bind_front or bind_back invocation,
- (1.2) — FD is the type decay_t<F>,
- (1.3) — fd is the target object of g (22.10.3) of type FD, direct-non-list-initialized with std::forward<F>(f),
- (1.4) — BoundArgs is a pack that denotes decay_t<Args>...,
- (1.5) — bound_args is a pack of bound argument entities of g (22.10.3) of types BoundArgs..., direct-non-list-initialized with std::forward<Args>(args)..., respectively, and
- (1.6) — call_args is an argument pack used in a function call expression (7.6.1.3) of g.

2 Mandates:

```
is_constructible_v<FD, F> &&
is_move_constructible_v<FD> &&
(is_constructible_v<BoundArgs, Args> && ...) &&
(is_move_constructible_v<BoundArgs> && ...)
```

is true.

3 Preconditions: FD meets the Cpp17MoveConstructible requirements. For each Ti in BoundArgs, if Ti is an object type, Ti meets the Cpp17MoveConstructible requirements.

- 4 >Returns: A perfect forwarding call wrapper (22.10.4) *g* with call pattern:
 (4.1) — `invoke(fd, bound_args..., call_args...)` for a `bind_front` invocation, or
 (4.2) — `invoke(fd, call_args..., bound_args...)` for a `bind_back` invocation.
 5 >Throws: Any exception thrown by the initialization of the state entities of *g* (22.10.3).

22.10.15 Function object binders

[func.bind]

22.10.15.1 General

[func.bind.general]

- ¹ Subclause 22.10.15 describes a uniform mechanism for binding arguments of callable objects.

22.10.15.2 Class template `is_bind_expression`

[func.bind.isbind]

```
namespace std {
    template<class T> struct is_bind_expression; // see below
}
```

- ¹ The class template `is_bind_expression` can be used to detect function objects generated by `bind`. The function template `bind` uses `is_bind_expression` to detect subexpressions.
² Specializations of the `is_bind_expression` template shall meet the *Cpp17UnaryTypeTrait* requirements (21.3.2). The implementation provides a definition that has a base characteristic of `true_type` if *T* is a type returned from `bind`, otherwise it has a base characteristic of `false_type`. A program may specialize this template for a program-defined type *T* to have a base characteristic of `true_type` to indicate that *T* should be treated as a subexpression in a `bind` call.

22.10.15.3 Class template `is_placeholder`

[func.bind.isplace]

```
namespace std {
    template<class T> struct is_placeholder; // see below
}
```

- ¹ The class template `is_placeholder` can be used to detect the standard placeholders `_1`, `_2`, and so on (22.10.15.5). The function template `bind` uses `is_placeholder` to detect placeholders.
² Specializations of the `is_placeholder` template shall meet the *Cpp17UnaryTypeTrait* requirements (21.3.2). The implementation provides a definition that has the base characteristic of `integral_constant<int, J>` if *T* is the type of `std::placeholders::_J`, otherwise it has a base characteristic of `integral_constant<int, 0>`. A program may specialize this template for a program-defined type *T* to have a base characteristic of `integral_constant<int, N>` with *N* > 0 to indicate that *T* should be treated as a placeholder type.

22.10.15.4 Function template `bind`

[func.bind.bind]

- ¹ In the text that follows:

- (1.1) — *g* is a value of the result of a `bind` invocation,
- (1.2) — *FD* is the type `decay_t<F>`,
- (1.3) — *fd* is an lvalue that is a target object of *g* (22.10.3) of type *FD* direct-non-list-initialized with `std::forward<F>(f)`,
- (1.4) — *T_i* is the *i*th type in the template parameter pack `BoundArgs`,
- (1.5) — *TD_i* is the type `decay_t<Ti>`,
- (1.6) — *t_i* is the *i*th argument in the function parameter pack `bound_args`,
- (1.7) — *td_i* is a bound argument entity of *g* (22.10.3) of type *TD_i* direct-non-list-initialized with `std::forward<Ti>(ti)`,
- (1.8) — *U_j* is the *j*th deduced type of the `UnBindArgs&&...` parameter of the argument forwarding call wrapper, and
- (1.9) — *u_j* is the *j*th argument associated with *U_j*.

```
template<class F, class... BoundArgs>
constexpr unspecified bind(F&& f, BoundArgs&&... bound_args);
```

`template<class R, class F, class... BoundArgs>`
`constexpr unspecified bind(F&& f, BoundArgs&&... bound_args);`

2 *Mandates:* `is_constructible_v<FD, F>` is true. For each T_i in `BoundArgs`, `is_constructible_v<TDi, Ti>` is true.

3 *Preconditions:* FD and each TD_i meet the *Cpp17MoveConstructible* and *Cpp17Destructible* requirements. `(INVOKE(fd, w1, w2, ..., wN)` (22.10.4) is a valid expression for some values w_1, w_2, \dots, w_N , where N has the value `sizeof...(bound_args)`.

4 *Returns:* An argument forwarding call wrapper g (22.10.4). A program that attempts to invoke a volatile-qualified g is ill-formed. When g is not volatile-qualified, invocation of $g(u_1, u_2, \dots, u_M)$ is expression-equivalent (3.21) to

`(INVOKE(static_cast<Vfd>(vfd),`
`static_cast<V1>(v1), static_cast<V2>(v2), ..., static_cast<VN>(vN))`

for the first overload, and

`(INVOKE<R>(static_cast<Vfd>(vfd),`
`static_cast<V1>(v1), static_cast<V2>(v2), ..., static_cast<VN>(vN))`

for the second overload, where the values and types of the target argument v_{fd} and of the bound arguments v_1, v_2, \dots, v_N are determined as specified below.

5 *Throws:* Any exception thrown by the initialization of the state entities of g .

6 *NOTE:* If all of FD and TD_i meet the requirements of *Cpp17CopyConstructible*, then the return type meets the requirements of *Cpp17CopyConstructible*.

7 The values of the *bound arguments* v_1, v_2, \dots, v_N and their corresponding types V_1, V_2, \dots, V_N depend on the types TD_i derived from the call to `bind` and the cv-qualifiers *cv* of the call wrapper g as follows:

(7.1) — if TD_i is `reference_wrapper<T>`, the argument is $td_i.get()$ and its type V_i is $T\&$;

(7.2) — if the value of `is_bind_expression_v<TDi>` is true, the argument is

`static_cast<cv TDi&>(tdi)(std::forward<Ujj)...)`

and its type V_i is `invoke_result_t<cv TDi&, Uj...>&&;`

(7.3) — if the value j of `is_placeholder_v<TDi>` is not zero, the argument is `std::forward<Uj>(uj)` and its type V_i is $U_j\&&;$;

(7.4) — otherwise, the value is td_i and its type V_i is `cv TDi&`.

8 The value of the target argument v_{fd} is fd and its corresponding type V_{fd} is `cv FD&`.

22.10.15.5 Placeholders

[func.bind.place]

```
namespace std::placeholders {
    // M is the number of placeholders
    see below _1;
    see below _2;
    .
    .
    .
    see below _M;
}
```

1 The number M of placeholders is implementation-defined.

2 All placeholder types meet the *Cpp17DefaultConstructible* and *Cpp17CopyConstructible* requirements, and their default constructors and copy/move constructors are `constexpr` functions that do not throw exceptions. It is implementation-defined whether placeholder types meet the *Cpp17CopyAssignable* requirements, but if so, their copy assignment operators are `constexpr` functions that do not throw exceptions.

3 Placeholders should be defined as:

`inline constexpr unspecified _1{};`

If they are not, they are declared as:

`extern unspecified _1;`

4 Placeholders are freestanding items (16.3.3.6).

22.10.16 Function template `mem_fn`

[func.memfn]

```
template<class R, class T> constexpr unspecified mem_fn(R T::* pm) noexcept;
```

- ¹ *Returns:* A simple call wrapper (22.10.4) fn with call pattern invoke(pmd, call_args...), where pmd is the target object of fn of type R T::* direct-non-list-initialized with pm, and call_args is an argument pack used in a function call expression (7.6.1.3) of fn.

22.10.17 Polymorphic function wrappers

[func.wrap]

22.10.17.1 General

[func.wrap.general]

- ¹ Subclause 22.10.17 describes polymorphic wrapper classes that encapsulate arbitrary callable objects.

22.10.17.2 Class `bad_function_call`

[func.wrap.badcall]

- ¹ An exception of type `bad_function_call` is thrown by `function::operator()` (22.10.17.3.5) when the function wrapper object has no target.

```
namespace std {
    class bad_function_call : public exception {
    public:
        // see 17.9.3 for the specification of the special member functions
        const char* what() const noexcept override;
    };
}

const char* what() const noexcept override;
```

- ² *Returns:* An implementation-defined NTBS.

22.10.17.3 Class template `function`

[func.wrap.func]

22.10.17.3.1 General

[func.wrap.func.general]

```
namespace std {
    template<class> class function;           // not defined

    template<class R, class... ArgTypes>
    class function<R(ArgTypes...)> {
    public:
        using result_type = R;

        // 22.10.17.3.2, construct/copy/destroy
        function() noexcept;
        function(nullptr_t) noexcept;
        function(const function&);
        function(function&&) noexcept;
        template<class F> function(F&&);

        function& operator=(const function&);
        function& operator=(function&&);
        function& operator=(nullptr_t) noexcept;
        template<class F> function& operator=(F&&);
        template<class F> function& operator=(reference_wrapper<F>) noexcept;

        ~function();

        // 22.10.17.3.3, function modifiers
        void swap(function&) noexcept;

        // 22.10.17.3.4, function capacity
        explicit operator bool() const noexcept;

        // 22.10.17.3.5, function invocation
        R operator()(ArgTypes...) const;
```

```

// 22.10.17.3.6, function target access
const type_info& target_type() const noexcept;
template<class T>      T* target() noexcept;
template<class T> const T* target() const noexcept;
};

template<class R, class... ArgTypes>
function(R(*)(ArgTypes...)) -> function<R(ArgTypes...)>

template<class F> function(F) -> function<see below>;
}

```

- ¹ The **function** class template provides polymorphic wrappers that generalize the notion of a function pointer. Wrappers can store, copy, and call arbitrary callable objects (22.10.3), given a call signature (22.10.3).
- ² A callable type (22.10.3) **F** is *Lvalue-Callable* for argument types **ArgTypes** and return type **R** if the expression *INVOKE*<**R**>(declval<**F**>(), declval<**ArgTypes**>()...), considered as an unevaluated operand (7.2.3), is well-formed (22.10.4).
- ³ The **function** class template is a call wrapper (22.10.3) whose call signature (22.10.3) is **R(ArgTypes...)**.
- ⁴ NOTE: The types deduced by the deduction guides for **function** might change in future revisions of C++.

22.10.17.3.2 Constructors and destructor

[func.wrap.func.con]

```

function() noexcept;

1   Postconditions: !*this.

function(nullptr_t) noexcept;

2   Postconditions: !*this.

function(const function& f);

3   Postconditions: !*this if !f; otherwise, the target object of *this is a copy of f.target().

4   Throws: Nothing if f's target is a specialization of reference_wrapper or a function pointer. Otherwise, may throw bad_alloc or any exception thrown by the copy constructor of the stored callable object.

5   Recommended practice: Implementations should avoid the use of dynamically allocated memory for small callable objects, for example, where f's target is an object holding only a pointer or reference to an object and a member function pointer.

function(function&& f) noexcept;

6   Postconditions: If !f, *this has no target; otherwise, the target of *this is equivalent to the target of f before the construction, and f is in a valid state with an unspecified value.

7   Recommended practice: Implementations should avoid the use of dynamically allocated memory for small callable objects, for example, where f's target is an object holding only a pointer or reference to an object and a member function pointer.

template<class F> function(F&& f);

8   Let FD be decay_t<F>.

9   Constraints:
(9.1)   — is_same_v<remove_cvref_t<FD>, function> is false, and
(9.2)   — FD is Lvalue-Callable (22.10.17.3) for argument types ArgTypes... and return type R.

10  Mandates:
(10.1)  — is_copy_constructible_v<FD> is true, and
(10.2)  — is_constructible_v<FD, F> is true.

11  Preconditions: FD meets the Cpp17CopyConstructible requirements.

12  Postconditions: !*this is true if any of the following hold:
(12.1)  — f is a null function pointer value.
(12.2)  — f is a null member pointer value.

```

(12.3) — `remove_cvref_t<F>` is a specialization of the `function` class template, and `!f` is `true`.
 13 Otherwise, `*this` has a target object of type FD direct-non-list-initialized with `std::forward<F>(f)`.
 14 *Throws:* Nothing if FD is a specialization of `reference_wrapper` or a function pointer type. Otherwise, may throw `bad_alloc` or any exception thrown by the initialization of the target object.
 15 *Recommended practice:* Implementations should avoid the use of dynamically allocated memory for small callable objects, for example, where `f` refers to an object holding only a pointer or reference to an object and a member function pointer.

```
template<class F> function(F) -> function<see below>;
```

16 *Constraints:* `&F::operator()` is well-formed when treated as an unevaluated operand and either
 (16.1) — `F::operator()` is a non-static member function and `decltype(&F::operator())` is either of the form `R(G::*)(A...)` *cv* $\&_{opt}$ `noexcept_{opt}` or of the form `R(*)(G, A...)` `noexcept_{opt}` for a type G, or
 (16.2) — `F::operator()` is a static member function and `decltype(&F::operator())` is of the form `R(*)(A...)` `noexcept_{opt}`.

17 *Remarks:* The deduced type is `function<R(A...)>`.
 18 EXAMPLE:

```
void f() {
    int i{5};
    function g = [&](double) { return i; };           // deduces function<int(double)>
}
```

19 `function& operator=(const function& f);`
 Effects: As if by `function(f).swap(*this);`
 Returns: `*this`.

20 `function& operator=(function&& f);`
 Effects: Replaces the target of `*this` with the target of `f`.
 Returns: `*this`.

21 `function& operator=(nullptr_t) noexcept;`
 Effects: If `*this != nullptr`, destroys the target of `this`.
 Postconditions: `!(*this)`.
 Returns: `*this`.

22 `template<class F> function& operator=(F&& f);`
 Constraints: `decay_t<F>` is Lvalue-Callable (22.10.17.3) for argument types `ArgTypes...` and return type R.
 Effects: As if by: `function(std::forward<F>(f)).swap(*this);`
 Returns: `*this`.

23 `template<class F> function& operator=(reference_wrapper<F> f) noexcept;`
 Effects: As if by: `function(f).swap(*this);`
 Returns: `*this`.

24 `~function();`
 Effects: If `*this != nullptr`, destroys the target of `this`.

22.10.17.3.3 Modifiers

[func.wrap.func.mod]

`void swap(function& other) noexcept;`1 Effects: Interchanges the target objects of `*this` and `other`.

22.10.17.3.4 Capacity

[func.wrap.func.cap]

```
explicit operator bool() const noexcept;
1 Returns: true if *this has a target, otherwise false.
```

22.10.17.3.5 Invocation

[func.wrap.func.inv]

```
R operator()(ArgTypes... args) const;
1 Returns: INVOKE<R>(f, std::forward<ArgTypes>(args)...)
```

(22.10.4), where f is the target object
(22.10.3) of *this.

2 Throws: bad_function_call if !*this; otherwise, any exception thrown by the target object.

22.10.17.3.6 Target access

[func.wrap.func.targ]

```
const type_info& target_type() const noexcept;
1 Returns: If *this has a target of type T, typeid(T); otherwise, typeid(void).
template<class T> T* target() noexcept;
template<class T> const T* target() const noexcept;
2 Returns: If target_type() == typeid(T) a pointer to the stored function target; otherwise a null pointer.
```

22.10.17.3.7 Null pointer comparison operator functions

[func.wrap.func.nullptr]

```
template<class R, class... ArgTypes>
bool operator==(const function<R(ArgTypes...)>& f, nullptr_t) noexcept;
1 Returns: !f.
```

22.10.17.3.8 Specialized algorithms

[func.wrap.func.alg]

```
template<class R, class... ArgTypes>
void swap(function<R(ArgTypes...)>& f1, function<R(ArgTypes...)>& f2) noexcept;
1 Effects: As if by: f1.swap(f2);
```

22.10.17.4 Move only wrapper

[func.wrap.move]

22.10.17.4.1 General

[func.wrap.move.general]

- 1 The header provides partial specializations of move_only_function for each combination of the possible replacements of the placeholders cv, ref, and noex where
 - (1.1) — cv is either const or empty,
 - (1.2) — ref is either &, &&, or empty, and
 - (1.3) — noex is either true or false.
- 2 For each of the possible combinations of the placeholders mentioned above, there is a placeholder *inv-quals* defined as follows:
 - (2.1) — If ref is empty, let *inv-quals* be cv&,
 - (2.2) — otherwise, let *inv-quals* be cv ref.

22.10.17.4.2 Class template move_only_function

[func.wrap.move.class]

```
namespace std {
  template<class... S> class move_only_function; // not defined

  template<class R, class... ArgTypes>
  class move_only_function<R(ArgTypes...) cv ref noexcept(noex)> {
    public:
      using result_type = R;
```

```

// 22.10.17.4.3, constructors, assignment, and destructor
move_only_function() noexcept;
move_only_function(nullptr_t) noexcept;
move_only_function(move_only_function&&) noexcept;
template<class F> move_only_function(F&&);
template<class T, class... Args>
    explicit move_only_function(in_place_type_t<T>, Args&&...);
template<class T, class U, class... Args>
    explicit move_only_function(in_place_type_t<T>, initializer_list<U>, Args&&...);

move_only_function& operator=(move_only_function&&);
move_only_function& operator=(nullptr_t) noexcept;
template<class F> move_only_function& operator=(F&&);

~move_only_function();

// 22.10.17.4.4, invocation
explicit operator bool() const noexcept;
R operator()(ArgTypes...) cv ref noexcept(noex);

// 22.10.17.4.5, utility
void swap(move_only_function&) noexcept;
friend void swap(move_only_function&, move_only_function&) noexcept;
friend bool operator==(const move_only_function&, nullptr_t) noexcept;

private:
    template<class VT>
        static constexpr bool is-callable-from = see below;           // exposition only
    };
}

```

¹ The `move_only_function` class template provides polymorphic wrappers that generalize the notion of a callable object (22.10.3). These wrappers can store, move, and call arbitrary callable objects, given a call signature.

² *Recommended practice:* Implementations should avoid the use of dynamically allocated memory for a small contained value.

NOTE: Such small-object optimization can only be applied to a type `T` for which `is_nothrow_move_constructible_v<T>` is `true`.

22.10.17.4.3 Constructors, assignment, and destructor

[func.wrap.move.ctor]

```

template<class VT>
    static constexpr bool is-callable-from = see below;

1   If noex is true, is-callable-from<VT> is equal to:
    is_nothrow_invocable_r_v<R, VT cv ref, ArgTypes...> &&
    is_nothrow_invocable_r_v<R, VT inv-quals, ArgTypes...>

Otherwise, is-callable-from<VT> is equal to:
    is_invocable_r_v<R, VT cv ref, ArgTypes...> &&
    is_invocable_r_v<R, VT inv-quals, ArgTypes...>

```

```

move_only_function() noexcept;
move_only_function(nullptr_t) noexcept;

```

² *Postconditions:* `*this` has no target object.

```
move_only_function(move_only_function&& f) noexcept;
```

³ *Postconditions:* The target object of `*this` is the target object `f` had before construction, and `f` is in a valid state with an unspecified value.

```
template<class F> move_only_function(F&& f);
```

⁴ Let `VT` be `decay_t<F>`.

5 *Constraints:*

(5.1) — `remove_cvref_t<F>` is not the same type as `move_only_function`, and

(5.2) — `remove_cvref_t<F>` is not a specialization of `in_place_type_t`, and

(5.3) — `is-callable-from<VT>` is true.

6 *Mandates:* `is_constructible_v<VT, F>` is true.

7 *Preconditions:* VT meets the *Cpp17Destructible* requirements, and if `is_move_constructible_v<VT>` is true, VT meets the *Cpp17MoveConstructible* requirements.

8 *Postconditions:* `*this` has no target object if any of the following hold:

(8.1) — `f` is a null function pointer value, or

(8.2) — `f` is a null member pointer value, or

(8.3) — `remove_cvref_t<F>` is a specialization of the `move_only_function` class template, and `f` has no target object.

Otherwise, `*this` has a target object of type VT direct-non-list-initialized with `std::forward<F>(f)`.

9 *Throws:* Any exception thrown by the initialization of the target object. May throw `bad_alloc` unless VT is a function pointer or a specialization of `reference_wrapper`.

```
template<class T, class... Args>
explicit move_only_function(in_place_type_t<T>, Args&&... args);
```

10 Let VT be `decay_t<T>`.

11 *Constraints:*

(11.1) — `is_constructible_v<VT, Args...>` is true, and

(11.2) — `is-callable-from<VT>` is true.

12 *Mandates:* VT is the same type as T.

13 *Preconditions:* VT meets the *Cpp17Destructible* requirements, and if `is_move_constructible_v<VT>` is true, VT meets the *Cpp17MoveConstructible* requirements.

14 *Postconditions:* `*this` has a target object of type VT direct-non-list-initialized with `std::forward<Args>(args)....`

15 *Throws:* Any exception thrown by the initialization of the target object. May throw `bad_alloc` unless VT is a function pointer or a specialization of `reference_wrapper`.

```
template<class T, class U, class... Args>
explicit move_only_function(in_place_type_t<T>, initializer_list<U> ilist, Args&&... args);
```

16 Let VT be `decay_t<T>`.

17 *Constraints:*

(17.1) — `is_constructible_v<VT, initializer_list<U>&, Args...>` is true, and

(17.2) — `is-callable-from<VT>` is true.

18 *Mandates:* VT is the same type as T.

19 *Preconditions:* VT meets the *Cpp17Destructible* requirements, and if `is_move_constructible_v<VT>` is true, VT meets the *Cpp17MoveConstructible* requirements.

20 *Postconditions:* `*this` has a target object of type VT direct-non-list-initialized with `ilist, std::forward<Args>(args)....`

21 *Throws:* Any exception thrown by the initialization of the target object. May throw `bad_alloc` unless VT is a function pointer or a specialization of `reference_wrapper`.

```
move_only_function& operator=(move_only_function&& f);
```

22 *Effects:* Equivalent to: `move_only_function(std::move(f)).swap(*this);`

23 *Returns:* `*this`.

```

move_only_function& operator=(nullptr_t) noexcept;
24   Effects: Destroys the target object of *this, if any.
25   Returns: *this.

template<class F> move_only_function& operator=(F&& f);
26   Effects: Equivalent to: move_only_function(std::forward<F>(f)).swap(*this);
27   Returns: *this.

~move_only_function();
28   Effects: Destroys the target object of *this, if any.

```

22.10.17.4.4 Invocation

[func.wrap.move.inv]

```

explicit operator bool() const noexcept;
1   Returns: true if *this has a target object, otherwise false.

```

```
R operator()(ArgTypes... args) cv ref noexcept(noex);
```

2 Preconditions: *this has a target object.

3 Effects: Equivalent to:

```
    return INVOKE<R>(static_cast<F inv-quals>(f), std::forward<ArgTypes>(args)...);
```

where f is an lvalue designating the target object of *this and F is the type of f.

22.10.17.4.5 Utility

[func.wrap.move.util]

```
void swap(move_only_function& other) noexcept;
```

1 Effects: Exchanges the target objects of *this and other.

```
friend void swap(move_only_function& f1, move_only_function& f2) noexcept;
```

2 Effects: Equivalent to f1.swap(f2).

```
friend bool operator==(const move_only_function& f, nullptr_t) noexcept;
```

3 Returns: true if f has no target object, otherwise false.

22.10.18 Searchers

[func.search]

22.10.18.1 General

[func.search.general]

1 Subclause 22.10.18 provides function object types (22.10) for operations that search for a sequence [pat_first, pat_last) in another sequence [first, last) that is provided to the object's function call operator. The first sequence (the pattern to be searched for) is provided to the object's constructor, and the second (the sequence to be searched) is provided to the function call operator.

2 Each specialization of a class template specified in 22.10.18 shall meet the *Cpp17CopyConstructible* and *Cpp17CopyAssignable* requirements. Template parameters named

- (2.1) — `ForwardIterator`,
- (2.2) — `ForwardIterator1`,
- (2.3) — `ForwardIterator2`,
- (2.4) — `RandomAccessIterator`,
- (2.5) — `RandomAccessIterator1`,
- (2.6) — `RandomAccessIterator2`, and
- (2.7) — `BinaryPredicate`

of templates specified in 22.10.18 shall meet the same requirements and semantics as specified in 27.1. Template parameters named `Hash` shall meet the *Cpp17Hash* requirements (Table 37).

3 The Boyer-Moore searcher implements the Boyer-Moore search algorithm. The Boyer-Moore-Horspool searcher implements the Boyer-Moore-Horspool search algorithm. In general, the Boyer-Moore searcher will use more memory and give better runtime performance than Boyer-Moore-Horspool.

22.10.18.2 Class template default_searcher

[func.search.default]

```

namespace std {
    template<class ForwardIterator1, class BinaryPredicate = equal_to<>>
    class default_searcher {
        public:
            constexpr default_searcher(ForwardIterator1 pat_first, ForwardIterator1 pat_last,
                                         BinaryPredicate pred = BinaryPredicate());

            template<class ForwardIterator2>
            constexpr pair<ForwardIterator2, ForwardIterator2>
            operator()(ForwardIterator2 first, ForwardIterator2 last) const;

        private:
            ForwardIterator1 pat_first_;           // exposition only
            ForwardIterator1 pat_last_;          // exposition only
            BinaryPredicate pred_;               // exposition only
    };
}

constexpr default_searcher(ForwardIterator1 pat_first, ForwardIterator1 pat_last,
                           BinaryPredicate pred = BinaryPredicate());

```

1 *Effects*: Constructs a `default_searcher` object, initializing `pat_first_` with `pat_first`, `pat_last_` with `pat_last`, and `pred_` with `pred`.

2 *Throws*: Any exception thrown by the copy constructor of `BinaryPredicate` or `ForwardIterator1`.

```

template<class ForwardIterator2>
constexpr pair<ForwardIterator2, ForwardIterator2>
operator()(ForwardIterator2 first, ForwardIterator2 last) const;

```

3 *Effects*: Returns a pair of iterators `i` and `j` such that

(3.1) — `i == search(first, last, pat_first_, pat_last_, pred_)`, and

(3.2) — if `i == last`, then `j == last`, otherwise `j == next(i, distance(pat_first_, pat_last_))`.

22.10.18.3 Class template boyer_moore_searcher

[func.search.bm]

```

namespace std {
    template<class RandomAccessIterator1,
              class Hash = hash<typename iterator_traits<RandomAccessIterator1>::value_type>,
              class BinaryPredicate = equal_to<>>
    class boyer_moore_searcher {
        public:
            boyer_moore_searcher(RandomAccessIterator1 pat_first,
                                 RandomAccessIterator1 pat_last,
                                 Hash hf = Hash(),
                                 BinaryPredicate pred = BinaryPredicate());

            template<class RandomAccessIterator2>
            pair<RandomAccessIterator2, RandomAccessIterator2>
            operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;

        private:
            RandomAccessIterator1 pat_first_;           // exposition only
            RandomAccessIterator1 pat_last_;          // exposition only
            Hash hash_;                  // exposition only
            BinaryPredicate pred_;               // exposition only
    };
}

boyer_moore_searcher(RandomAccessIterator1 pat_first,
                     RandomAccessIterator1 pat_last,
                     Hash hf = Hash(),
                     BinaryPredicate pred = BinaryPredicate());

```

BinaryPredicate pred = BinaryPredicate());

1 *Preconditions:* The value type of RandomAccessIterator1 meets the Cpp17DefaultConstructible, the Cpp17CopyConstructible, and the Cpp17CopyAssignable requirements.

2 Let V be iterator_traits<RandomAccessIterator1>::value_type. For any two values A and B of type V, if pred(A, B) == true, then hf(A) == hf(B) is true.

3 *Effects:* Initializes pat_first_ with pat_first, pat_last_ with pat_last, hash_ with hf, and pred_ with pred.

4 *Throws:* Any exception thrown by the copy constructor of RandomAccessIterator1, or by the default constructor, copy constructor, or the copy assignment operator of the value type of RandomAccessIterator1, or the copy constructor or operator() of BinaryPredicate or Hash. May throw bad_alloc if additional memory needed for internal data structures cannot be allocated.

```
template<class RandomAccessIterator2>
pair<RandomAccessIterator2, RandomAccessIterator2>
operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;
```

5 *Mandates:* RandomAccessIterator1 and RandomAccessIterator2 have the same value type.

6 *Effects:* Finds a subsequence of equal values in a sequence.

7 *Returns:* A pair of iterators i and j such that

(7.1) — i is the first iterator in the range [first, last - (pat_last_ - pat_first_)) such that for every non-negative integer n less than pat_last_ - pat_first_ the following condition holds: pred(*(i + n), *(pat_first_ + n)) != false, and

(7.2) — j == next(i, distance(pat_first_, pat_last_)).

Returns make_pair(first, first) if [pat_first_, pat_last_] is empty, otherwise returns make_pair(last, last) if no such iterator is found.

8 *Complexity:* At most (last - first) * (pat_last_ - pat_first_) applications of the predicate.

22.10.18.4 Class template boyer_moore_horspool_searcher [func.search.bmh]

```
namespace std {
    template<class RandomAccessIterator1,
              class Hash = hash<typename iterator_traits<RandomAccessIterator1>::value_type>,
              class BinaryPredicate = equal_to<>>
    class boyer_moore_horspool_searcher {
public:
    boyer_moore_horspool_searcher(RandomAccessIterator1 pat_first,
                                  RandomAccessIterator1 pat_last,
                                  Hash hf = Hash(),
                                  BinaryPredicate pred = BinaryPredicate());

    template<class RandomAccessIterator2>
    pair<RandomAccessIterator2, RandomAccessIterator2>
    operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;

private:
    RandomAccessIterator1 pat_first_; // exposition only
    RandomAccessIterator1 pat_last_; // exposition only
    Hash hash_; // exposition only
    BinaryPredicate pred_; // exposition only
};

boyer_moore_horspool_searcher(RandomAccessIterator1 pat_first,
                            RandomAccessIterator1 pat_last,
                            Hash hf = Hash(),
                            BinaryPredicate pred = BinaryPredicate());
```

1 *Preconditions:* The value type of RandomAccessIterator1 meets the Cpp17DefaultConstructible, Cpp17CopyConstructible, and Cpp17CopyAssignable requirements.

- 2 Let V be `iterator_traits<RandomAccessIterator1>::value_type`. For any two values A and B of type V , if $\text{pred}(A, B) == \text{true}$, then $\text{hf}(A) == \text{hf}(B)$ is true .
- 3 *Effects:* Initializes `pat_first_` with `pat_first`, `pat_last_` with `pat_last`, `hash_` with `hf`, and `pred_` with `pred`.
- 4 *Throws:* Any exception thrown by the copy constructor of `RandomAccessIterator1`, or by the default constructor, copy constructor, or the copy assignment operator of the value type of `RandomAccessIterator1`, or the copy constructor or `operator()` of `BinaryPredicate` or `Hash`. May throw `bad_alloc` if additional memory needed for internal data structures cannot be allocated.

```
template<class RandomAccessIterator2>
pair<RandomAccessIterator2, RandomAccessIterator2>
operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;
```

5 *Mandates:* `RandomAccessIterator1` and `RandomAccessIterator2` have the same value type.

6 *Effects:* Finds a subsequence of equal values in a sequence.

7 *Returns:* A pair of iterators i and j such that

(7.1) — i is the first iterator in the range $[first, last - (pat_last_ - pat_first_)]$ such that for every non-negative integer n less than $pat_last_ - pat_first_$ the following condition holds: $\text{pred}(*i + n), *(pat_first_ + n)) != \text{false}$, and

(7.2) — $j == \text{next}(i, \text{distance}(pat_first_, pat_last_))$.

Returns `make_pair(first, first)` if $[pat_first_, pat_last_]$ is empty, otherwise returns `make_pair(last, last)` if no such iterator is found.

8 *Complexity:* At most $(last - first) * (pat_last_ - pat_first_)$ applications of the predicate.

22.10.19 Class template `hash`

[unord.hash]

- 1 The unordered associative containers defined in 24.5 use specializations of the class template `hash` (22.10.2) as the default hash function.
- 2 Each specialization of `hash` is either enabled or disabled, as described below.
- NOTE 1: Enabled specializations meet the *Cpp17Hash* requirements, and disabled specializations do not. Each header that declares the template `hash` provides enabled specializations of `hash` for `nullptr_t` and all cv-unqualified arithmetic, enumeration, and pointer types. For any type `Key` for which neither the library nor the user provides an explicit or partial specialization of the class template `hash`, `hash<Key>` is disabled.
- 3 If the library provides an explicit or partial specialization of `hash<Key>`, that specialization is enabled except as noted otherwise, and its member functions are `noexcept` except as noted otherwise.
- 4 If `H` is a disabled specialization of `hash`, these values are `false`: `is_default_constructible_v<H>`, `is_copy_constructible_v<H>`, `is_move_constructible_v<H>`, `is_copy_assignable_v<H>`, and `is_move_assignable_v<H>`. Disabled specializations of `hash` are not function object types (22.10).

NOTE 2: This means that the specialization of `hash` exists, but any attempts to use it as a *Cpp17Hash* will be ill-formed.

- 5 An enabled specialization `hash<Key>` will:

- (5.1) — meet the *Cpp17Hash* requirements (Table 37), with `Key` as the function call argument type, the *Cpp17DefaultConstructible* requirements (Table 30), the *Cpp17CopyAssignable* requirements (Table 34), the *Cpp17Swappable* requirements (16.4.4.3),
- (5.2) — meet the requirement that if $k1 == k2$ is `true`, $h(k1) == h(k2)$ is also `true`, where `h` is an object of type `hash<Key>` and $k1$ and $k2$ are objects of type `Key`;
- (5.3) — meet the requirement that the expression `h(k)`, where `h` is an object of type `hash<Key>` and k is an object of type `Key`, shall not throw an exception unless `hash<Key>` is a program-defined specialization.

22.11 Class `type_index`

[type.index]

22.11.1 Header `<typeindex>` synopsis

[type.index.synopsis]

```
#include <compare> // see 17.11.1
```

```
namespace std {
    class type_index;
    template<class T> struct hash;
    template<> struct hash<type_index>;
}
```

22.11.2 type_index overview

[type.index.overview]

```
namespace std {
    class type_index {
        public:
            type_index(const type_info& rhs) noexcept;
            bool operator==(const type_index& rhs) const noexcept;
            bool operator< (const type_index& rhs) const noexcept;
            bool operator> (const type_index& rhs) const noexcept;
            bool operator<=(const type_index& rhs) const noexcept;
            bool operator>=(const type_index& rhs) const noexcept;
            strong_ordering operator<=>(const type_index& rhs) const noexcept;
            size_t hash_code() const noexcept;
            const char* name() const noexcept;

        private:
            const type_info* target; // exposition only
            // Note that the use of a pointer here, rather than a reference,
            // means that the default copy/move constructor and assignment
            // operators will be provided and work as expected.
    };
}
```

- ¹ The class `type_index` provides a simple wrapper for `type_info` which can be used as an index type in associative containers (24.4) and in unordered associative containers (24.5).

22.11.3 type_index members

[type.index.members]

```
type_index(const type_info& rhs) noexcept;
1   Effects: Constructs a type_index object, the equivalent of target = &rhs.
bool operator==(const type_index& rhs) const noexcept;
2   Returns: *target == *rhs.target.
bool operator<(const type_index& rhs) const noexcept;
3   Returns: target->before(*rhs.target).
bool operator> (const type_index& rhs) const noexcept;
4   Returns: rhs.target->before(*target).
bool operator<=(const type_index& rhs) const noexcept;
5   Returns: !rhs.target->before(*target).
bool operator>=(const type_index& rhs) const noexcept;
6   Returns: !target->before(*rhs.target).
strong_ordering operator<=>(const type_index& rhs) const noexcept;
7   Effects: Equivalent to:
        if (*target == *rhs.target) return strong_ordering::equal;
        if (target->before(*rhs.target)) return strong_ordering::less;
        return strong_ordering::greater;
size_t hash_code() const noexcept;
8   Returns: target->hash_code().
```

```
const char* name() const noexcept;
9   Returns: target->name().
```

22.11.4 Hash support

[type.index.hash]

```
template<> struct hash<type_index>;
```

- 1 For an object `index` of type `type_index`, `hash<type_index>()(index)` shall evaluate to the same result as `index.hash_code()`.

22.12 Execution policies

[execpol]

22.12.1 In general

[execpol.general]

- 1 Subclause 22.12 describes classes that are *execution policy* types. An object of an execution policy type indicates the kinds of parallelism allowed in the execution of an algorithm and expresses the consequent requirements on the element access functions.

EXAMPLE:

```
using namespace std;
vector<int> v = /* ... */;

// standard sequential sort
sort(v.begin(), v.end());

// explicitly sequential sort
sort(execution::seq, v.begin(), v.end());

// permitting parallel execution
sort(execution::par, v.begin(), v.end());

// permitting vectorization as well
sort(execution::par_unseq, v.begin(), v.end());
```

NOTE: Implementations can provide additional execution policies to those described in this standard as extensions to address parallel architectures that require idiosyncratic parameters for efficient execution.

22.12.2 Header <execution> synopsis

[execution.syn]

```
namespace std {
  // 22.12.3, execution policy type trait
  template<class T> struct is_execution_policy;
  template<class T> constexpr bool is_execution_policy_v = is_execution_policy<T>::value;
}

namespace std::execution {
  // 22.12.4, sequenced execution policy
  class sequenced_policy;

  // 22.12.5, parallel execution policy
  class parallel_policy;

  // 22.12.6, parallel and unsequenced execution policy
  class parallel_unsequenced_policy;

  // 22.12.7, unsequenced execution policy
  class unsequenced_policy;

  // 22.12.8, execution policy objects
  inline constexpr sequenced_policy           seq{ unspecified };
  inline constexpr parallel_policy             par{ unspecified };
  inline constexpr parallel_unsequenced_policy par_unseq{ unspecified };
  inline constexpr unsequenced_policy         unseq{ unspecified };
}
```

22.12.3 Execution policy type trait

[execpol.type]

```
template<class T> struct is_execution_policy { see below };
```

- 1 `is_execution_policy` can be used to detect execution policies for the purpose of excluding function signatures from otherwise ambiguous overload resolution participation.
- 2 `is_execution_policy<T>` is a *Cpp17UnaryTypeTrait* with a base characteristic of `true_type` if `T` is the type of a standard or implementation-defined execution policy, otherwise `false_type`.
NOTE: This provision reserves the privilege of creating non-standard execution policies to the library implementation.
- 3 The behavior of a program that adds specializations for `is_execution_policy` is undefined.

22.12.4 Sequenced execution policy

[execpol.seq]

```
class execution::sequenced_policy { unspecified };
```

- 1 The class `execution::sequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and require that a parallel algorithm's execution may not be parallelized.
- 2 During the execution of a parallel algorithm with the `execution::sequenced_policy` policy, if the invocation of an element access function exits via an exception, `terminate` is invoked (14.6.2).

22.12.5 Parallel execution policy

[execpol.par]

```
class execution::parallel_policy { unspecified };
```

- 1 The class `execution::parallel_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized.
- 2 During the execution of a parallel algorithm with the `execution::parallel_policy` policy, if the invocation of an element access function exits via an exception, `terminate` is invoked (14.6.2).

22.12.6 Parallel and unsequenced execution policy

[execpol.parunseq]

```
class execution::parallel_unsequenced_policy { unspecified };
```

- 1 The class `execution::parallel_unsequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized and vectorized.
- 2 During the execution of a parallel algorithm with the `execution::parallel_unsequenced_policy` policy, if the invocation of an element access function exits via an exception, `terminate` is invoked (14.6.2).

22.12.7 Unsequenced execution policy

[execpol.unseq]

```
class execution::unsequenced_policy { unspecified };
```

- 1 The class `unsequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be vectorized, e.g., executed on a single thread using instructions that operate on multiple data items.
- 2 During the execution of a parallel algorithm with the `execution::unsequenced_policy` policy, if the invocation of an element access function exits via an exception, `terminate` is invoked (14.6.2).

22.12.8 Execution policy objects

[execpol.objects]

<code>inline constexpr execution::sequenced_policy</code>	<code>execution::seq{ <i>unspecified</i> };</code>
<code>inline constexpr execution::parallel_policy</code>	<code>execution::par{ <i>unspecified</i> };</code>
<code>inline constexpr execution::parallel_unsequenced_policy</code>	<code>execution::par_unseq{ <i>unspecified</i> };</code>
<code>inline constexpr execution::unsequenced_policy</code>	<code>execution::unseq{ <i>unspecified</i> };</code>

- 1 The header `<execution>` declares global objects associated with each type of execution policy.

22.13 Primitive numeric conversions

[charconv]

22.13.1 Header <charconv> synopsis

[charconv.syn]

- ¹ When a function is specified with a type placeholder of *integer-type*, the implementation provides overloads for all cv-unqualified signed and unsigned integer types and *char* in lieu of *integer-type*. When a function is specified with a type placeholder of *floating-point-type*, the implementation provides overloads for all cv-unqualified floating-point types (6.8.2) in lieu of *floating-point-type*.

```
namespace std {
    // floating-point format for primitive numerical conversion
    enum class chars_format {
        scientific = unspecified,
        fixed = unspecified,
        hex = unspecified,
        general = fixed | scientific
    };

    // 22.13.2, primitive numerical output conversion
    struct to_chars_result {
        char* ptr;
        errc ec;
        friend bool operator==(const to_chars_result&, const to_chars_result&) = default;
    };

    constexpr to_chars_result to_chars(char* first, char* last, integer-type value, int base = 10);
    to_chars_result to_chars(char* first, char* last, bool value, int base = 10) = delete;

    to_chars_result to_chars(char* first, char* last, floating-point-type value);
    to_chars_result to_chars(char* first, char* last, floating-point-type value, chars_format fmt);
    to_chars_result to_chars(char* first, char* last, floating-point-type value,
                           chars_format fmt, int precision);

    // 22.13.3, primitive numerical input conversion
    struct from_chars_result {
        const char* ptr;
        errc ec;
        friend bool operator==(const from_chars_result&, const from_chars_result&) = default;
    };

    constexpr from_chars_result from_chars(const char* first, const char* last,
                                           integer-type& value, int base = 10);

    from_chars_result from_chars(const char* first, const char* last, floating-point-type& value,
                                 chars_format fmt = chars_format::general);
}
```

- ² The type *chars_format* is a bitmask type (16.3.3.3) with elements *scientific*, *fixed*, and *hex*.
- ³ The types *to_chars_result* and *from_chars_result* have the data members and special members specified above. They have no base classes or members other than those specified.

22.13.2 Primitive numeric output conversion

[charconv.to.chars]

- ¹ All functions named *to_chars* convert *value* into a character string by successively filling the range *[first, last)*, where *[first, last)* is required to be a valid range. If the member *ec* of the return value is such that the value is equal to the value of a value-initialized *errc*, the conversion was successful and the member *ptr* is the one-past-the-end pointer of the characters written. Otherwise, the member *ec* has the value *errc::value_too_large*, the member *ptr* has the value *last*, and the contents of the range *[first, last)* are unspecified.
- ² The functions that take a floating-point *value* but not a *precision* parameter ensure that the string representation consists of the smallest number of characters such that there is at least one digit before the radix point (if present) and parsing the representation using the corresponding *from_chars* function recovers *value* exactly.

NOTE: This guarantee applies only if *to_chars* and *from_chars* are executed on the same implementation.

If there are several such representations, the representation with the smallest difference from the floating-point argument value is chosen, resolving any remaining ties using rounding according to `round_to_nearest` (17.3.4).

- 3 The functions taking a `chars_format` parameter determine the conversion specifier for `printf` as follows: The conversion specifier is `f` if `fmt` is `chars_format::fixed`, `e` if `fmt` is `chars_format::scientific`, `a` (without leading "0x" in the result) if `fmt` is `chars_format::hex`, and `g` if `fmt` is `chars_format::general`.

```
constexpr to_chars_result to_chars(char* first, char* last, integer-type value, int base = 10);
```

4 *Preconditions*: `base` has a value between 2 and 36 (inclusive).

5 *Effects*: The value of `value` is converted to a string of digits in the given base (with no redundant leading zeroes). Digits in the range 10..35 (inclusive) are represented as lowercase characters `a..z`. If `value` is less than zero, the representation starts with '-'.

6 *Throws*: Nothing.

```
to_chars_result to_chars(char* first, char* last, floating-point-type value);
```

7 *Effects*: `value` is converted to a string in the style of `printf` in the "C" locale. The conversion specifier is `f` or `e`, chosen according to the requirement for a shortest representation (see above); a tie is resolved in favor of `f`.

8 *Throws*: Nothing.

```
to_chars_result to_chars(char* first, char* last, floating-point-type value, chars_format fmt);
```

9 *Preconditions*: `fmt` has the value of one of the enumerators of `chars_format`.

10 *Effects*: `value` is converted to a string in the style of `printf` in the "C" locale.

11 *Throws*: Nothing.

```
to_chars_result to_chars(char* first, char* last, floating-point-type value,
                         chars_format fmt, int precision);
```

12 *Preconditions*: `fmt` has the value of one of the enumerators of `chars_format`.

13 *Effects*: `value` is converted to a string in the style of `printf` in the "C" locale with the given precision.

14 *Throws*: Nothing.

SEE ALSO: ISO C 7.21.6.1

22.13.3 Primitive numeric input conversion

[`charconv.from.chars`]

- 1 All functions named `from_chars` analyze the string `[first, last)` for a pattern, where `[first, last)` is required to be a valid range. If no characters match the pattern, `value` is unmodified, the member `ptr` of the return value is `first` and the member `ec` is equal to `errc::invalid_argument`.

NOTE: If the pattern allows for an optional sign, but the string has no digit characters following the sign, no characters match the pattern.

Otherwise, the characters matching the pattern are interpreted as a representation of a value of the type of `value`. The member `ptr` of the return value points to the first character not matching the pattern, or has the value `last` if all characters match. If the parsed value is not in the range representable by the type of `value`, `value` is unmodified and the member `ec` of the return value is equal to `errc::result_out_of_range`. Otherwise, `value` is set to the parsed value, after rounding according to `round_to_nearest` (17.3.4), and the member `ec` is value-initialized.

```
constexpr from_chars_result from_chars(const char* first, const char* last,
                                         integer-type& value, int base = 10);
```

2 *Preconditions*: `base` has a value between 2 and 36 (inclusive).

3 *Effects*: The pattern is the expected form of the subject sequence in the "C" locale for the given nonzero base, as described for `strtol`, except that no "0x" or "0X" prefix shall appear if the value of `base` is 16, and except that '-' is the only sign that may appear, and only if `value` has a signed type.

4 *Throws*: Nothing.

```

from_chars_result from_chars(const char* first, const char* last, floating-point-type& value,
                           chars_format fmt = chars_format::general);
5   Preconditions: fmt has the value of one of the enumerators of chars_format.
6   Effects: The pattern is the expected form of the subject sequence in the "C" locale, as described for
              strtod, except that
(6.1)    — the sign '+' may only appear in the exponent part;
(6.2)    — if fmt has chars_format::scientific set but not chars_format::fixed, the otherwise optional
          exponent part shall appear;
(6.3)    — if fmt has chars_format::fixed set but not chars_format::scientific, the optional exponent
          part shall not appear; and
(6.4)    — if fmt is chars_format::hex, the prefix "0x" or "0X" is assumed.

EXAMPLE: The string "0x123" is parsed to have the value 0 with remaining characters "x123".
In any case, the resulting value is one of at most two floating-point values closest to the value of the
string matching the pattern.

7   Throws: Nothing.

```

¹ The class template `format_to_n_result` has the template parameters, data members, and special members specified above. It has no base classes or members other than those specified.

22.14.2 Format string

[`format.string`]

22.14.2.1 In general

[`format.string.general`]

¹ A *format string* for arguments `args` is a (possibly empty) sequence of *replacement fields*, *escape sequences*, and characters other than `{` and `}`. Let `charT` be the character type of the format string. Each character that is not part of a replacement field or an escape sequence is copied unchanged to the output. An escape

sequence is one of `{` or `}`. It is replaced with `{` or `}`, respectively, in the output. The syntax of replacement fields is as follows:

```

replacement-field:
  { arg-idopt format-specifieropt }

arg-id:
  0
  positive-integer

positive-integer:
  nonzero-digit
  positive-integer digit

nonnegative-integer:
  digit
  nonnegative-integer digit

nonzero-digit: one of
  1 2 3 4 5 6 7 8 9

digit: one of
  0 1 2 3 4 5 6 7 8 9

format-specifier:
  : format-spec

format-spec:
  as specified by the formatter specialization for the argument type

```

- ² The `arg-id` field specifies the index of the argument in `args` whose value is to be formatted and inserted into the output instead of the replacement field. If there is no argument with the index `arg-id` in `args`, the string is not a format string for `args`. The optional `format-specifier` field explicitly specifies a format for the replacement value.

³ EXAMPLE 1:

```
string s = format("{0}-{1}", 8);           // value of s is "8-{"
```

- ⁴ If all `arg-ids` in a format string are omitted (including those in the `format-spec`, as interpreted by the corresponding `formatter` specialization), argument indices 0, 1, 2, ... will automatically be used in that order. If some `arg-ids` are omitted and some are present, the string is not a format string.

NOTE: A format string cannot contain a mixture of automatic and manual indexing.

EXAMPLE 2:

```

string s0 = format("{} to {}", "a", "b"); // OK, automatic indexing
string s1 = format("{1} to {0}", "a", "b"); // OK, manual indexing
string s2 = format("{0} to {}", "a", "b"); // not a format string (mixing automatic and manual indexing),
                                            // ill-formed
string s3 = format("{} to {1}", "a", "b"); // not a format string (mixing automatic and manual indexing),
                                            // ill-formed

```

- ⁵ The `format-spec` field contains *format specifications* that define how the value should be presented. Each type can define its own interpretation of the `format-spec` field. If `format-spec` does not conform to the format specifications for the argument type referred to by `arg-id`, the string is not a format string for `args`.

EXAMPLE 3:

- (5.1) — For arithmetic, pointer, and string types the `format-spec` is interpreted as a `std-format-spec` as described in (22.14.2.2).
- (5.2) — For chrono types the `format-spec` is interpreted as a `chrono-format-spec` as described in (29.12).
- (5.3) — For user-defined `formatter` specializations, the behavior of the `parse` member function determines how the `format-spec` is interpreted.

22.14.2.2 Standard format specifiers

[**format.string.std**]

- ¹ Each `formatter` specialization described in 22.14.6.3 for fundamental and string types interprets `format-spec` as a `std-format-spec`.

NOTE 1: The format specification can be used to specify such details as minimum field width, alignment, padding, and decimal precision. Some of the formatting options are only supported for arithmetic types.

The syntax of format specifications is as follows:

```

std-format-spec:
    fill-and-alignopt signopt #opt 0opt widthopt precisionopt Lopt typeopt
fill-and-align:
    fillopt align
fill:
    any character other than { or }
align: one of
    < > ^
sign: one of
    + - space
width:
    positive-integer
    { arg-idopt }
precision:
    . nonnegative-integer
    . { arg-idopt }
type: one of
    a A b B c d e E f F g G o p s x X ?

```

- 2 Field widths are specified in *field width units*; the number of column positions required to display a sequence of characters in a terminal. The *minimum field width* is the number of field width units a replacement field minimally requires of the formatted sequence of characters produced for a format argument. The *estimated field width* is the number of field width units that are required for the formatted sequence of characters produced for a format argument independent of the effects of the *width* option. The *padding width* is the greater of 0 and the difference of the minimum field width and the estimated field width.

NOTE 2: The POSIX `wcswidth` function is an example of a function that, given a string, returns the number of column positions required by a terminal to display the string.

- 3 The *fill character* is the character denoted by the *fill* option or, if the *fill* option is absent, the space character. For a format specification in UTF-8, UTF-16, or UTF-32, the fill character corresponds to a single Unicode scalar value.

NOTE 3: The presence of a *fill* option is signaled by the character following it, which must be one of the alignment options. If the second character of *std-format-spec* is not a valid alignment option, then it is assumed that the *fill* and *align* options are both absent.

- 4 The *align* option applies to all argument types. The meaning of the various alignment options is as specified in [Table 65](#).

EXAMPLE 1:

```

char c = 120;
string s0 = format("{:6}", 42);           // value of s0 is "     42"
string s1 = format("{:6}", 'x');           // value of s1 is "x     "
string s2 = format("{:*<6}", 'x');         // value of s2 is "*****"
string s3 = format("{:*>6}", 'x');         // value of s3 is "*****x"
string s4 = format("{:.*^6}", 'x');          // value of s4 is "***x***"
string s5 = format("{:6d}", c);             // value of s5 is "   120"
string s6 = format("{:6}", true);            // value of s6 is "true   "
string s7 = format("{:*<6.3}", "123456"); // value of s7 is "123***"
string s8 = format("{:02}", 1234);           // value of s8 is "1234"
string s9 = format("{:*<}", "12");          // value of s9 is "12"
string sA = format("{:*<6}", "12345678"); // value of sA is "12345678"
string sB = format("{:.*^6}", "x");          // value of sB is "x*x*x*x*x"
string sC = format("{:.*^6}", "🤡");          // value of sC is "🤡🤡🤡🤡🤡🤡"

```

NOTE 4: The *fill*, *align*, and 0 options have no effect when the minimum field width is not greater than the estimated field width because padding width is 0 in that case. Since fill characters are assumed to have a field width of 1, use of a character with a different field width can produce misaligned output. The **🤡** (U+1F921 CLOWN FACE) character has a field width of 2. The examples above that include that character illustrate the effect of the field width when that character is used as a fill character as opposed to when it is used as a formatting argument.

Table 65: Meaning of *align* options [tab:format.align]

Option	Meaning
<	Forces the formatted argument to be aligned to the start of the field by inserting n fill characters after the formatted argument where n is the padding width. This is the default for non-arithmetic non-pointer types, <code>charT</code> , and <code>bool</code> , unless an integer presentation type is specified.
>	Forces the formatted argument to be aligned to the end of the field by inserting n fill characters before the formatted argument where n is the padding width. This is the default for arithmetic types other than <code>charT</code> and <code>bool</code> , pointer types, or when an integer presentation type is specified.
^	Forces the formatted argument to be centered within the field by inserting $\lceil \frac{n}{2} \rceil$ fill characters before and $\lceil \frac{n}{2} \rceil$ fill characters after the formatted argument, where n is the padding width.

- ⁵ The *sign* option is only valid for arithmetic types other than `charT` and `bool` or when an integer presentation type is specified. The meaning of the various options is as specified in [Table 66](#).

Table 66: Meaning of *sign* options [tab:format.sign]

Option	Meaning
+	Indicates that a sign should be used for both non-negative and negative numbers. The + sign is inserted before the output of <code>to_chars</code> for non-negative numbers other than negative zero. NOTE 5: For negative numbers and negative zero the output of <code>to_chars</code> will already contain the sign so no additional transformation is performed.
-	Indicates that a sign should be used for negative numbers and negative zero only (this is the default behavior).
space	Indicates that a leading space should be used for non-negative numbers other than negative zero, and a minus sign for negative numbers and negative zero.

- ⁶ The *sign* option applies to floating-point infinity and NaN.

EXAMPLE 2:

```
double inf = numeric_limits<double>::infinity();
double nan = numeric_limits<double>::quiet_NaN();
string s0 = format("{0:},{0:+},{0:-},{0: }", 1);           // value of s0 is "1,+1,1, 1"
string s1 = format("{0:},{0:+},{0:-},{0: }", -1);          // value of s1 is "-1,-1,-1,-1"
string s2 = format("{0:},{0:+},{0:-},{0: }", inf);         // value of s2 is "inf,+inf,inf, inf"
string s3 = format("{0:},{0:+},{0:-},{0: }", nan);          // value of s3 is "nan,+nan,nan, nan"
```

- ⁷ The # option causes the *alternate form* to be used for the conversion. This option is valid for arithmetic types other than `charT` and `bool` or when an integer presentation type is specified, and not otherwise. For integral types, the alternate form inserts the base prefix (if any) specified in [Table 68](#) into the output after the sign character (possibly space) if there is one, or before the output of `to_chars` otherwise. For floating-point types, the alternate form causes the result of the conversion of finite values to always contain a decimal-point character, even if no digits follow it. Normally, a decimal-point character appears in the result of these conversions only if a digit follows it. In addition, for g and G conversions, trailing zeros are not removed from the result.

- ⁸ The 0 option is valid for arithmetic types other than `charT` and `bool` or when an integer presentation type is specified. For formatting arguments that have a value other than an infinity or a NaN, this option pads the formatted argument by inserting the 0 character n times following the sign or base prefix indicators (if any) where n is 0 if the *align* option is present and is the padding width otherwise.

EXAMPLE 3:

```
char c = 120;
string s1 = format("{:+06d}", c);           // value of s1 is "+00120"
string s2 = format("{:#06x}", 0xa);          // value of s2 is "0x000a"
```

```
string s3 = format("{:<06}", -42);      // value of s3 is "-42    " (0 has no effect)
string s4 = format("{:06}", inf);        // value of s4 is "    inf" (0 has no effect)
```

- 9 The *width* option specifies the minimum field width. If the *width* option is absent, the minimum field width is 0.
- 10 If $\{ \arg-id_{opt} \}$ is used in a *width* or *precision* option, the value of the corresponding formatting argument is used as the value of the option. If the corresponding formatting argument is not of standard signed or unsigned integer type, or its value is negative, an exception of type `format_error` is thrown.
- 11 If *positive-integer* is used in a *width* option, the value of the *positive-integer* is interpreted as a decimal integer and used as the value of the option.
- 12 For the purposes of width computation, a string is assumed to be in a locale-independent, implementation-defined encoding. Implementations should use either UTF-8, UTF-16, or UTF-32, on platforms capable of displaying Unicode text in a terminal.

NOTE 6: This is the case for Windows²⁰⁵-based and many POSIX-based operating systems.

- 13 For a sequence of characters in UTF-8, UTF-16, or UTF-32, an implementation should use as its field width the sum of the field widths of the first code point of each extended grapheme cluster. Extended grapheme clusters are defined by UAX #29 of the Unicode Standard. The following code points have a field width of 2:

 - (13.1) — any code point with the `East_Asian_Width="W"` or `East_Asian_Width="F"` Derived Extracted Property as described by UAX #44 of the Unicode Standard
 - (13.2) — U+4DC0 – U+4DFF (Yijing Hexagram Symbols)
 - (13.3) — U+1F300 – U+1F5FF (Miscellaneous Symbols and Pictographs)
 - (13.4) — U+1F900 – U+1F9FF (Supplemental Symbols and Pictographs)

The field width of all other code points is 1.

- 14 For a sequence of characters in neither UTF-8, UTF-16, nor UTF-32, the field width is unspecified.
- 15 The *precision* option is valid for floating-point and string types. For floating-point types, the value of this option specifies the precision to be used for the floating-point presentation type. For string types, this option specifies the longest prefix of the formatted argument to be included in the replacement field such that the field width of the prefix is no greater than the value of this option.
- 16 If *nonnegative-integer* is used in a *precision* option, the value of the decimal integer is used as the value of the option.
- 17 When the L option is used, the form used for the conversion is called the *locale-specific form*. The L option is only valid for arithmetic types, and its effect depends upon the type.
 - (17.1) — For integral types, the locale-specific form causes the context's locale to be used to insert the appropriate digit group separator characters.
 - (17.2) — For floating-point types, the locale-specific form causes the context's locale to be used to insert the appropriate digit group and radix separator characters.
 - (17.3) — For the textual representation of `bool`, the locale-specific form causes the context's locale to be used to insert the appropriate string as if obtained with `numpunct::truename` or `numpunct::falsename`.
- 18 The *type* determines how the data should be presented.
- 19 The available string presentation types are specified in [Table 67](#).

Table 67: Meaning of *type* options for strings [tab:format.type.string]

Type	Meaning
none, s	Copies the string to the output.
?	Copies the escaped string (22.14.6.4) to the output.

- 20 The meaning of some non-string presentation types is defined in terms of a call to `to_chars`. In such cases, let `[first, last)` be a range large enough to hold the `to_chars` output and `value` be the formatting argument

²⁰⁵ Windows® is a registered trademark of Microsoft Corporation. This information is given for the convenience of users of this document and does not constitute an endorsement by ISO or IEC of this product.

value. Formatting is done as if by calling `to_chars` as specified and copying the output through the output iterator of the format context.

NOTE 7: Additional padding and adjustments are performed prior to copying the output through the output iterator as specified by the format specifiers.

- ²¹ The available integer presentation types for integral types other than `bool` and `charT` are specified in [Table 68](#).

EXAMPLE 4:

```
string s0 = format("{}", 42);                                // value of s0 is "42"
string s1 = format("{0:b} {0:d} {0:o} {0:x}", 42);           // value of s1 is "101010 42 52 2a"
string s2 = format("{0:#x} {0:#X}", 42);                      // value of s2 is "0x2a 0X2A"
string s3 = format("{:L}", 1234);                            // value of s3 can be "1,234"
                                                               // (depending on the locale)
```

Table 68: Meaning of *type* options for integer types [tab:format.type.int]

Type	Meaning
b	<code>to_chars(first, last, value, 2);</code> the base prefix is 0b.
B	The same as b, except that the base prefix is 0B.
c	Copies the character <code>static_cast<charT>(value)</code> to the output. Throws <code>format_error</code> if value is not in the range of representable values for <code>charT</code> .
d	<code>to_chars(first, last, value).</code>
o	<code>to_chars(first, last, value, 8);</code> the base prefix is 0 if value is nonzero and is empty otherwise.
x	<code>to_chars(first, last, value, 16);</code> the base prefix is 0x.
X	The same as x, except that it uses uppercase letters for digits above 9 and the base prefix is 0X.
none	The same as d. NOTE 8: If the formatting argument type is <code>charT</code> or <code>bool</code> , the default is instead c or s, respectively.

- ²² The available `charT` presentation types are specified in [Table 69](#).

Table 69: Meaning of *type* options for `charT` [tab:format.type.char]

Type	Meaning
none, c	Copies the character to the output.
b, B, d, o, x, X	As specified in Table 68 .
?	Copies the escaped character (22.14.6.4) to the output.

- ²³ The available `bool` presentation types are specified in [Table 70](#).

Table 70: Meaning of *type* options for `bool` [tab:format.type.bool]

Type	Meaning
none, s	Copies textual representation, either <code>true</code> or <code>false</code> , to the output.
b, B, d, o, x, X	As specified in Table 68 for the value <code>static_cast<unsigned char>(value)</code> .

- ²⁴ The available floating-point presentation types and their meanings for values other than infinity and NaN are specified in [Table 71](#). For lower-case presentation types, infinity and NaN are formatted as `inf` and `nan`, respectively. For upper-case presentation types, infinity and NaN are formatted as `INF` and `NAN`, respectively. NOTE 9: In either case, a sign is included if indicated by the `sign` option.

- ²⁵ The available pointer presentation types and their mapping to `to_chars` are specified in [Table 72](#).

NOTE 10: Pointer presentation types also apply to `nullptr_t`.

Table 71: Meaning of *type* options for floating-point types [tab:format.type.float]

Type	Meaning
a	If <i>precision</i> is specified, equivalent to <code>to_chars(first, last, value, chars_format::hex, precision)</code> where <i>precision</i> is the specified formatting precision; equivalent to <code>to_chars(first, last, value, chars_format::hex)</code> otherwise.
A	The same as a, except that it uses uppercase letters for digits above 9 and P to indicate the exponent.
e	Equivalent to <code>to_chars(first, last, value, chars_format::scientific, precision)</code> where <i>precision</i> is the specified formatting precision, or 6 if <i>precision</i> is not specified.
E	The same as e, except that it uses E to indicate exponent.
f, F	Equivalent to <code>to_chars(first, last, value, chars_format::fixed, precision)</code> where <i>precision</i> is the specified formatting precision, or 6 if <i>precision</i> is not specified.
g	Equivalent to <code>to_chars(first, last, value, chars_format::general, precision)</code> where <i>precision</i> is the specified formatting precision, or 6 if <i>precision</i> is not specified.
G	The same as g, except that it uses E to indicate exponent.
none	If <i>precision</i> is specified, equivalent to <code>to_chars(first, last, value, chars_format::general, precision)</code> where <i>precision</i> is the specified formatting precision; equivalent to <code>to_chars(first, last, value)</code> otherwise.

Table 72: Meaning of *type* options for pointer types [tab:format.type.ptr]

Type	Meaning
none, p	If <code>uintptr_t</code> is defined, <code>to_chars(first, last, reinterpret_cast<uintptr_t>(value), 16)</code> with the prefix 0x inserted immediately before the output of <code>to_chars</code> ; otherwise, implementation-defined.

22.14.3 Error reporting

[format.err.report]

- ¹ Formatting functions throw `format_error` if an argument `fmt` is passed that is not a format string for `args`. They propagate exceptions thrown by operations of `formatter` specializations and iterators. Failure to allocate storage is reported by throwing an exception as described in 16.4.6.13.

22.14.4 Class template `basic_format_string`

[format.fmt.string]

```
namespace std {
    template<class charT, class... Args>
    struct basic_format_string {
        private:
            basic_string_view<charT> str;           // exposition only

        public:
            template<class T> consteval basic_format_string(const T& s);

            constexpr basic_string_view<charT> get() const noexcept { return str; }
    };
}

template<class T> consteval basic_format_string(const T& s);
```

¹ *Constraints:* `const T&` models `convertible_to<basic_string_view<charT>>`.

² *Effects:* Direct-non-list-initializes `str` with `s`.

3 *Remarks:* A call to this function is not a core constant expression (7.7) unless there exist `args` of types `Args` such that `str` is a format string for `args`.

22.14.5 Formatting functions

[format.functions]

1 In the description of the functions, operator `+` is used for some of the iterator categories for which it does not have to be defined. In these cases the semantics of `a + n` are the same as in 27.2.

```
template<class... Args>
string format(format_string<Args...> fmt, Args&&... args);
```

2 *Effects:* Equivalent to:

```
    return vformat(fmt.str, make_format_args(args...));
```

```
template<class... Args>
wstring format(wformat_string<Args...> fmt, Args&&... args);
```

3 *Effects:* Equivalent to:

```
    return vformat(fmt.str, make_wformat_args(args...));
```

```
template<class... Args>
string format(const locale& loc, format_string<Args...> fmt, Args&&... args);
```

4 *Effects:* Equivalent to:

```
    return vformat(loc, fmt.str, make_format_args(args...));
```

```
template<class... Args>
wstring format(const locale& loc, wformat_string<Args...> fmt, Args&&... args);
```

5 *Effects:* Equivalent to:

```
    return vformat(loc, fmt.str, make_wformat_args(args...));
```

```
string vformat(string_view fmt, format_args args);
```

```
wstring vformat(wstring_view fmt, wformat_args args);
```

```
string vformat(const locale& loc, string_view fmt, format_args args);
```

```
wstring vformat(const locale& loc, wstring_view fmt, wformat_args args);
```

6 *Returns:* A string object holding the character representation of formatting arguments provided by `args` formatted according to specifications given in `fmt`. If present, `loc` is used for locale-specific formatting.

7 *Throws:* As specified in 22.14.3.

```
template<class Out, class... Args>
Out format_to(Out out, format_string<Args...> fmt, Args&&... args);
```

8 *Effects:* Equivalent to:

```
    return vformat_to(std::move(out), fmt.str, make_format_args(args...));
```

```
template<class Out, class... Args>
Out format_to(Out out, wformat_string<Args...> fmt, Args&&... args);
```

9 *Effects:* Equivalent to:

```
    return vformat_to(std::move(out), fmt.str, make_wformat_args(args...));
```

```
template<class Out, class... Args>
Out format_to(Out out, const locale& loc, format_string<Args...> fmt, Args&&... args);
```

10 *Effects:* Equivalent to:

```
    return vformat_to(std::move(out), loc, fmt.str, make_format_args(args...));
```

```
template<class Out, class... Args>
Out format_to(Out out, const locale& loc, wformat_string<Args...> fmt, Args&&... args);
```

11 *Effects:* Equivalent to:

```
    return vformat_to(std::move(out), loc, fmt.str, make_wformat_args(args...));
```

```
template<class Out>
Out vformat_to(Out out, string_view fmt, format_args args);
```

template<class Out>
 Out vformat_to(Out out, wstring_view fmt, wformat_args args);
 template<class Out>
 Out vformat_to(Out out, const locale& loc, string_view fmt, format_args args);
 template<class Out>
 Out vformat_to(Out out, const locale& loc, wstring_view fmt, wformat_args args);

12 Let `charT` be `decltype(fmt)::value_type`.

13 *Constraints*: `Out` satisfies `output_iterator<const charT&>`.

14 *Preconditions*: `Out` models `output_iterator<const charT&>`.

15 *Effects*: Places the character representation of formatting the arguments provided by `args`, formatted according to the specifications given in `fmt`, into the range $[out, out + N]$, where N is the number of characters in that character representation. If present, `loc` is used for locale-specific formatting.

16 *Returns*: `out + N`.

17 *Throws*: As specified in [22.14.3](#).

template<class Out, class... Args>
 format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n,
 format_string<Args...> fmt, Args&&... args);
 template<class Out, class... Args>
 format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n,
 wformat_string<Args...> fmt, Args&&... args);
 template<class Out, class... Args>
 format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n,
 const locale& loc, format_string<Args...> fmt,
 Args&&... args);
 template<class Out, class... Args>
 format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n,
 const locale& loc, wformat_string<Args...> fmt,
 Args&&... args);

18 Let

(18.1) — `charT` be `decltype(fmt.str)::value_type`,

(18.2) — `N` be `formatted_size(fmt, args...)` for the functions without a `loc` parameter and `formatted_size(loc, fmt, args...)` for the functions with a `loc` parameter, and

(18.3) — `M` be `clamp(n, 0, N)`.

19 *Constraints*: `Out` satisfies `output_iterator<const charT&>`.

20 *Preconditions*: `Out` models `output_iterator<const charT&>`, and `formatter<remove_cvref_t<Ti>, charT>` meets the *BasicFormatter* requirements ([22.14.6.1](#)) for each T_i in `Args`.

21 *Effects*: Places the first M characters of the character representation of formatting the arguments provided by `args`, formatted according to the specifications given in `fmt`, into the range $[out, out + M]$. If present, `loc` is used for locale-specific formatting.

22 *Returns*: $\{out + M, N\}$.

23 *Throws*: As specified in [22.14.3](#).

template<class... Args>
 size_t formatted_size(format_string<Args...> fmt, Args&&... args);
 template<class... Args>
 size_t formatted_size(wformat_string<Args...> fmt, Args&&... args);
 template<class... Args>
 size_t formatted_size(const locale& loc, format_string<Args...> fmt, Args&&... args);
 template<class... Args>
 size_t formatted_size(const locale& loc, wformat_string<Args...> fmt, Args&&... args);

24 Let `charT` be `decltype(fmt.str)::value_type`.

25 *Preconditions*: `formatter<remove_cvref_t<Ti>, charT>` meets the *BasicFormatter* requirements ([22.14.6.1](#)) for each T_i in `Args`.

26 *Returns*: The number of characters in the character representation of formatting arguments `args`
 formatted according to specifications given in `fmt`. If present, `loc` is used for locale-specific formatting.
 27 *Throws*: As specified in [22.14.3](#).

22.14.6 Formatter

[`format.formatter`]

22.14.6.1 Formatter requirements

[`formatter.requirements`]

- 1 A type `F` meets the *BasicFormatter* requirements if it meets the
 - (1.1) — `Cpp17DefaultConstructible` ([Table 30](#)),
 - (1.2) — `Cpp17CopyConstructible` ([Table 32](#)),
 - (1.3) — `Cpp17CopyAssignable` ([Table 34](#)),
 - (1.4) — `Cpp17Swappable` ([16.4.4.3](#)), and
 - (1.5) — `Cpp17Destructible` ([Table 35](#))

requirements, and the expressions shown in [Table 73](#) are valid and have the indicated semantics.

- 2 A type `F` meets the *Formatter* requirements if it meets the *BasicFormatter* requirements and the expressions shown in [Table 74](#) are valid and have the indicated semantics.
- 3 Given character type `charT`, output iterator type `Out`, and formatting argument type `T`, in [Table 73](#) and [Table 74](#):
 - (3.1) — `f` is a value of type (possibly const) `F`,
 - (3.2) — `g` is an lvalue of type `F`,
 - (3.3) — `u` is an lvalue of type `T`,
 - (3.4) — `t` is a value of a type convertible to (possibly const) `T`,
 - (3.5) — `PC` is `basic_format_parse_context<charT>`,
 - (3.6) — `FC` is `basic_format_context<Out, charT>`,
 - (3.7) — `pc` is an lvalue of type `PC`, and
 - (3.8) — `fc` is an lvalue of type `FC`.

`pc.begin()` points to the beginning of the *format-spec* ([22.14.2](#)) of the replacement field being formatted in the format string. If *format-spec* is empty then either `pc.begin() == pc.end()` or `*pc.begin() == '}'`.

Table 73: *BasicFormatter* requirements [tab:formatter.basic]

Expression	Return type	Requirement
<code>g.parse(pc)</code>	<code>PC::iterator</code>	Parses <i>format-spec</i> (22.14.2) for type <code>T</code> in the range <code>[pc.begin(), pc.end()]</code> until the first unmatched character. Throws <code>format_error</code> unless the whole range is parsed or the unmatched character is <code>}</code> . NOTE: This allows formatters to emit meaningful error messages. Stores the parsed format specifiers in <code>*this</code> and returns an iterator past the end of the parsed range.
<code>f.format(u, fc)</code>	<code>FC::iterator</code>	Formats <code>u</code> according to the specifiers stored in <code>*this</code> , writes the output to <code>fc.out()</code> , and returns an iterator past the end of the output range. The output shall only depend on <code>u</code> , <code>fc.locale()</code> , <code>fc.arg(n)</code> for any value <code>n</code> of type <code>size_t</code> , and the range <code>[pc.begin(), pc.end()]</code> from the last call to <code>f.parse(pc)</code> .

Table 74: *Formatter* requirements [tab:formatter]

Expression	Return type	Requirement
<code>f.format(t, fc)</code>	<code>FC::iterator</code>	Formats <code>t</code> according to the specifiers stored in <code>*this</code> , writes the output to <code>fc.out()</code> , and returns an iterator past the end of the output range. The output shall only depend on <code>t</code> , <code>fc.locale()</code> , <code>fc.arg(n)</code> for any value <code>n</code> of type <code>size_t</code> , and the range <code>[pc.begin(), pc.end()]</code> from the last call to <code>f.parse(pc)</code> .
<code>f.format(u, fc)</code>	<code>FC::iterator</code>	As above, but does not modify <code>u</code> .

22.14.6.2 Concept formattable

[format.formattable]

- ¹ Let `fmt-iter-for<charT>` be an unspecified type that models `output_iterator<const charT&>` (25.3.4.10).

```
template<class T, class Context,
        class Formatter = typename Context::template formatter_type<remove_const_t<T>>>
concept formattable-with =
    // exposition only
    semiregular<Formatter> &&
    requires(Formatter& f, const Formatter& cf, T& t, Context fc,
             basic_format_parse_context<typename Context::char_type> pc)
{
    { f.parse(pc) } -> same_as<typename decltype(pc)::iterator>;
    { cf.format(t, fc) } -> same_as<typename Context::iterator>;
};

template<class T, class charT>
concept formattable =
    formattable-with<remove_reference_t<T>, basic_format_context<fmt-iter-for<charT>>>;
```

- ² A type `T` and a character type `charT` model `formattable` if `formatter<remove_cvref_t<T>, charT>` meets the *BasicFormatter* requirements (22.14.6.1) and, if `remove_reference_t<T>` is const-qualified, the *Formatter* requirements.

22.14.6.3 Formatter specializations

[format.formatter.spec]

- ¹ The functions defined in 22.14.5 use specializations of the class template `formatter` to format individual arguments.
- ² Let `charT` be either `char` or `wchar_t`. Each specialization of `formatter` is either enabled or disabled, as described below. A *debug-enabled* specialization of `formatter` additionally provides a public, `constexpr`, non-static member function `set_debug_format()` which modifies the state of the `formatter` to be as if the type of the `std-format-spec` parsed by the last call to `parse` were `?`. Each header that declares the template `formatter` provides the following enabled specializations:

- (2.1) — The debug-enabled specializations

```
template<> struct formatter<char, char>;
template<> struct formatter<char, wchar_t>;
template<> struct formatter<wchar_t, wchar_t>;
```

- (2.2) — For each `charT`, the debug-enabled string type specializations

```
template<> struct formatter<charT*, charT>;
template<> struct formatter<const charT*, charT>;
template<size_t N> struct formatter<charT[N], charT>;
template<class traits, class Allocator>
    struct formatter<basic_string<charT, traits, Allocator>, charT>;
template<class traits>
    struct formatter<basic_string_view<charT, traits>, charT>;
```

- (2.3) — For each `charT`, for each cv-unqualified arithmetic type `ArithmeticT` other than `char`, `wchar_t`, `char8_t`, `char16_t`, or `char32_t`, a specialization

```
template<> struct formatter<ArithmeticT, charT>;
```

- (2.4) — For each `charT`, the pointer type specializations

```
template<> struct formatter<nullptr_t, charT>;
template<> struct formatter<void*, charT>;
template<> struct formatter<const void*, charT>;
```

The `parse` member functions of these formatters interpret the format specification as a *std-format-spec* as described in 22.14.2.2.

NOTE: Specializations such as `formatter<wchar_t, char>` and `formatter<const char*, wchar_t>` that would require implicit multibyte / wide string or character conversion are disabled.

- 3 For any types `T` and `charT` for which neither the library nor the user provides an explicit or partial specialization of the class template `formatter`, `formatter<T, charT>` is disabled.
- 4 If the library provides an explicit or partial specialization of `formatter<T, charT>`, that specialization is enabled and meets the *Formatter* requirements except as noted otherwise.
- 5 If `F` is a disabled specialization of `formatter`, these values are `false`:

- (5.1) — `is_default_constructible_v<F>`,
- (5.2) — `is_copy_constructible_v<F>`,
- (5.3) — `is_move_constructible_v<F>`,
- (5.4) — `is_copy_assignable_v<F>`, and
- (5.5) — `is_move_assignable_v<F>`.

- 6 An enabled specialization `formatter<T, charT>` meets the *BasicFormatter* requirements (22.14.6.1).

EXAMPLE:

```
#include <format>

enum color { red, green, blue };
const char* color_names[] = { "red", "green", "blue" };

template<> struct std::formatter<color> : std::formatter<const char*> {
    auto format(color c, format_context& ctx) const {
        return formatter<const char*>::format(color_names[c], ctx);
    }
};

struct err {};

std::string s0 = std::format("{}", 42);           // OK, library-provided formatter
std::string s1 = std::format("{}", L"foo");        // error: disabled formatter
std::string s2 = std::format("{}", red);           // OK, user-provided formatter
std::string s3 = std::format("{}", err{});         // error: disabled formatter
```

22.14.6.4 Formatting escaped characters and strings

[`format.string.escaped`]

- 1 A character or string can be formatted as *escaped* to make it more suitable for debugging or for logging.
- 2 The escaped string `E` representation of a string `S` is constructed by encoding a sequence of characters as follows. The associated character encoding `CE` for `charT` (Table 12) is used to both interpret `S` and construct `E`.

- (2.1) — U+0022 QUOTATION MARK ("") is appended to `E`.
- (2.2) — For each code unit sequence `X` in `S` that either encodes a single character, is a shift sequence, or is a sequence of ill-formed code units, processing is in order as follows:
 - (2.2.1) — If `X` encodes a single character `C`, then:
 - (2.2.1.1) — If `C` is one of the characters in Table 75, then the two characters shown as the corresponding escape sequence are appended to `E`.
 - (2.2.1.2) — Otherwise, if `C` is not U+0020 SPACE and
 - (2.2.1.2) — `CE` is UTF-8, UTF-16, or UTF-32 and `C` corresponds to a Unicode scalar value whose Unicode property `General_Category` has a value in the groups `Separator` (Z) or `Other` (C), as described by UAX #44 of the Unicode Standard, or

- (2.2.1.2) — CE is UTF-8, UTF-16, or UTF-32 and C corresponds to a Unicode scalar value with the Unicode property `Grapheme_Extend=Yes` as described by UAX #44 of the Unicode Standard and C is not immediately preceded in S by a character P appended to E without translation to an escape sequence, or
- (2.2.1.2) — CE is neither UTF-8, UTF-16, nor UTF-32 and C is one of an implementation-defined set of separator or non-printable characters
- then the sequence `\u{hex-digit-sequence}` is appended to E , where `hex-digit-sequence` is the shortest hexadecimal representation of C using lower-case hexadecimal digits.
- (2.2.1.3) — Otherwise, C is appended to E .
- (2.2.2) — Otherwise, if X is a shift sequence, the effect on E and further decoding of S is unspecified.
Recommended practice: A shift sequence should be represented in E such that the original code unit sequence of S can be reconstructed.
- (2.2.3) — Otherwise (X is a sequence of ill-formed code units), each code unit U is appended to E in order as the sequence `\x{hex-digit-sequence}`, where `hex-digit-sequence` is the shortest hexadecimal representation of U using lower-case hexadecimal digits.
- (2.3) — Finally, U+0022 QUOTATION MARK ("") is appended to E .

Table 75: Mapping of characters to escape sequences [tab:format.escape.sequences]

Character	Escape sequence
U+0009 CHARACTER TABULATION	<code>\t</code>
U+000A LINE FEED	<code>\n</code>
U+000D CARRIAGE RETURN	<code>\r</code>
U+0022 QUOTATION MARK	<code>\"</code>
U+005C REVERSE SOLIDUS	<code>\\"</code>

³ The escaped string representation of a character C is equivalent to the escaped string representation of a string of C , except that:

- (3.1) — the result starts and ends with U+0027 APOSTROPHE (') instead of U+0022 QUOTATION MARK (""), and
- (3.2) — if C is U+0027 APOSTROPHE, the two characters \’ are appended to E , and
- (3.3) — if C is U+0022 QUOTATION MARK, then C is appended unchanged.

EXAMPLE:

```

string s0 = format("[{}]", "h\tllo");                                // s0 has value: [h      llo]
string s1 = format("[{:?}]", "h\tllo");                                // s1 has value: ["h\tllo"]
string s2 = format("[{:?}]", "Спасибо, Виктор ❤!"); // s2 has value: ["Спасибо, Виктор ❤!"]
string s3 = format("[{:?:}, {:?}]", '\'', ''');                         // s3 has value: ['\'', ''']

// The following examples assume use of the UTF-8 encoding
string s4 = format("[{:?}]", string("\0 \n \t \x02 \x1b", 9));        // s4 has value: ["\u{0} \n \t \u{2} \u{1b}"]
string s5 = format("[{:?}]", "\xc3\x28");                                // invalid UTF-8
string s6 = format("[{:?}]", "\u20d\ufe0f");                           // s6 has value: ["\u{c3}\u{28}\u{20d}\u{fe0f}"]
string s7 = format("[{:?}]", "\u0301");                                 // s7 has value: ["\u{301}"]
string s8 = format("[{:?}]", "\\\u0301");                               // s8 has value: ["\\\" \u{301}"]
string s9 = format("[{:?}]", "e\u0301\u0323");                          // s9 has value: ["é"]

```

22.14.6.5 Class template basic_format_parse_context

[format.parse.ctx]

```

namespace std {
    template<class charT>
    class basic_format_parse_context {
public:
    using char_type = charT;
    using const_iterator = typename basic_string_view<charT>::const_iterator;
    using iterator = const_iterator;
}

```

```

private:
    iterator begin_;                                // exposition only
    iterator end_;                                 // exposition only
    enum indexing { unknown, manual, automatic }; // exposition only
    indexing indexing_;
    size_t next_arg_id_;                           // exposition only
    size_t num_args_;                            // exposition only

public:
    constexpr explicit basic_format_parse_context(basic_string_view<charT> fmt,
                                                    size_t num_args = 0) noexcept;
    basic_format_parse_context(const basic_format_parse_context&) = delete;
    basic_format_parse_context& operator=(const basic_format_parse_context&) = delete;

    constexpr const_iterator begin() const noexcept;
    constexpr const_iterator end() const noexcept;
    constexpr void advance_to(const_iterator it);

    constexpr size_t next_arg_id();
    constexpr void check_arg_id(size_t id);
};

}

```

- 1 An instance of `basic_format_parse_context` holds the format string parsing state consisting of the format string range being parsed and the argument counter for automatic indexing.

```
constexpr explicit basic_format_parse_context(basic_string_view<charT> fmt,
                                              size_t num_args = 0) noexcept;
```

- 2 *Effects:* Initializes `begin_` with `fmt.begin()`, `end_` with `fmt.end()`, `indexing_` with `unknown`, `next_arg_id_` with 0, and `num_args_` with `num_args`.

`constexpr const_iterator begin() const noexcept;`

- 3 *Returns:* `begin_`.

`constexpr const_iterator end() const noexcept;`

- 4 *Returns:* `end_`.

`constexpr void advance_to(const_iterator it);`

- 5 *Preconditions:* `end()` is reachable from `it`.

- 6 *Effects:* Equivalent to: `begin_ = it`;

`constexpr size_t next_arg_id();`

- 7 *Effects:* If `indexing_ != manual` is true, equivalent to:

```
if (indexing_ == unknown)
    indexing_ = automatic;
return next_arg_id_++;
```

- 8 *Throws:* `format_error` if `indexing_ == manual` is true which indicates mixing of automatic and manual argument indexing.

- 9 *Remarks:* Let `cur-arg-id` be the value of `next_arg_id_` prior to this call. Call expressions where `cur-arg-id >= num_args_` is true are not core constant expressions (7.7).

`constexpr void check_arg_id(size_t id);`

- 10 *Effects:* If `indexing_ != automatic` is true, equivalent to:

```
if (indexing_ == unknown)
    indexing_ = manual;
```

- 11 *Throws:* `format_error` if `indexing_ == automatic` is true which indicates mixing of automatic and manual argument indexing.

- 12 *Remarks:* Call expressions where `id >= num_args_` is true are not core constant expressions (7.7).

22.14.6.6 Class template `basic_format_context`

[format.context]

```

namespace std {
    template<class Out, class charT>
    class basic_format_context {
        basic_format_args<basic_format_context> args_;           // exposition only
        Out out_;                                                 // exposition only

    public:
        using iterator = Out;
        using char_type = charT;
        template<class T> using formatter_type = formatter<T, charT>

        basic_format_arg<basic_format_context> arg(size_t id) const noexcept;
        std::locale locale();

        iterator out();
        void advance_to(iterator it);
    };
}

```

- ¹ An instance of `basic_format_context` holds formatting state consisting of the formatting arguments and the output iterator.
- ² `Out` shall model `output_iterator<const charT&>`.
- ³ `format_context` is an alias for a specialization of `basic_format_context` with an output iterator that appends to `string`, such as `back_insert_iterator<string>`. Similarly, `wformat_context` is an alias for a specialization of `basic_format_context` with an output iterator that appends to `wstring`.
- ⁴ *Recommended practice:* For a given type `charT`, implementations should provide a single instantiation of `basic_format_context` for appending to `basic_string<charT>`, `vector<charT>`, or any other container with contiguous storage by wrapping those in temporary objects with a uniform interface (such as a `span<charT>`) and polymorphic reallocation.

```

basic_format_arg<basic_format_context> arg(size_t id) const noexcept;
5     Returns: args_.get(id).

std::locale locale();
6     Returns: The locale passed to the formatting function if the latter takes one, and std::locale() otherwise.

iterator out();
7     Effects: Equivalent to: return std::move(out_);

void advance_to(iterator it);
8     Effects: Equivalent to: out_ = std::move(it);

```

EXAMPLE:

```

struct S { int value; };

template<> struct std::formatter<S> {
    size_t width_arg_id = 0;

    // Parses a width argument id in the format { digit }.
    constexpr auto parse(format_parse_context& ctx) {
        auto iter = ctx.begin();
        auto get_char = [&](){ return iter != ctx.end() ? *iter : 0; };
        if (get_char() != '{')
            return iter;
        ++iter;
        char c = get_char();
        if (!isdigit(c) || (++iter, get_char()) != '}')
            throw format_error("invalid format");
        width_arg_id = c - '0';
    }
};

```

```

    ctx.check_arg_id(width_arg_id);
    return ++iter;
}

// Formats an S with width given by the argument width_arg_id.
auto format(S s, format_context& ctx) const {
    int width = visit_format_arg([](auto value) -> int {
        if constexpr (!is_integral_v<decltype(value)>)
            throw format_error("width is not integral");
        else if (value < 0 || value > numeric_limits<int>::max())
            throw format_error("invalid width");
        else
            return value;
    }, ctx.arg(width_arg_id));
    return format_to(ctx.out(), "{0:x<{1}>}", s.value, width);
}
};

std::string s = std::format("{0:{1}}", S{42}, 10); // value of s is "xxxxxxxx42"

```

22.14.7 Formatting of ranges

[format.range]

22.14.7.1 Variable template format_kind

[format.range.fmtkind]

```
template<ranges::input_range R>
    requires same_as<R, remove_cvref_t<R>>
constexpr range_format format_kind<R> = see below;
```

1 A program that instantiates the primary template of `format_kind` is ill-formed.

2 For a type `R`, `format_kind<R>` is defined as follows:

- (2.1) — If `same_as<remove_cvref_t<ranges::range_reference_t<R>>, R>` is true, `format_kind<R>` is `range_format::disabled`.

NOTE: This prevents constraint recursion for ranges whose reference type is the same range type. For example, `std::filesystem::path` is a range of `std::filesystem::path`.

- (2.2) — Otherwise, if the `qualified-id R::key_type` is valid and denotes a type:

(2.2.1) — If the `qualified-id R::mapped_type` is valid and denotes a type, let `U` be `remove_cvref_t<ranges::range_reference_t<R>>`. If either `U` is a specialization of `pair` or `U` is a specialization of `tuple` and `tuple_size_v<U> == 2`, `format_kind<R>` is `range_format::map`.

(2.2.2) — Otherwise, `format_kind<R>` is `range_format::set`.

(2.3) — Otherwise, `format_kind<R>` is `range_format::sequence`.

3 Remarks: Pursuant to 16.4.5.2.1, users may specialize `format_kind` for cv-unqualified program-defined types that model `ranges::input_range`. Such specializations shall be usable in constant expressions (7.7) and have type `const range_format`.

22.14.7.2 Class template range_formatter

[format.range.formatter]

```

namespace std {
    template<class T, class charT = char>
        requires same_as<remove_cvref_t<T>, T> && formattable<T, charT>
    class range_formatter {
        formatter<T, charT> underlying_; // exposition only
        basic_string_view<charT> separator_ = STATICALLY-WIDEN<charT>(", "); // exposition only
        basic_string_view<charT> opening-bracket_ = STATICALLY-WIDEN<charT>("["); // exposition only
        basic_string_view<charT> closing-bracket_ = STATICALLY-WIDEN<charT>("]"); // exposition only

        public:
            constexpr void set_separator(basic_string_view<charT> sep) noexcept;
            constexpr void set_brackets(basic_string_view<charT> opening,
                                         basic_string_view<charT> closing) noexcept;
            constexpr formatter<T, charT>& underlying() noexcept { return underlying_; }
            constexpr const formatter<T, charT>& underlying() const noexcept { return underlying_; }
    };
}
```

```

template<class ParseContext>
constexpr typename ParseContext::iterator
parse(ParseContext& ctx);

template<ranges::input_range R, class FormatContext>
    requires formattable<ranges::range_reference_t<R>, charT> &&
        same_as<remove_cvref_t<ranges::range_reference_t<R>>, T>
typename FormatContext::iterator
format(R&& r, FormatContext& ctx) const;
};

}

```

- ¹ The class template `range_formatter` is a utility for implementing `formatter` specializations for range types.
- ² `range_formatter` interprets *format-spec* as a *range-format-spec*. The syntax of format specifications is as follows:

```

range-format-spec:
    range-fill-and-alignopt widthopt nopt range-typeopt range-underlying-specopt

range-fill-and-align:
    range-fillopt align

range-fill:
    any character other than { or } or :

range-type:
    m
    s
    ?s

range-underlying-spec:
    : format-spec

```

- ³ For `range_formatter<T, charT>`, the *format-spec* in a *range-underlying-spec*, if any, is interpreted by `formatter<T, charT>`.
 - ⁴ The *range-fill-and-align* is interpreted the same way as a *fill-and-align* (22.14.2.2). The productions *align* and *width* are described in 22.14.2.
 - ⁵ The *n* option causes the range to be formatted without the opening and closing brackets.
- NOTE 1: This is equivalent to invoking `set_brackets({}, {})`.
- ⁶ The *range-type* specifier changes the way a range is formatted, with certain options only valid with certain argument types. The meaning of the various type options is as specified in Table 76.

Table 76: Meaning of *range-type* options [tab:formatter.range.type]

Option	Requirements	Meaning
m	T shall be either a specialization of <code>pair</code> or a specialization of <code>tuple</code> such that <code>tuple_size_v<T></code> is 2.	Indicates that the opening bracket should be "{", the closing bracket should be "}", the separator should be ", ", and each range element should be formatted as if m were specified for its <i>tuple-type</i> . NOTE 2: If the n option is provided in addition to the m option, both the opening and closing brackets are still empty.
s	T shall be <code>charT</code> .	Indicates that the range should be formatted as a <code>string</code> .
?s	T shall be <code>charT</code> .	Indicates that the range should be formatted as an escaped string (22.14.6.4).

If the *range-type* is s or ?s, then there shall be no n option and no *range-underlying-spec*.

```
constexpr void set_separator(basic_string_view<charT> sep) noexcept;
```

- ⁷ Effects: Equivalent to: `separator_ = sep;`

```

constexpr void set_brackets(basic_string_view<charT> opening,
                           basic_string_view<charT> closing) noexcept;

```

8 *Effects:* Equivalent to:

```

opening-bracket_ = opening;
closing-bracket_ = closing;

```

```

template<class ParseContext>
constexpr typename ParseContext::iterator
parse(ParseContext& ctx);

```

9 *Effects:* Parses the format specifier as a *range-format-spec* and stores the parsed specifiers in **this*. The values of *opening-bracket_*, *closing-bracket_*, and *separator_* are modified if and only if required by the *range-type* or the *n* option, if present. If:

- (9.1) — the *range-type* is neither *s* nor *?s*,
- (9.2) — *underlying_.set_debug_format()* is a valid expression, and
- (9.3) — there is no *range-underlying-spec*,

then calls *underlying_.set_debug_format()*.

10 *Returns:* An iterator past the end of the *range-format-spec*.

```

template<ranges::input_range R, class FormatContext>
requires formattable<ranges::range_reference_t<R>, charT> &&
        same_as<remove_cvref_t<ranges::range_reference_t<R>>, T>
typename FormatContext::iterator
format(R&& r, FormatContext& ctx) const;

```

11 *Effects:* Writes the following into *ctx.out()*, adjusted according to the *range-format-spec*:

- (11.1) — If the *range-type* was *s*, then as if by formatting *basic_string<charT>(from_range, r)*.
- (11.2) — Otherwise, if the *range-type* was *?s*, then as if by formatting *basic_string<charT>(from_range, r)* as an escaped string (22.14.6.4).
- (11.3) — Otherwise,
 - (11.3.1) — *opening-bracket_*,
 - (11.3.2) — for each element *e* of the range *r*:
 - (11.3.2.1) — the result of writing *e* via *underlying_* and
 - (11.3.2.2) — *separator_*, unless *e* is the last element of *r*, and
 - (11.3.3) — *closing-bracket_*.

12 *Returns:* An iterator past the end of the output range.

22.14.7.3 Class template *range-default-formatter*

[format.range.fmtdef]

```

namespace std {
    template<ranges::input_range R, class charT>
    struct range-default-formatter<range_format::sequence, R, charT> { // exposition only
private:
    using maybe-const-r = fmt-maybe-const<R, charT>; // exposition only
    range_formatter<remove_cvref_t<ranges::range_reference_t<maybe-const-r>>,
                    charT> underlying_; // exposition only

public:
    constexpr void set_separator(basic_string_view<charT> sep) noexcept;
    constexpr void set_brackets(basic_string_view<charT> opening,
                               basic_string_view<charT> closing) noexcept;

    template<class ParseContext>
    constexpr typename ParseContext::iterator
    parse(ParseContext& ctx);
}

```

```

    template<class FormatContext>
    typename FormatContext::iterator
    format(maybe-const-r& elems, FormatContext& ctx) const;
};

}

constexpr void set_separator(basic_string_view<charT> sep) noexcept;

1   Effects: Equivalent to: underlying_.set_separator(sep);

constexpr void set_brackets(basic_string_view<charT> opening,
                           basic_string_view<charT> closing) noexcept;

2   Effects: Equivalent to: underlying_.set_brackets(opening, closing);

template<class ParseContext>
constexpr typename ParseContext::iterator
parse(ParseContext& ctx);

3   Effects: Equivalent to: return underlying_.parse(ctx);

template<class FormatContext>
typename FormatContext::iterator
format(maybe-const-r& elems, FormatContext& ctx) const;

4   Effects: Equivalent to: return underlying_.format(elems, ctx);

```

22.14.7.4 Specialization of *range-default-formatter* for maps

[format.range.fmtmap]

```

namespace std {
    template<ranges::input_range R, class charT>
    struct range-default-formatter<range_format::map, R, charT> {
        private:
            using maybe-const-map = fmt-maybe-const<R, charT>; // exposition only
            using element-type = // exposition only
                remove_cvref_t<ranges::range_reference_t<maybe-const-map>>;
            range_formatter<element-type, charT> underlying_; // exposition only

        public:
            constexpr range-default-formatter();

            template<class ParseContext>
            constexpr typename ParseContext::iterator
            parse(ParseContext& ctx);

            template<class FormatContext>
            typename FormatContext::iterator
            format(maybe-const-map& r, FormatContext& ctx) const;
    };
}

constexpr range-default-formatter();

```

1 Mandates: Either:

- (1.1) — *element-type* is a specialization of *pair*, or
(1.2) — *element-type* is a specialization of *tuple* and *tuple_size_v<element-type> == 2*.

2 Effects: Equivalent to:

```

underlying_.set_brackets(STATICALLY-WIDEN<charT>("{"), STATICALLY-WIDEN<charT>("}"));
underlying_.underlying().set_brackets({}, {});
underlying_.underlying().set_separator(STATICALLY-WIDEN<charT>(": "));

```

```

template<class ParseContext>
constexpr typename ParseContext::iterator
parse(ParseContext& ctx);

```

3 Effects: Equivalent to: return *underlying_.parse(ctx)*;

```

template<class FormatContext>
typename FormatContext::iterator
format(maybe-const-map& r, FormatContext& ctx) const;
4   Effects: Equivalent to: return underlying_.format(r, ctx);

```

22.14.7.5 Specialization of *range-default-formatter* for sets

[format.range.fmtset]

```

namespace std {
    template<ranges::input_range R, class charT>
    struct range-default-formatter<range_format::set, R, charT> {
        private:
            using maybe-const-set = fmt-maybe-const<R, charT>; // exposition only
            range_formatter<remove_cvref_t<ranges::range_reference_t<maybe-const-set>>, // exposition only
                           charT> underlying_;
        public:
            constexpr range-default-formatter();
            template<class ParseContext>
            constexpr typename ParseContext::iterator
            parse(ParseContext& ctx);
            template<class FormatContext>
            typename FormatContext::iterator
            format(maybe-const-set& r, FormatContext& ctx) const;
    };
}

```

constexpr range-default-formatter();

1 Effects: Equivalent to:

underlying_.set_brackets(STATICALLY-WIDEN<charT>("{"), STATICALLY-WIDEN<charT>}));

```

template<class ParseContext>
constexpr typename ParseContext::iterator
parse(ParseContext& ctx);

```

2 Effects: Equivalent to: return *underlying_*.parse(ctx);

```

template<class FormatContext>
typename FormatContext::iterator
format(maybe-const-set& r, FormatContext& ctx) const;

```

3 Effects: Equivalent to: return *underlying_*.format(r, ctx);

22.14.7.6 Specialization of *range-default-formatter* for strings

[format.range.fmtstr]

```

namespace std {
    template<range_format K, ranges::input_range R, class charT>
    requires (K == range_format::string || K == range_format::debug_string)
    struct range-default-formatter<K, R, charT> {
        private:
            formatter<basic_string<charT>, charT> underlying_; // exposition only
        public:
            template<class ParseContext>
            constexpr typename ParseContext::iterator
            parse(ParseContext& ctx);
            template<class FormatContext>
            typename FormatContext::iterator
            format(see below& str, FormatContext& ctx) const;
    };
}

```

1 Mandates: same_as<remove_cvref_t<range_reference_t<R>>, charT> is true.

```
template<class ParseContext>
constexpr typename ParseContext::iterator
parse(ParseContext& ctx);
```

2 *Effects:* Equivalent to:

```
auto i = underlying_.parse(ctx);
if constexpr (K == range_format::debug_string) {
    underlying_.set_debug_format();
}
return i;
```

```
template<class FormatContext>
typename FormatContext::iterator
format(see below& r, FormatContext& ctx) const;
```

3 The type of *r* is *const R*& if *ranges::input_range<const R>* is true and *R*& otherwise.

4 *Effects:* Let *s* be a *basic_string<charT>* such that *ranges::equal(s, r)* is true. Equivalent to:
return *underlying_.format(s, ctx)*;

22.14.8 Arguments

[format.arguments]

22.14.8.1 Class template basic_format_arg

[format.arg]

```
namespace std {
    template<class Context>
    class basic_format_arg {
        public:
            class handle;

        private:
            using char_type = typename Context::char_type; // exposition only

            variant<monostate, bool, char_type,
                    int, unsigned int, long long int, unsigned long long int,
                    float, double, long double,
                    const char_type*, basic_string_view<char_type>,
                    const void*, handle> value; // exposition only

            template<class T> explicit basic_format_arg(T& v) noexcept; // exposition only

        public:
            basic_format_arg() noexcept;

            explicit operator bool() const noexcept;
    };
}
```

1 An instance of *basic_format_arg* provides access to a formatting argument for user-defined formatters.

2 The behavior of a program that adds specializations of *basic_format_arg* is undefined.

```
basic_format_arg() noexcept;
```

3 *Postconditions:* !(**this*).

```
template<class T> explicit basic_format_arg(T& v) noexcept;
```

4 *Constraints:* *T* satisfies *formattable-with<Context>*.

5 *Preconditions:* If *decay_t<T>* is *char_type** or *const char_type**, *static_cast<const char_type*>(v)* points to a NTCTS (3.36).

6 *Effects:* Let *TD* be *remove_const_t<T>*.

(6.1) — If *TD* is *bool* or *char_type*, initializes *value* with *v*;

(6.2) — otherwise, if *TD* is *char* and *char_type* is *wchar_t*, initializes *value* with *static_cast<wchar_t>(v)*;

- (6.3) — otherwise, if TD is a signed integer type (6.8.2) and `sizeof(TD) <= sizeof(int)`, initializes value with `static_cast<int>(v)`;
- (6.4) — otherwise, if TD is an unsigned integer type and `sizeof(TD) <= sizeof(unsigned int)`, initializes value with `static_cast<unsigned int>(v)`;
- (6.5) — otherwise, if TD is a signed integer type and `sizeof(TD) <= sizeof(long long int)`, initializes value with `static_cast<long long int>(v)`;
- (6.6) — otherwise, if TD is an unsigned integer type and `sizeof(TD) <= sizeof(unsigned long long int)`, initializes value with `static_cast<unsigned long long int>(v)`;
- (6.7) — otherwise, if TD is a standard floating-point type, initializes value with v;
- (6.8) — otherwise, if TD is a specialization of `basic_string_view` or `basic_string` and TD::value_type is `char_type`, initializes value with `basic_string_view<char_type>(v.data(), v.size())`;
- (6.9) — otherwise, if `decay_t<TD>` is `char_type*` or `const char_type*`, initializes value with `static_cast<const char_type*>(v)`;
- (6.10) — otherwise, if `is_void_v<remove_pointer_t<TD>>` is true or `is_null_pointer_v<TD>` is true, initializes value with `static_cast<const void*>(v)`;
- (6.11) — otherwise, initializes value with `handle(v)`.

NOTE: Constructing `basic_format_arg` from a pointer to a member is ill-formed unless the user provides an enabled specialization of `formatter` for that pointer to member type.

`explicit operator bool() const noexcept;`

7 >Returns: `!holds_alternative<monostate>(value)`.

8 The class `handle` allows formatting an object of a user-defined type.

```
namespace std {
    template<class Context>
    class basic_format_arg<Context>::handle {
        const void* ptr_; // exposition only
        void (*format_)(basic_format_parse_context<char_type>&, Context&, const void*); // exposition only

        template<class T> explicit handle(T& val) noexcept; // exposition only

        friend class basic_format_arg<Context>; // exposition only

    public:
        void format(basic_format_parse_context<char_type>&, Context& ctx) const;
    };
}
```

`template<class T> explicit handle(T& val) noexcept;`

9 Let

— TD be `remove_const_t<T>`,

— TQ be `const TD` if `const TD` satisfies `formattable-with<Context>` and TD otherwise.

10 *Mandates:* TQ satisfies `formattable-with<Context>`.

11 *Effects:* Initializes `ptr_` with `addressof(val)` and `format_` with

```
[](basic_format_parse_context<char_type>& parse_ctx,
    Context& format_ctx, const void* ptr) {
    typename Context::template formatter_type<TD> f;
    parse_ctx.advance_to(f.parse(parse_ctx));
    format_ctx.advance_to(f.format(*const_cast<TQ*>(static_cast<const TD*>(ptr)),
        format_ctx));
}
```

`void format(basic_format_parse_context<char_type>& parse_ctx, Context& format_ctx) const;`

12 *Effects:* Equivalent to: `format_(parse_ctx, format_ctx, ptr_)`;

```
template<class Visitor, class Context>
    decltype(auto) visit_format_arg(Visitor&& vis, basic_format_arg<Context> arg);
13   Effects: Equivalent to: return visit(std::forward<Visitor>(vis), arg.value);
```

22.14.8.2 Class template *format-arg-store*

[format.arg.store]

```
namespace std {
    template<class Context, class... Args>
    class format-arg-store { // exposition only
        array<basic_format_arg<Context>, sizeof...(Args)> args; // exposition only
    };
}
```

- ¹ An instance of *format-arg-store* stores formatting arguments.

```
template<class Context = format_context, class... Args>
    format-arg-store<Context, Args...> make_format_args(Args&&... fmt_args);
```

- ² *Preconditions*: The type `typename Context::template formatter_type<remove_cvref_t<Ti>>` meets the *BasicFormatter* requirements (22.14.6.1) for each T_i in *Args*.

- ³ *Returns*: An object of type `format-arg-store<Context, Args...>` whose *args* data member is initialized with `{basic_format_arg<Context>(fmt_args)...}`.

```
template<class... Args>
    format-arg-store<wformat_context, Args...> make_wformat_args(Args&&... args);
```

- ⁴ *Effects*: Equivalent to: `return make_format_args<wformat_context>(args...);`

22.14.8.3 Class template *basic_format_args*

[format.args]

```
namespace std {
    template<class Context>
    class basic_format_args {
        size_t size_; // exposition only
        const basic_format_arg<Context>* data_; // exposition only

    public:
        basic_format_args() noexcept;

        template<class... Args>
        basic_format_args(const format-arg-store<Context, Args...>& store) noexcept;

        basic_format_arg<Context> get(size_t i) const noexcept;
    };

    template<class Context, class... Args>
    basic_format_args(format-arg-store<Context, Args...>) -> basic_format_args<Context>;
}
```

- ¹ An instance of *basic_format_args* provides access to formatting arguments. Implementations should optimize the representation of *basic_format_args* for a small number of formatting arguments.

NOTE: For example, by storing indices of type alternatives separately from values and packing the former.

```
basic_format_args() noexcept;
```

- ² *Effects*: Initializes *size_* with 0.

```
template<class... Args>
    basic_format_args(const format-arg-store<Context, Args...>& store) noexcept;
```

- ³ *Effects*: Initializes *size_* with `sizeof...(Args)` and *data_* with `store.args.data()`.

```
basic_format_arg<Context> get(size_t i) const noexcept;
```

- ⁴ *Returns*: `i < size_ ? data_[i] : basic_format_arg<Context>()`.

22.14.9 Tuple formatter

[format.tuple]

- ¹ For each of `pair` and `tuple`, the library provides the following formatter specialization where *pair-or-tuple* is the name of the template:

```
namespace std {
    template<class charT, formattable<charT>... Ts>
    struct formatter<iostream::pair-or-tuple<Ts...>, charT> {
        private:
            tuple<formatter<remove_cvref_t<Ts>, charT>...> underlying_; // exposition only
            basic_string_view<charT> separator_ = STATICALLY-WIDEN<charT>(", "); // exposition only
            basic_string_view<charT> opening-bracket_ = STATICALLY-WIDEN<charT>( "(" ); // exposition only
            basic_string_view<charT> closing-bracket_ = STATICALLY-WIDEN<charT>( ")" ); // exposition only

        public:
            constexpr void set_separator(basic_string_view<charT> sep) noexcept;
            constexpr void set_brackets(basic_string_view<charT> opening,
                                         basic_string_view<charT> closing) noexcept;

            template<class ParseContext>
            constexpr typename ParseContext::iterator
            parse(ParseContext& ctx);

            template<class FormatContext>
            typename FormatContext::iterator
            format(see below& elems, FormatContext& ctx) const;
    };
}
```

- ² The `parse` member functions of these formatters interpret the format specification as a *tuple-format-spec* according to the following syntax:

```
tuple-format-spec:
    tuple-fill-and-alignopt widthopt tuple-typeopt

tuple-fill-and-align:
    tuple-fillopt align

tuple-fill:
    any character other than { or } or :

tuple-type:
    m
    n
```

- ³ The *tuple-fill-and-align* is interpreted the same way as a *fill-and-align* (22.14.2.2). The productions *align* and *width* are described in 22.14.2.
- ⁴ The *tuple-type* specifier changes the way a `pair` or `tuple` is formatted, with certain options only valid with certain argument types. The meaning of the various type options is as specified in Table 77.

Table 77: Meaning of *tuple-type* options [tab:formatter.tuple.type]

Option	Requirements	Meaning
m	<code>sizeof...(Ts) == 2</code>	Equivalent to: <code>set_separator(STATICALLY-WIDEN<charT>(": "));</code> <code>set_brackets({}, {});</code>
n	none	Equivalent to: <code>set_brackets({}, {});</code>
none	none	No effects

```
constexpr void set_separator(basic_string_view<charT> sep) noexcept;
```

- ⁵ Effects: Equivalent to: *separator_* = *sep*;

```
constexpr void set_brackets(basic_string_view<charT> opening,
                           basic_string_view<charT> closing) noexcept;
```

6 *Effects:* Equivalent to:
 $\text{opening-bracket}_\text{=} \text{opening};$
 $\text{closing-bracket}_\text{=} \text{closing};$

```
template<class ParseContext>
constexpr typename ParseContext::iterator
parse(ParseContext& ctx);
```

7 *Effects:* Parses the format specifier as a *tuple-format-spec* and stores the parsed specifiers in **this*. The values of *opening-bracket*, *closing-bracket*, and *separator* are modified if and only if required by the *tuple-type*, if present. For each element *e* in *underlying*, if *e.set_debug_format()* is a valid expression, calls *e.set_debug_format()*.

8 *Returns:* An iterator past the end of the *tuple-format-spec*.

```
template<class FormatContext>
typename FormatContext::iterator
format(see below& elems, FormatContext& ctx) const;
```

9 The type of *elems* is:
(9.1) — If *(formattable<const Ts, charT> && ...)* is true, *const pair-or-tuple<Ts...>&*.
(9.2) — Otherwise *pair-or-tuple<Ts...>&*.

10 *Effects:* Writes the following into *ctx.out()*, adjusted according to the *tuple-format-spec*:
(10.1) — *opening-bracket*,
(10.2) — for each index *I* in the *[0, sizeof... (Ts)]*:
(10.2.1) — if *I != 0*, *separator*,
(10.2.2) — the result of writing *get<I>(elems)* via *get<I>(underlying)*, and
(10.3) — *closing-bracket*.

11 *Returns:* An iterator past the end of the output range.

22.14.10 Class format_error**[format.error]**

```
namespace std {
    class format_error : public runtime_error {
public:
    explicit format_error(const string& what_arg);
    explicit format_error(const char* what_arg);
};
```

1 The class **format_error** defines the type of objects thrown as exceptions to report errors from the formatting library.

```
format_error(const string& what_arg);
Postconditions: strcmp(what(), what_arg.c_str()) == 0.
```

```
format_error(const char* what_arg);
Postconditions: strcmp(what(), what_arg) == 0.
```

22.15 Bit manipulation**[bit]****22.15.1 General****[bit.general]**

1 The header **<bit>** provides components to access, manipulate and process both individual bits and bit sequences.

22.15.2 Header <bit> synopsis**[bit.syn]**

```
// all freestanding
namespace std {
    // 22.15.3, bit_cast
```

```

template<class To, class From>
constexpr To bit_cast(const From& from) noexcept;

// 22.15.4, byteswap
template<class T>
constexpr T byteswap(T value) noexcept;

// 22.15.5, integral powers of 2
template<class T>
constexpr bool has_single_bit(T x) noexcept;
template<class T>
constexpr T bit_ceil(T x);
template<class T>
constexpr T bit_floor(T x) noexcept;
template<class T>
constexpr int bit_width(T x) noexcept;

// 22.15.6, rotating
template<class T>
[[nodiscard]] constexpr T rotl(T x, int s) noexcept;
template<class T>
[[nodiscard]] constexpr T rotr(T x, int s) noexcept;

// 22.15.7, counting
template<class T>
constexpr int countl_zero(T x) noexcept;
template<class T>
constexpr int countl_one(T x) noexcept;
template<class T>
constexpr int countr_zero(T x) noexcept;
template<class T>
constexpr int countr_one(T x) noexcept;
template<class T>
constexpr int popcount(T x) noexcept;

// 22.15.8, endian
enum class endian {
    little = see below,
    big     = see below,
    native  = see below
};
}

```

22.15.3 Function template `bit_cast`

[bit.cast]

```
template<class To, class From>
constexpr To bit_cast(const From& from) noexcept;
```

1 *Constraints:*

- (1.1) — `sizeof(To) == sizeof(From)` is true;
- (1.2) — `is_trivially_copyable_v<To>` is true; and
- (1.3) — `is_trivially_copyable_v<From>` is true.

2 *Returns:* An object of type `To`. Implicitly creates objects nested within the result (6.7.2). Each bit of the value representation of the result is equal to the corresponding bit in the object representation of `from`. Padding bits of the result are unspecified. For the result and each object created within it, if there is no value of the object's type corresponding to the value representation produced, the behavior is undefined. If there are multiple such values, which value is produced is unspecified. A bit in the value representation of the result is indeterminate if it does not correspond to a bit in the value representation of `from` or corresponds to a bit of an object that is not within its lifetime or has an indeterminate value (6.7.4). For each bit in the value representation of the result that is indeterminate, the smallest object containing that bit has an indeterminate value; the behavior is undefined unless

that object is of unsigned ordinary character type or `std::byte` type. The result does not otherwise contain any indeterminate values.

3 *Remarks:* This function is `constexpr` if and only if `To`, `From`, and the types of all subobjects of `To` and `From` are types `T` such that:

- (3.1) — `is_union_v<T>` is `false`;
- (3.2) — `is_pointer_v<T>` is `false`;
- (3.3) — `is_member_pointer_v<T>` is `false`;
- (3.4) — `is_VOLATILE_v<T>` is `false`; and
- (3.5) — `T` has no non-static data members of reference type.

22.15.4 byteswap

[bit.byteswap]

```
template<class T>
constexpr T byteswap(T value) noexcept;
```

1 *Constraints:* `T` models `integral`.

2 *Mandates:* `T` does not have padding bits (6.8.1).

3 Let the sequence R comprise the bytes of the object representation of `value` in reverse order.

4 *Returns:* An object `v` of type `T` such that each byte in the object representation of `v` is equal to the byte in the corresponding position in R .

22.15.5 Integral powers of 2

[bit.pow.two]

```
template<class T>
constexpr bool has_single_bit(T x) noexcept;
```

1 *Constraints:* `T` is an unsigned integer type (6.8.2).

2 *Returns:* `true` if `x` is an integral power of two; `false` otherwise.

```
template<class T>
constexpr T bit_ceil(T x);
```

3 Let N be the smallest power of 2 greater than or equal to `x`.

4 *Constraints:* `T` is an unsigned integer type (6.8.2).

5 *Preconditions:* N is representable as a value of type `T`.

6 *Returns:* N .

7 *Throws:* Nothing.

8 *Remarks:* A function call expression that violates the precondition in the *Preconditions:* element is not a core constant expression (7.7).

```
template<class T>
constexpr T bit_floor(T x) noexcept;
```

9 *Constraints:* `T` is an unsigned integer type (6.8.2).

10 *Returns:* If `x == 0, 0`; otherwise the maximal value `y` such that `has_single_bit(y)` is `true` and `y <= x`.

```
template<class T>
constexpr int bit_width(T x) noexcept;
```

11 *Constraints:* `T` is an unsigned integer type (6.8.2).

12 *Returns:* If `x == 0, 0`; otherwise one plus the base-2 logarithm of `x`, with any fractional part discarded.

22.15.6 Rotating

[bit.rotate]

¹ In the following descriptions, let `N` denote `numeric_limits<T>::digits`.

```
template<class T>
[[nodiscard]] constexpr T rotl(T x, int s) noexcept;
```

2 *Constraints:* T is an unsigned integer type (6.8.2).

3 Let r be s % N.

4 *Returns:* If r is 0, x; if r is positive, (x << r) | (x >> (N - r)); if r is negative, rotl(x, -r).

```
template<class T>
[[nodiscard]] constexpr T rotr(T x, int s) noexcept;
```

5 *Constraints:* T is an unsigned integer type (6.8.2).

6 Let r be s % N.

7 *Returns:* If r is 0, x; if r is positive, (x >> r) | (x << (N - r)); if r is negative, rotr(x, -r).

22.15.7 Counting

[bit.count]

- ¹ In the following descriptions, let N denote numeric_limits<T>::digits.

```
template<class T>
constexpr int countl_zero(T x) noexcept;
```

2 *Constraints:* T is an unsigned integer type (6.8.2).

3 *Returns:* The number of consecutive 0 bits in the value of x, starting from the most significant bit.

NOTE 1: Returns N if x == 0.

```
template<class T>
constexpr int countl_one(T x) noexcept;
```

4 *Constraints:* T is an unsigned integer type (6.8.2).

5 *Returns:* The number of consecutive 1 bits in the value of x, starting from the most significant bit.

NOTE 2: Returns N if x == numeric_limits<T>::max().

```
template<class T>
constexpr int countr_zero(T x) noexcept;
```

6 *Constraints:* T is an unsigned integer type (6.8.2).

7 *Returns:* The number of consecutive 0 bits in the value of x, starting from the least significant bit.

NOTE 3: Returns N if x == 0.

```
template<class T>
constexpr int countr_one(T x) noexcept;
```

8 *Constraints:* T is an unsigned integer type (6.8.2).

9 *Returns:* The number of consecutive 1 bits in the value of x, starting from the least significant bit.

NOTE 4: Returns N if x == numeric_limits<T>::max().

```
template<class T>
constexpr int popcount(T x) noexcept;
```

10 *Constraints:* T is an unsigned integer type (6.8.2).

11 *Returns:* The number of 1 bits in the value of x.

22.15.8 Endian

[bit.endian]

- ¹ Two common methods of byte ordering in multibyte scalar types are big-endian and little-endian in the execution environment. Big-endian is a format for storage of binary data in which the most significant byte is placed first, with the rest in descending order. Little-endian is a format for storage of binary data in which the least significant byte is placed first, with the rest in ascending order. This subclause describes the endianness of the scalar types of the execution environment.

```
enum class endian {
    little = see below,
    big    = see below,
    native = see below
```

{};

- 2 If all scalar types have size 1 byte, then all of `endian::little`, `endian::big`, and `endian::native` have the same value. Otherwise, `endian::little` is not equal to `endian::big`. If all scalar types are big-endian, `endian::native` is equal to `endian::big`. If all scalar types are little-endian, `endian::native` is equal to `endian::little`. Otherwise, `endian::native` is not equal to either `endian::big` or `endian::little`.

23 Strings library

[strings]

23.1 General

[strings.general]

- ¹ This Clause describes components for manipulating sequences of any non-array trivial standard-layout (6.8.1) type. Such types are called *char-like types*, and objects of char-like types are called *char-like objects* or simply *characters*.
- ² The following subclauses describe a character traits class, string classes, and null-terminated sequence utilities, as summarized in [Table 78](#).

Table 78: Strings library summary [tab:strings.summary]

Subclause	Header
23.2 Character traits	<string>
23.3 String view classes	<string_view>
23.4 String classes	<string>
23.5 Null-terminated sequence utilities	<cctype>, <cstdlib>, <cstring>, <cuchar>, <cwchar>, <cwctype>

23.2 Character traits

[char.traits]

23.2.1 General

[char.traits.general]

- ¹ Subclause [23.2](#) defines requirements on classes representing *character traits*, and defines a class template `char_traits<charT>`, along with five specializations, `char_traits<char>`, `char_traits<char8_t>`, `char_traits<char16_t>`, `char_traits<char32_t>`, and `char_traits<wchar_t>`, that meet those requirements.
- ² Most classes specified in [23.4](#), [23.3](#), and [Clause 31](#) need a set of related types and functions to complete the definition of their semantics. These types and functions are provided as a set of member *typedef-names* and functions in the template parameter `traits` used by each such template. Subclause [23.2](#) defines the semantics of these members.
- ³ To specialize those templates to generate a string, string view, or iostream class to handle a particular character container type (3.10) `C`, that and its related character traits class `X` are passed as a pair of parameters to the string, string view, or iostream template as parameters `charT` and `traits`. If `X::char_type` is not the same type as `C`, the program is ill-formed.

23.2.2 Character traits requirements

[char.traits.require]

- ¹ In [Table 79](#), `X` denotes a traits class defining types and functions for the character container type `C`; `c` and `d` denote values of type `C`; `p` and `q` denote values of type `const C*`; `s` denotes a value of type `C*`; `n`, `i` and `j` denote values of type `size_t`; `e` and `f` denote values of type `X::int_type`; `pos` denotes a value of type `X::pos_type`; and `r` denotes an lvalue of type `C`. No expression which is part of the character traits requirements specified in this subclause [23.2.2](#) shall exit via an exception.

Table 79: Character traits requirements [tab:char.traits.req]

Expression	Return type	Assertion/note pre-/post-condition	Complexity
<code>X::char_type</code>	<code>C</code>		compile-time
<code>X::int_type</code>		(described in 23.2.3)	compile-time
<code>X::off_type</code>		(described in 31.2.3 and 31.3)	compile-time
<code>X::pos_type</code>		(described in 31.2.3 and 31.3)	compile-time
<code>X::state_type</code>		(described in 23.2.3)	compile-time
<code>X::eq(c,d)</code>	<code>bool</code>	Returns: whether <code>c</code> is to be treated as equal to <code>d</code> .	constant

Table 79: Character traits requirements (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
X::lt(c,d)	bool	Returns: whether c is to be treated as less than d.	constant
X::compare(p,q,n)	int	Returns: 0 if for each i in [0,n), X::eq(p[i],q[i]) is true; else, a negative value if, for some j in [0,n), X::lt(p[j],q[j]) is true and for each i in [0,j) X::eq(p[i],q[i]) is true; else a positive value.	linear
X::length(p)	size_t	Returns: the smallest i such that X::eq(p[i],charT()) is true.	linear
X::find(p,n,c)	const X::char_type*	Returns: the smallest q in [p,p+n) such that X::eq(*q,c) is true, nullptr otherwise.	linear
X::move(s,p,n)	X::char_type*	for each i in [0,n), performs X::assign(s[i],p[i]). Copies correctly even where the ranges [p,p+n) and [s,s+n) overlap. Returns: s.	linear
X::copy(s,p,n)	X::char_type*	Preconditions: The ranges [p,p+n) and [s,s+n) do not overlap. Returns: s. for each i in [0,n), performs X::assign(s[i],p[i]).	linear
X::assign(r,d)	(not used)	assigns r=d.	constant
X::assign(s,n,c)	X::char_type*	for each i in [0,n), performs X::assign(s[i],c). Returns: s.	linear
X::not_eof(e)	int_type	Returns: e if X::eq_int_type(e,X::eof()) is false, otherwise a value f such that X::eq_int_type(f,X::eof()) is false.	constant
X::to_char_type(e)	X::char_type	Returns: if for some c, X::eq_int_type(e,X::to_int_type(c)) is true, c; else some unspecified value.	constant
X::to_int_type(c)	X::int_type	Returns: some value e, constrained by the definitions of to_char_type and eq_int_type.	constant

Table 79: Character traits requirements (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
X::eq_int_type(e,f)	bool	Returns: for all c and d, X::eq(c,d) is equal to X::eq_int_type(X::to_int_type(c), X::to_int_type(d)); otherwise, yields true if e and f are both copies of X::eof(); otherwise, yields false if one of e and f is a copy of X::eof() and the other is not; otherwise the value is unspecified.	constant
X::eof()	X::int_type	Returns: a value e such that X::eq_int_type(e,X::to_int_type(c)) is false for all values c.	constant

2 The class template

```
template<class charT> struct char_traits;
```

is provided in the header <string> as a basis for explicit specializations.

23.2.3 Traits typedefs

[char.traits.typedefs]

```
using int_type = see below;
```

- ¹ *Preconditions:* int_type shall be able to represent all of the valid characters converted from the corresponding char_type values, as well as an end-of-file value, eof().²⁰⁶

```
using state_type = see below;
```

- ² *Preconditions:* state_type meets the Cpp17Destructible (Table 35), Cpp17CopyAssignable (Table 34), Cpp17CopyConstructible (Table 32), and Cpp17DefaultConstructible (Table 30) requirements.

23.2.4 char_traits specializations

[char.traits.specializations]

23.2.4.1 General

[char.traits.specializations.general]

```
namespace std {
    template<> struct char_traits<char>;
    template<> struct char_traits<char8_t>;
    template<> struct char_traits<char16_t>;
    template<> struct char_traits<char32_t>;
    template<> struct char_traits<wchar_t>;
}
```

- ¹ The header <string> defines five specializations of the class template char_traits: char_traits<char>, char_traits<char8_t>, char_traits<char16_t>, char_traits<char32_t>, and char_traits<wchar_t>.

23.2.4.2 struct char_traits<char>

[char.traits.specializations.char]

```
namespace std {
    template<> struct char_traits<char> {
        using char_type = char;
        using int_type = int;
        using off_type = streamoff;
        using pos_type = streampos;
        using state_type = mbstate_t;
        using comparison_category = strong_ordering;

        static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
        static constexpr bool lt(char_type c1, char_type c2) noexcept;
    };
}
```

²⁰⁶ If eof() can be held in char_type then some iostreams operations can give surprising results.

```

    static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
    static constexpr size_t length(const char_type* s);
    static constexpr const char_type* find(const char_type* s, size_t n,
                                         const char_type& a);
    static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* assign(char_type* s, size_t n, char_type a);

    static constexpr int_type not_eof(int_type c) noexcept;
    static constexpr char_type to_char_type(int_type c) noexcept;
    static constexpr int_type to_int_type(char_type c) noexcept;
    static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
    static constexpr int_type eof() noexcept;
};

}

```

- ¹ The type `mbstate_t` is defined in `<cwchar>` and can represent any of the conversion states that can occur in an implementation-defined set of supported multibyte character encoding rules.
- ² The two-argument member `assign` is defined identically to the built-in operator `=`. The two-argument members `eq` and `lt` are defined identically to the built-in operators `==` and `<` for type `unsigned char`.
- ³ The member `eof()` returns EOF.

23.2.4.3 struct `char_traits<char8_t>`

[`char.traits.specializations.char8.t`]

```

namespace std {
    template<> struct char_traits<char8_t> {
        using char_type = char8_t;
        using int_type = unsigned int;
        using off_type = streamoff;
        using pos_type = u8streampos;
        using state_type = mbstate_t;
        using comparison_category = strong_ordering;

        static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
        static constexpr bool lt(char_type c1, char_type c2) noexcept;

        static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
        static constexpr size_t length(const char_type* s);
        static constexpr const char_type* find(const char_type* s, size_t n,
                                             const char_type& a);
        static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* assign(char_type* s, size_t n, char_type a);
        static constexpr int_type not_eof(int_type c) noexcept;
        static constexpr char_type to_char_type(int_type c) noexcept;
        static constexpr int_type to_int_type(char_type c) noexcept;
        static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
        static constexpr int_type eof() noexcept;
    };
}

```

- ¹ The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<` respectively.
- ² The member `eof()` returns an implementation-defined constant that cannot appear as a valid UTF-8 code unit.

23.2.4.4 struct `char_traits<char16_t>`

[`char.traits.specializations.char16.t`]

```

namespace std {
    template<> struct char_traits<char16_t> {
        using char_type = char16_t;
        using int_type = uint_least16_t;
        using off_type = streamoff;
        using pos_type = u16streampos;
    };
}

```

```

using state_type = mbstate_t;
using comparison_category = strong_ordering;

static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
static constexpr bool eq(char_type c1, char_type c2) noexcept;
static constexpr bool lt(char_type c1, char_type c2) noexcept;

static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
static constexpr size_t length(const char_type* s);
static constexpr const char_type* find(const char_type* s, size_t n,
                                      const char_type& a);
static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
static constexpr char_type* assign(char_type* s, size_t n, char_type a);

static constexpr int_type not_eof(int_type c) noexcept;
static constexpr char_type to_char_type(int_type c) noexcept;
static constexpr int_type to_int_type(char_type c) noexcept;
static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
static constexpr int_type eof() noexcept;
};

}

```

- ¹ The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<`, respectively.
- ² The member `eof()` returns an implementation-defined constant that cannot appear as a valid UTF-16 code unit.

23.2.4.5 struct `char_traits<char32_t>`

[`char.traits.specializations.char32.t`]

```

namespace std {
    template<> struct char_traits<char32_t> {
        using char_type = char32_t;
        using int_type = uint_least32_t;
        using off_type = streamoff;
        using pos_type = u32streampos;
        using state_type = mbstate_t;
        using comparison_category = strong_ordering;

        static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
        static constexpr bool lt(char_type c1, char_type c2) noexcept;

        static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
        static constexpr size_t length(const char_type* s);
        static constexpr const char_type* find(const char_type* s, size_t n,
                                              const char_type& a);
        static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* assign(char_type* s, size_t n, char_type a);

        static constexpr int_type not_eof(int_type c) noexcept;
        static constexpr char_type to_char_type(int_type c) noexcept;
        static constexpr int_type to_int_type(char_type c) noexcept;
        static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
        static constexpr int_type eof() noexcept;
    };
}

```

- ¹ The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<`, respectively.
- ² The member `eof()` returns an implementation-defined constant that cannot appear as a Unicode code point.

```
23.2.4.6 struct char_traits<wchar_t> [char.traits.specializations.wchar.t]
namespace std {
    template<> struct char_traits<wchar_t> {
        using char_type = wchar_t;
        using int_type = wint_t;
        using off_type = streamoff;
        using pos_type = wstreampos;
        using state_type = mbstate_t;
        using comparison_category = strong_ordering;

        static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
        static constexpr bool lt(char_type c1, char_type c2) noexcept;

        static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
        static constexpr size_t length(const char_type* s);
        static constexpr const char_type* find(const char_type* s, size_t n,
                                              const char_type& a);
        static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* assign(char_type* s, size_t n, char_type a);

        static constexpr int_type not_eof(int_type c) noexcept;
        static constexpr char_type to_char_type(int_type c) noexcept;
        static constexpr int_type to_int_type(char_type c) noexcept;
        static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
        static constexpr int_type eof() noexcept;
    };
}
```

- ¹ The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<`, respectively.
- ² The member `eof()` returns `WEOF`.

23.3 String view classes

[string.view]

23.3.1 General

[string.view.general]

- ¹ The class template `basic_string_view` describes an object that can refer to a constant contiguous sequence of char-like (23.1) objects with the first element of the sequence at position zero. In the rest of 23.3, the type of the char-like objects held in a `basic_string_view` object is designated by `charT`.
- ² NOTE: The library provides implicit conversions from `const charT*` and `std::basic_string<charT, ...>` to `std::basic_string_view<charT, ...>` so that user code can accept just `std::basic_string_view<charT>` as a non-templated parameter wherever a sequence of characters is expected. User-defined types can define their own implicit conversions to `std::basic_string_view<charT>` in order to interoperate with these functions.

23.3.2 Header <string_view> synopsis

[string.view.synop]

```
#include <compare> // see 17.11.1

namespace std {
    // 23.3.3, class template basic_string_view
    template<class charT, class traits = char_traits<charT>>
    class basic_string_view;

    template<class charT, class traits>
    constexpr bool ranges::enable_view<basic_string_view<charT, traits>> = true;
    template<class charT, class traits>
    constexpr bool ranges::enable_borrowed_range<basic_string_view<charT, traits>> = true;

    // 23.3.4, non-member comparison functions
    template<class charT, class traits>
    constexpr bool operator==(basic_string_view<charT, traits> x,
                             basic_string_view<charT, traits> y) noexcept;
```

```

template<class charT, class traits>
constexpr see below operator<=>(basic_string_view<charT, traits> x,
                                    basic_string_view<charT, traits> y) noexcept;

// see 23.3.4, sufficient additional overloads of comparison functions

// 23.3.5, inserters and extractors
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os,
            basic_string_view<charT, traits> str);

// basic_string_view typedef-names
using string_view      = basic_string_view<char>;
using u8string_view   = basic_string_view<char8_t>;
using u16string_view = basic_string_view<char16_t>;
using u32string_view = basic_string_view<char32_t>;
using wstring_view    = basic_string_view<wchar_t>;

// 23.3.6, hash support
template<class T> struct hash;
template<> struct hash<string_view>;
template<> struct hash<u8string_view>;
template<> struct hash<u16string_view>;
template<> struct hash<u32string_view>;
template<> struct hash<wstring_view>;

inline namespace literals {
  inline namespace string_view_literals {
    // 23.3.7, suffix for basic_string_view literals
    constexpr string_view operator""sv(const char* str, size_t len) noexcept;
    constexpr u8string_view operator""sv(const char8_t* str, size_t len) noexcept;
    constexpr u16string_view operator""sv(const char16_t* str, size_t len) noexcept;
    constexpr u32string_view operator""sv(const char32_t* str, size_t len) noexcept;
    constexpr wstring_view operator""sv(const wchar_t* str, size_t len) noexcept;
  }
}
}
}

```

¹ The function templates defined in 22.2.2 and 25.7 are available when <string_view> is included.

23.3.3 Class template basic_string_view

[string.view.template]

23.3.3.1 General

[string.view.template.general]

```

namespace std {
  template<class charT, class traits = char_traits<charT>>
  class basic_string_view {
  public:
    // types
    using traits_type          = traits;
    using value_type           = charT;
    using pointer              = value_type*;
    using const_pointer        = const value_type*;
    using reference            = value_type&;
    using const_reference      = const value_type&;
    using const_iterator        = implementation-defined; // see 23.3.3.4
    using iterator              = const_iterator;207
    using const_reverse_iterator = reverse_iterator<const_iterator>;
    using reverse_iterator      = const_reverse_iterator;
    using size_type             = size_t;
    using difference_type       = ptrdiff_t;
    static constexpr size_type npos = size_type(-1);
}

```

²⁰⁷ Because basic_string_view refers to a constant sequence, iterator and const_iterator are the same type.

```

// 23.3.3.2, construction and assignment

};

// 23.3.3.3, deduction guides
template<class It, class End>
basic_string_view(It, End) -> basic_string_view<iter_value_t<It>>;
template<class R>
basic_string_view(R&&) -> basic_string_view<ranges::range_value_t<R>>;
}

```

¹ In every specialization `basic_string_view<charT, traits>`, the type `traits` shall meet the character traits requirements (23.2).

NOTE: The program is ill-formed if `traits::char_type` is not the same type as `charT`.

² For a `basic_string_view str`, any operation that invalidates a pointer in the range

`[str.data(), str.data() + str.size()]`

invalidates pointers, iterators, and references returned from `str`'s member functions.

³ The complexity of `basic_string_view` member functions is $\mathcal{O}(1)$ unless otherwise specified.

⁴ `basic_string_view<charT, traits>` is a trivially copyable type (6.8.1).

23.3.3.2 Construction and assignment

[string.view.cons]

`constexpr basic_string_view() noexcept;`

¹ *Postconditions:* `size_ == 0` and `data_ == nullptr`.

`constexpr basic_string_view(const charT* str);`

² *Preconditions:* `[str, str + traits::length(str)]` is a valid range.

³ *Effects:* Constructs a `basic_string_view`, initializing `data_` with `str` and initializing `size_` with `traits::length(str)`.

4 *Complexity:* $\mathcal{O}(\text{traits}::\text{length}(\text{str}))$.

5 `constexpr basic_string_view(const charT* str, size_type len);`

6 *Preconditions:* $[\text{str}, \text{str} + \text{len}]$ is a valid range.

6 *Effects:* Constructs a `basic_string_view`, initializing `data_` with `str` and initializing `size_` with `len`.

7 `template<class It, class End>`
 `constexpr basic_string_view(It begin, End end);`

7 *Constraints:*

(7.1) — `It` satisfies `contiguous_iterator`.

(7.2) — `End` satisfies `sized_sentinel_for<It>`.

(7.3) — `is_same_v<iter_value_t<It>, charT>` is true.

(7.4) — `is_convertible_v<End, size_type>` is false.

8 *Preconditions:*

(8.1) — $[\text{begin}, \text{end}]$ is a valid range.

(8.2) — `It` models `contiguous_iterator`.

(8.3) — `End` models `sized_sentinel_for<It>`.

9 *Effects:* Initializes `data_` with `to_address(begin)` and initializes `size_` with `end - begin`.

10 *Throws:* When and what `end - begin` throws.

11 `template<class R>`
 `constexpr explicit basic_string_view(R&& r);`

11 Let `d` be an lvalue of type `remove_cvref_t<R>`.

12 *Constraints:*

(12.1) — `remove_cvref_t<R>` is not the same type as `basic_string_view`,

(12.2) — `R` models `ranges::contiguous_range` and `ranges::sized_range`,

(12.3) — `is_same_v<ranges::range_value_t<R>, charT>` is true,

(12.4) — `is_convertible_v<R, const charT*>` is false, and

(12.5) — `d.operator ::std::basic_string_view<charT, traits>()` is not a valid expression.

13 *Effects:* Initializes `data_` with `ranges::data(r)` and `size_` with `ranges::size(r)`.

14 *Throws:* Any exception thrown by `ranges::data(r)` and `ranges::size(r)`.

23.3.3.3 Deduction guides

[string.view.deduct]

`template<class It, class End>`
 `basic_string_view(It, End) -> basic_string_view<iter_value_t<It>>;`

1 *Constraints:*

- (1.1) — `It` satisfies `contiguous_iterator`.
- (1.2) — `End` satisfies `sized_sentinel_for<It>`.

`template<class R>`
 `basic_string_view(R&&) -> basic_string_view<ranges::range_value_t<R>>;`

2 *Constraints:* `R` satisfies `ranges::contiguous_range`.

23.3.3.4 Iterator support

[string.view.iterators]

`using const_iterator = implementation-defined;`

1 A type that meets the requirements of a constant `Cpp17RandomAccessIterator` (25.3.5.7), models `contiguous_iterator` (25.3.4.14), and meets the `constexpr` iterator requirements (25.3.1), whose `value_type` is the template parameter `charT`.

2 All requirements on container iterators (24.2) apply to `basic_string_view::const_iterator` as well.

```

constexpr const_iterator begin() const noexcept;
constexpr const_iterator cbegin() const noexcept;

3   Returns: An iterator such that
(3.1) — if !empty(), addressof(*begin()) == data_,
(3.2) — otherwise, an unspecified value such that [begin(), end()) is a valid range.

constexpr const_iterator end() const noexcept;
constexpr const_iterator cend() const noexcept;

4   Returns: begin() + size().

constexpr const_reverse_iterator rbegin() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept;

5   Returns: const_reverse_iterator(end()).

constexpr const_reverse_iterator rend() const noexcept;
constexpr const_reverse_iterator crend() const noexcept;

6   Returns: const_reverse_iterator(begin());

```

23.3.3.5 Capacity

[string.view.capacity]

```

constexpr size_type size() const noexcept;
constexpr size_type length() const noexcept;

```

1 Returns: size_.

```
constexpr size_type max_size() const noexcept;
```

2 Returns: The largest possible number of char-like objects that can be referred to by a `basic_string_view`.

```
[[nodiscard]] constexpr bool empty() const noexcept;
```

3 Returns: size_ == 0.

23.3.3.6 Element access

[string.view.access]

```
constexpr const_reference operator[](size_type pos) const;
```

1 Preconditions: pos < size().

2 Returns: data_[pos].

3 Throws: Nothing.

4 NOTE 1: Unlike `basic_string::operator[]`, `basic_string_view::operator[](size())` has undefined behavior instead of returning `charT()`.

```
constexpr const_reference at(size_type pos) const;
```

5 Returns: data_[pos].

6 Throws: `out_of_range` if pos >= size().

```
constexpr const_reference front() const;
```

7 Preconditions: !empty().

8 Returns: data_[0].

9 Throws: Nothing.

```
constexpr const_reference back() const;
```

10 Preconditions: !empty().

11 Returns: data_[size() - 1].

12 Throws: Nothing.

```
constexpr const_pointer data() const noexcept;
13   Returns: data_.

14 NOTE 2: Unlike basic_string::data() and string-literals, data() can return a pointer to a buffer that is not null-terminated. Therefore it is typically a mistake to pass data() to a function that takes just a const charT* and expects a null-terminated string.
```

23.3.3.7 Modifiers

[string.view.modifiers]

```
constexpr void remove_prefix(size_type n);
1   Preconditions: n <= size().
2   Effects: Equivalent to: data_ += n; size_ -= n;

constexpr void remove_suffix(size_type n);
3   Preconditions: n <= size().
4   Effects: Equivalent to: size_ -= n;

constexpr void swap(basic_string_view& s) noexcept;
5   Effects: Exchanges the values of *this and s.
```

23.3.3.8 String operations

[string.view.ops]

```
constexpr size_type copy(charT* s, size_type n, size_type pos = 0) const;
1   Let rlen be the smaller of n and size() - pos.
2   Preconditions: [s, s + rlen) is a valid range.
3   Effects: Equivalent to traits::copy(s, data() + pos, rlen).
4   Returns: rlen.
5   Throws: out_of_range if pos > size().
6   Complexity:  $\mathcal{O}(rlen)$ .

constexpr basic_string_view substr(size_type pos = 0, size_type n = npos) const;
7   Let rlen be the smaller of n and size() - pos.
8   Effects: Determines rlen, the effective length of the string to reference.
9   Returns: basic_string_view(data() + pos, rlen).
10  Throws: out_of_range if pos > size().
```

```
constexpr int compare(basic_string_view str) const noexcept;
11  Let rlen be the smaller of size() and str.size().
12  Effects: Determines rlen, the effective length of the strings to compare. The function then compares the two strings by calling traits::compare(data(), str.data(), rlen).
13  Returns: The nonzero result if the result of the comparison is nonzero. Otherwise, returns a value as indicated in Table 80.
```

Table 80: `compare()` results [tab:string.view.compare]

Condition	Return Value
<code>size() < str.size()</code>	<code>< 0</code>
<code>size() == str.size()</code>	<code>0</code>
<code>size() > str.size()</code>	<code>> 0</code>

14 Complexity: $\mathcal{O}(rlen)$.

```
constexpr int compare(size_type pos1, size_type n1, basic_string_view str) const;
15   Effects: Equivalent to: return substr(pos1, n1).compare(str);
```

```

constexpr int compare(size_type pos1, size_type n1, basic_string_view str,
                     size_type pos2, size_type n2) const;
16   Effects: Equivalent to: return substr(pos1, n1).compare(str.substr(pos2, n2));

constexpr int compare(const charT* s) const;
17   Effects: Equivalent to: return compare(basic_string_view(s));

constexpr int compare(size_type pos1, size_type n1, const charT* s) const;
18   Effects: Equivalent to: return substr(pos1, n1).compare(basic_string_view(s));

constexpr int compare(size_type pos1, size_type n1, const charT* s, size_type n2) const;
19   Effects: Equivalent to: return substr(pos1, n1).compare(basic_string_view(s, n2));

constexpr bool starts_with(basic_string_view x) const noexcept;
20   Effects: Equivalent to: return substr(0, x.size()) == x;

constexpr bool starts_with(charT x) const noexcept;
21   Effects: Equivalent to: return !empty() && traits::eq(front(), x);

constexpr bool starts_with(const charT* x) const;
22   Effects: Equivalent to: return starts_with(basic_string_view(x));

constexpr bool ends_with(basic_string_view x) const noexcept;
23   Effects: Equivalent to:
        return size() >= x.size() && compare(size() - x.size(), npos, x) == 0;

constexpr bool ends_with(charT x) const noexcept;
24   Effects: Equivalent to: return !empty() && traits::eq(back(), x);

constexpr bool ends_with(const charT* x) const;
25   Effects: Equivalent to: return ends_with(basic_string_view(x));

constexpr bool contains(basic_string_view x) const noexcept;
constexpr bool contains(charT x) const noexcept;
constexpr bool contains(const charT* x) const;
26   Effects: Equivalent to: return find(x) != npos;

```

23.3.3.9 Searching

[string.view.find]

- 1 Member functions in this subclause have complexity $\mathcal{O}(\text{size()} * \text{str.size()})$ at worst, although implementations should do better.
- 2 Let F be one of `find`, `rfind`, `find_first_of`, `find_last_of`, `find_first_not_of`, and `find_last_not_of`.
 - (2.1) — Each member function of the form

```
constexpr return-type F(const charT* s, size_type pos) const;
```

 has effects equivalent to: `return F(basic_string_view(s), pos);`
 - (2.2) — Each member function of the form

```
constexpr return-type F(const charT* s, size_type pos, size_type n) const;
```

 has effects equivalent to: `return F(basic_string_view(s, n), pos);`
 - (2.3) — Each member function of the form

```
constexpr return-type F(charT c, size_type pos) const noexcept;
```

 has effects equivalent to: `return F(basic_string_view(addressof(c), 1), pos);`
- 3 Let $xpos$ be the lowest position, if possible, such that the following conditions hold:
 - (3.1) — $\text{pos} \leq \text{xpos}$

(3.2) — $xpos + str.size() \leq size()$
 (3.3) — $traits::eq(at(xpos + I), str.at(I))$ for all elements I of the string referenced by str .

4 *Effects:* Determines $xpos$.
 5 *Returns:* $xpos$ if the function can determine such a value for $xpos$. Otherwise, returns $npos$.

```
constexpr size_type rfind(basic_string_view str, size_type pos = npos) const noexcept;
```

6 Let $xpos$ be the highest position, if possible, such that the following conditions hold:

(6.1) — $xpos \leq pos$
 (6.2) — $xpos + str.size() \leq size()$
 (6.3) — $traits::eq(at(xpos + I), str.at(I))$ for all elements I of the string referenced by str .

7 *Effects:* Determines $xpos$.
 8 *Returns:* $xpos$ if the function can determine such a value for $xpos$. Otherwise, returns $npos$.

```
constexpr size_type find_first_of(basic_string_view str, size_type pos = 0) const noexcept;
```

9 Let $xpos$ be the lowest position, if possible, such that the following conditions hold:

(9.1) — $pos \leq xpos$
 (9.2) — $xpos < size()$
 (9.3) — $traits::eq(at(xpos), str.at(I))$ for some element I of the string referenced by str .

10 *Effects:* Determines $xpos$.
 11 *Returns:* $xpos$ if the function can determine such a value for $xpos$. Otherwise, returns $npos$.

```
constexpr size_type find_last_of(basic_string_view str, size_type pos = npos) const noexcept;
```

12 Let $xpos$ be the highest position, if possible, such that the following conditions hold:

(12.1) — $xpos \leq pos$
 (12.2) — $xpos < size()$
 (12.3) — $traits::eq(at(xpos), str.at(I))$ for some element I of the string referenced by str .

13 *Effects:* Determines $xpos$.
 14 *Returns:* $xpos$ if the function can determine such a value for $xpos$. Otherwise, returns $npos$.

```
constexpr size_type find_first_not_of(basic_string_view str, size_type pos = 0) const noexcept;
```

15 Let $xpos$ be the lowest position, if possible, such that the following conditions hold:

(15.1) — $pos \leq xpos$
 (15.2) — $xpos < size()$
 (15.3) — $traits::eq(at(xpos), str.at(I))$ for no element I of the string referenced by str .

16 *Effects:* Determines $xpos$.
 17 *Returns:* $xpos$ if the function can determine such a value for $xpos$. Otherwise, returns $npos$.

```
constexpr size_type find_last_not_of(basic_string_view str, size_type pos = npos) const noexcept;
```

18 Let $xpos$ be the highest position, if possible, such that the following conditions hold:

(18.1) — $xpos \leq pos$
 (18.2) — $xpos < size()$
 (18.3) — $traits::eq(at(xpos), str.at(I))$ for no element I of the string referenced by str .

19 *Effects:* Determines $xpos$.
 20 *Returns:* $xpos$ if the function can determine such a value for $xpos$. Otherwise, returns $npos$.

23.3.4 Non-member comparison functions**[string.view.comparison]**

¹ Let S be `basic_string_view<charT, traits>, and sv be an instance of S . Implementations shall provide sufficient additional overloads marked constexpr and noexcept so that an object t with an implicit conversion`

to S can be compared according to [Table 81](#).

Table 81: Additional `basic_string_view` comparison overloads [tab:string.view.comparison.overloads]

Expression	Equivalent to
$t == sv$	$S(t) == sv$
$sv == t$	$sv == S(t)$
$t != sv$	$S(t) != sv$
$sv != t$	$sv != S(t)$
$t < sv$	$S(t) < sv$
$sv < t$	$sv < S(t)$
$t > sv$	$S(t) > sv$
$sv > t$	$sv > S(t)$
$t \leq sv$	$S(t) \leq sv$
$sv \leq t$	$sv \leq S(t)$
$t \geq sv$	$S(t) \geq sv$
$sv \geq t$	$sv \geq S(t)$
$t \lessgtr sv$	$S(t) \lessgtr sv$
$sv \lessgtr t$	$sv \lessgtr S(t)$

EXAMPLE: A sample conforming implementation for `operator==` would be:

```
template<class charT, class traits>
constexpr bool operator==(basic_string_view<charT, traits> lhs,
                           basic_string_view<charT, traits> rhs) noexcept {
    return lhs.compare(rhs) == 0;
}

template<class charT, class traits>
constexpr bool operator==(basic_string_view<charT, traits> lhs,
                           type_identity_t<basic_string_view<charT, traits>> rhs) noexcept {
    return lhs.compare(rhs) == 0;
}

template<class charT, class traits>
constexpr bool operator==(basic_string_view<charT, traits> lhs,
                           basic_string_view<charT, traits> rhs) noexcept;
```

2 >Returns: `lhs.compare(rhs) == 0.`

```
template<class charT, class traits>
constexpr see below operator<=(basic_string_view<charT, traits> lhs,
                           basic_string_view<charT, traits> rhs) noexcept;
```

3 Let R denote the type `traits::comparison_category` if that *qualified-id* is valid and denotes a type ([13.10.3](#)), otherwise R is `weak_ordering`.

4 Mandates: R denotes a comparison category type ([17.11.2](#)).

5 >Returns: `static_cast<R>(lhs.compare(rhs)) <= 0.`

23.3.5 Inserters and extractors

[`string.view.io`]

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, basic_string_view<charT, traits> str);
```

1 Effects: Behaves as a formatted output function ([31.7.6.3.1](#)) of `os`. Forms a character sequence `seq`, initially consisting of the elements defined by the range `[str.begin(), str.end()]`. Determines padding for `seq` as described in [31.7.6.3.1](#). Then inserts `seq` as if by calling `os.rdbuf()->sputn(seq, n)`, where `n` is the larger of `os.width()` and `str.size()`; then calls `os.width(0)`.

2 >Returns: `os`

23.3.6 Hash support

[`string.view.hash`]

```
template<> struct hash<string_view>;
```

```
template<> struct hash<u8string_view>;
template<> struct hash<u16string_view>;
template<> struct hash<u32string_view>;
template<> struct hash<wstring_view>;
```

- ¹ The specialization is enabled (22.10.19).

NOTE: The hash value of a string view object is equal to the hash value of the corresponding string object (23.4.6).

23.3.7 Suffix for `basic_string_view` literals

[`string.view.literals`]

```
constexpr string_view operator""sv(const char* str, size_t len) noexcept;
1   Returns: string_view{str, len}.
constexpr u8string_view operator""sv(const char8_t* str, size_t len) noexcept;
2   Returns: u8string_view{str, len}.
constexpr u16string_view operator""sv(const char16_t* str, size_t len) noexcept;
3   Returns: u16string_view{str, len}.
constexpr u32string_view operator""sv(const char32_t* str, size_t len) noexcept;
4   Returns: u32string_view{str, len}.
constexpr wstring_view operator""sv(const wchar_t* str, size_t len) noexcept;
5   Returns: wstring_view{str, len}.
```

23.4 String classes

[`string.classes`]

23.4.1 General

[`string.classes.general`]

- ¹ The header `<string>` defines the `basic_string` class template for manipulating varying-length sequences of char-like objects and five *typedef-names*, `string`, `u8string`, `u16string`, `u32string`, and `wstring`, that name the specializations `basic_string<char>`, `basic_string<char8_t>`, `basic_string<char16_t>`, `basic_string<char32_t>`, and `basic_string<wchar_t>`, respectively.

23.4.2 Header `<string>` synopsis

[`string.syn`]

```
#include <compare>           // see 17.11.1
#include <initializer_list>    // see 17.10.2

namespace std {
  // 23.2, character traits
  template<class charT> struct char_traits;
  template<> struct char_traits<char>;
  template<> struct char_traits<char8_t>;
  template<> struct char_traits<char16_t>;
  template<> struct char_traits<char32_t>;
  template<> struct char_traits<wchar_t>;

  // 23.4.3, basic_string
  template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
  class basic_string;

  template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
  operator+(const basic_string<charT, traits, Allocator>& lhs,
             const basic_string<charT, traits, Allocator>& rhs);
  template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>

23.4.3 Class template `basic_string`

[`basic.string`]

23.4.3.1 General

[`basic.string.general`]

- 1 The class template `basic_string` describes objects that can store a sequence consisting of a varying number of arbitrary char-like objects with the first element of the sequence at position zero. Such a sequence is also called a “string” if the type of the char-like objects that it holds is clear from context. In the rest of 23.4.3, the type of the char-like objects held in a `basic_string` object is designated by `charT`.
- 2 A specialization of `basic_string` is a contiguous container (24.2.2.2).
- 3 In all cases, `[data(), data() + size()]` is a valid range, `data() + size()` points at an object with value `charT()` (a “null terminator”), and `size() <= capacity()` is true.

```

namespace std {
    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_string {
        public:
            // types
            using traits_type          = traits;
            using value_type           = charT;
            using allocator_type       = Allocator;

```

⁴ A `size_type` parameter type in a `basic_string` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

⁵ The types `iterator` and `const_iterator` meet the `constexpr` iterator requirements (25.3.1).

23.4.3.2 General requirements

[string.require]

- If any operation would cause `size()` to exceed `max_size()`, that operation throws an exception object of type `length_error`.
- If any member function or operator of `basic_string` throws an exception, that function or operator has no other effect on the `basic_string` object.
- In every specialization `basic_string<charT, traits, Allocator>`, the type `allocator_traits<Allocator>::value_type` shall name the same type as `charT`. Every object of type `basic_string<charT,`

`traits, Allocator>` uses an object of type `Allocator` to allocate and free storage for the contained `charT` objects as needed. The `Allocator` object used is obtained as described in [24.2.2.1](#). In every specialization `basic_string<charT, traits, Allocator>`, the type `traits` shall meet the character traits requirements ([23.2](#)).

NOTE 1: Every specialization `basic_string<charT, traits, Allocator>` is an allocator-aware container, but does not use the allocator's `construct` and `destroy` member functions ([24.2.2.1](#)).

NOTE 2: The program is ill-formed if `traits::char_type` is not the same type as `charT`.

- 4 References, pointers, and iterators referring to the elements of a `basic_string` sequence may be invalidated by the following uses of that `basic_string` object:

- (4.1) — Passing as an argument to any standard library function taking a reference to non-const `basic_string` as an argument.²⁰⁸
- (4.2) — Calling non-const member functions, except `operator[]`, `at`, `data`, `front`, `back`, `begin`, `rbegin`, `end`, and `rend`.

23.4.3.3 Constructors and assignment operators

[`string.cons`]

```
constexpr explicit basic_string(const Allocator& a) noexcept;
```

- 1 *Postconditions*: `size()` is equal to 0.

```
constexpr basic_string(const basic_string& str);
constexpr basic_string(basic_string&& str) noexcept;
```

- 2 *Effects*: Constructs an object whose value is that of `str` prior to this call.

- 3 *Remarks*: In the second form, `str` is left in a valid but unspecified state.

```
constexpr basic_string(const basic_string& str, size_type pos,
                      const Allocator& a = Allocator());
constexpr basic_string(const basic_string& str, size_type pos, size_type n,
                      const Allocator& a = Allocator());
constexpr basic_string(basic_string&& str, size_type pos,
                      const Allocator& a = Allocator());
constexpr basic_string(basic_string&& str, size_type pos, size_type n,
                      const Allocator& a = Allocator());
```

- 4 Let

- (4.1) — `s` be the value of `str` prior to this call and

- (4.2) — `rpos` be `pos + min(n, s.size() - pos)` for the overloads with parameter `n`, and `s.size()` otherwise.

- 5 *Effects*: Constructs an object whose initial value is the range `[s.data() + pos, s.data() + rpos]`.

- 6 *Throws*: `out_of_range` if `pos > s.size()`.

- 7 *Remarks*: For the overloads with a `basic_string&&` parameter, `str` is left in a valid but unspecified state.

- 8 *Recommended practice*: For the overloads with a `basic_string&&` parameter, implementations should avoid allocation if `s.get_allocator() == a` is true.

```
template<class T>
constexpr basic_string(const T& t, size_type pos, size_type n, const Allocator& a = Allocator());
```

- 9 *Constraints*: `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true.

- 10 *Effects*: Creates a variable, `sv`, as if by `basic_string_view<charT, traits> sv = t`; and then behaves the same as:

```
    basic_string(sv.substr(pos, n), a);
```

```
template<class T>
constexpr explicit basic_string(const T& t, const Allocator& a = Allocator());
```

- 11 *Constraints*:

²⁰⁸) For example, as an argument to non-member functions `swap()` ([23.4.4.3](#)), `operator>>()` ([23.4.4.4](#)), and `getline()` ([23.4.4.4](#)), or as an argument to `basic_string::swap()`.

(11.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and
 (11.2) — `is_convertible_v<const T&, const charT*>` is false.

12 *Effects:* Creates a variable, `sv`, as if by `basic_string_view<charT, traits> sv = t;` and then behaves the same as `basic_string(sv.data(), sv.size(), a)`.

```
constexpr basic_string(const charT* s, size_type n, const Allocator& a = Allocator());
```

13 *Preconditions:* `[s, s + n]` is a valid range.

14 *Effects:* Constructs an object whose initial value is the range `[s, s + n]`.

15 *Postconditions:* `size()` is equal to `n`, and `traits::compare(data(), s, n)` is equal to 0.

```
constexpr basic_string(const charT* s, const Allocator& a = Allocator());
```

16 *Constraints:* `Allocator` is a type that qualifies as an allocator ([24.2.2.1](#)).

NOTE 1: This affects class template argument deduction.

17 *Effects:* Equivalent to: `basic_string(s, traits::length(s), a)`.

```
constexpr basic_string(size_type n, charT c, const Allocator& a = Allocator());
```

18 *Constraints:* `Allocator` is a type that qualifies as an allocator ([24.2.2.1](#)).

NOTE 2: This affects class template argument deduction.

19 *Effects:* Constructs an object whose value consists of `n` copies of `c`.

```
template<class InputIterator>
constexpr basic_string(InputIterator begin, InputIterator end, const Allocator& a = Allocator());
```

20 *Constraints:* `InputIterator` is a type that qualifies as an input iterator ([24.2.2.1](#)).

21 *Effects:* Constructs a string from the values in the range `[begin, end)`, as specified in [24.2.4](#).

```
template<container-compatible-range<charT> R>
constexpr basic_string(from_range_t, R&& rg, const Allocator& = Allocator());
```

22 *Effects:* Constructs a string from the values in the range `rg`, as specified in [24.2.4](#).

```
constexpr basic_string(initializer_list<charT> il, const Allocator& a = Allocator());
```

23 *Effects:* Equivalent to `basic_string(il.begin(), il.end(), a)`.

```
constexpr basic_string(const basic_string& str, const Allocator& alloc);
constexpr basic_string(basic_string&& str, const Allocator& alloc);
```

24 *Effects:* Constructs an object whose value is that of `str` prior to this call. The stored allocator is constructed from `alloc`. In the second form, `str` is left in a valid but unspecified state.

25 *Throws:* The second form throws nothing if `alloc == str.get_allocator()`.

```
template<class InputIterator,
        class Allocator = allocator<typename iterator_traits<InputIterator>::value_type>>
basic_string(InputIterator, InputIterator, Allocator = Allocator())
-> basic_string<typename iterator_traits<InputIterator>::value_type,
                char_traits<typename iterator_traits<InputIterator>::value_type>,
                Allocator>;
```

26 *Constraints:* `InputIterator` is a type that qualifies as an input iterator, and `Allocator` is a type that qualifies as an allocator ([24.2.2.1](#)).

```
template<class charT,
        class traits,
        class Allocator = allocator<charT>>
explicit basic_string(basic_string_view<charT, traits>, const Allocator& = Allocator())
-> basic_string<charT, traits, Allocator>;
```

```
template<class charT,
        class traits,
        class Allocator = allocator<charT>>
basic_string(basic_string_view<charT, traits>,
```

```

        typename see below::size_type, typename see below::size_type,
        const Allocator& = Allocator())
-> basic_string<charT, traits, Allocator>;
27   Constraints: Allocator is a type that qualifies as an allocator (24.2.2.1).

  constexpr basic_string& operator=(const basic_string& str);
28   Effects: If *this and str are the same object, has no effect. Otherwise, replaces the value of *this
    with a copy of str.

29   Returns: *this.

  constexpr basic_string& operator=(basic_string&& str)
    noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
              allocator_traits<Allocator>::is_always_equal::value);
30   Effects: Move assigns as a sequence container (24.2), except that iterators, pointers and references may
    be invalidated.

31   Returns: *this.

  template<class T>
  constexpr basic_string& operator=(const T& t);
32   Constraints:
(32.1)   — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(32.2)   — is_convertible_v<const T&, const charT*> is false.

33   Effects: Equivalent to:
    basic_string_view<charT, traits> sv = t;
    return assign(sv);

  constexpr basic_string& operator=(const charT* s);
34   Effects: Equivalent to: return *this = basic_string_view<charT, traits>(s);

  constexpr basic_string& operator=(charT c);
35   Effects: Equivalent to:
    return *this = basic_string_view<charT, traits>(addressof(c), 1);

  constexpr basic_string& operator=(initializer_list<charT> il);
36   Effects: Equivalent to:
    return *this = basic_string_view<charT, traits>(il.begin(), il.size());

```

23.4.3.4 Iterator support

[string.iterators]

```

constexpr iterator      begin() noexcept;
constexpr const_iterator begin() const noexcept;
constexpr const_iterator cbegin() const noexcept;

```

1 *Returns:* An iterator referring to the first character in the string.

```

constexpr iterator      end() noexcept;
constexpr const_iterator end() const noexcept;
constexpr const_iterator cend() const noexcept;

```

2 *Returns:* An iterator which is the past-the-end value.

```

constexpr reverse_iterator      rbegin() noexcept;
constexpr const_reverse_iterator rbegin() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept;

```

3 *Returns:* An iterator which is semantically equivalent to reverse_iterator(end()).

```

constexpr reverse_iterator      rend() noexcept;
constexpr const_reverse_iterator rend() const noexcept;

```

```
constexpr const_reverse_iterator crend() const noexcept;
```

4 *Returns:* An iterator which is semantically equivalent to `reverse_iterator(begin())`.

23.4.3.5 Capacity

[`string.capacity`]

```
constexpr size_type size() const noexcept;
constexpr size_type length() const noexcept;
```

1 *Returns:* A count of the number of char-like objects currently in the string.

2 *Complexity:* Constant time.

```
constexpr size_type max_size() const noexcept;
```

3 *Returns:* The largest possible number of char-like objects that can be stored in a `basic_string`.

4 *Complexity:* Constant time.

```
constexpr void resize(size_type n, charT c);
```

5 *Effects:* Alters the value of `*this` as follows:

(5.1) — If $n \leq \text{size}()$, erases the last $\text{size}() - n$ elements.

(5.2) — If $n > \text{size}()$, appends $n - \text{size}()$ copies of `c`.

```
constexpr void resize(size_type n);
```

6 *Effects:* Equivalent to `resize(n, charT())`.

```
template<class Operation> constexpr void resize_and_overwrite(size_type n, Operation op);
```

7 Let

(7.1) — $o = \text{size}()$ before the call to `resize_and_overwrite`.

(7.2) — k be $\min(o, n)$.

(7.3) — p be a value of type `charT*` or `charT* const`, such that the range $[p, p + n]$ is valid and $\text{this}->\text{compare}(0, k, p, k) == 0$ is true before the call. The values in the range $[p + k, p + n]$ may be indeterminate (6.7.4).

(7.4) — m be a value of type `size_type` or `const size_type` equal to n .

(7.5) — OP be the expression `std::move(op)(p, m)`.

(7.6) — $r = OP$.

8 *Mandates:* OP has an integer-like type (25.3.4.4).

9 *Preconditions:*

(9.1) — OP does not throw an exception or modify p or m .

(9.2) — $r \geq 0$.

(9.3) — $r \leq m$.

(9.4) — After evaluating OP there are no indeterminate values in the range $[p, p + r]$.

10 *Effects:* Evaluates OP , replaces the contents of `*this` with $[p, p + r]$, and invalidates all pointers and references to the range $[p, p + n]$.

11 *Recommended practice:* Implementations should avoid unnecessary copies and allocations by, for example, making p a pointer into internal storage and by restoring $*(p + r)$ to `charT()` after evaluating OP .

```
constexpr size_type capacity() const noexcept;
```

12 *Returns:* The size of the allocated storage in the string.

13 *Complexity:* Constant time.

```
constexpr void reserve(size_type res_arg);
```

14 *Effects:* A directive that informs a `basic_string` of a planned change in size, so that the storage allocation can be managed accordingly. After `reserve()`, `capacity()` is greater or equal to the argument of `reserve` if reallocation happens; and equal to the previous value of `capacity()` otherwise.

Reallocation happens at this point if and only if the current capacity is less than the argument of `reserve()`.

15 *Throws:* `length_error` if `res_arg > max_size()` or any exceptions thrown by `allocator_traits<Allocator>::allocate`.

```
constexpr void shrink_to_fit();
```

16 *Effects:* `shrink_to_fit` is a non-binding request to reduce `capacity()` to `size()`.

NOTE 1: The request is non-binding to allow latitude for implementation-specific optimizations.

It does not increase `capacity()`, but may reduce `capacity()` by causing reallocation.

17 *Complexity:* If the size is not equal to the old capacity, linear in the size of the sequence; otherwise constant.

18 *Remarks:* Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator.

NOTE 2: If no reallocation happens, they remain valid.

```
constexpr void clear() noexcept;
```

19 *Effects:* Equivalent to: `erase(begin(), end())`.

```
[[nodiscard]] constexpr bool empty() const noexcept;
```

20 *Effects:* Equivalent to: `return size() == 0`;

23.4.3.6 Element access

[string.access]

```
constexpr const_reference operator[](size_type pos) const;
constexpr reference operator[](size_type pos);
```

1 *Preconditions:* `pos <= size()`.

2 *Returns:* `*(begin() + pos)` if `pos < size()`. Otherwise, returns a reference to an object of type `charT` with value `charT()`, where modifying the object to any value other than `charT()` leads to undefined behavior.

3 *Throws:* Nothing.

4 *Complexity:* Constant time.

```
constexpr const_reference at(size_type pos) const;
constexpr reference at(size_type pos);
```

5 *Returns:* `operator[](pos)`.

6 *Throws:* `out_of_range` if `pos >= size()`.

```
constexpr const charT& front() const;
constexpr charT& front();
```

7 *Preconditions:* `!empty()`.

8 *Effects:* Equivalent to: `return operator[](0)`;

```
constexpr const charT& back() const;
constexpr charT& back();
```

9 *Preconditions:* `!empty()`.

10 *Effects:* Equivalent to: `return operator[](size() - 1)`;

23.4.3.7 Modifiers

[string.modifiers]

23.4.3.7.1 basic_string::operator+=

[string.op.append]

```
constexpr basic_string& operator+=(const basic_string& str);
```

1 *Effects:* Equivalent to: `return append(str)`;

`template<class T>`
`constexpr basic_string& operator+=(const T& t);`

2 *Constraints:*

(2.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and
 (2.2) — `is_convertible_v<const T&, const charT*>` is false.

3 *Effects:* Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return append(sv);
```

`constexpr basic_string& operator+=(const charT* s);`

4 *Effects:* Equivalent to: `return append(s);`

`constexpr basic_string& operator+=(charT c);`

5 *Effects:* Equivalent to: `return append(size_type{1}, c);`

`constexpr basic_string& operator+=(initializer_list<charT> il);`

6 *Effects:* Equivalent to: `return append(il);`

23.4.3.7.2 basic_string::append

[string.append]

`constexpr basic_string& append(const basic_string& str);`

1 *Effects:* Equivalent to: `return append(str.data(), str.size());`

`constexpr basic_string& append(const basic_string& str, size_type pos, size_type n = npos);`

2 *Effects:* Equivalent to:

```
return append(basic_string_view<charT, traits>(str).substr(pos, n));
```

`template<class T>`

`constexpr basic_string& append(const T& t);`

3 *Constraints:*

- (3.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and
- (3.2) — `is_convertible_v<const T&, const charT*>` is false.

4 *Effects:* Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return append(sv.data(), sv.size());
```

`template<class T>`

`constexpr basic_string& append(const T& t, size_type pos, size_type n = npos);`

5 *Constraints:*

- (5.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and
- (5.2) — `is_convertible_v<const T&, const charT*>` is false.

6 *Effects:* Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return append(sv.substr(pos, n));
```

`constexpr basic_string& append(const charT* s, size_type n);`

7 *Preconditions:* `[s, s + n)` is a valid range.

8 *Effects:* Appends a copy of the range `[s, s + n)` to the string.

9 *Returns:* `*this`.

`constexpr basic_string& append(const charT* s);`

10 *Effects:* Equivalent to: `return append(s, traits::length(s));`

```

constexpr basic_string& append(size_type n, charT c);
11   Effects: Appends n copies of c to the string.
12   Returns: *this.

template<class InputIterator>
constexpr basic_string& append(InputIterator first, InputIterator last);
13   Constraints: InputIterator is a type that qualifies as an input iterator (24.2.2.1).
14   Effects: Equivalent to: return append(basic_string(first, last, get_allocator()));

template<container-compatible-range<charT> R>
constexpr basic_string& append_range(R&& rg);
15   Effects: Equivalent to: return append(basic_string(from_range, std::forward<R>(rg), get_allocator()));

constexpr basic_string& append(initializer_list<charT> il);
16   Effects: Equivalent to: return append(il.begin(), il.size());

constexpr void push_back(charT c);
17   Effects: Equivalent to append(size_type{1}, c).

23.4.3.7.3 basic_string::assign [string.assign]

constexpr basic_string& assign(const basic_string& str);
1   Effects: Equivalent to: return *this = str;

constexpr basic_string& assign(basic_string&& str)
    noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value || 
              allocator_traits<Allocator>::is_always_equal::value);
2   Effects: Equivalent to: return *this = std::move(str);

constexpr basic_string& assign(const basic_string& str, size_type pos, size_type n = npos);
3   Effects: Equivalent to:
        return assign(basic_string_view<charT, traits>(str).substr(pos, n));

template<class T>
constexpr basic_string& assign(const T& t);
4   Constraints:
(4.1)   — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(4.2)   — is_convertible_v<const T&, const charT*> is false.

5   Effects: Equivalent to:
        basic_string_view<charT, traits> sv = t;
        return assign(sv.data(), sv.size());

template<class T>
constexpr basic_string& assign(const T& t, size_type pos, size_type n = npos);
6   Constraints:
(6.1)   — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(6.2)   — is_convertible_v<const T&, const charT*> is false.

7   Effects: Equivalent to:
        basic_string_view<charT, traits> sv = t;
        return assign(sv.substr(pos, n));

constexpr basic_string& assign(const charT* s, size_type n);
8   Preconditions: [s, s + n) is a valid range.
9   Effects: Replaces the string controlled by *this with a copy of the range [s, s + n).

```

10 *Returns:* `*this`.

```
constexpr basic_string& assign(const charT* s);
```

11 *Effects:* Equivalent to: `return assign(s, traits::length(s));`

```
constexpr basic_string& assign(initializer_list<charT> il);
```

12 *Effects:* Equivalent to: `return assign(il.begin(), il.size());`

```
constexpr basic_string& assign(size_type n, charT c);
```

13 *Effects:* Equivalent to:

```
    clear();
    resize(n, c);
    return *this;
```

template<class InputIterator>
constexpr basic_string& assign(InputIterator first, InputIterator last);

14 *Constraints:* `InputIterator` is a type that qualifies as an input iterator ([24.2.2.1](#)).

15 *Effects:* Equivalent to: `return assign(basic_string(first, last, get_allocator()));`

template<container-compatible-range<charT> R>
constexpr basic_string& assign_range(R&& rg);

16 *Effects:* Equivalent to: `return assign(basic_string(from_range, std::forward<R>(rg), get_allocator()));`

23.4.3.7.4 basic_string::insert [string.insert]

```
constexpr basic_string& insert(size_type pos, const basic_string& str);
```

1 *Effects:* Equivalent to: `return insert(pos, str.data(), str.size());`

```
constexpr basic_string& insert(size_type pos1, const basic_string& str,
                               size_type pos2, size_type n =npos);
```

2 *Effects:* Equivalent to:

```
    return insert(pos1, basic_string_view<charT, traits>(str), pos2, n);
```

template<class T>
constexpr basic_string& insert(size_type pos, const T& t);

3 *Constraints:*

(3.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and

(3.2) — `is_convertible_v<const T&, const charT*>` is false.

4 *Effects:* Equivalent to:

```
    basic_string_view<charT, traits> sv = t;
    return insert(pos, sv.data(), sv.size());
```

template<class T>
constexpr basic_string& insert(size_type pos1, const T& t,
 size_type pos2, size_type n =npos);

5 *Constraints:*

(5.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and

(5.2) — `is_convertible_v<const T&, const charT*>` is false.

6 *Effects:* Equivalent to:

```
    basic_string_view<charT, traits> sv = t;
    return insert(pos1, sv.substr(pos2, n));
```

```
constexpr basic_string& insert(size_type pos, const charT* s, size_type n);
```

7 *Preconditions:* `[s, s + n)` is a valid range.

```

8   Effects: Inserts a copy of the range [s, s + n) immediately before the character at position pos if pos
9   < size(), or otherwise at the end of the string.
10  Returns: *this.
11  Throws:
12  (10.1) — out_of_range if pos > size(),
13  (10.2) — length_error if n > max_size() - size(), or
14  (10.3) — any exceptions thrown by allocator_traits<Allocator>::allocate.

    constexpr basic_string& insert(size_type pos, const charT* s);

11  Effects: Equivalent to: return insert(pos, s, traits::length(s));

    constexpr basic_string& insert(size_type pos, size_type n, charT c);

12  Effects: Inserts n copies of c before the character at position pos if pos < size(), or otherwise at the
13  end of the string.
14  Returns: *this
15  Throws:
16  (14.1) — out_of_range if pos > size(),
17  (14.2) — length_error if n > max_size() - size(), or
18  (14.3) — any exceptions thrown by allocator_traits<Allocator>::allocate.

    constexpr iterator insert(const_iterator p, charT c);

15  Preconditions: p is a valid iterator on *this.
16  Effects: Inserts a copy of c at the position p.
17  Returns: An iterator which refers to the inserted character.

    constexpr iterator insert(const_iterator p, size_type n, charT c);

18  Preconditions: p is a valid iterator on *this.
19  Effects: Inserts n copies of c at the position p.
20  Returns: An iterator which refers to the first inserted character, or p if n == 0.

template<class InputIterator>
    constexpr iterator insert(const_iterator p, InputIterator first, InputIterator last);

21  Constraints: InputIterator is a type that qualifies as an input iterator (24.2.2.1).
22  Preconditions: p is a valid iterator on *this.
23  Effects: Equivalent to insert(p - begin(), basic_string(first, last, get_allocator())).
24  Returns: An iterator which refers to the first inserted character, or p if first == last.

template<container-compatible-range<charT> R>
    constexpr iterator insert_range(const_iterator p, R&& rg);

25  Preconditions: p is a valid iterator on *this.
26  Effects: Equivalent to insert(p - begin(), basic_string(from_range, std::forward<R>(rg),
27  get_allocator())).
28  Returns: An iterator which refers to the first inserted character, or p if rg is empty.

    constexpr iterator insert(const_iterator p, initializer_list<charT> il);

28  Effects: Equivalent to: return insert(p, il.begin(), il.end());

```

23.4.3.7.5 basic_string::erase [string.erase]

```

    constexpr basic_string& erase(size_type pos = 0, size_type n = npos);

1   Effects: Determines the effective length xlen of the string to be removed as the smaller of n and size()
2   - pos. Removes the characters in the range [begin() + pos, begin() + pos + xlen].

```

2 *Returns:* `*this`.
 3 *Throws:* `out_of_range` if `pos > size()`.

`constexpr iterator erase(const_iterator p);`
 4 *Preconditions:* `p` is a valid dereferenceable iterator on `*this`.
 5 *Effects:* Removes the character referred to by `p`.
 6 *Returns:* An iterator which points to the element immediately following `p` prior to the element being erased. If no such element exists, `end()` is returned.
 7 *Throws:* Nothing.

`constexpr iterator erase(const_iterator first, const_iterator last);`
 8 *Preconditions:* `first` and `last` are valid iterators on `*this`. `[first, last)` is a valid range.
 9 *Effects:* Removes the characters in the range `[first, last)`.
 10 *Returns:* An iterator which points to the element pointed to by `last` prior to the other elements being erased. If no such element exists, `end()` is returned.
 11 *Throws:* Nothing.

`constexpr void pop_back();`
 12 *Preconditions:* `!empty()`.
 13 *Effects:* Equivalent to `erase(end() - 1)`.
 14 *Throws:* Nothing.

23.4.3.7.6 basic_string::replace [string.replace]`constexpr basic_string& replace(size_type pos1, size_type n1, const basic_string& str);`

1 *Effects:* Equivalent to: `return replace(pos1, n1, str.data(), str.size());`

`constexpr basic_string& replace(size_type pos1, size_type n1, const basic_string& str,
size_type pos2, size_type n2 = npos);`

2 *Effects:* Equivalent to:

`return replace(pos1, n1, basic_string_view<charT, traits>(str).substr(pos2, n2));``template<class T>``constexpr basic_string& replace(size_type pos1, size_type n1, const T& t);`

3 *Constraints:*

(3.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and

(3.2) — `is_convertible_v<const T&, const charT*>` is false.

4 *Effects:* Equivalent to:

`basic_string_view<charT, traits> sv = t;
return replace(pos1, n1, sv.data(), sv.size());``template<class T>``constexpr basic_string& replace(size_type pos1, size_type n1, const T& t,
size_type pos2, size_type n2 = npos);`

5 *Constraints:*

(5.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and

(5.2) — `is_convertible_v<const T&, const charT*>` is false.

6 *Effects:* Equivalent to:

`basic_string_view<charT, traits> sv = t;
return replace(pos1, n1, sv.substr(pos2, n2));``constexpr basic_string& replace(size_type pos1, size_type n1, const charT* s, size_type n2);`

7 *Preconditions:* `[s, s + n2)` is a valid range.

8 *Effects:* Determines the effective length `xlen` of the string to be removed as the smaller of `n1` and `size()` - `pos1`. If `size() - xlen >= max_size() - n2` throws `length_error`. Otherwise, the function replaces the characters in the range `[begin() + pos1, begin() + pos1 + xlen]` with a copy of the range `[s, s + n2]`.

9 *Returns:* `*this`.

10 *Throws:*

(10.1) — `out_of_range` if `pos1 > size()`,

(10.2) — `length_error` if the length of the resulting string would exceed `max_size()`, or

(10.3) — any exceptions thrown by `allocator_traits<Allocator>::allocate`.

```
constexpr basic_string& replace(size_type pos, size_type n, const charT* s);
```

11 *Effects:* Equivalent to: `return replace(pos, n, s, traits::length(s));`

```
constexpr basic_string& replace(size_type pos1, size_type n1, size_type n2, charT c);
```

12 *Effects:* Determines the effective length `xlen` of the string to be removed as the smaller of `n1` and `size()` - `pos1`. If `size() - xlen >= max_size() - n2` throws `length_error`. Otherwise, the function replaces the characters in the range `[begin() + pos1, begin() + pos1 + xlen]` with `n2` copies of `c`.

13 *Returns:* `*this`.

14 *Throws:*

(14.1) — `out_of_range` if `pos1 > size()`,

(14.2) — `length_error` if the length of the resulting string would exceed `max_size()`, or

(14.3) — any exceptions thrown by `allocator_traits<Allocator>::allocate`.

```
constexpr basic_string& replace(const_iterator i1, const_iterator i2, const basic_string& str);
```

15 *Effects:* Equivalent to: `return replace(i1, i2, basic_string_view<charT, traits>(str));`

```
template<class T>
constexpr basic_string& replace(const_iterator i1, const_iterator i2, const T& t);
```

16 *Constraints:*

(16.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and

(16.2) — `is_convertible_v<const T&, const charT*>` is false.

17 *Preconditions:* `[begin(), i1)` and `[i1, i2)` are valid ranges.

18 *Effects:* Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return replace(i1 - begin(), i2 - i1, sv.data(), sv.size());
```

```
constexpr basic_string& replace(const_iterator i1, const_iterator i2, const charT* s, size_type n);
```

19 *Effects:* Equivalent to: `return replace(i1, i2, basic_string_view<charT, traits>(s, n));`

```
constexpr basic_string& replace(const_iterator i1, const_iterator i2, const charT* s);
```

20 *Effects:* Equivalent to: `return replace(i1, i2, basic_string_view<charT, traits>(s));`

```
constexpr basic_string& replace(const_iterator i1, const_iterator i2, size_type n, charT c);
```

21 *Preconditions:* `[begin(), i1)` and `[i1, i2)` are valid ranges.

22 *Effects:* Equivalent to: `return replace(i1 - begin(), i2 - i1, n, c);`

```
template<class InputIterator>
constexpr basic_string& replace(const_iterator i1, const_iterator i2,
                               InputIterator j1, InputIterator j2);
```

23 *Constraints:* `InputIterator` is a type that qualifies as an input iterator ([24.2.2.1](#)).

24 *Effects:* Equivalent to: `return replace(i1, i2, basic_string(j1, j2, get_allocator()));`

```
template<container-compatible-range<charT> R>
constexpr basic_string& replace_with_range(const_iterator i1, const_iterator i2, R&& rg);
```

25 *Effects:* Equivalent to:
 return replace(i1, i2, basic_string(from_range, std::forward<R>(rg), get_allocator()));

 constexpr basic_string& replace(const_iterator i1, const_iterator i2, initializer_list<charT> il);

26 *Effects:* Equivalent to: return replace(i1, i2, il.begin(), il.size());

23.4.3.7.7 basic_string::copy

[string.copy]

```
constexpr size_type copy(charT* s, size_type n, size_type pos = 0) const;
```

1 *Effects:* Equivalent to: return basic_string_view<charT, traits>(*this).copy(s, n, pos);
 NOTE: This does not terminate s with a null object.

23.4.3.7.8 basic_string::swap

[string.swap]

```
constexpr void swap(basic_string& s)
noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value ||
allocator_traits<Allocator>::is_always_equal::value);
```

1 *Preconditions:* allocator_traits<Allocator>::propagate_on_container_swap::value is true or
 get_allocator() == s.get_allocator().

 2 *Postconditions:* *this contains the same sequence of characters that was in s, s contains the same
 sequence of characters that was in *this.

 3 *Throws:* Nothing.

 4 *Complexity:* Constant time.

23.4.3.8 String operations

[string.ops]

23.4.3.8.1 Accessors

[string.accessors]

```
constexpr const charT* c_str() const noexcept;
constexpr const charT* data() const noexcept;
```

1 *Returns:* A pointer p such that p + i == addressof(operator[](i)) for each i in [0, size()).
 2 *Complexity:* Constant time.

 3 *Remarks:* The program shall not modify any of the values stored in the character array; otherwise, the
 behavior is undefined.

```
constexpr charT* data() noexcept;
```

4 *Returns:* A pointer p such that p + i == addressof(operator[](i)) for each i in [0, size()).
 5 *Complexity:* Constant time.

 6 *Remarks:* The program shall not modify the value stored at p + size() to any value other than
 charT(); otherwise, the behavior is undefined.

```
constexpr operator basic_string_view<charT, traits>() const noexcept;
```

7 *Effects:* Equivalent to: return basic_string_view<charT, traits>(data(), size());

```
constexpr allocator_type get_allocator() const noexcept;
```

8 *Returns:* A copy of the Allocator object used to construct the string or, if that allocator has been
 replaced, a copy of the most recent replacement.

23.4.3.8.2 Searching

[string.find]

1 Let F be one of find, rfind, find_first_of, find_last_of, find_first_not_of, and find_last_not_of.
 (1.1) — Each member function of the form

```
constexpr size_type F(const basic_string& str, size_type pos) const noexcept;
```

has effects equivalent to: return F(basic_string_view<charT, traits>(str), pos);

(1.2) — Each member function of the form

```
constexpr size_type F(const charT* s, size_type pos) const;
has effects equivalent to: return F(basic_string_view<charT, traits>(s), pos);
```

(1.3) — Each member function of the form

```
constexpr size_type F(const charT* s, size_type pos, size_type n) const;
```

has effects equivalent to: return F(basic_string_view<charT, traits>(s, n), pos);

(1.4) — Each member function of the form

```
constexpr size_type F(charT c, size_type pos) const noexcept;
```

has effects equivalent to:

```
return F(basic_string_view<charT, traits>(addressof(c), 1), pos);
```

```
template<class T>
constexpr size_type find(const T& t, size_type pos = 0) const noexcept(see below);
template<class T>
constexpr size_type rfind(const T& t, size_type pos = npos) const noexcept(see below);
template<class T>
constexpr size_type find_first_of(const T& t, size_type pos = 0) const noexcept(see below);
template<class T>
constexpr size_type find_last_of(const T& t, size_type pos = npos) const noexcept(see below);
template<class T>
constexpr size_type find_first_not_of(const T& t, size_type pos = 0) const noexcept(see below);
template<class T>
constexpr size_type find_last_not_of(const T& t, size_type pos = npos) const noexcept(see below);
```

2 *Constraints:*

(2.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and

(2.2) — `is_convertible_v<const T&, const charT*>` is false.

3 *Effects:* Let *G* be the name of the function. Equivalent to:

```
basic_string_view<charT, traits> s = *this, sv = t;
return s.G(sv, pos);
```

4 *Remarks:* The exception specification is equivalent to `is_nothrow_convertible_v<const T&, basic_string_view<charT, traits>>`.

23.4.3.8.3 basic_string::substr

[string.substr]

```
constexpr basic_string substr(size_type pos = 0, size_type n = npos) const &;
```

1 *Effects:* Equivalent to: `return basic_string(*this, pos, n);`

```
constexpr basic_string substr(size_type pos = 0, size_type n = npos) &&;
```

2 *Effects:* Equivalent to: `return basic_string(std::move(*this)), pos, n);`

23.4.3.8.4 basic_string::compare

[string.compare]

```
template<class T>
```

```
constexpr int compare(const T& t) const noexcept(see below);
```

1 *Constraints:*

(1.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and

(1.2) — `is_convertible_v<const T&, const charT*>` is false.

2 *Effects:* Equivalent to: `return basic_string_view<charT, traits>(*this).compare(t);`

3 *Remarks:* The exception specification is equivalent to `is_nothrow_convertible_v<const T&, basic_string_view<charT, traits>>`.

```
template<class T>
```

```
constexpr int compare(size_type pos1, size_type n1, const T& t) const;
```

4 *Constraints:*

(4.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and
 (4.2) — `is_convertible_v<const T&, const charT*>` is false.

5 *Effects:* Equivalent to:

```
    return basic_string_view<charT, traits>(*this).substr(pos1, n1).compare(t);
```

template<class T>
 constexpr int compare(size_type pos1, size_type n1, const T& t,
 size_type pos2, size_type n2 = npos) const;

6 *Constraints:*

(6.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and
 (6.2) — `is_convertible_v<const T&, const charT*>` is false.

7 *Effects:* Equivalent to:

```
    basic_string_view<charT, traits> s = *this, sv = t;  

    return s.substr(pos1, n1).compare(sv.substr(pos2, n2));
```

constexpr int compare(const basic_string& str) const noexcept;

8 *Effects:* Equivalent to: `return compare(basic_string_view<charT, traits>(str));`

constexpr int compare(size_type pos1, size_type n1, const basic_string& str) const;

9 *Effects:* Equivalent to: `return compare(pos1, n1, basic_string_view<charT, traits>(str));`

constexpr int compare(size_type pos1, size_type n1, const basic_string& str,
 size_type pos2, size_type n2 = npos) const;

10 *Effects:* Equivalent to:

```
    return compare(pos1, n1, basic_string_view<charT, traits>(str), pos2, n2);
```

constexpr int compare(const charT* s) const;

11 *Effects:* Equivalent to: `return compare(basic_string_view<charT, traits>(s));`

constexpr int compare(size_type pos, size_type n1, const charT* s) const;

12 *Effects:* Equivalent to: `return compare(pos, n1, basic_string_view<charT, traits>(s));`

constexpr int compare(size_type pos, size_type n1, const charT* s, size_type n2) const;

13 *Effects:* Equivalent to: `return compare(pos, n1, basic_string_view<charT, traits>(s, n2));`

23.4.3.8.5 basic_string::starts_with [string.starts.with]

```
constexpr bool starts_with(basic_string_view<charT, traits> x) const noexcept;  

constexpr bool starts_with(charT x) const noexcept;  

constexpr bool starts_with(const charT* x) const;
```

1 *Effects:* Equivalent to:
`return basic_string_view<charT, traits>(data(), size()).starts_with(x);`

23.4.3.8.6 basic_string::ends_with [string.ends.with]

```
constexpr bool ends_with(basic_string_view<charT, traits> x) const noexcept;  

constexpr bool ends_with(charT x) const noexcept;  

constexpr bool ends_with(const charT* x) const;
```

1 *Effects:* Equivalent to:
`return basic_string_view<charT, traits>(data(), size()).ends_with(x);`

23.4.3.8.7 basic_string::contains [string.contains]

```
constexpr bool contains(basic_string_view<charT, traits> x) const noexcept;  

constexpr bool contains(charT x) const noexcept;  

constexpr bool contains(const charT* x) const;
```

1 *Effects:* Equivalent to:

```
    return basic_string_view<charT, traits>(data(), size()).contains(x);
```

23.4.4 Non-member functions

[**string.nonmembers**]

23.4.4.1 operator+

[**string.op.plus**]

```
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs,
           const basic_string<charT, traits, Allocator>& rhs);
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs, const charT* rhs);
```

1 *Effects:* Equivalent to:

```
basic_string<charT, traits, Allocator> r = lhs;
r.append(rhs);
return r;
```

```
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(basic_string<charT, traits, Allocator>&& lhs,
           const basic_string<charT, traits, Allocator>& rhs);
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(basic_string<charT, traits, Allocator>&& lhs, const charT* rhs);
```

2 *Effects:* Equivalent to:

```
lhs.append(rhs);
return std::move(lhs);
```

```
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(basic_string<charT, traits, Allocator>&& lhs,
           basic_string<charT, traits, Allocator>&& rhs);
```

3 *Effects:* Equivalent to:

```
lhs.append(rhs);
return std::move(lhs);
```

except that both `lhs` and `rhs` are left in valid but unspecified states.

NOTE: If `lhs` and `rhs` have equal allocators, the implementation can move from either.

```
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs,
           basic_string<charT, traits, Allocator>&& rhs);
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const charT* lhs, basic_string<charT, traits, Allocator>&& rhs);
```

4 *Effects:* Equivalent to:

```
rhs.insert(0, lhs);
return std::move(rhs);
```

```
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const charT* lhs, const basic_string<charT, traits, Allocator>& rhs);
```

5 *Effects:* Equivalent to:

```
basic_string<charT, traits, Allocator> r = rhs;
r.insert(0, lhs);
return r;
```

```

template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(charT lhs, const basic_string<charT, traits, Allocator>& rhs);
6   Effects: Equivalent to:
    basic_string<charT, traits, Allocator> r = rhs;
    r.insert(r.begin(), lhs);
    return r;

template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(charT lhs, basic_string<charT, traits, Allocator>&& rhs);
7   Effects: Equivalent to:
    rhs.insert(rhs.begin(), lhs);
    return std::move(rhs);

template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs, charT rhs);
8   Effects: Equivalent to:
    basic_string<charT, traits, Allocator> r = lhs;
    r.push_back(rhs);
    return r;

template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(basic_string<charT, traits, Allocator>&& lhs, charT rhs);
9   Effects: Equivalent to:
    lhs.push_back(rhs);
    return std::move(lhs);

```

23.4.4.2 Non-member comparison operator functions

[string.cmp]

```

template<class charT, class traits, class Allocator>
constexpr bool
operator==(const basic_string<charT, traits, Allocator>& lhs,
            const basic_string<charT, traits, Allocator>& rhs) noexcept;
template<class charT, class traits, class Allocator>
constexpr bool operator==(const basic_string<charT, traits, Allocator>& lhs,
                           const charT* rhs);

template<class charT, class traits, class Allocator>
constexpr see below operator<=>(const basic_string<charT, traits, Allocator>& lhs,
                                    const basic_string<charT, traits, Allocator>& rhs) noexcept;
template<class charT, class traits, class Allocator>
constexpr see below operator<=>(const basic_string<charT, traits, Allocator>& lhs,
                                    const charT* rhs);

```

1 Effects: Let *op* be the operator. Equivalent to:

```
    return basic_string_view<charT, traits>(lhs) op basic_string_view<charT, traits>(rhs);
```

23.4.4.3 swap

[string.special]

```

template<class charT, class traits, class Allocator>
constexpr void
swap(basic_string<charT, traits, Allocator>& lhs,
      basic_string<charT, traits, Allocator>& rhs)
noexcept(noexcept(lhs.swap(rhs)));

```

1 Effects: Equivalent to `lhs.swap(rhs)`.

23.4.4.4 Inserters and extractors

[string.io]

```
template<class charT, class traits, class Allocator>
basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, basic_string<charT, traits, Allocator>& str);
```

Effects: Behaves as a formatted input function (31.7.5.3.1). After constructing a **sentry** object, if the **sentry** object returns **true** when converted to a value of type **bool**, calls **str.erase()** and then extracts characters from **is** and appends them to **str** as if by calling **str.append(1, c)**. If **is.width()** is greater than zero, the maximum number **n** of characters appended is **is.width()**; otherwise **n** is **str.max_size()**. Characters are extracted and appended until any of the following occurs:

- (1.1) — **n** characters are stored;
- (1.2) — end-of-file occurs on the input sequence;
- (1.3) — **isspace(c, is.getloc())** is **true** for the next available input character **c**.

After the last character (if any) is extracted, **is.width(0)** is called and the **sentry** object is destroyed.

If the function extracts no characters, **ios_base::failbit** is set in the input function's local error state before **setstate** is called.

Returns: **is**.

```
template<class charT, class traits, class Allocator>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os,
           const basic_string<charT, traits, Allocator>& str);
```

Effects: Equivalent to: `return os << basic_string_view<charT, traits>(str);`

```
template<class charT, class traits, class Allocator>
basic_istream<charT, traits>&
getline(basic_istream<charT, traits>& is,
        basic_string<charT, traits, Allocator>& str,
        charT delim);

template<class charT, class traits, class Allocator>
basic_istream<charT, traits>&
getline(basic_istream<charT, traits>&& is,
        basic_string<charT, traits, Allocator>& str,
        charT delim);
```

Effects: Behaves as an unformatted input function (31.7.5.4), except that it does not affect the value returned by subsequent calls to **basic_istream<>::gcount()**. After constructing a **sentry** object, if the **sentry** object returns **true** when converted to a value of type **bool**, calls **str.erase()** and then extracts characters from **is** and appends them to **str** as if by calling **str.append(1, c)** until any of the following occurs:

- (6.1) — end-of-file occurs on the input sequence;
- (6.2) — **traits::eq(c, delim)** for the next available input character **c** (in which case, **c** is extracted but not appended);
- (6.3) — **str.max_size()** characters are stored (in which case, **ios_base::failbit** is set in the input function's local error state).

The conditions are tested in the order shown. In any case, after the last character is extracted, the **sentry** object is destroyed.

If the function extracts no characters, **ios_base::failbit** is set in the input function's local error state before **setstate** is called.

Returns: **is**.

```
template<class charT, class traits, class Allocator>
basic_istream<charT, traits>&
getline(basic_istream<charT, traits>& is,
        basic_string<charT, traits, Allocator>& str);
```

```
template<class charT, class traits, class Allocator>
basic_istream<charT, traits>&
getline(basic_istream<charT, traits>&& is,
        basic_string<charT, traits, Allocator>& str);
```

10 *Returns:* `getline(is, str, is.widen('\n')).`

23.4.4.5 Erasure

[**string.erasure**]

```
template<class charT, class traits, class Allocator, class U>
constexpr typename basic_string<charT, traits, Allocator>::size_type
erase(basic_string<charT, traits, Allocator>& c, const U& value);
```

1 *Effects:* Equivalent to:

```
auto it = remove(c.begin(), c.end(), value);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;
```

```
template<class charT, class traits, class Allocator, class Predicate>
constexpr typename basic_string<charT, traits, Allocator>::size_type
erase_if(basic_string<charT, traits, Allocator>& c, Predicate pred);
```

2 *Effects:* Equivalent to:

```
auto it = remove_if(c.begin(), c.end(), pred);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;
```

23.4.5 Numeric conversions

[**string.conversions**]

```
int stoi(const string& str, size_t* idx = nullptr, int base = 10);
long stol(const string& str, size_t* idx = nullptr, int base = 10);
unsigned long stoul(const string& str, size_t* idx = nullptr, int base = 10);
long long stoll(const string& str, size_t* idx = nullptr, int base = 10);
unsigned long long stoull(const string& str, size_t* idx = nullptr, int base = 10);
```

1 *Effects:* The first two functions call `strtol(str.c_str(), ptr, base)`, and the last three functions call `strtoul(str.c_str(), ptr, base)`, `strtoll(str.c_str(), ptr, base)`, and `strtoull(str.c_str(), ptr, base)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != nullptr`, the function stores in `*idx` the index of the first unconverted element of `str`.

2 *Returns:* The converted result.

3 *Throws:* `invalid_argument` if `strtol`, `strtoul`, `strtoll`, or `strtoull` reports that no conversion can be performed. Throws `out_of_range` if `strtol`, `strtoul`, `strtoll` or `strtoull` sets `errno` to `ERANGE`, or if the converted value is outside the range of representable values for the return type.

```
float stof(const string& str, size_t* idx = nullptr);
double stod(const string& str, size_t* idx = nullptr);
long double stold(const string& str, size_t* idx = nullptr);
```

4 *Effects:* These functions call `strtof(str.c_str(), ptr)`, `strtod(str.c_str(), ptr)`, and `strtold(str.c_str(), ptr)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != nullptr`, the function stores in `*idx` the index of the first unconverted element of `str`.

5 *Returns:* The converted result.

6 *Throws:* `invalid_argument` if `strtof`, `strtod`, or `strtold` reports that no conversion can be performed. Throws `out_of_range` if `strtof`, `strtod`, or `strtold` sets `errno` to `ERANGE` or if the converted value is outside the range of representable values for the return type.

```
string to_string(int val);
string to_string(unsigned val);
string to_string(long val);
string to_string(unsigned long val);
string to_string(long long val);
string to_string(unsigned long long val);
string to_string(float val);
string to_string(double val);
string to_string(long double val);
```

- 7 *Returns:* Each function returns a `string` object holding the character representation of the value of its argument that would be generated by calling `sprintf(buf, fmt, val)` with a format specifier of `"%d"`, `"%u"`, `"%ld"`, `"%lu"`, `"%lld"`, `"%llu"`, `"%f"`, `"%f"`, or `"%Lf"`, respectively, where `buf` designates an internal character buffer of sufficient size.

```
int stoi(const wstring& str, size_t* idx = nullptr, int base = 10);
long stol(const wstring& str, size_t* idx = nullptr, int base = 10);
unsigned long stoul(const wstring& str, size_t* idx = nullptr, int base = 10);
long long stoll(const wstring& str, size_t* idx = nullptr, int base = 10);
unsigned long long stoull(const wstring& str, size_t* idx = nullptr, int base = 10);
```

- 8 *Effects:* The first two functions call `wcstol(str.c_str(), ptr, base)`, and the last three functions call `wcstoul(str.c_str(), ptr, base)`, `wcstoll(str.c_str(), ptr, base)`, and `wcstoull(str.c_str(), ptr, base)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != nullptr`, the function stores in `*idx` the index of the first unconverted element of `str`.

- 9 *Returns:* The converted result.

- 10 *Throws:* `invalid_argument` if `wcstol`, `wcstoul`, `wcstoll`, or `wcstoull` reports that no conversion can be performed. Throws `out_of_range` if the converted value is outside the range of representable values for the return type.

```
float stof(const wstring& str, size_t* idx = nullptr);
double stod(const wstring& str, size_t* idx = nullptr);
long double stold(const wstring& str, size_t* idx = nullptr);
```

- 11 *Effects:* These functions call `wcstof(str.c_str(), ptr)`, `wcstd(str.c_str(), ptr)`, and `wcstold(str.c_str(), ptr)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != nullptr`, the function stores in `*idx` the index of the first unconverted element of `str`.

- 12 *Returns:* The converted result.

- 13 *Throws:* `invalid_argument` if `wcstof`, `wcstd`, or `wcstold` reports that no conversion can be performed. Throws `out_of_range` if `wcstof`, `wcstd`, or `wcstold` sets `errno` to `ERANGE`.

```
wstring to_wstring(int val);
wstring to_wstring(unsigned val);
wstring to_wstring(long val);
wstring to_wstring(unsigned long val);
wstring to_wstring(long long val);
wstring to_wstring(unsigned long long val);
wstring to_wstring(float val);
wstring to_wstring(double val);
wstring to_wstring(long double val);
```

- 14 *Returns:* Each function returns a `wstring` object holding the character representation of the value of its argument that would be generated by calling `swprintf(buf, buffsz, fmt, val)` with a format specifier of `L"%d"`, `L"%u"`, `L"%ld"`, `L"%lu"`, `L"%lld"`, `L"%llu"`, `L"%f"`, `L"%f"`, or `L"%Lf"`, respectively, where `buf` designates an internal character buffer of sufficient size `buffsz`.

23.4.6 Hash support

[`basic.string.hash`]

```
template<class A> struct hash<basic_string<char, char_traits<char>, A>>;
```

```
template<class A> struct hash<basic_string<char8_t, char_traits<char8_t>, A>>;
template<class A> struct hash<basic_string<char16_t, char_traits<char16_t>, A>>;
template<class A> struct hash<basic_string<char32_t, char_traits<char32_t>, A>>;
template<class A> struct hash<basic_string<wchar_t, char_traits<wchar_t>, A>>;
```

- ¹ If S is one of these string types, SV is the corresponding string view type, and s is an object of type S, then `hash<S>()(s) == hash<SV>()(SV(s))`.

23.4.7 Suffix for `basic_string` literals

[`basic.string.literals`]

```
constexpr string operator""s(const char* str, size_t len);
```

- ¹ Returns: `string{str, len}`.

```
constexpr u8string operator""s(const char8_t* str, size_t len);
```

- ² Returns: `u8string{str, len}`.

```
constexpr u16string operator""s(const char16_t* str, size_t len);
```

- ³ Returns: `u16string{str, len}`.

```
constexpr u32string operator""s(const char32_t* str, size_t len);
```

- ⁴ Returns: `u32string{str, len}`.

```
constexpr wstring operator""s(const wchar_t* str, size_t len);
```

- ⁵ Returns: `wstring{str, len}`.

- ⁶ NOTE: The same suffix s is used for `chrono::duration` literals denoting seconds but there is no conflict, since duration suffixes apply to numbers and string literal suffixes apply to character array literals.

23.5 Null-terminated sequence utilities

[`c.strings`]

23.5.1 Header `<cctype>` synopsis

[`cctype.syn`]

```
namespace std {
    int isalnum(int c);
    int isalpha(int c);
    int isblank(int c);
    int iscntrl(int c);
    int isdigit(int c);
    int isgraph(int c);
    int islower(int c);
    int isprint(int c);
    int ispunct(int c);
    int isspace(int c);
    int isupper(int c);
    int isxdigit(int c);
    int tolower(int c);
    int toupper(int c);
}
```

23.5.5 Header <cuchar> synopsis

[cuchar.syn]

```

namespace std {
    using mbstate_t = see below;
    using size_t = see 17.2.4;

    size_t mbrtoc8(char8_t* pc8, const char* s, size_t n, mbstate_t* ps);
    size_t c8rtomb(char* s, char8_t c8, mbstate_t* ps);
    size_t mbrtoc16(char16_t* pc16, const char* s, size_t n, mbstate_t* ps);
    size_t c16rtomb(char* s, char16_t c16, mbstate_t* ps);
    size_t mbrtoc32(char32_t* pc32, const char* s, size_t n, mbstate_t* ps);
    size_t c32rtomb(char* s, char32_t c32, mbstate_t* ps);
}

```

- ¹ The contents and meaning of the header <cuchar> are the same as the C standard library header <uchar.h>, except that it declares the additional mbrtoc8 and c8rtomb functions and does not declare types char16_t nor char32_t.

SEE ALSO: ISO C 7.28

23.5.6 Multibyte / wide string and character conversion functions

[c.mb.wcs]

- ¹ NOTE: The headers <cstdlib> (17.2.2), <cuchar> (23.5.5), and <cwchar> (23.5.4) declare the functions described in this subclause.

```

int mbsinit(const mbstate_t* ps);
int mbolen(const char* s, size_t n);
size_t mbstowcs(wchar_t* pwcs, const char* s, size_t n);
size_t wcstombs(char* s, const wchar_t* pwcs, size_t n);

```

- ² *Effects:* These functions have the semantics specified in the C standard library.

SEE ALSO: ISO C 7.22.7.1, 7.22.8, 7.29.6.2.1

```

int mbtowc(wchar_t* pwc, const char* s, size_t n);
int wctomb(char* s, wchar_t wchar);

```

- ³ *Effects:* These functions have the semantics specified in the C standard library.

- ⁴ *Remarks:* Calls to these functions may introduce a data race (16.4.6.10) with other calls to the same function.

SEE ALSO: ISO C 7.22.7

```
size_t mbrlen(const char* s, size_t n, mbstate_t* ps);
size_t mbrtowc(wchar_t* pwc, const char* s, size_t n, mbstate_t* ps);
size_t wcrtomb(char* s, wchar_t wc, mbstate_t* ps);
size_t mbsrtowcs(wchar_t* dst, const char** src, size_t len, mbstate_t* ps);
size_t wcsrtombs(char* dst, const wchar_t** src, size_t len, mbstate_t* ps);
```

5 *Effects:* These functions have the semantics specified in the C standard library.

6 *Remarks:* Calling these functions with an `mbstate_t*` argument that is a null pointer value may introduce a data race (16.4.6.10) with other calls to the same function with an `mbstate_t*` argument that is a null pointer value.

SEE ALSO: ISO C 7.29.6.3

```
size_t mbrtoc8(char8_t* pc8, const char* s, size_t n, mbstate_t* ps);
```

7 *Effects:* If `s` is a null pointer, equivalent to `mbrtoc8(nullptr, "", 1, ps)`. Otherwise, the function inspects at most `n` bytes beginning with the byte pointed to by `s` to determine the number of bytes needed to complete the next multibyte character (including any shift sequences). If the function determines that the next multibyte character is complete and valid, it determines the values of the corresponding UTF-8 code units and then, if `pc8` is not a null pointer, stores the value of the first (or only) such code unit in the object pointed to by `pc8`. Subsequent calls will store successive UTF-8 code units without consuming any additional input until all the code units have been stored. If the corresponding Unicode character is U+0000 NULL, the resulting state described is the initial conversion state.

8 *Returns:* The first of the following that applies (given the current conversion state):

- (8.1) — 0, if the next `n` or fewer bytes complete the multibyte character that corresponds to the U+0000 NULL Unicode character (which is the value stored).
- (8.2) — between 1 and `n` (inclusive), if the next `n` or fewer bytes complete a valid multibyte character (whose first (or only) code unit is stored); the value returned is the number of bytes that complete the multibyte character.
- (8.3) — (`size_t`) (-3), if the next code unit resulting from a previous call has been stored (no bytes from the input have been consumed by this call).
- (8.4) — (`size_t`) (-2), if the next `n` bytes contribute to an incomplete (but potentially valid) multibyte character, and all `n` bytes have been processed (no value is stored).
- (8.5) — (`size_t`) (-1), if an encoding error occurs, in which case the next `n` or fewer bytes do not contribute to a complete and valid multibyte character (no value is stored); the value of the macro `EILSEQ` is stored in `errno`, and the conversion state is unspecified.

```
size_t c8rtomb(char* s, char8_t c8, mbstate_t* ps);
```

9 *Effects:* If `s` is a null pointer, equivalent to `c8rtomb(buf, u8'\0', ps)` where `buf` is an internal buffer. Otherwise, if `c8` completes a sequence of valid UTF-8 code units, determines the number of bytes needed to represent the multibyte character (including any shift sequences), and stores the multibyte character representation in the array whose first element is pointed to by `s`. At most `MB_CUR_MAX` bytes are stored. If the multibyte character is a null character, a null byte is stored, preceded by any shift sequence needed to restore the initial shift state; the resulting state described is the initial conversion state.

10 *Returns:* The number of bytes stored in the array object (including any shift sequences). If `c8` does not contribute to a sequence of `char8_t` corresponding to a valid multibyte character, the value of the macro `EILSEQ` is stored in `errno`, (`size_t`) (-1) is returned, and the conversion state is unspecified.

11 *Remarks:* Calls to `c8rtomb` with a null pointer argument for `s` may introduce a data race (16.4.6.10) with other calls to `c8rtomb` with a null pointer argument for `s`.

24 Containers library [containers]

24.1 General

[containers.general]

- ¹ This Clause describes components that C++ programs may use to organize collections of information.
- ² The following subclauses describe container requirements, and components for sequence containers and associative containers, as summarized in [Table 82](#).

Table 82: Containers library summary [tab:containers.summary]

Subclause	Header
24.2 Requirements	
24.3 Sequence containers	<code><array>, <deque>, <forward_list>, <list>, <vector></code>
24.4 Associative containers	<code><map>, <set></code>
24.5 Unordered associative containers	<code><unordered_map>, <unordered_set></code>
24.6 Container adaptors	<code><queue>, <stack>, <flat_map>, <flat_set></code>
24.7 Views	<code>, <mdspan></code>

24.2 Requirements

[container.requirements]

24.2.1 Preamble

[container.requirements.pre]

- ¹ Containers are objects that store other objects. They control allocation and deallocation of these objects through constructors, destructors, insert and erase operations.
- ² All of the complexity requirements in this Clause are stated solely in terms of the number of operations on the contained objects.

EXAMPLE: The copy constructor of type `vector<vector<int>>` has linear complexity, even though the complexity of copying each contained `vector<int>` is itself linear.

- ³ Allocator-aware containers ([24.2.2.5](#)) other than `basic_string` construct elements using the function `allocator_traits<allocator_type>::rebind_traits<U>::construct` and destroy elements using the function `allocator_traits<allocator_type>::rebind_traits<U>::destroy` ([20.2.9.3](#)), where U is either `allocator_type::value_type` or an internal type used by the container. These functions are called only for the container's element type, not for internal types used by the container.

NOTE: This means, for example, that a node-based container would need to construct nodes containing aligned buffers and call `construct` to place the element into the buffer.

24.2.2 General containers

[container.gen.reqmts]

24.2.2.1 General

[container.requirements.general]

- ¹ In subclause [24.2.2](#),
 - (1.1) — X denotes a container class containing objects of type T,
 - (1.2) — a denotes a value of type X,
 - (1.3) — b and c denote values of type (possibly const) X,
 - (1.4) — i and j denote values of type (possibly const) X::iterator,
 - (1.5) — u denotes an identifier,
 - (1.6) — v denotes an lvalue of type (possibly const) X or an rvalue of type `const X`,
 - (1.7) — s and t denote non-const lvalues of type X, and
 - (1.8) — rv denotes a non-const rvalue of type X.
- ² The following exposition-only concept is used in the definition of containers:

```
template<class R, class T>
concept container-compatible-range = // exposition only
    ranges::input_range<R> && convertible_to<ranges::range_reference_t<R>, T>;
```

24.2.2.2 Containers

[container.reqmts]

- 1 A type `X` meets the *container* requirements if the following types, statements, and expressions are well-formed and have the specified semantics.

2 **typename X::value_type**

3 *Result:* `T`

3 *Preconditions:* `T` is *Cpp17Erasable* from `X` (see 24.2.2.5, below).

4 **typename X::reference**

5 *Result:* `T&`

6 **typename X::const_reference**

7 *Result:* `const T&`

8 **typename X::iterator**

9 *Result:* A type that meets the forward iterator requirements (25.3.5.5) with value type `T`. The type `X::iterator` is convertible to `X::const_iterator`.

10 **typename X::const_iterator**

11 *Result:* A type that meets the requirements of a constant iterator and those of a forward iterator with value type `T`.

12 **typename X::difference_type**

13 *Result:* A signed integer type, identical to the difference type of `X::iterator` and `X::const_iterator`.

14 **typename X::size_type**

15 *Result:* An unsigned integer type that can represent any non-negative value of `X::difference_type`.

16 `X u;`

17 `X u = X();`

18 *Postconditions:* `u.empty()`

19 *Complexity:* Constant.

20 `X u(v);`

21 `X u = v;`

22 *Preconditions:* `T` is *Cpp17CopyInsertable* into `X` (see below).

23 *Postconditions:* `u == v`.

24 *Complexity:* Linear.

25 `X u(rv);`

26 `X u = rv;`

27 *Postconditions:* `u` is equal to the value that `rv` had before this construction.

28 *Complexity:* Linear for `array` and constant for all other standard containers.

29 `t = v;`

30 *Result:* `X&`.

31 *Postconditions:* `t == v`.

32 *Complexity:* Linear.

33 `t = rv`

34 *Result:* `X&`.

35 *Effects:* All existing elements of `t` are either move assigned to or destroyed.

36 *Postconditions:* If `t` and `rv` do not refer to the same object, `t` is equal to the value that `rv` had before this assignment.

37 *Complexity:* Linear.

```

a.~X()
24   Result: void.
25   Effects: Destroys every element of a; any memory obtained is deallocated.
26   Complexity: Linear.

b.begin()
27   Result: iterator; const_iterator for constant b.
28   Returns: An iterator referring to the first element in the container.
29   Complexity: Constant.

b.end()
30   Result: iterator; const_iterator for constant b.
31   Returns: An iterator which is the past-the-end value for the container.
32   Complexity: Constant.

b.cbegin()
33   Result: const_iterator.
34   Returns: const_cast<X const&>(b).begin()
35   Complexity: Constant.

b.cend()
36   Result: const_iterator.
37   Returns: const_cast<X const&>(b).end()
38   Complexity: Constant.

i <= j
39   Result: strong_ordering.
40   Constraints: X::iterator meets the random access iterator requirements.
41   Complexity: Constant.

c == b
42   Preconditions: T meets the Cpp17EqualityComparable requirements.
43   Result: bool.
44   Returns: equal(c.begin(), c.end(), b.begin(), b.end())
        NOTE 1: The algorithm equal is defined in 27.6.13.
45   Complexity: Constant if c.size() != b.size(), linear otherwise.
46   Remarks: == is an equivalence relation.

c != b
47   Effects: Equivalent to !(c == b).

t.swap(s)
48   Result: void.
49   Effects: Exchanges the contents of t and s.
50   Complexity: Linear for array and constant for all other standard containers.

swap(t, s)
51   Effects: Equivalent to t.swap(s).

c.size()
52   Result: size_type.

```

53 *Returns:* `distance(c.begin(), c.end())`, i.e., the number of elements in the container.
 54 *Complexity:* Constant.
 55 *Remarks:* The number of elements is defined by the rules of constructors, inserts, and erases.

`c.max_size()`
 56 *Result:* `size_type`.
 57 *Returns:* `distance(begin(), end())` for the largest possible container.
 58 *Complexity:* Constant.

`c.empty()`
 59 *Result:* `bool`.
 60 *Returns:* `c.begin() == c.end()`
 61 *Complexity:* Constant.
 62 *Remarks:* If the container is empty, then `c.empty()` is `true`.

63 In the expressions

```
i == j
i != j
i < j
i <= j
i >= j
i > j
i <=> j
i - j
```

where `i` and `j` denote objects of a container's `iterator` type, either or both may be replaced by an object of the container's `const_iterator` type referring to the same element with no change in semantics.

64 Unless otherwise specified, all containers defined in this Clause obtain memory using an allocator (see [16.4.4.6](#)).

NOTE 2: In particular, containers and iterators do not store references to allocated elements other than through the allocator's pointer type, i.e., as objects of type `P` or `pointer_traits<P>::template rebind<unspecified>`, where `P` is `allocator_traits<allocator_type>::pointer`.

Copy constructors for these container types obtain an allocator by calling `allocator_traits<allocator_type>::select_on_container_copy_construction` on the allocator belonging to the container being copied. Move constructors obtain an allocator by move construction from the allocator belonging to the container being moved. Such move construction of the allocator shall not exit via an exception. All other constructors for these container types take a `const allocator_type&` argument.

NOTE 3: If an invocation of a constructor uses the default value of an optional allocator argument, then the allocator type must support value-initialization.

A copy of this allocator is used for any memory allocation and element construction performed, by these constructors and by all member functions, during the lifetime of each container object or until the allocator is replaced. The allocator may be replaced only via assignment or `swap()`. Allocator replacement is performed by copy assignment, move assignment, or swapping of the allocator only if

- (64.1) — `allocator_traits<allocator_type>::propagate_on_container_copy_assignment::value`,
- (64.2) — `allocator_traits<allocator_type>::propagate_on_container_move_assignment::value`, or
- (64.3) — `allocator_traits<allocator_type>::propagate_on_container_swap::value`

is `true` within the implementation of the corresponding container operation. In all container types defined in this Clause, the member `get_allocator()` returns a copy of the allocator used to construct the container or, if that allocator has been replaced, a copy of the most recent replacement.

65 The expression `a.swap(b)`, for containers `a` and `b` of a standard container type other than `array`, shall exchange the values of `a` and `b` without invoking any move, copy, or swap operations on the individual container elements. Any `Compare`, `Pred`, or `Hash` types belonging to `a` and `b` shall meet the `Cpp17Swappable` requirements and shall be exchanged by calling `swap` as described in [16.4.4.3](#). If `allocator_traits<allocator_type>::propagate_on_container_swap::value` is `true`, then `allocator_type` shall meet the `Cpp17Swappable` requirements and the allocators of `a` and `b` shall also be exchanged by calling `swap` as described in [16.4.4.3](#).

Otherwise, the allocators shall not be swapped, and the behavior is undefined unless `a.get_allocator() == b.get_allocator()`. Every iterator referring to an element in one container before the swap shall refer to the same element in the other container after the swap. It is unspecified whether an iterator with value `a.end()` before the swap will have value `b.end()` after the swap.

- 66 Unless otherwise specified (see 24.2.7.2, 24.2.8.2, 24.3.8.4, and 24.3.11.5) all container types defined in this Clause meet the following additional requirements:

- (66.1) — If an exception is thrown by an `insert()` or `emplace()` function while inserting a single element, that function has no effects.
- (66.2) — If an exception is thrown by a `push_back()`, `push_front()`, `emplace_back()`, or `emplace_front()` function, that function has no effects.
- (66.3) — No `erase()`, `clear()`, `pop_back()` or `pop_front()` function throws an exception.
- (66.4) — No copy constructor or assignment operator of a returned iterator throws an exception.
- (66.5) — No `swap()` function throws an exception.
- (66.6) — No `swap()` function invalidates any references, pointers, or iterators referring to the elements of the containers being swapped.

NOTE 4: The `end()` iterator does not refer to any element, so it can be invalidated.

- 67 Unless otherwise specified (either explicitly or by defining a function in terms of other functions), invoking a container member function or passing a container as an argument to a library function shall not invalidate iterators to, or change the values of, objects within that container.

- 68 A *contiguous container* is a container whose member types `iterator` and `const_iterator` meet the `Cpp17RandomAccessIterator` requirements (25.3.5.7) and model `contiguous_iterator` (25.3.4.14).

- 69 The behavior of certain container member functions and deduction guides depends on whether types qualify as input iterators or allocators. The extent to which an implementation determines that a type cannot be an input iterator is unspecified, except that as a minimum integral types shall not qualify as input iterators. Likewise, the extent to which an implementation determines that a type cannot be an allocator is unspecified, except that as a minimum a type `A` shall not qualify as an allocator unless it meets both of the following conditions:

- (69.1) — The *qualified-id* `A::value_type` is valid and denotes a type (13.10.3).
- (69.2) — The expression `declval<A&>().allocate(size_t{})` is well-formed when treated as an unevaluated operand.

24.2.2.3 Reversible container requirements

[container.rev.reqmts]

- 1 A type `X` meets the *reversible container* requirements if `X` meets the container requirements, the iterator type of `X` belongs to the bidirectional or random access iterator categories (25.3), and the following types and expressions are well-formed and have the specified semantics.

`typename X::reverse_iterator`

- 2 *Result:* The type `reverse_iterator<X::iterator>`, an iterator type whose value type is `T`.

`typename X::const_reverse_iterator`

- 3 *Result:* The type `reverse_iterator<X::const_iterator>`, a constant iterator type whose value type is `T`.

`a.rbegin()`

- 4 *Result:* `reverse_iterator; const_reverse_iterator` for constant `a`.

5 *Returns:* `reverse_iterator(end())`

6 *Complexity:* Constant.

`a.rend()`

- 7 *Result:* `reverse_iterator; const_reverse_iterator` for constant `a`.

8 *Returns:* `reverse_iterator(begin())`

9 *Complexity:* Constant.

```

a.crbegin()
10   Result: const_reverse_iterator.
11   Returns: const_cast<X const&>(a).rbegin()
12   Complexity: Constant.

a.crend()
13   Result: const_reverse_iterator.
14   Returns: const_cast<X const&>(a).rend()
15   Complexity: Constant.

```

24.2.2.4 Optional container requirements

[container.opt.reqmts]

- 1 The following operations are provided for some types of containers but not others. Those containers for which the listed operations are provided shall implement the semantics as described unless otherwise stated. If the iterators passed to `lexicographical_compare_three_way` meet the `constexpr` iterator requirements (25.3.1) then the operations described below are implemented by `constexpr` functions.

```

a <=> b
2   Result: synth-three-way-result<X::value_type>.
3   Preconditions: Either <=> is defined for values of type (possibly const) T, or < is defined for values of type (possibly const) T and < is a total ordering relationship.
4   Returns: lexicographical_compare_three_way(a.begin(), a.end(), b.begin(), b.end(),
synth-three-way)
NOTE: The algorithm lexicographical_compare_three_way is defined in Clause 27.
5   Complexity: Linear.

```

24.2.2.5 Allocator-aware containers

[container.alloc.reqmts]

- 1 All of the containers defined in Clause 24 and in 23.4.3 except `array` meet the additional requirements of an *allocator-aware container*, as described below.
- 2 Given an allocator type `A` and given a container type `X` having a `value_type` identical to `T` and an `allocator_type` identical to `allocator_traits<A>::rebind_alloc<T>` and given an lvalue `m` of type `A`, a pointer `p` of type `T*`, an expression `v` of type `T` or `const T`, and an rvalue `rv` of type `T`, the following terms are defined. If `X` is not allocator-aware or is a specialization of `basic_string`, the terms below are defined as if `A` were `allocator<T>` — no allocator object needs to be created and user specializations of `allocator<T>` are not instantiated:

- (2.1) — `T` is *Cpp17DefaultInsertable into X* means that the following expression is well-formed:
`allocator_traits<A>::construct(m, p)`
- (2.2) — An element of `X` is *default-inserted* if it is initialized by evaluation of the expression
`allocator_traits<A>::construct(m, p)`
where `p` is the address of the uninitialized storage for the element allocated within `X`.
- (2.3) — `T` is *Cpp17MoveInsertable into X* means that the following expression is well-formed:
`allocator_traits<A>::construct(m, p, rv)`
and its evaluation causes the following postcondition to hold: The value of `*p` is equivalent to the value of `rv` before the evaluation.
NOTE 1: `rv` remains a valid object. Its state is unspecified
- (2.4) — `T` is *Cpp17CopyInsertable into X* means that, in addition to `T` being *Cpp17MoveInsertable into X*, the following expression is well-formed:
`allocator_traits<A>::construct(m, p, v)`
and its evaluation causes the following postcondition to hold: The value of `v` is unchanged and is equivalent to `*p`.
- (2.5) — `T` is *Cpp17EmplaceConstructible into X from args*, for zero or more arguments `args`, means that the following expression is well-formed:

`allocator_traits<A>::construct(m, p, args)`

- (2.6) — T is *Cpp17Erasable* from X means that the following expression is well-formed:

`allocator_traits<A>::destroy(m, p)`

NOTE 2: A container calls `allocator_traits<A>::construct(m, p, args)` to construct an element at p using args, with m == `get_allocator()`. The default `construct` in `allocator` will call `::new((void*)p) T(args)`, but specialized allocators can choose a different definition.

- 3 In this subclause,

- (3.1) — X denotes an allocator-aware container class with a `value_type` of T using an allocator of type A,
- (3.2) — u denotes a variable,
- (3.3) — a and b denote non-const lvalues of type X,
- (3.4) — c denotes an lvalue of type `const X`,
- (3.5) — t denotes an lvalue or a const rvalue of type X,
- (3.6) — rv denotes a non-const rvalue of type X, and
- (3.7) — m is a value of type A.

A type X meets the allocator-aware container requirements if X meets the container requirements and the following types, statements, and expressions are well-formed and have the specified semantics.

`typename X::allocator_type`

4 *Result:* A

5 *Mandates:* `allocator_type::value_type` is the same as `X::value_type`.

`c.get_allocator()`

6 *Result:* A

7 *Complexity:* Constant.

`X u;`

`X u = X();`

8 *Preconditions:* A meets the *Cpp17DefaultConstructible* requirements.

9 *Postconditions:* u.empty() returns true, u.get_allocator() == A().

10 *Complexity:* Constant.

`X u(m);`

11 *Postconditions:* u.empty() returns true, u.get_allocator() == m.

12 *Complexity:* Constant.

`X u(t, m);`

13 *Preconditions:* T is *Cpp17CopyInsertable* into X.

14 *Postconditions:* u == t, u.get_allocator() == m

15 *Complexity:* Linear.

`X u(rv);`

16 *Postconditions:* u has the same elements as rv had before this construction; the value of u.get_allocator() is the same as the value of rv.get_allocator() before this construction.

17 *Complexity:* Constant.

`X u(rv, m);`

18 *Preconditions:* T is *Cpp17MoveInsertable* into X.

19 *Postconditions:* u has the same elements, or copies of the elements, that rv had before this construction, u.get_allocator() == m.

20 *Complexity:* Constant if m == rv.get_allocator(), otherwise linear.

```

a = t
21   Result: X&.
22   Preconditions: T is Cpp17CopyInsertable into X and Cpp17CopyAssignable.
23   Postconditions: a == t is true.
24   Complexity: Linear.

a = rv
25   Result: X&.
26   Preconditions: If allocator_traits<allocator_type>::propagate_on_container_move_assignment::value is false, T is Cpp17MoveInsertable into X and Cpp17MoveAssignable.
27   Effects: All existing elements of a are either move assigned to or destroyed.
28   Postconditions: If a and rv do not refer to the same object, a is equal to the value that rv had before this assignment.
29   Complexity: Linear.

a.swap(b)
30   Result: void
31   Effects: Exchanges the contents of a and b.
32   Complexity: Constant.

```

24.2.3 Container data races

[container.requirements.dataraces]

- For purposes of avoiding data races (16.4.6.10), implementations shall consider the following functions to be `const`: `begin`, `end`, `rbegin`, `rend`, `front`, `back`, `data`, `find`, `lower_bound`, `upper_bound`, `equal_range`, `at` and, except in associative or unordered associative containers, `operator[]`.
- Notwithstanding 16.4.6.10, implementations are required to avoid data races when the contents of the contained object in different elements in the same container, excepting `vector<bool>`, are modified concurrently.
- NOTE: For a `vector<int>` x with a size greater than one, `x[1] = 5` and `*x.begin() = 10` can be executed concurrently without a data race, but `x[0] = 5` and `*x.begin() = 10` executed concurrently can result in a data race. As an exception to the general rule, for a `vector<bool>` y, `y[0] = true` can race with `y[1] = true`.

24.2.4 Sequence containers

[sequence.reqmts]

- A sequence container organizes a finite set of objects, all of the same type, into a strictly linear arrangement. The library provides four basic kinds of sequence containers: `vector`, `forward_list`, `list`, and `deque`. In addition, `array` is provided as a sequence container which provides limited sequence operations because it has a fixed number of elements. The library also provides container adaptors that make it easy to construct abstract data types, such as `stacks`, `queues`, `flat_maps`, `flat_multimaps`, `flat_sets`, or `flat_multisets`, out of the basic sequence container kinds (or out of other program-defined sequence containers).
- NOTE 1: The sequence containers offer the programmer different complexity trade-offs. `vector` is appropriate in most circumstances. `array` has a fixed size known during translation. `list` or `forward_list` support frequent insertions and deletions from the middle of the sequence. `deque` supports efficient insertions and deletions taking place at the beginning or at the end of the sequence. When choosing a container, remember `vector` is best; leave a comment to explain if you choose from the rest!
- In this subclause,
 - (3.1) — X denotes a sequence container class,
 - (3.2) — a denotes a value of type X containing elements of type T,
 - (3.3) — u denotes the name of a variable being declared,
 - (3.4) — A denotes X::allocator_type if the qualified-id X::allocator_type is valid and denotes a type (13.10.3) and allocator<T> if it doesn't,
 - (3.5) — i and j denote iterators that meet the Cpp17InputIterator requirements and refer to elements implicitly convertible to value_type,
 - (3.6) — [i, j) denotes a valid range,

- (3.7) — `rg` denotes a value of a type `R` that models `container-compatible-range`<`T`>,
- (3.8) — `il` designates an object of type `initializer_list<value_type>`,
- (3.9) — `n` denotes a value of type `X::size_type`,
- (3.10) — `p` denotes a valid constant iterator to `a`,
- (3.11) — `q` denotes a valid dereferenceable constant iterator to `a`,
- (3.12) — `[q1, q2)` denotes a valid range of constant iterators in `a`,
- (3.13) — `t` denotes an lvalue or a const rvalue of `X::value_type`, and
- (3.14) — `rv` denotes a non-const rvalue of `X::value_type`.
- (3.15) — `Args` denotes a template parameter pack;
- (3.16) — `args` denotes a function parameter pack with the pattern `Args&&`.

⁴ The complexities of the expressions are sequence dependent.

⁵ A type `X` meets the *sequence container* requirements if `X` meets the container requirements and the following statements and expressions are well-formed and have the specified semantics.

`X u(n, t);`

6 *Preconditions:* `T` is *Cpp17CopyInsertable* into `X`.

7 *Effects:* Constructs a sequence container with `n` copies of `t`.

8 *Postconditions:* `distance(u.begin(), u.end()) == n` is true.

`X u(i, j);`

9 *Preconditions:* `T` is *Cpp17EmplaceConstructible* into `X` from `*i`. For `vector`, if the iterator does not meet the *Cpp17ForwardIterator* requirements (25.3.5.5), `T` is also *Cpp17MoveInsertable* into `X`.

10 *Effects:* Constructs a sequence container equal to the range `[i, j)`. Each iterator in the range `[i, j)` is dereferenced exactly once.

11 *Postconditions:* `distance(u.begin(), u.end()) == distance(i, j)` is true.

`X(from_range, rg)`

12 *Preconditions:* `T` is *Cpp17EmplaceConstructible* into `X` from `*ranges::begin(rg)`. For `vector`, if `R` models neither `ranges::sized_range` nor `ranges::forward_range`, `T` is also *Cpp17MoveInsertable* into `X`.

13 *Effects:* Constructs a sequence container equal to the range `rg`. Each iterator in the range `rg` is dereferenced exactly once.

14 *Postconditions:* `distance(begin(), end()) == ranges::distance(rg)` is true.

`X(il)`

15 *Effects:* Equivalent to `X(il.begin(), il.end())`.

`a = il`

16 *Result:* `X&`.

17 *Preconditions:* `T` is *Cpp17CopyInsertable* into `X` and *Cpp17CopyAssignable*.

18 *Effects:* Assigns the range `[il.begin(), il.end())` into `a`. All existing elements of `a` are either assigned to or destroyed.

19 *Returns:* `*this`.

`a.emplace(p, args)`

20 *Result:* iterator.

21 *Preconditions:* `T` is *Cpp17EmplaceConstructible* into `X` from `args`. For `vector` and `deque`, `T` is also *Cpp17MoveInsertable* into `X` and *Cpp17MoveAssignable*.

22 *Effects:* Inserts an object of type `T` constructed with `std::forward<Args>(args)...` before `p`.

NOTE 2: `args` can directly or indirectly refer to a value in `a`.

23 *Returns:* An iterator that points to the new element constructed from `args` into `a`.

24 `a.insert(p, t)`
 Result: iterator.
 Preconditions: T is *Cpp17CopyInsertable* into X. For `vector` and `deque`, T is also *Cpp17CopyAssignable*.
 Effects: Inserts a copy of `t` before `p`.
 Returns: An iterator that points to the copy of `t` inserted into `a`.

25 `a.insert(p, rv)`
 Result: iterator.
 Preconditions: T is *Cpp17MoveInsertable* into X. For `vector` and `deque`, T is also *Cpp17MoveAssignable*.
 Effects: Inserts a copy of `rv` before `p`.
 Returns: An iterator that points to the copy of `rv` inserted into `a`.

26 `a.insert(p, n, t)`
 Result: iterator.
 Preconditions: T is *Cpp17CopyInsertable* into X and *Cpp17CopyAssignable*.
 Effects: Inserts `n` copies of `t` before `p`.
 Returns: An iterator that points to the copy of the first element inserted into `a`, or `p` if `n == 0`.

27 `a.insert(p, i, j)`
 Result: iterator.
 Preconditions: T is *Cpp17EmplaceConstructible* into X from `*i`. For `vector` and `deque`, T is also *Cpp17MoveInsertable* into X, and T meets the *Cpp17MoveConstructible*, *Cpp17MoveAssignable*, and *Cpp17Swappable* (16.4.4.3) requirements. Neither `i` nor `j` are iterators into `a`.
 Effects: Inserts copies of elements in `[i, j)` before `p`. Each iterator in the range `[i, j)` shall be dereferenced exactly once.
 Returns: An iterator that points to the copy of the first element inserted into `a`, or `p` if `i == j`.

28 `a.insert_range(p, rg)`
 Result: iterator.
 Preconditions: T is *Cpp17EmplaceConstructible* into X from `*ranges::begin(rg)`. For `vector` and `deque`, T is also *Cpp17MoveInsertable* into X, and T meets the *Cpp17MoveConstructible*, *Cpp17MoveAssignable*, and *Cpp17Swappable* (16.4.4.3) requirements. `rg` and `a` do not overlap.
 Effects: Inserts copies of elements in `rg` before `p`. Each iterator in the range `rg` is dereferenced exactly once.
 Returns: An iterator that points to the copy of the first element inserted into `a`, or `p` if `rg` is empty.

29 `a.insert(p, il)`
 Effects: Equivalent to `a.insert(p, il.begin(), il.end())`.

30 `a.erase(q)`
 Result: iterator.
 Preconditions: For `vector` and `deque`, T is *Cpp17MoveAssignable*.
 Effects: Erases the element pointed to by `q`.
 Returns: An iterator that points to the element immediately following `q` prior to the element being erased. If no such element exists, `a.end()` is returned.

31 `a.erase(q1, q2)`
 Result: iterator.
 Preconditions: For `vector` and `deque`, T is *Cpp17MoveAssignable*.

51 *Effects:* Erases the elements in the range [q1, q2].
 52 *Returns:* An iterator that points to the element pointed to by q2 prior to any elements being erased. If no such element exists, `a.end()` is returned.

`a.clear()`

53 *Result:* void

54 *Effects:* Destroys all elements in a. Invalidates all references, pointers, and iterators referring to the elements of a and may invalidate the past-the-end iterator.

55 *Postconditions:* `a.empty()` is true.

56 *Complexity:* Linear.

`a.assign(i, j)`

57 *Result:* void

58 *Preconditions:* T is *Cpp17EmplaceConstructible* into X from *i and assignable from *i. For `vector`, if the iterator does not meet the forward iterator requirements (25.3.5.5), T is also *Cpp17MoveInsertable* into X. Neither i nor j are iterators into a.

59 *Effects:* Replaces elements in a with a copy of [i, j). Invalidates all references, pointers and iterators referring to the elements of a. For `vector` and `deque`, also invalidates the past-the-end iterator. Each iterator in the range [i, j) is dereferenced exactly once.

`a.assign_range(rg)`

60 *Result:* void

61 *Mandates:* `assignable_from<T&, ranges::range_reference_t<R>>` is modeled.

62 *Preconditions:* T is *Cpp17EmplaceConstructible* into X from `*ranges::begin(rg)`. For `vector`, if R models neither `ranges::sized_range` nor `ranges::forward_range`, T is also *Cpp17MoveInsertable* into X. rg and a do not overlap.

63 *Effects:* Replaces elements in a with a copy of each element in rg. Invalidates all references, pointers, and iterators referring to the elements of a. For `vector` and `deque`, also invalidates the past-the-end iterator. Each iterator in the range rg is dereferenced exactly once.

`a.assign(il)`

64 *Effects:* Equivalent to `a.assign(il.begin(), il.end())`.

`a.assign(n, t)`

65 *Result:* void

66 *Preconditions:* T is *Cpp17CopyInsertable* into X and *Cpp17CopyAssignable*. t is not a reference into a.

67 *Effects:* Replaces elements in a with n copies of t. Invalidates all references, pointers and iterators referring to the elements of a. For `vector` and `deque`, also invalidates the past-the-end iterator.

68 For every sequence container defined in this Clause and in Clause 23:

(68.1) — If the constructor

```
template<class InputIterator>
X(InputIterator first, InputIterator last,
  const allocator_type& alloc = allocator_type());
```

is called with a type `InputIterator` that does not qualify as an input iterator, then the constructor shall not participate in overload resolution.

(68.2) — If the member functions of the forms:

```
template<class InputIterator>
return-type F(const_iterator p,
             InputIterator first, InputIterator last); // such as insert

template<class InputIterator>
return-type F(InputIterator first, InputIterator last); // such as append, assign
```

```
template<class InputIterator>
return-type F(const_iterator i1, const_iterator i2,
           InputIterator first, InputIterator last);      // such as replace
```

are called with a type `InputIterator` that does not qualify as an input iterator, then these functions shall not participate in overload resolution.

- (68.3) — A deduction guide for a sequence container shall not participate in overload resolution if it has an `InputIterator` template parameter and a type that does not qualify as an input iterator is deduced for that parameter, or if it has an `Allocator` template parameter and a type that does not qualify as an allocator is deduced for that parameter.

- 69 The following operations are provided for some types of sequence containers but not others. Operations other than `prepend_range` and `append_range` are implemented so as to take amortized constant time.

`a.front()`

70 *Result:* `reference`; `const_reference` for constant `a`.

71 *Returns:* `*a.begin()`

72 *Remarks:* Required for `basic_string`, `array`, `deque`, `forward_list`, `list`, and `vector`.

`a.back()`

73 *Result:* `reference`; `const_reference` for constant `a`.

74 *Effects:* Equivalent to:

```
auto tmp = a.end();
--tmp;
return *tmp;
```

75 *Remarks:* Required for `basic_string`, `array`, `deque`, `list`, and `vector`.

`a.emplace_front(args)`

76 *Result:* `reference`

77 *Preconditions:* `T` is *Cpp17EmplaceConstructible* into `X` from `args`.

78 *Effects:* Prepends an object of type `T` constructed with `std::forward<Args>(args)`....

79 *Returns:* `a.front()`.

80 *Remarks:* Required for `deque`, `forward_list`, and `list`.

`a.emplace_back(args)`

81 *Result:* `reference`

82 *Preconditions:* `T` is *Cpp17EmplaceConstructible* into `X` from `args`. For `vector`, `T` is also *Cpp17MoveInsertable* into `X`.

83 *Effects:* Appends an object of type `T` constructed with `std::forward<Args>(args)`....

84 *Returns:* `a.back()`.

85 *Remarks:* Required for `deque`, `list`, and `vector`.

`a.push_front(t)`

86 *Result:* `void`

87 *Preconditions:* `T` is *Cpp17CopyInsertable* into `X`.

88 *Effects:* Prepends a copy of `t`.

89 *Remarks:* Required for `deque`, `forward_list`, and `list`.

`a.push_front(rv)`

90 *Result:* `void`

91 *Preconditions:* `T` is *Cpp17MoveInsertable* into `X`.

92 *Effects:* Prepends a copy of `rv`.

93 *Remarks:* Required for `deque`, `forward_list`, and `list`.

```

a.prepend_range(rg)
94   Result: void
95   Preconditions: T is Cpp17EmplaceConstructible into X from *ranges::begin(rg). For deque, T is also Cpp17MoveInsertable into X, and T meets the Cpp17MoveConstructible, Cpp17MoveAssignable, and Cpp17Swappable (16.4.4.3) requirements.
96   Effects: Inserts copies of elements in rg before begin(). Each iterator in the range rg is dereferenced exactly once.
         NOTE 3: The order of elements in rg is not reversed.
97   Remarks: Required for deque, forward_list, and list.

a.push_back(t)
98   Result: void
99   Preconditions: T is Cpp17CopyInsertable into X.
100  Effects: Appends a copy of t.
101  Remarks: Required for basic_string, deque, list, and vector.

a.push_back(rv)
102  Result: void
103  Preconditions: T is Cpp17MoveInsertable into X.
104  Effects: Appends a copy of rv.
105  Remarks: Required for basic_string, deque, list, and vector.

a.append_range(rg)
106  Result: void
107  Preconditions: T is Cpp17EmplaceConstructible into X from *ranges::begin(rg). For vector, T is also Cpp17MoveInsertable into X.
108  Effects: Inserts copies of elements in rg before end(). Each iterator in the range rg is dereferenced exactly once.
109  Remarks: Required for deque, list, and vector.

a.pop_front()
110  Result: void
111  Preconditions: a.empty() is false.
112  Effects: Destroys the first element.
113  Remarks: Required for deque, forward_list, and list.

a.pop_back()
114  Result: void
115  Preconditions: a.empty() is false.
116  Effects: Destroys the last element.
117  Remarks: Required for basic_string, deque, list, and vector.

a[n]
118  Result: reference; const_reference for constant a
119  Returns: *(a.begin() + n)
120  Remarks: Required for basic_string, array, deque, and vector.

a.at(n)
121  Result: reference; const_reference for constant a
122  Returns: *(a.begin() + n)

```

123 *Throws:* `out_of_range` if $n \geq a.size()$.
 124 *Remarks:* Required for `basic_string`, `array`, `deque`, and `vector`.

24.2.5 Node handles

[`container.node`]

24.2.5.1 Overview

[`container.node.overview`]

- ¹ A *node handle* is an object that accepts ownership of a single element from an associative container (24.2.7) or an unordered associative container (24.2.8). It may be used to transfer that ownership to another container with compatible nodes. Containers with compatible nodes have the same node handle type. Elements may be transferred in either direction between container types in the same row of Table 83.

Table 83: Container types with compatible nodes [tab:container.node.compat]

<code>map<K, T, C1, A></code>	<code>map<K, T, C2, A></code>
<code>map<K, T, C1, A></code>	<code>multimap<K, T, C2, A></code>
<code>set<K, C1, A></code>	<code>set<K, C2, A></code>
<code>set<K, C1, A></code>	<code>multiset<K, C2, A></code>
<code>unordered_map<K, T, H1, E1, A></code>	<code>unordered_map<K, T, H2, E2, A></code>
<code>unordered_map<K, T, H1, E1, A></code>	<code>unordered_multimap<K, T, H2, E2, A></code>
<code>unordered_set<K, H1, E1, A></code>	<code>unordered_set<K, H2, E2, A></code>
<code>unordered_set<K, H1, E1, A></code>	<code>unordered_multiset<K, H2, E2, A></code>

- ² If a node handle is not empty, then it contains an allocator that is equal to the allocator of the container when the element was extracted. If a node handle is empty, it contains no allocator.
- ³ Class `node-handle` is for exposition only.
- ⁴ If a user-defined specialization of `pair` exists for `pair<const Key, T>` or `pair<Key, T>`, where `Key` is the container's `key_type` and `T` is the container's `mapped_type`, the behavior of operations involving node handles is undefined.

```
template<unspecified>
class node-handle {
public:
  // These type declarations are described in 24.2.7 and 24.2.8.
  using value_type      = see below;           // not present for map containers
  using key_type        = see below;           // not present for set containers
  using mapped_type     = see below;           // not present for set containers
  using allocator_type  = see below;

private:
  using container_node_type = unspecified;       // exposition only
  using ator_traits        = allocator_traits<allocator_type>;           // exposition only

  typename ator_traits::template
    rebind_traits<container_node_type>::pointer ptr_;           // exposition only
  optional<allocator_type> alloc_;                  // exposition only

public:
  // 24.2.5.2, constructors, copy, and assignment
  constexpr node-handle() noexcept : ptr_(), alloc_() {}
  node-handle(node-handle&&) noexcept;
  node-handle& operator=(node-handle&&);

  // 24.2.5.3, destructor
  ~node-handle();

  // 24.2.5.4, observers
  value_type& value() const;                      // not present for map containers
  key_type& key() const;                          // not present for set containers
  mapped_type& mapped() const;                   // not present for set containers
```

```

allocator_type get_allocator() const;
explicit operator bool() const noexcept;
[[nodiscard]] bool empty() const noexcept;

// 24.2.5.5, modifiers
void swap(node_handle&)
    noexcept(ator_traits::propagate_on_container_swap::value ||
              ator_traits::is_always_equal::value);

friend void swap(node_handle& x, node_handle& y) noexcept(noexcept(x.swap(y))) {
    x.swap(y);
}
};

```

24.2.5.2 Constructors, copy, and assignment

[container.node.cons]

node-handle(*node-handle&& nh*) noexcept;

1 *Effects:* Constructs a *node-handle* object initializing *ptr_* with *nh.ptr_*. Move constructs *alloc_* with *nh.alloc_*. Assigns *nullptr* to *nh.ptr_* and assigns *nullopt* to *nh.alloc_*.

node-handle& operator=(*node-handle&& nh*);

2 *Preconditions:* Either *!alloc_*, or *ator_traits::propagate_on_container_move_assignment::value* is *true*, or *alloc_ == nh.alloc_*.

3 *Effects:*

- (3.1) — If *ptr_ != nullptr*, destroys the *value_type* subobject in the *container_node_type* object pointed to by *ptr_* by calling *ator_traits::destroy*, then deallocates *ptr_* by calling *ator_traits::template rebind_traits<container_node_type>::deallocate*.
- (3.2) — Assigns *nh.ptr_* to *ptr_*.
- (3.3) — If *!alloc_* or *ator_traits::propagate_on_container_move_assignment::value* is *true*, move assigns *nh.alloc_* to *alloc_*.
- (3.4) — Assigns *nullptr* to *nh.ptr_* and assigns *nullopt* to *nh.alloc_*.

4 *Returns:* **this*.

5 *Throws:* Nothing.

24.2.5.3 Destructor

[container.node.dtor]

~node-handle();

1 *Effects:* If *ptr_ != nullptr*, destroys the *value_type* subobject in the *container_node_type* object pointed to by *ptr_* by calling *ator_traits::destroy*, then deallocates *ptr_* by calling *ator_traits::template rebind_traits<container_node_type>::deallocate*.

24.2.5.4 Observers

[container.node.observers]

value_type& value() const;

1 *Preconditions:* *empty() == false*.

2 *Returns:* A reference to the *value_type* subobject in the *container_node_type* object pointed to by *ptr_*.

3 *Throws:* Nothing.

key_type& key() const;

4 *Preconditions:* *empty() == false*.

5 *Returns:* A non-const reference to the *key_type* member of the *value_type* subobject in the *container_node_type* object pointed to by *ptr_*.

6 *Throws:* Nothing.

7 *Remarks:* Modifying the key through the returned reference is permitted.

```

mapped_type& mapped() const;
8   Preconditions: empty() == false.
9   Returns: A reference to the mapped_type member of the value_type subobject in the container_
node_type object pointed to by ptr_.
10  Throws: Nothing.

allocator_type get_allocator() const;
11  Preconditions: empty() == false.
12  Returns: *alloc_.
13  Throws: Nothing.

explicit operator bool() const noexcept;
14  Returns: ptr_ != nullptr.

[[nodiscard]] bool empty() const noexcept;
15  Returns: ptr_ == nullptr.

```

24.2.5.5 Modifiers

[container.node.modifiers]

```

void swap(node_handle& nh)
    noexcept(ator_traits::propagate_on_container_swap::value ||
              ator_traits::is_always_equal::value);
1  Preconditions: !alloc_, or !nh.alloc_, or ator_traits::propagate_on_container_swap::value
is true, or alloc_ == nh.alloc_.
2  Effects: Calls swap(ptr_, nh.ptr_). If !alloc_, or !nh.alloc_, or ator_traits::propagate_on_
container_swap::value is true calls swap(alloc_, nh.alloc_).

```

24.2.6 Insert return type

[container.insert.return]

- ¹ The associative containers with unique keys and the unordered containers with unique keys have a member function `insert` that returns a nested type `insert_return_type`. That return type is a specialization of the template specified in this subclause.

```

template<class Iterator, class NodeType>
struct insert-return-type
{
    Iterator position;
    bool inserted;
    NodeType node;
};

```

- ² The name `insert-return-type` is exposition only. `insert-return-type` has the template parameters, data members, and special members specified above. It has no base classes or members other than those specified.

24.2.7 Associative containers

[associative.reqmts]

24.2.7.1 General

[associative.reqmts.general]

- ¹ Associative containers provide fast retrieval of data based on keys. The library provides four basic kinds of associative containers: `set`, `multiset`, `map` and `multimap`. The library also provides container adaptors that make it easy to construct abstract data types, such as `flat_maps`, `flat_multimaps`, `flat_sets`, or `flat_multisets`, out of the basic sequence container kinds (or out of other program-defined sequence containers).
- ² Each associative container is parameterized on `Key` and an ordering relation `Compare` that induces a strict weak ordering ([27.8](#)) on elements of `Key`. In addition, `map` and `multimap` associate an arbitrary *mapped type* `T` with the `Key`. The object of type `Compare` is called the *comparison object* of a container.
- ³ The phrase “equivalence of keys” means the equivalence relation imposed by the comparison object. That is, two keys `k1` and `k2` are considered to be equivalent if for the comparison object `comp`, `comp(k1, k2) == false && comp(k2, k1) == false`.

NOTE 1: This is not necessarily the same as the result of `k1 == k2`.

For any two keys `k1` and `k2` in the same container, calling `comp(k1, k2)` shall always return the same value.

- ⁴ An associative container supports *unique keys* if it may contain at most one element for each key. Otherwise, it supports *equivalent keys*. The `set` and `map` classes support unique keys; the `multiset` and `multimap` classes support equivalent keys. For `multiset` and `multimap`, `insert`, `emplace`, and `erase` preserve the relative ordering of equivalent elements.
- ⁵ For `set` and `multiset` the value type is the same as the key type. For `map` and `multimap` it is equal to `pair<const Key, T>`.
- ⁶ `iterator` of an associative container is of the bidirectional iterator category. For associative containers where the value type is the same as the key type, both `iterator` and `const_iterator` are constant iterators. It is unspecified whether or not `iterator` and `const_iterator` are the same type.

NOTE 2: `iterator` and `const_iterator` have identical semantics in this case, and `iterator` is convertible to `const_iterator`. Users can avoid violating the one-definition rule by always using `const_iterator` in their function parameter lists.

- ⁷ In this subclause,

- (7.1) — `X` denotes an associative container class,
- (7.2) — `a` denotes a value of type `X`,
- (7.3) — `a2` denotes a value of a type with nodes compatible with type `X` ([Table 83](#)),
- (7.4) — `b` denotes a value or type `X` or `const X`,
- (7.5) — `u` denotes the name of a variable being declared,
- (7.6) — `a_uniq` denotes a value of type `X` when `X` supports unique keys,
- (7.7) — `a_eq` denotes a value of type `X` when `X` supports multiple keys,
- (7.8) — `a_tran` denotes a value of type `X` or `const X` when the *qualified-id* `X::key_compare::is_transparent` is valid and denotes a type ([13.10.3](#)),
- (7.9) — `i` and `j` meet the *Cpp17InputIterator* requirements and refer to elements implicitly convertible to `value_type`,
- (7.10) — `[i, j)` denotes a valid range,
- (7.11) — `rg` denotes a value of a type `R` that models `container-compatible-range<value_type>`,
- (7.12) — `p` denotes a valid constant iterator to `a`,
- (7.13) — `q` denotes a valid dereferenceable constant iterator to `a`,
- (7.14) — `r` denotes a valid dereferenceable iterator to `a`,
- (7.15) — `[q1, q2)` denotes a valid range of constant iterators in `a`,
- (7.16) — `il` designates an object of type `initializer_list<value_type>`,
- (7.17) — `t` denotes a value of type `X::value_type`,
- (7.18) — `k` denotes a value of type `X::key_type`, and
- (7.19) — `c` denotes a value of type `X::key_compare` or `const X::key_compare`;
- (7.20) — `k1` is a value such that `a` is partitioned ([27.8](#)) with respect to `c(x, k1)`, with `x` the key value of `e` and `e` in `a`;
- (7.21) — `ku` is a value such that `a` is partitioned with respect to `!c(ku, x)`, with `x` the key value of `e` and `e` in `a`;
- (7.22) — `ke` is a value such that `a` is partitioned with respect to `c(x, ke)` and `!c(ke, x)`, with `c(x, ke)` implying `!c(ke, x)` and with `x` the key value of `e` and `e` in `a`;
- (7.23) — `kx` is a value such that
 - (7.23.1) — `a` is partitioned with respect to `c(x, kx)` and `!c(kx, x)`, with `c(x, kx)` implying `!c(kx, x)` and with `x` the key value of `e` and `e` in `a`, and
 - (7.23.2) — `kx` is not convertible to either `iterator` or `const_iterator`; and
- (7.24) — `A` denotes the storage allocator used by `X`, if any, or `allocator<X::value_type>` otherwise,

(7.25) — `m` denotes an allocator of a type convertible to `A`, and `nh` denotes a non-const rvalue of type `X::node_type`.

8 A type `X` meets the *associative container* requirements if `X` meets all the requirements of an allocator-aware container (24.2.2.1) and the following types, statements, and expressions are well-formed and have the specified semantics, except that for `map` and `multimap`, the requirements placed on `value_type` in 24.2.2.5 apply instead to `key_type` and `mapped_type`.

NOTE 3: For example, in some cases `key_type` and `mapped_type` are required to be *Cpp17CopyAssignable* even though the associated `value_type`, `pair<const key_type, mapped_type>`, is not *Cpp17CopyAssignable*.

`typename X::key_type`

9 *Result:* `Key`.

`typename X::mapped_type`

10 *Result:* `T`.

11 *Remarks:* For `map` and `multimap` only.

`typename X::value_type`

12 *Result:* Key for `set` and `multiset` only; `pair<const Key, T>` for `map` and `multimap` only.

13 *Preconditions:* `X::value_type` is *Cpp17Erasable* from `X`.

`typename X::key_compare`

14 *Result:* `Compare`.

15 *Preconditions:* `key_compare` is *Cpp17CopyConstructible*.

`typename X::value_compare`

16 *Result:* A binary predicate type. It is the same as `key_compare` for `set` and `multiset`; is an ordering relation on pairs induced by the first component (i.e., `Key`) for `map` and `multimap`.

`typename X::node_type`

17 *Result:* A specialization of the `node-handle` class template (24.2.5), such that the public nested types are the same types as the corresponding types in `X`.

`X(c)`

18 *Effects:* Constructs an empty container. Uses a copy of `c` as a comparison object.

19 *Complexity:* Constant.

`X u = X();
X u;`

20 *Preconditions:* `key_compare` meets the *Cpp17DefaultConstructible* requirements.

21 *Effects:* Constructs an empty container. Uses `Compare()` as a comparison object.

22 *Complexity:* Constant.

`X(i, j, c)`

23 *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into `X` from `*i`.

24 *Effects:* Constructs an empty container and inserts elements from the range $[i, j]$ into it; uses `c` as a comparison object.

25 *Complexity:* $N \log N$ in general, where N has the value `distance(i, j)`; linear if $[i, j]$ is sorted with respect to `value_comp()`.

`X(i, j)`

26 *Preconditions:* `key_compare` meets the *Cpp17DefaultConstructible* requirements. `value_type` is *Cpp17EmplaceConstructible* into `X` from `*i`.

27 *Effects:* Constructs an empty container and inserts elements from the range $[i, j]$ into it; uses `Compare()` as a comparison object.

28 *Complexity:* $N \log N$ in general, where N has the value `distance(i, j)`; linear if $[i, j)$ is sorted with respect to `value_comp()`.

29 **X(from_range, rg, c)**
 Preconditions: `value_type` is *Cpp17EmplaceConstructible* into `X` from `*ranges::begin(rg)`.
 Effects: Constructs an empty container and inserts each element from `rg` into it. Uses `c` as the comparison object.

31 *Complexity:* $N \log N$ in general, where N has the value `ranges::distance(rg)`; linear if `rg` is sorted with respect to `value_comp()`.

32 **X(from_range, rg)**
 Preconditions: `key_compare` meets the *Cpp17DefaultConstructible* requirements. `value_type` is *Cpp17EmplaceConstructible* into `X` from `*ranges::begin(rg)`.
 Effects: Constructs an empty container and inserts each element from `rg` into it. Uses `Compare()` as the comparison object.
 Complexity: Same as `X(from_range, rg, c)`.

35 **X(il, c)**
 Effects: Equivalent to `X(il.begin(), il.end(), c)`.

36 **X(il)**
 Effects: Equivalent to `X(il.begin(), il.end())`.

37 **a = il**
 Result: `X&`
 Preconditions: `value_type` is *Cpp17CopyInsertable* into `X` and *Cpp17CopyAssignable*.
 Effects: Assigns the range `[il.begin(), il.end())` into `a`. All existing elements of `a` are either assigned to or destroyed.
 Complexity: $N \log N$ in general, where N has the value `il.size() + a.size()`; linear if `[il.begin(), il.end())` is sorted with respect to `value_comp()`.

41 **b.key_comp()**
 Result: `X::key_compare`
 Returns: The comparison object out of which `b` was constructed.
 Complexity: Constant.

44 **b.value_comp()**
 Result: `X::value_compare`
 Returns: An object of `value_compare` constructed out of the comparison object.
 Complexity: Constant.

47 **a_uniq.emplace(args)**
 Result: `pair<iterator, bool>`
 Preconditions: `value_type` is *Cpp17EmplaceConstructible* into `X` from `args`.
 Effects: Inserts a `value_type` object `t` constructed with `std::forward<Args>(args)...` if and only if there is no element in the container with key equivalent to the key of `t`.
 Returns: The `bool` component of the returned pair is `true` if and only if the insertion takes place, and the iterator component of the pair points to the element with key equivalent to the key of `t`.
 Complexity: Logarithmic.

52 **a_eq.emplace(args)**
 Result: `iterator`
 Preconditions: `value_type` is *Cpp17EmplaceConstructible* into `X` from `args`.

54 *Effects:* Inserts a `value_type` object `t` constructed with `std::forward<Args>(args)....`. If a range containing elements equivalent to `t` exists in `a_eq`, `t` is inserted at the end of that range.

55 *Returns:* An iterator pointing to the newly inserted element.

56 *Complexity:* Logarithmic.

57 `a.emplace_hint(p, args)`

58 *Result:* iterator

59 *Effects:* Equivalent to `a.emplace(std::forward<Args>(args)....)`, except that the element is inserted as close as possible to the position just prior to `p`.

60 *Returns:* An iterator pointing to the element with the key equivalent to the newly inserted element.

61 *Complexity:* Logarithmic in general, but amortized constant if the element is inserted right before `p`.

62 `a_uniq.insert(t)`

63 *Result:* pair<iterator, bool>

64 *Preconditions:* If `t` is a non-const rvalue, `value_type` is *Cpp17MoveInsertable* into `X`; otherwise, `value_type` is *Cpp17CopyInsertable* into `X`.

65 *Effects:* Inserts `t` if and only if there is no element in the container with key equivalent to the key of `t`.

66 *Returns:* The `bool` component of the returned pair is `true` if and only if the insertion takes place, and the `iterator` component of the pair points to the element with key equivalent to the key of `t`.

67 *Complexity:* Logarithmic.

68 `a_eq.insert(t)`

69 *Result:* iterator

70 *Preconditions:* If `t` is a non-const rvalue, `value_type` is *Cpp17MoveInsertable* into `X`; otherwise, `value_type` is *Cpp17CopyInsertable* into `X`.

71 *Effects:* Inserts `t` and returns the iterator pointing to the newly inserted element. If a range containing elements equivalent to `t` exists in `a_eq`, `t` is inserted at the end of that range.

72 *Complexity:* Logarithmic.

73 `a.insert(p, t)`

74 *Result:* iterator

75 *Preconditions:* If `t` is a non-const rvalue, `value_type` is *Cpp17MoveInsertable* into `X`; otherwise, `value_type` is *Cpp17CopyInsertable* into `X`.

76 *Effects:* Inserts `t` if and only if there is no element with key equivalent to the key of `t` in containers with unique keys; always inserts `t` in containers with equivalent keys. `t` is inserted as close as possible to the position just prior to `p`.

77 *Returns:* An iterator pointing to the element with key equivalent to the key of `t`.

78 *Complexity:* Logarithmic in general, but amortized constant if `t` is inserted right before `p`.

79 `a.insert(i, j)`

80 *Result:* void

81 *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into `X` from `*i`. Neither `i` nor `j` are iterators into `a`.

82 *Effects:* Inserts each element from the range $[i, j)$ if and only if there is no element with key equivalent to the key of that element in containers with unique keys; always inserts that element in containers with equivalent keys.

83 *Complexity:* $N \log(a.size() + N)$, where N has the value `distance(i, j)`.

84 `a.insert_range(rg)`

85 *Result:* void

80 *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into `X` from `*ranges::begin(rg)`. `rg` and `a` do not overlap.

81 *Effects:* Inserts each element from `rg` if and only if there is no element with key equivalent to the key of that element in containers with unique keys; always inserts that element in containers with equivalent keys.

82 *Complexity:* $N \log(a.size() + N)$, where N has the value `ranges::distance(rg)`.

83 `a.insert(il)`

84 *Effects:* Equivalent to `a.insert(il.begin(), il.end())`.

85 `a_uniq.insert(nh)`

86 *Result:* `insert_return_type`

87 *Preconditions:* `nh` is empty or `a_uniq.get_allocator() == nh.get_allocator()` is true.

88 *Effects:* If `nh` is empty, has no effect. Otherwise, inserts the element owned by `nh` if and only if there is no element in the container with a key equivalent to `nh.key()`.

89 *Returns:* If `nh` is empty, `inserted` is `false`, `position` is `end()`, and `node` is empty. Otherwise if the insertion took place, `inserted` is `true`, `position` points to the inserted element, and `node` is empty; if the insertion failed, `inserted` is `false`, `node` has the previous value of `nh`, and `position` points to an element with a key equivalent to `nh.key()`.

90 *Complexity:* Logarithmic.

91 `a_eq.insert(nh)`

92 *Result:* `iterator`

93 *Preconditions:* `nh` is empty or `a_eq.get_allocator() == nh.get_allocator()` is true.

94 *Effects:* If `nh` is empty, has no effect and returns `a_eq.end()`. Otherwise, inserts the element owned by `nh` and returns an iterator pointing to the newly inserted element. If a range containing elements with keys equivalent to `nh.key()` exists in `a_eq`, the element is inserted at the end of that range.

95 *Postconditions:* `nh` is empty.

96 *Complexity:* Logarithmic.

97 `a.insert(p, nh)`

98 *Result:* `iterator`

99 *Preconditions:* `nh` is empty or `a.get_allocator() == nh.get_allocator()` is true.

100 *Effects:* If `nh` is empty, has no effect and returns `a.end()`. Otherwise, inserts the element owned by `nh` if and only if there is no element with key equivalent to `nh.key()` in containers with unique keys; always inserts the element owned by `nh` in containers with equivalent keys. The element is inserted as close as possible to the position just prior to `p`.

101 *Postconditions:* `nh` is empty if insertion succeeds, unchanged if insertion fails.

102 *Returns:* An iterator pointing to the element with key equivalent to `nh.key()`.

103 *Complexity:* Logarithmic in general, but amortized constant if the element is inserted right before `p`.

104 `a.extract(k)`

105 *Result:* `node_type`

106 *Effects:* Removes the first element in the container with key equivalent to `k`.

107 *Returns:* A `node_type` owning the element if found, otherwise an empty `node_type`.

108 *Complexity:* $\log(a.size())$

109 `a_tran.extract(kx)`

110 *Result:* `node_type`

111 *Effects:* Removes the first element in the container with key `r` such that `!c(r, kx) && !c(kx, r)` is true.

106 *Returns:* A `node_type` owning the element if found, otherwise an empty `node_type`.
 107 *Complexity:* $\log(a_tran.size())$

108 `a.extract(q)`
 Result: `node_type`
 109 *Effects:* Removes the element pointed to by `q`.
 110 *Returns:* A `node_type` owning that element.
 111 *Complexity:* Amortized constant.

112 `a.merge(a2)`
 Result: `void`
 113 *Preconditions:* `a.get_allocator() == a2.get_allocator()`.
 114 *Effects:* Attempts to extract each element in `a2` and insert it into `a` using the comparison object of `a`. In containers with unique keys, if there is an element in `a` with key equivalent to the key of an element from `a2`, then that element is not extracted from `a2`.
 115 *Postconditions:* Pointers and references to the transferred elements of `a2` refer to those same elements but as members of `a`. Iterators referring to the transferred elements will continue to refer to their elements, but they now behave as iterators into `a`, not into `a2`.
 116 *Throws:* Nothing unless the comparison object throws.
 117 *Complexity:* $N \log(a.size() + N)$, where N has the value `a2.size()`.

118 `a.erase(k)`
 Result: `size_type`
 119 *Effects:* Erases all elements in the container with key equivalent to `k`.
 120 *Returns:* The number of erased elements.
 121 *Complexity:* $\log(a.size()) + a.count(k)$

122 `a_tran.erase(kx)`
 Result: `size_type`
 123 *Effects:* Erases all elements in the container with key `r` such that `!c(r, kx) && !c(kx, r)` is true.
 124 *Returns:* The number of erased elements.
 125 *Complexity:* $\log(a_tran.size()) + a_tran.count(kx)$

126 `a.erase(q)`
 Result: `iterator`
 127 *Effects:* Erases the element pointed to by `q`.
 128 *Returns:* An iterator pointing to the element immediately following `q` prior to the element being erased. If no such element exists, returns `a.end()`.
 129 *Complexity:* Amortized constant.

130 `a.erase(r)`
 Result: `iterator`
 131 *Effects:* Erases the element pointed to by `r`.
 132 *Returns:* An iterator pointing to the element immediately following `r` prior to the element being erased. If no such element exists, returns `a.end()`.
 133 *Complexity:* Amortized constant.

134 `a.erase(q1, q2)`
 Result: `iterator`
 135 *Effects:* Erases all the elements in the range $[q_1, q_2]$.

136 *Returns:* An iterator pointing to the element pointed to by q2 prior to any elements being erased. If no such element exists, a.end() is returned.

137 *Complexity:* $\log(a.size()) + N$, where N has the value distance(q1, q2).

 a.clear()

138 *Effects:* Equivalent to a.erase(a.begin(), a.end()).

139 *Postconditions:* a.empty() is true.

140 *Complexity:* Linear in a.size().

 b.find(k)

141 *Result:* iterator; const_iterator for constant b.

142 *Returns:* An iterator pointing to an element with the key equivalent to k, or b.end() if such an element is not found.

143 *Complexity:* Logarithmic.

 a_tran.find(ke)

144 *Result:* iterator; const_iterator for constant a_tran.

145 *Returns:* An iterator pointing to an element with key r such that !c(r, ke) && !c(ke, r) is true, or a_tran.end() if such an element is not found.

146 *Complexity:* Logarithmic.

 b.count(k)

147 *Result:* size_type

148 *Returns:* The number of elements with key equivalent to k.

149 *Complexity:* $\log(b.size()) + b.count(k)$

 a_tran.count(ke)

150 *Result:* size_type

151 *Returns:* The number of elements with key r such that !c(r, ke) && !c(ke, r).

152 *Complexity:* $\log(a_tran.size()) + a_tran.count(ke)$

 b.contains(k)

153 *Result:* bool

154 *Effects:* Equivalent to: return b.find(k) != b.end();

 a_tran.contains(ke)

155 *Result:* bool

156 *Effects:* Equivalent to: return a_tran.find(ke) != a_tran.end();

 b.lower_bound(k)

157 *Result:* iterator; const_iterator for constant b.

158 *Returns:* An iterator pointing to the first element with key not less than k, or b.end() if such an element is not found.

159 *Complexity:* Logarithmic.

 a_tran.lower_bound(kl)

160 *Result:* iterator; const_iterator for constant a_tran.

161 *Returns:* An iterator pointing to the first element with key r such that !c(r, kl), or a_tran.end() if such an element is not found.

162 *Complexity:* Logarithmic.

b.upper_bound(k)

163 *Result:* iterator; const_iterator for constant b.

164 *Returns:* An iterator pointing to the first element with key greater than k, or b.end() if such an element is not found.

165 *Complexity:* Logarithmic,

a_tran.upper_bound(ku)

166 *Result:* iterator; const_iterator for constant a_tran.

167 *Returns:* An iterator pointing to the first element with key r such that c(ku, r), or a_tran.end() if such an element is not found.

168 *Complexity:* Logarithmic.

b.equal_range(k)

169 *Result:* pair<iterator, iterator>; pair<const_iterator, const_iterator> for constant b.

170 *Effects:* Equivalent to: return make_pair(b.lower_bound(k), b.upper_bound(k));

171 *Complexity:* Logarithmic.

a_tran.equal_range(ke)

172 *Result:* pair<iterator, iterator>; pair<const_iterator, const_iterator> for constant a_tran.

173 *Effects:* Equivalent to: return make_pair(a_tran.lower_bound(ke), a_tran.upper_bound(ke));

174 *Complexity:* Logarithmic.

175 The **insert**, **insert_range**, and **emplace** members shall not affect the validity of iterators and references to the container, and the **erase** members shall invalidate only iterators and references to the erased elements.

176 The **extract** members invalidate only iterators to the removed element; pointers and references to the removed element remain valid. However, accessing the element through such pointers and references while the element is owned by a **node_type** is undefined behavior. References and pointers to an element obtained while it is owned by a **node_type** are invalidated if the element is successfully inserted.

177 The fundamental property of iterators of associative containers is that they iterate through the containers in the non-descending order of keys where non-descending is defined by the comparison that was used to construct them. For any two dereferenceable iterators i and j such that distance from i to j is positive, the following condition holds:

```
value_comp(*j, *i) == false
```

178 For associative containers with unique keys the stronger condition holds:

```
value_comp(*i, *j) != false
```

179 When an associative container is constructed by passing a comparison object the container shall not store a pointer or reference to the passed object, even if that object is passed by reference. When an associative container is copied, through either a copy constructor or an assignment operator, the target container shall then use the comparison object from the container being copied, as if that comparison object had been passed to the target container in its constructor.

180 The member function templates **find**, **count**, **contains**, **lower_bound**, **upper_bound**, **equal_range**, **erase**, and **extract** shall not participate in overload resolution unless the *qualified-id* Compare::is_transparent is valid and denotes a type (13.10.3). Additionally, the member function templates **extract** and **erase** shall not participate in overload resolution if **is_convertible_v<K&&, iterator>** || **is_convertible_v<K&&, const_iterator>** is **true**, where K is the type substituted as the first template argument.

181 A deduction guide for an associative container shall not participate in overload resolution if any of the following are true:

- (181.1) — It has an **InputIterator** template parameter and a type that does not qualify as an input iterator is deduced for that parameter.
- (181.2) — It has an **Allocator** template parameter and a type that does not qualify as an allocator is deduced for that parameter.

- (181.3) — It has a `Compare` template parameter and a type that qualifies as an allocator is deduced for that parameter.

24.2.7.2 Exception safety guarantees

[`associative.reqmts.exception`]

- ¹ For associative containers, no `clear()` function throws an exception. `erase(k)` does not throw an exception unless that exception is thrown by the container's `Compare` object (if any).
- ² For associative containers, if an exception is thrown by any operation from within an `insert` or `emplace` function inserting a single element, the insertion has no effect.
- ³ For associative containers, no `swap` function throws an exception unless that exception is thrown by the swap of the container's `Compare` object (if any).

24.2.8 Unordered associative containers

[`unord.req`]

24.2.8.1 General

[`unord.req.general`]

- ¹ Unordered associative containers provide an ability for fast retrieval of data based on keys. The worst-case complexity for most operations is linear, but the average case is much faster. The library provides four unordered associative containers: `unordered_set`, `unordered_map`, `unordered_multiset`, and `unordered_multimap`.
- ² Unordered associative containers conform to the requirements for Containers (24.2), except that the expressions `a == b` and `a != b` have different semantics than for the other container types.
- ³ Each unordered associative container is parameterized by `Key`, by a function object type `Hash` that meets the *C_{pp17}Hash* requirements (16.4.4.5) and acts as a hash function for argument values of type `Key`, and by a binary predicate `Pred` that induces an equivalence relation on values of type `Key`. Additionally, `unordered_map` and `unordered_multimap` associate an arbitrary *mapped type* `T` with the `Key`.
- ⁴ The container's object of type `Hash` — denoted by `hash` — is called the *hash function* of the container. The container's object of type `Pred` — denoted by `pred` — is called the *key equality predicate* of the container.
- ⁵ Two values `k1` and `k2` are considered equivalent if the container's key equality predicate `pred(k1, k2)` is valid and returns `true` when passed those values. If `k1` and `k2` are equivalent, the container's hash function shall return the same value for both.

NOTE 1: Thus, when an unordered associative container is instantiated with a non-default `Pred` parameter it usually needs a non-default `Hash` parameter as well.

For any two keys `k1` and `k2` in the same container, calling `pred(k1, k2)` shall always return the same value. For any key `k` in a container, calling `hash(k)` shall always return the same value.

- ⁶ An unordered associative container supports *unique keys* if it may contain at most one element for each key. Otherwise, it supports *equivalent keys*. `unordered_set` and `unordered_map` support unique keys. `unordered_multiset` and `unordered_multimap` support equivalent keys. In containers that support equivalent keys, elements with equivalent keys are adjacent to each other in the iteration order of the container. Thus, although the absolute order of elements in an unordered container is not specified, its elements are grouped into *equivalent-key groups* such that all elements of each group have equivalent keys. Mutating operations on unordered containers shall preserve the relative order of elements within each equivalent-key group unless otherwise specified.
- ⁷ For `unordered_set` and `unordered_multiset` the value type is the same as the key type. For `unordered_map` and `unordered_multimap` it is `pair<const Key, T>`.
- ⁸ For unordered containers where the value type is the same as the key type, both `iterator` and `const_iterator` are constant iterators. It is unspecified whether or not `iterator` and `const_iterator` are the same type.

NOTE 2: `iterator` and `const_iterator` have identical semantics in this case, and `iterator` is convertible to `const_iterator`. Users can avoid violating the one-definition rule by always using `const_iterator` in their function parameter lists.

- ⁹ The elements of an unordered associative container are organized into *buckets*. Keys with the same hash code appear in the same bucket. The number of buckets is automatically increased as elements are added to an unordered associative container, so that the average number of elements per bucket is kept below a bound. Rehashing invalidates iterators, changes ordering between elements, and changes which buckets elements appear in, but does not invalidate pointers or references to elements. For `unordered_multiset` and `unordered_multimap`, rehashing preserves the relative ordering of equivalent elements.

- ¹⁰ In this subclause,
- (10.1) — X denotes an unordered associative container class,
 - (10.2) — a denotes a value of type X ,
 - (10.3) — a_2 denotes a value of a type with nodes compatible with type X ([Table 83](#)),
 - (10.4) — b denotes a value of type X or `const X`,
 - (10.5) — a_{uniq} denotes a value of type X when X supports unique keys,
 - (10.6) — a_{eq} denotes a value of type X when X supports equivalent keys,
 - (10.7) — a_{tran} denotes a value of type X or `const X` when the *qualified-ids* $X::key_equal::is_transparent$ and $X::hasher::is_transparent$ are both valid and denote types ([13.10.3](#)),
 - (10.8) — i and j denote input iterators that refer to `value_type`,
 - (10.9) — $[i, j)$ denotes a valid range,
 - (10.10) — rg denotes a value of a type R that models `container-compatible-range<value_type>`,
 - (10.11) — p and q_2 denote valid constant iterators to a ,
 - (10.12) — q and q_1 denote valid dereferenceable constant iterators to a ,
 - (10.13) — r denotes a valid dereferenceable iterator to a ,
 - (10.14) — $[q_1, q_2)$ denotes a valid range in a ,
 - (10.15) — il denotes a value of type `initializer_list<value_type>`,
 - (10.16) — t denotes a value of type $X::value_type$,
 - (10.17) — k denotes a value of type `key_type`,
 - (10.18) — hf denotes a value of type `hasher` or `const hasher`,
 - (10.19) — eq denotes a value of type `key_equal` or `const key_equal`,
 - (10.20) — ke is a value such that
 - (10.20.1) — $eq(r_1, ke) == eq(ke, r_1)$,
 - (10.20.2) — $hf(r_1) == hf(ke)$ if $eq(r_1, ke)$ is `true`, and
 - (10.20.3) — if any two of $eq(r_1, ke)$, $eq(r_2, ke)$, and $eq(r_1, r_2)$ are `true`, then all three are `true`, where r_1 and r_2 are keys of elements in a_{tran} ,
 - (10.21) — kx is a value such that
 - (10.21.1) — $eq(r_1, kx) == eq(kx, r_1)$,
 - (10.21.2) — $hf(r_1) == hf(kx)$ if $eq(r_1, kx)$ is `true`,
 - (10.21.3) — if any two of $eq(r_1, kx)$, $eq(r_2, kx)$, and $eq(r_1, r_2)$ are `true`, then all three are `true`, and
 - (10.21.4) — kx is not convertible to either `iterator` or `const_iterator`,
 where r_1 and r_2 are keys of elements in a_{tran} ,
 - (10.22) — n denotes a value of type `size_type`,
 - (10.23) — z denotes a value of type `float`, and
 - (10.24) — nh denotes an rvalue of type $X::node_type$.

¹¹ A type X meets the *unordered associative container* requirements if X meets all the requirements of an allocator-aware container ([24.2.2.1](#)) and the following types, statements, and expressions are well-formed and have the specified semantics, except that for `unordered_map` and `unordered_multimap`, the requirements placed on `value_type` in [24.2.2.5](#) apply instead to `key_type` and `mapped_type`.

NOTE 3: For example, `key_type` and `mapped_type` are sometimes required to be *Cpp17CopyAssignable* even though the associated `value_type`, `pair<const key_type, mapped_type>`, is not *Cpp17CopyAssignable*.

`typename X::key_type`

¹² *Result:* Key.

```

typename X::mapped_type
13   Result: T.
14   Remarks: For unordered_map and unordered_multimap only.

typename X::value_type
15   Result: Key for unordered_set and unordered_multiset only; pair<const Key, T> for unordered_map and unordered_multimap only.
16   Preconditions: value_type is Cpp17Erasable from X.

typename X::hasher
17   Result: Hash.
18   Preconditions: Hash is a unary function object type such that the expression hf(k) has type size_t.

typename X::key_equal
19   Result: Pred.
20   Preconditions: Pred meets the Cpp17CopyConstructible requirements. Pred is a binary predicate that takes two arguments of type Key. Pred is an equivalence relation.

typename X::local_iterator
21   Result: An iterator type whose category, value type, difference type, and pointer and reference types are the same as X::iterator's.

    NOTE 4: A local_iterator object can be used to iterate through a single bucket, but cannot be used to iterate across buckets.

typename X::const_local_iterator
22   Result: An iterator type whose category, value type, difference type, and pointer and reference types are the same as X::const_iterator's.

    NOTE 5: A const_local_iterator object can be used to iterate through a single bucket, but cannot be used to iterate across buckets.

typename X::node_type
23   Result: A specialization of a node-handle class template (24.2.5), such that the public nested types are the same types as the corresponding types in X.

X(n, hf, eq)
24   Effects: Constructs an empty container with at least n buckets, using hf as the hash function and eq as the key equality predicate.
25   Complexity:  $\mathcal{O}(n)$ 

X(n, hf)
26   Preconditions: key_equal meets the Cpp17DefaultConstructible requirements.
27   Effects: Constructs an empty container with at least n buckets, using hf as the hash function and key_equal() as the key equality predicate.
28   Complexity:  $\mathcal{O}(n)$ 

X(n)
29   Preconditions: hasher and key_equal meet the Cpp17DefaultConstructible requirements.
30   Effects: Constructs an empty container with at least n buckets, using hasher() as the hash function and key_equal() as the key equality predicate.
31   Complexity:  $\mathcal{O}(n)$ 

X a = X();  
X a;
32   Preconditions: hasher and key_equal meet the Cpp17DefaultConstructible requirements.

```

33 *Effects:* Constructs an empty container with an unspecified number of buckets, using `hasher()` as the hash function and `key_equal()` as the key equality predicate.

34 *Complexity:* Constant.

`X(i, j, n, hf, eq)`

35 *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into `X` from `*i`.

36 *Effects:* Constructs an empty container with at least `n` buckets, using `hf` as the hash function and `eq` as the key equality predicate, and inserts elements from `[i, j)` into it.

37 *Complexity:* Average case $\mathcal{O}(N)$ (N is `distance(i, j)`), worst case $\mathcal{O}(N^2)$.

`X(i, j, n, hf)`

38 *Preconditions:* `key_equal` meets the *Cpp17DefaultConstructible* requirements. `value_type` is *Cpp17EmplaceConstructible* into `X` from `*i`.

39 *Effects:* Constructs an empty container with at least `n` buckets, using `hf` as the hash function and `key_equal()` as the key equality predicate, and inserts elements from `[i, j)` into it.

40 *Complexity:* Average case $\mathcal{O}(N)$ (N is `distance(i, j)`), worst case $\mathcal{O}(N^2)$.

`X(i, j, n)`

41 *Preconditions:* `hasher` and `key_equal` meet the *Cpp17DefaultConstructible* requirements. `value_type` is *Cpp17EmplaceConstructible* into `X` from `*i`.

42 *Effects:* Constructs an empty container with at least `n` buckets, using `hasher()` as the hash function and `key_equal()` as the key equality predicate, and inserts elements from `[i, j)` into it.

43 *Complexity:* Average case $\mathcal{O}(N)$ (N is `distance(i, j)`), worst case $\mathcal{O}(N^2)$.

`X(i, j)`

44 *Preconditions:* `hasher` and `key_equal` meet the *Cpp17DefaultConstructible* requirements. `value_type` is *Cpp17EmplaceConstructible* into `X` from `*i`.

45 *Effects:* Constructs an empty container with an unspecified number of buckets, using `hasher()` as the hash function and `key_equal()` as the key equality predicate, and inserts elements from `[i, j)` into it.

46 *Complexity:* Average case $\mathcal{O}(N)$ (N is `distance(i, j)`), worst case $\mathcal{O}(N^2)$.

`X(from_range, rg, n, hf, eq)`

47 *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into `X` from `*ranges::begin(rg)`.

48 *Effects:* Constructs an empty container with at least `n` buckets, using `hf` as the hash function and `eq` as the key equality predicate, and inserts elements from `rg` into it.

49 *Complexity:* Average case $\mathcal{O}(N)$ (N is `ranges::distance(rg)`), worst case $\mathcal{O}(N^2)$.

`X(from_range, rg, n, hf)`

50 *Preconditions:* `key_equal` meets the *Cpp17DefaultConstructible* requirements. `value_type` is *Cpp17EmplaceConstructible* into `X` from `*ranges::begin(rg)`.

51 *Effects:* Constructs an empty container with at least `n` buckets, using `hf` as the hash function and `key_equal()` as the key equality predicate, and inserts elements from `rg` into it.

52 *Complexity:* Average case $\mathcal{O}(N)$ (N is `ranges::distance(rg)`), worst case $\mathcal{O}(N^2)$.

`X(from_range, rg, n)`

53 *Preconditions:* `hasher` and `key_equal` meet the *Cpp17DefaultConstructible* requirements. `value_type` is *Cpp17EmplaceConstructible* into `X` from `*ranges::begin(rg)`.

54 *Effects:* Constructs an empty container with at least `n` buckets, using `hasher()` as the hash function and `key_equal()` as the key equality predicate, and inserts elements from `rg` into it.

55 *Complexity:* Average case $\mathcal{O}(N)$ (N is `ranges::distance(rg)`), worst case $\mathcal{O}(N^2)$.

`X(from_range, rg)`

56 *Preconditions:* `hasher` and `key_equal` meet the *Cpp17DefaultConstructible* requirements. `value_type` is *Cpp17EmplaceConstructible* into `X` from `*ranges::begin(rg)`.

57 *Effects:* Constructs an empty container with an unspecified number of buckets, using `hasher()` as the hash function and `key_equal()` as the key equality predicate, and inserts elements from `rg` into it.

58 *Complexity:* Average case $\mathcal{O}(N)$ (N is `ranges::distance(rg)`), worst case $\mathcal{O}(N^2)$.

`X(il)`

59 *Effects:* Equivalent to `X(il.begin(), il.end())`.

`X(il, n)`

60 *Effects:* Equivalent to `X(il.begin(), il.end(), n)`.

`X(il, n, hf)`

61 *Effects:* Equivalent to `X(il.begin(), il.end(), n, hf)`.

`X(il, n, hf, eq)`

62 *Effects:* Equivalent to `X(il.begin(), il.end(), n, hf, eq)`.

`X(b)`

63 *Effects:* In addition to the container requirements (24.2.2.1), copies the hash function, predicate, and maximum load factor.

64 *Complexity:* Average case linear in `b.size()`, worst case quadratic.

`a = b`

65 *Result:* `X&`

66 *Effects:* In addition to the container requirements, copies the hash function, predicate, and maximum load factor.

67 *Complexity:* Average case linear in `b.size()`, worst case quadratic.

`a = il`

68 *Result:* `X&`

69 *Preconditions:* `value_type` is *Cpp17CopyInsertable* into `X` and *Cpp17CopyAssignable*.

70 *Effects:* Assigns the range `[il.begin(), il.end()]` into `a`. All existing elements of `a` are either assigned to or destroyed.

71 *Complexity:* Average case linear in `il.size()`, worst case quadratic.

`b.hash_function()`

72 *Result:* `hasher`

73 *Returns:* `b`'s hash function.

74 *Complexity:* Constant.

`b.key_eq()`

75 *Result:* `key_equal`

76 *Returns:* `b`'s key equality predicate.

77 *Complexity:* Constant.

`a_uniq.emplace(args)`

78 *Result:* `pair<iterator, bool>`

79 *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into `X` from `args`.

80 *Effects:* Inserts a `value_type` object `t` constructed with `std::forward<Args>(args)...` if and only if there is no element in the container with key equivalent to the key of `t`.

81 >Returns: The `bool` component of the returned pair is `true` if and only if the insertion takes place, and
 the iterator component of the pair points to the element with key equivalent to the key of `t`.

82 >*Complexity:* Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(\text{a_uniq.size}())$.

83 `a_eq.emplace(args)`

84 *Result:* iterator

85 *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into `X` from `args`.

86 *Effects:* Inserts a `value_type` object `t` constructed with `std::forward<Args>(args)....`

87 *Returns:* An iterator pointing to the newly inserted element.

88 *Complexity:* Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(\text{a_eq.size}())$.

89 `a.emplace_hint(p, args)`

90 *Result:* iterator

91 *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into `X` from `args`.

92 *Effects:* Equivalent to `a.emplace(std::forward<Args>(args)....)`.

93 *Returns:* An iterator pointing to the element with the key equivalent to the newly inserted element. The
 `const_iterator p` is a hint pointing to where the search should start. Implementations are permitted
 to ignore the hint.

94 *Complexity:* Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(\text{a.size}())$.

95 `a_uniq.insert(t)`

96 *Result:* pair<iterator, bool>

97 *Preconditions:* If `t` is a non-const rvalue, `value_type` is *Cpp17MoveInsertable* into `X`; otherwise,
 `value_type` is *Cpp17CopyInsertable* into `X`.

98 *Effects:* Inserts `t` if and only if there is no element in the container with key equivalent to the key of `t`.

99 *Returns:* The `bool` component of the returned pair indicates whether the insertion takes place, and the
 iterator component points to the element with key equivalent to the key of `t`.

100 *Complexity:* Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(\text{a_uniq.size}())$.

101 `a_eq.insert(t)`

102 *Result:* iterator

103 *Preconditions:* If `t` is a non-const rvalue, `value_type` is *Cpp17MoveInsertable* into `X`; otherwise,
 `value_type` is *Cpp17CopyInsertable* into `X`.

104 *Effects:* Inserts `t`.

105 *Returns:* An iterator pointing to the newly inserted element.

106 *Complexity:* Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(\text{a_eq.size}())$.

107 `a.insert(p, t)`

108 *Result:* iterator

109 *Preconditions:* If `t` is a non-const rvalue, `value_type` is *Cpp17MoveInsertable* into `X`; otherwise,
 `value_type` is *Cpp17CopyInsertable* into `X`.

110 *Effects:* Equivalent to `a.insert(t)`. The iterator `p` is a hint pointing to where the search should start.
 Implementations are permitted to ignore the hint.

111 *Returns:* An iterator pointing to the element with the key equivalent to that of `t`.

112 *Complexity:* Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(\text{a.size}())$.

113 `a.insert(i, j)`

114 *Result:* void

115 *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into `X` from `*i`. Neither `i` nor `j` are iterators
 into `a`.

110 *Effects:* Equivalent to `a.insert(t)` for each element in $[i, j]$.
 111 *Complexity:* Average case $\mathcal{O}(N)$, where N is `distance(i, j)`, worst case $\mathcal{O}(N(a.size() + 1))$.

112 `a.insert_range(rg)`
 113 *Result:* void
 114 *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into `X` from `*ranges::begin(rg)`. `rg` and `a` do not overlap.
 115 *Effects:* Equivalent to `a.insert(t)` for each element `t` in `rg`.
 116 *Complexity:* Average case $\mathcal{O}(N)$, where N is `ranges::distance(rg)`, worst case $\mathcal{O}(N(a.size() + 1))$.

117 `a.insert(il)`
 118 *Effects:* Equivalent to `a.insert(il.begin(), il.end())`.
 119 *Preconditions:* `a_uniq.insert(nh)`
 120 *Result:* `insert_return_type`
 121 *Effects:* nh is empty or `a_uniq.get_allocator() == nh.get_allocator()` is true.
 122 *Postconditions:* If nh is empty, has no effect. Otherwise, inserts the element owned by nh if and only if there is no element in the container with a key equivalent to `nh.key()`.
 123 *Complexity:* Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(a_uniq.size())$.

124 `a_eq.insert(nh)`
 125 *Result:* iterator
 126 *Preconditions:* nh is empty or `a_eq.get_allocator() == nh.get_allocator()` is true.
 127 *Effects:* If nh is empty, has no effect and returns `a_eq.end()`. Otherwise, inserts the element owned by nh and returns an iterator pointing to the newly inserted element.
 128 *Postconditions:* nh is empty.
 129 *Complexity:* Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(a_eq.size())$.

130 `a.insert(q, nh)`
 131 *Result:* iterator
 132 *Preconditions:* nh is empty or `a.get_allocator() == nh.get_allocator()` is true.
 133 *Effects:* If nh is empty, has no effect and returns `a.end()`. Otherwise, inserts the element owned by nh if and only if there is no element with key equivalent to `nh.key()` in containers with unique keys; always inserts the element owned by nh in containers with equivalent keys. The iterator q is a hint pointing to where the search should start. Implementations are permitted to ignore the hint.
 134 *Postconditions:* nh is empty if insertion succeeds, unchanged if insertion fails.
 135 *Returns:* An iterator pointing to the element with key equivalent to `nh.key()`.
 136 *Complexity:* Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(a.size())$.

137 `a.extract(k)`
 138 *Result:* node_type
 139 *Effects:* Removes an element in the container with key equivalent to k.
 140 *Returns:* A node_type owning the element if found, otherwise an empty node_type.
 141 *Complexity:* Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(a.size())$.

142 `a_tran.extract(kx)`
 143 *Result:* node_type

138 *Effects:* Removes an element in the container with key equivalent to kx .
 139 *Returns:* A `node_type` owning the element if found, otherwise an empty `node_type`.
 140 *Complexity:* Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(a_tran.size())$.

141 `a.extract(q)`
 142 *Result:* `node_type`
 143 *Effects:* Removes the element pointed to by q .
 144 *Returns:* A `node_type` owning that element.
 145 *Complexity:* Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(a.size())$.

146 `a.merge(a2)`
 147 *Result:* `void`
 148 *Preconditions:* `a.get_allocator() == a2.get_allocator()`.
 149 *Effects:* Attempts to extract each element in $a2$ and insert it into a using the hash function and key equality predicate of a . In containers with unique keys, if there is an element in a with key equivalent to the key of an element from $a2$, then that element is not extracted from $a2$.
 150 *Postconditions:* Pointers and references to the transferred elements of $a2$ refer to those same elements but as members of a . Iterators referring to the transferred elements and all iterators referring to a will be invalidated, but iterators to elements remaining in $a2$ will remain valid.
 151 *Complexity:* Average case $\mathcal{O}(N)$, where N is $a2.size()$, worst case $\mathcal{O}(N*a.size() + N)$.

152 `a.erase(k)`
 153 *Result:* `size_type`
 154 *Effects:* Erases all elements with key equivalent to k .
 155 *Returns:* The number of elements erased.
 156 *Complexity:* Average case $\mathcal{O}(a.count(k))$, worst case $\mathcal{O}(a.size())$.

157 `a_tran.erase(kx)`
 158 *Result:* `size_type`
 159 *Effects:* Erases all elements with key equivalent to kx .
 160 *Returns:* The number of elements erased.
 161 *Complexity:* Average case $\mathcal{O}(a_tran.count(kx))$, worst case $\mathcal{O}(a_tran.size())$.

162 `a.erase(q)`
 163 *Result:* `iterator`
 164 *Effects:* Erases the element pointed to by q .
 165 *Returns:* The iterator immediately following q prior to the erasure.
 166 *Complexity:* Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(a.size())$.

167 `a.erase(r)`
 168 *Result:* `iterator`
 169 *Effects:* Erases the element pointed to by r .
 170 *Returns:* The iterator immediately following r prior to the erasure.
 171 *Complexity:* Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(a.size())$.

172 `a.erase(q1, q2)`
 173 *Result:* `iterator`
 174 *Effects:* Erases all elements in the range $[q1, q2]$.
 175 *Returns:* The iterator immediately following the erased elements prior to the erasure.
 176 *Complexity:* Average case linear in $distance(q1, q2)$, worst case $\mathcal{O}(a.size())$.

```

a.clear()
170   Result: void
171   Effects: Erases all elements in the container.
172   Postconditions: a.empty() is true.
173   Complexity: Linear in a.size().

b.find(k)
174   Result: iterator; const_iterator for constant b.
175   Returns: An iterator pointing to an element with key equivalent to k, or b.end() if no such element exists.
176   Complexity: Average case  $\mathcal{O}(1)$ , worst case  $\mathcal{O}(b.size())$ .

a_tran.find(ke)
177   Result: iterator; const_iterator for constant a_tran.
178   Returns: An iterator pointing to an element with key equivalent to ke, or a_tran.end() if no such element exists.
179   Complexity: Average case  $\mathcal{O}(1)$ , worst case  $\mathcal{O}(a\_tran.size())$ .

b.count(k)
180   Result: size_type
181   Returns: The number of elements with key equivalent to k.
182   Complexity: Average case  $\mathcal{O}(b.count(k))$ , worst case  $\mathcal{O}(b.size())$ .

a_tran.count(ke)
183   Result: size_type
184   Returns: The number of elements with key equivalent to ke.
185   Complexity: Average case  $\mathcal{O}(a\_tran.count(ke))$ , worst case  $\mathcal{O}(a\_tran.size())$ .

b.contains(k)
186   Effects: Equivalent to b.find(k) != b.end().

a_tran.contains(ke)
187   Effects: Equivalent to a_tran.find(ke) != a_tran.end().

b.equal_range(k)
188   Result: pair<iterator, iterator>; pair<const_iterator, const_iterator> for constant b.
189   Returns: A range containing all elements with keys equivalent to k. Returns make_pair(b.end(), b.end()) if no such elements exist.
190   Complexity: Average case  $\mathcal{O}(b.count(k))$ , worst case  $\mathcal{O}(b.size())$ .

a_tran.equal_range(ke)
191   Result: pair<iterator, iterator>; pair<const_iterator, const_iterator> for constant a_tran.
192   Returns: A range containing all elements with keys equivalent to ke. Returns make_pair(a_tran.end(), a_tran.end()) if no such elements exist.
193   Complexity: Average case  $\mathcal{O}(a\_tran.count(ke))$ , worst case  $\mathcal{O}(a\_tran.size())$ .

b.bucket_count()
194   Result: size_type
195   Returns: The number of buckets that b contains.
196   Complexity: Constant.

```

```

b.max_bucket_count()
197   Result: size_type
198   Returns: An upper bound on the number of buckets that b can ever contain.
199   Complexity: Constant.

b.bucket(k)
200   Result: size_type
201   Preconditions: b.bucket_count() > 0.
202   Returns: The index of the bucket in which elements with keys equivalent to k would be found, if any such element existed. The return value is in the range [0, b.bucket_count()).
203   Complexity: Constant.

b.bucket_size(n)
204   Result: size_type
205   Preconditions: n shall be in the range [0, b.bucket_count()).
206   Returns: The number of elements in the nth bucket.
207   Complexity:  $\mathcal{O}(b.bucket\_size(n))$ 

b.begin(n)
208   Result: local_iterator; const_local_iterator for constant b.
209   Preconditions: n is in the range [0, b.bucket_count()).
210   Returns: An iterator referring to the first element in the bucket. If the bucket is empty, then b.begin(n) == b.end(n).
211   Complexity: Constant.

b.end(n)
212   Result: local_iterator; const_local_iterator for constant b.
213   Preconditions: n is in the range [0, b.bucket_count()).
214   Returns: An iterator which is the past-the-end value for the bucket.
215   Complexity: Constant.

b.cbegin(n)
216   Result: const_local_iterator
217   Preconditions: n shall be in the range [0, b.bucket_count()).
218   Returns: An iterator referring to the first element in the bucket. If the bucket is empty, then b.cbegin(n) == b.cend(n).
219   Complexity: Constant.

b.cend(n)
220   Result: const_local_iterator
221   Preconditions: n is in the range [0, b.bucket_count()).
222   Returns: An iterator which is the past-the-end value for the bucket.
223   Complexity: Constant.

b.load_factor()
224   Result: float
225   Returns: The average number of elements per bucket.
226   Complexity: Constant.

```

```

b.max_load_factor()
227   Result: float
228   Returns: A positive number that the container attempts to keep the load factor less than or equal to. The container automatically increases the number of buckets as necessary to keep the load factor below this number.
229   Complexity: Constant.

a.max_load_factor(z)
230   Result: void
231   Preconditions: z is positive. May change the container's maximum load factor, using z as a hint.
232   Complexity: Constant.

a.rehash(n)
233   Result: void
234   Postconditions: a.bucket_count() >= a.size() / a.max_load_factor() and a.bucket_count() >= n.
235   Complexity: Average case linear in a.size(), worst case quadratic.

a.reserve(n)
236   Effects: Equivalent to a.rehash(ceil(n / a.max_load_factor())).
237 Two unordered containers a and b compare equal if a.size() == b.size() and, for every equivalent-key group [Ea1, Ea2] obtained from a.equal_range(Ea1), there exists an equivalent-key group [Eb1, Eb2] obtained from b.equal_range(Ea1), such that is_permutation(Ea1, Ea2, Eb1, Eb2) returns true. For unordered_set and unordered_map, the complexity of operator== (i.e., the number of calls to the == operator of the value_type, to the predicate returned by key_eq(), and to the hasher returned by hash_function()) is proportional to N in the average case and to N2 in the worst case, where N is a.size(). For unordered_multiset and unordered_multimap, the complexity of operator== is proportional to  $\sum E_i^2$  in the average case and to N2 in the worst case, where N is a.size(), and Ei is the size of the ith equivalent-key group in a. However, if the respective elements of each corresponding pair of equivalent-key groups Eai and Ebi are arranged in the same order (as is commonly the case, e.g., if a and b are unmodified copies of the same container), then the average-case complexity for unordered_multiset and unordered_multimap becomes proportional to N (but worst-case complexity remains  $\mathcal{O}(N^2)$ , e.g., for a pathologically bad hash function). The behavior of a program that uses operator== or operator!= on unordered containers is undefined unless the Pred function object has the same behavior for both containers and the equality comparison function for Key is a refinement209 of the partition into equivalent-key groups produced by Pred.
238 The iterator types iterator and const_iterator of an unordered associative container are of at least the forward iterator category. For unordered associative containers where the key type and value type are the same, both iterator and const_iterator are constant iterators.
239 The insert, insert_range, and emplace members shall not affect the validity of references to container elements, but may invalidate all iterators to the container. The erase members shall invalidate only iterators and references to the erased elements, and preserve the relative order of the elements that are not erased.
240 The insert, insert_range, and emplace members shall not affect the validity of iterators if (N+n) <= z * B, where N is the number of elements in the container prior to the insert operation, n is the number of elements inserted, B is the container's bucket count, and z is the container's maximum load factor.
241 The extract members invalidate only iterators to the removed element, and preserve the relative order of the elements that are not erased; pointers and references to the removed element remain valid. However, accessing the element through such pointers and references while the element is owned by a node_type is undefined behavior. References and pointers to an element obtained while it is owned by a node_type are invalidated if the element is successfully inserted.
242 The member function templates find, count, equal_range, contains, extract, and erase shall not participate in overload resolution unless the qualified-ids Pred::is_transparent and Hash::is_transparent are both valid and denote types (13.10.3). Additionally, the member function templates extract and erase

```

²⁰⁹ Equality comparison is a refinement of partitioning if no two objects that compare equal fall into different partitions.

shall not participate in overload resolution if `is_convertible_v<K&&, iterator> || is_convertible_v<K&&, const_iterator>` is `true`, where K is the type substituted as the first template argument.

- 243 A deduction guide for an unordered associative container shall not participate in overload resolution if any of the following are true:
- (243.1) — It has an `InputIterator` template parameter and a type that does not qualify as an input iterator is deduced for that parameter.
 - (243.2) — It has an `Allocator` template parameter and a type that does not qualify as an allocator is deduced for that parameter.
 - (243.3) — It has a `Hash` template parameter and an integral type or a type that qualifies as an allocator is deduced for that parameter.
 - (243.4) — It has a `Pred` template parameter and a type that qualifies as an allocator is deduced for that parameter.

24.2.8.2 Exception safety guarantees

[unord.req.exception]

- ¹ For unordered associative containers, no `clear()` function throws an exception. `erase(k)` does not throw an exception unless that exception is thrown by the container's `Hash` or `Pred` object (if any).
- ² For unordered associative containers, if an exception is thrown by any operation other than the container's hash function from within an `insert` or `emplace` function inserting a single element, the insertion has no effect.
- ³ For unordered associative containers, no `swap` function throws an exception unless that exception is thrown by the swap of the container's `Hash` or `Pred` object (if any).
- ⁴ For unordered associative containers, if an exception is thrown from within a `rehash()` function other than by the container's hash function or comparison function, the `rehash()` function has no effect.

24.3 Sequence containers

[sequences]

24.3.1 In general

[sequences.general]

- ¹ The headers `<array>` (24.3.2), `<deque>` (24.3.3), `<forward_list>` (24.3.4), `<list>` (24.3.5), and `<vector>` (24.3.6) define class templates that meet the requirements for sequence containers.
- ² The following exposition-only alias template may appear in deduction guides for sequence containers:

```
template<class InputIterator>
using iter-value-type = typename iterator_traits<InputIterator>::value_type; // exposition only
```

24.3.2 Header `<array>` synopsis

[array.syn]

```
#include <compare>           // see 17.11.1
#include <initializer_list>    // see 17.10.2

namespace std {
// 24.3.7, class template array
template<class T, size_t N> struct array;

template<class T, size_t N>
constexpr bool operator==(const array<T, N>& x, const array<T, N>& y);
template<class T, size_t N>
constexpr synth-three-way-result<T>
operator<=>(const array<T, N>& x, const array<T, N>& y);

// 24.3.7.4, specialized algorithms
template<class T, size_t N>
constexpr void swap(array<T, N>& x, array<T, N>& y) noexcept(noexcept(x.swap(y)));

// 24.3.7.6, array creation functions
template<class T, size_t N>
constexpr array<remove_cv_t<T>, N> to_array(T (&a)[N]);
template<class T, size_t N>
constexpr array<remove_cv_t<T>, N> to_array(T (&&a)[N]);
```

```
// 24.3.7.7, tuple interface
template<class T> struct tuple_size;
template<size_t I, class T> struct tuple_element;
template<class T, size_t N>
    struct tuple_size<array<T, N>>;
template<size_t I, class T, size_t N>
    struct tuple_element<I, array<T, N>>;
template<size_t I, class T, size_t N>
    constexpr T& get(array<T, N>&) noexcept;
template<size_t I, class T, size_t N>
    constexpr T&& get(array<T, N>&&) noexcept;
template<size_t I, class T, size_t N>
    constexpr const T& get(const array<T, N>&) noexcept;
template<size_t I, class T, size_t N>
    constexpr const T&& get(const array<T, N>&&) noexcept;
}
```

24.3.3 Header <deque> synopsis

[deque.syn]

```
#include <compare>           // see 17.11.1
#include <initializer_list>   // see 17.10.2

namespace std {
    // 24.3.8, class template deque
    template<class T, class Allocator = allocator<T>> class deque;

    template<class T, class Allocator>
        bool operator==(const deque<T, Allocator>& x, const deque<T, Allocator>& y);
    template<class T, class Allocator>
        synth-three-way-result<T> operator<=>(const deque<T, Allocator>& x,

24.3.7 Class template array

[array]

24.3.7.1 Overview

[array.overview]

- ¹ The header `<array>` defines a class template for storing fixed-size sequences of objects. An **array** is a contiguous container (24.2.2.2). An instance of `array<T, N>` stores `N` elements of type `T`, so that `size() == N` is an invariant.
- ² An **array** is an aggregate (9.4.2) that can be list-initialized with up to `N` elements whose types are convertible to `T`.
- ³ An **array** meets all of the requirements of a container (24.2.2.2) and of a reversible container (24.2.2.3), except that a default constructed **array** object is not empty if `N > 0`. An **array** meets some of the requirements of a sequence container (24.2.4). Descriptions are provided here only for operations on **array** that are not described in one of these tables and for operations where there is additional semantic information.
- ⁴ `array<T, N>` is a structural type (13.2) if `T` is a structural type. Two values `a1` and `a2` of type `array<T, N>` are template-argument-equivalent (13.6) if and only if each pair of corresponding elements in `a1` and `a2` are template-argument-equivalent.
- ⁵ The types `iterator` and `const_iterator` meet the `constexpr` iterator requirements (25.3.1).

```

namespace std {
    template<class T, size_t N>
    struct array {
        // types
        using value_type      = T;
        using pointer          = T*;
        using const_pointer    = const T*;
        using reference        = T&;
        using const_reference  = const T&;
        using size_type        = size_t;
        using difference_type = ptrdiff_t;
    };
}

```

```

using iterator          = implementation-defined; // see 24.2
using const_iterator    = implementation-defined; // see 24.2
using reverse_iterator  = std::reverse_iterator<iterator>;
using const_reverse_iterator = std::reverse_iterator<const_iterator>;

// no explicit construct/copy/destroy for aggregate type

constexpr void fill(const T& u);
constexpr void swap(array&) noexcept(is_nothrow_swappable_v<T>);

// iterators
constexpr iterator      begin() noexcept;
constexpr const_iterator begin() const noexcept;
constexpr iterator      end() noexcept;
constexpr const_iterator end() const noexcept;

constexpr reverse_iterator rbegin() noexcept;
constexpr const_reverse_iterator rbegin() const noexcept;
constexpr reverse_iterator rend() noexcept;
constexpr const_reverse_iterator rend() const noexcept;

constexpr const_iterator cbegin() const noexcept;
constexpr const_iterator cend() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept;
constexpr const_reverse_iterator crend() const noexcept;

// capacity
[[nodiscard]] constexpr bool empty() const noexcept;
constexpr size_type size() const noexcept;
constexpr size_type max_size() const noexcept;

// element access
constexpr reference operator[](size_type n);
constexpr const_reference operator[](size_type n) const;
constexpr reference at(size_type n);
constexpr const_reference at(size_type n) const;
constexpr reference front();
constexpr const_reference front() const;
constexpr reference back();
constexpr const_reference back() const;

constexpr T * data() noexcept;
constexpr const T * data() const noexcept;
};

template<class T, class... U>
array(T, U...) -> array<T, 1 + sizeof...(U)>;
}

```

24.3.7.2 Constructors, copy, and assignment

[array.cons]

- ¹ The conditions for an aggregate (9.4.2) shall be met. Class `array` relies on the implicitly-declared special member functions (11.4.5.2, 11.4.7, 11.4.5.3) to conform to the container requirements table in 24.2. In addition to the requirements specified in the container requirements table, the implicit move constructor and move assignment operator for `array` require that `T` be *Cpp17MoveConstructible* or *Cpp17MoveAssignable*, respectively.

```
template<class T, class... U>
array(T, U...) -> array<T, 1 + sizeof...(U)>;
```

- ² *Mandates:* (`is_same_v<T, U> && ...`) is true.

24.3.7.3 Member functions

[array.members]

```
constexpr size_type size() const noexcept;
1   Returns: N.

constexpr T* data() noexcept;
constexpr const T* data() const noexcept;
2   Returns: A pointer such that [data(), data() + size()] is a valid range. For a non-empty array,
            data() == addressof(front()).

constexpr void fill(const T& u);
3   Effects: As if by fill_n(begin(), N, u).

constexpr void swap(array& y) noexcept(is_nothrow_swappable_v<T>);
4   Effects: Equivalent to swap_ranges(begin(), end(), y.begin()).

5   NOTE: Unlike the swap function for other containers, array::swap takes linear time, can exit via an exception,
         and does not cause iterators to become associated with the other container.
```

24.3.7.4 Specialized algorithms

[array.special]

```
template<class T, size_t N>
constexpr void swap(array<T, N>& x, array<T, N>& y) noexcept(noexcept(x.swap(y)));
1   Constraints: N == 0 or is_swappable_v<T> is true.
2   Effects: As if by x.swap(y).
3   Complexity: Linear in N.
```

24.3.7.5 Zero-sized arrays

[array.zero]

- 1 array shall provide support for the special case N == 0.
- 2 In the case that N == 0, begin() == end() == unique value. The return value of data() is unspecified.
- 3 The effect of calling front() or back() for a zero-sized array is undefined.
- 4 Member function swap() shall have a non-throwing exception specification.

24.3.7.6 Array creation functions

[array.creation]

```
template<class T, size_t N>
constexpr array<remove_cv_t<T>, N> to_array(T (&a)[N]);
1   Mandates: is_array_v<T> is false and is_constructible_v<T, T&> is true.
2   Preconditions: T meets the Cpp17CopyConstructible requirements.
3   Returns: {{ a[0], ..., a[N - 1] }}.

template<class T, size_t N>
constexpr array<remove_cv_t<T>, N> to_array(T (&&a)[N]);
4   Mandates: is_array_v<T> is false and is_move_constructible_v<T> is true.
5   Preconditions: T meets the Cpp17MoveConstructible requirements.
6   Returns: {{ std::move(a[0]), ..., std::move(a[N - 1]) }}.
```

24.3.7.7 Tuple interface

[array.tuple]

```
template<class T, size_t N>
struct tuple_size<array<T, N>> : integral_constant<size_t, N> { };

template<size_t I, class T, size_t N>
struct tuple_element<I, array<T, N>> {
    using type = T;
};

1   Mandates: I < N is true.
```

```

template<size_t I, class T, size_t N>
    constexpr T& get(array<T, N>& a) noexcept;
template<size_t I, class T, size_t N>
    constexpr T&& get(array<T, N>&& a) noexcept;
template<size_t I, class T, size_t N>
    constexpr const T& get(const array<T, N>& a) noexcept;
template<size_t I, class T, size_t N>
    constexpr const T&& get(const array<T, N>&& a) noexcept;

```

2 *Mandates:* $I < N$ is true.

3 *Returns:* A reference to the I^{th} element of a , where indexing is zero-based.

24.3.8 Class template deque

[**deque**]

24.3.8.1 Overview

[**deque.overview**]

- 1 A **deque** is a sequence container that supports random access iterators (25.3.5.7). In addition, it supports constant time insert and erase operations at the beginning or the end; insert and erase in the middle take linear time. That is, a **deque** is especially optimized for pushing and popping elements at the beginning and end. Storage management is handled automatically.
- 2 A **deque** meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), and of a sequence container, including the optional sequence container requirements (24.2.4). Descriptions are provided here only for operations on **deque** that are not described in one of these tables or for operations where there is additional semantic information.

```

namespace std {
    template<class T, class Allocator = allocator<T>>
    class deque {
        public:
            // types
            using value_type          = T;
            using allocator_type       = Allocator;
            using pointer              = typename allocator_traits<Allocator>::pointer;
            using const_pointer         = typename allocator_traits<Allocator>::const_pointer;
            using reference             = value_type&;
            using const_reference       = const value_type&;
            using size_type             = implementation-defined; // see 24.2
            using difference_type       = implementation-defined; // see 24.2
            using iterator              = implementation-defined; // see 24.2
            using const_iterator         = implementation-defined; // see 24.2
            using reverse_iterator       = std::reverse_iterator<iterator>;
            using const_reverse_iterator = std::reverse_iterator<const_iterator>;

            // 24.3.8.2, construct/copy/destroy
            deque() : deque(Allocator{}) { }
            explicit deque(const Allocator&);

            explicit deque(size_type n, const Allocator& = Allocator());
            deque(size_type n, const T& value, const Allocator& = Allocator());
            template<class InputIterator>
                deque(InputIterator first, InputIterator last, const Allocator& = Allocator());
            template<container-compatible-range<T> R>
                deque(from_range_t, R&& rg, const Allocator& = Allocator());
                deque(const deque& x);
                deque(deque&&);

                deque(const deque&, const type_identity_t<Allocator>&);
                deque(deque&&, const type_identity_t<Allocator>&);

                deque(initializer_list<T>, const Allocator& = Allocator());

                ~deque();
                deque& operator=(const deque& x);
                deque& operator=(deque&& x)
                    noexcept(allocator_traits<Allocator>::is_always_equal::value);
                deque& operator=(initializer_list<T>);

            template<class InputIterator>
                void assign(InputIterator first, InputIterator last);

```

```

template<container-compatible-range<T> R>
    void assign_range(R&& rg);
void assign(size_type n, const T& t);
void assign(initializer_list<T>);
allocator_type get_allocator() const noexcept;

// iterators
iterator begin() noexcept;
const_iterator begin() const noexcept;

void push_front(const T& x);
void push_front(T&& x);
template<container-compatible-range<T> R>
    void prepend_range(R&& rg);
void push_back(const T& x);
void push_back(T&& x);
template<container-compatible-range<T> R>
    void append_range(R&& rg);

iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
    iterator insert(const_iterator position, InputIterator first, InputIterator last);
template<container-compatible-range<T> R>
    iterator insert_range(const_iterator position, R&& rg);
iterator insert(const_iterator position, initializer_list<T>);

void pop_front();
void pop_back();

```

```

iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
void swap(deque&)
    noexcept(allocator_traits<Allocator>::is_always_equal::value);
void clear() noexcept;
};

template<class InputIterator, class Allocator = allocator<iter_value_type<InputIterator>>>
deque(InputIterator, InputIterator, Allocator = Allocator())
    -> deque<iter_value_type<InputIterator>, Allocator>;

template<ranges::input_range R, class Allocator = allocator<ranges::range_value_t<R>>>
deque(from_range_t, R&&, Allocator = Allocator())
    -> deque<ranges::range_value_t<R>, Allocator>;
}

```

24.3.8.2 Constructors, copy, and assignment

[deque.cons]

```
explicit deque(const Allocator&);
```

1 *Effects*: Constructs an empty deque, using the specified allocator.

2 *Complexity*: Constant.

```
explicit deque(size_type n, const Allocator& = Allocator());
```

3 *Preconditions*: T is *Cpp17DefaultInsertable* into *this.

4 *Effects*: Constructs a deque with n default-inserted elements using the specified allocator.

5 *Complexity*: Linear in n.

```
deque(size_type n, const T& value, const Allocator& = Allocator());
```

6 *Preconditions*: T is *Cpp17CopyInsertable* into *this.

7 *Effects*: Constructs a deque with n copies of value, using the specified allocator.

8 *Complexity*: Linear in n.

```
template<class InputIterator>
deque(InputIterator first, InputIterator last, const Allocator& = Allocator());
```

9 *Effects*: Constructs a deque equal to the range [first, last), using the specified allocator.

10 *Complexity*: Linear in distance(first, last).

```
template<container-compatible-range<T> R>
deque(from_range_t, R&& rg, const Allocator& = Allocator());
```

11 *Effects*: Constructs a deque with the elements of the range rg, using the specified allocator.

12 *Complexity*: Linear in ranges::distance(rg).

24.3.8.3 Capacity

[deque.capacity]

```
void resize(size_type sz);
```

1 *Preconditions*: T is *Cpp17MoveInsertable* and *Cpp17DefaultInsertable* into *this.

2 *Effects*: If sz < size(), erases the last size() - sz elements from the sequence. Otherwise, appends sz - size() default-inserted elements to the sequence.

```
void resize(size_type sz, const T& c);
```

3 *Preconditions*: T is *Cpp17CopyInsertable* into *this.

4 *Effects*: If sz < size(), erases the last size() - sz elements from the sequence. Otherwise, appends sz - size() copies of c to the sequence.

```
void shrink_to_fit();
```

5 *Preconditions*: T is *Cpp17MoveInsertable* into *this.

- 6 *Effects:* `shrink_to_fit` is a non-binding request to reduce memory use but does not change the size of the sequence.
- NOTE: The request is non-binding to allow latitude for implementation-specific optimizations.
- If the size is equal to the old capacity, or if an exception is thrown other than by the move constructor of a non-*Cpp17CopyInsertable* T, then there are no effects.
- 7 *Complexity:* If the size is not equal to the old capacity, linear in the size of the sequence; otherwise constant.
- 8 *Remarks:* If the size is not equal to the old capacity, then invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator.

24.3.8.4 Modifiers

[**deque.modifiers**]

```
iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
    iterator insert(const_iterator position,
                    InputIterator first, InputIterator last);
template<container-compatible-range<T> R>
    iterator insert_range(const_iterator position, R&& rg);
iterator insert(const_iterator position, initializer_list<T>);

template<class... Args> reference emplace_front(Args&&... args);
template<class... Args> reference emplace_back(Args&&... args);
template<class... Args> iterator emplace(const_iterator position, Args&&... args);
void push_front(const T& x);
void push_front(T&& x);
template<container-compatible-range<T> R>
    void prepend_range(R&& rg);
void push_back(const T& x);
void push_back(T&& x);
template<container-compatible-range<T> R>
    void append_range(R&& rg);
```

- 1 *Effects:* An insertion in the middle of the deque invalidates all the iterators and references to elements of the deque. An insertion at either end of the deque invalidates all the iterators to the deque, but has no effect on the validity of references to elements of the deque.
- 2 *Complexity:* The complexity is linear in the number of elements inserted plus the lesser of the distances to the beginning and end of the deque. Inserting a single element at either the beginning or end of a deque always takes constant time and causes a single call to a constructor of T.
- 3 *Remarks:* If an exception is thrown other than by the copy constructor, move constructor, assignment operator, or move assignment operator of T there are no effects. If an exception is thrown while inserting a single element at either end, there are no effects. Otherwise, if an exception is thrown by the move constructor of a non-*Cpp17CopyInsertable* T, the effects are unspecified.

```
iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
void pop_front();
void pop_back();
```

- 4 *Effects:* An erase operation that erases the last element of a deque invalidates only the past-the-end iterator and all iterators and references to the erased elements. An erase operation that erases the first element of a deque but not the last element invalidates only iterators and references to the erased elements. An erase operation that erases neither the first element nor the last element of a deque invalidates the past-the-end iterator and all iterators and references to all the elements of the deque.

NOTE: `pop_front` and `pop_back` are erase operations.

- 5 *Throws:* Nothing unless an exception is thrown by the assignment operator of T.
- 6 *Complexity:* The number of calls to the destructor of T is the same as the number of elements erased, but the number of calls to the assignment operator of T is no more than the lesser of the number of elements before the erased elements and the number of elements after the erased elements.

24.3.8.5 Erasure

[deque.erasure]

```
template<class T, class Allocator, class U>
typename deque<T, Allocator>::size_type
erase(deque<T, Allocator>& c, const U& value);

1 Effects: Equivalent to:
```

```
auto it = remove(c.begin(), c.end(), value);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;
```

```
template<class T, class Allocator, class Predicate>
typename deque<T, Allocator>::size_type
erase_if(deque<T, Allocator>& c, Predicate pred);
```

2 Effects: Equivalent to:

```
auto it = remove_if(c.begin(), c.end(), pred);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;
```

24.3.9 Class template forward_list

[forward.list]

24.3.9.1 Overview

[forward.list.overview]

- 1 A `forward_list` is a container that supports forward iterators and allows constant time insert and erase operations anywhere within the sequence, with storage management handled automatically. Fast random access to list elements is not supported.

NOTE 1: It is intended that `forward_list` have zero space or time overhead relative to a hand-written C-style singly linked list. Features that would conflict with that goal have been omitted.

- 2 A `forward_list` meets all of the requirements of a container (24.2.2.2), except that the `size()` member function is not provided and `operator==` has linear complexity. A `forward_list` also meets all of the requirements for an allocator-aware container (24.2.2.5). In addition, a `forward_list` provides the `assign` member functions and several of the optional sequence container requirements (24.2.4). Descriptions are provided here only for operations on `forward_list` that are not described in that table or for operations where there is additional semantic information.
- 3 NOTE 2: Modifying any list requires access to the element preceding the first element of interest, but in a `forward_list` there is no constant-time way to access a preceding element. For this reason, `erase_after` and `splice_after` take fully-open ranges, not semi-open ranges.

```
namespace std {
    template<class T, class Allocator = allocator<T>>
    class forward_list {
        public:
            // types
            using value_type      = T;
            using allocator_type   = Allocator;
            using pointer          = typename allocator_traits<Allocator>::pointer;
            using const_pointer     = typename allocator_traits<Allocator>::const_pointer;
            using reference         = value_type&;
            using const_reference   = const value_type&;
            using size_type         = implementation-defined; // see 24.2
            using difference_type   = implementation-defined; // see 24.2
            using iterator          = implementation-defined; // see 24.2
            using const_iterator     = implementation-defined; // see 24.2

            // 24.3.9.2, construct/copy/destroy
            forward_list() : forward_list(Allocator{}) { }
            explicit forward_list(const Allocator&);
            explicit forward_list(size_type n, const Allocator& = Allocator());
            forward_list(size_type n, const T& value, const Allocator& = Allocator());
            template<class InputIterator>
                forward_list(InputIterator first, InputIterator last, const Allocator& = Allocator());
```

```

template<container-compatible-range<T> R>
    forward_list(from_range_t, R&& rg, const Allocator& = Allocator());
forward_list(const forward_list& x);
forward_list(forward_list&& x);
forward_list(const forward_list& x, const type_identity_t<Allocator>&);
forward_list(forward_list&& x, const type_identity_t<Allocator>&);
forward_list(initializer_list<T>, const Allocator& = Allocator());
~forward_list();
forward_list& operator=(const forward_list& x);
forward_list& operator=(forward_list&& x)
    noexcept(allocator_traits<Allocator>::is_always_equal::value);
forward_list& operator=(initializer_list<T>);

template<class InputIterator>
    void assign(InputIterator first, InputIterator last);
template<container-compatible-range<T> R>
    void assign_range(R&& rg);
void assign(size_type n, const T& t);
void assign(initializer_list<T>);
allocator_type get_allocator() const noexcept;

// 24.3.9.3, iterators

const_iterator begin() const noexcept;
iterator end() noexcept;
const_iterator end() const noexcept;

const_iterator cbegin() const noexcept;
const_iterator cbefore_begin() const noexcept;
const_iterator cend() const noexcept;

// capacity
[[nodiscard]] bool empty() const noexcept;
size_type max_size() const noexcept;

// 24.3.9.4, element access
reference front();
const_reference front() const;

// 24.3.9.5, modifiers
template<class... Args> reference emplace_front(Args&&... args);
void push_front(const T& x);
void push_front(T&& x);
template<container-compatible-range<T> R>
    void prepend_range(R&& rg);
void pop_front();

template<class... Args> iterator emplace_after(const_iterator position, Args&&... args);
iterator insert_after(const_iterator position, const T& x);
iterator insert_after(const_iterator position, T&& x);

iterator insert_after(const_iterator position, size_type n, const T& x);
template<class InputIterator>
    iterator insert_after(const_iterator position, InputIterator first, InputIterator last);
iterator insert_after(const_iterator position, initializer_list<T> il);
template<container-compatible-range<T> R>
    iterator insert_range_after(const_iterator position, R&& rg);

iterator erase_after(const_iterator position);
iterator erase_after(const_iterator position, const_iterator last);
void swap(forward_list&)
    noexcept(allocator_traits<Allocator>::is_always_equal::value);

```

```

void resize(size_type sz);
void resize(size_type sz, const value_type& c);
void clear() noexcept;

// 24.3.9.6, forward_list operations
void splice_after(const_iterator position, forward_list& x);
void splice_after(const_iterator position, forward_list&& x);
void splice_after(const_iterator position, forward_list& x, const_iterator i);
void splice_after(const_iterator position, forward_list&& x, const_iterator i);
void splice_after(const_iterator position, forward_list& x,
                  const_iterator first, const_iterator last);
void splice_after(const_iterator position, forward_list&& x,
                  const_iterator first, const_iterator last);

size_type remove(const T& value);
template<class Predicate> size_type remove_if(Predicate pred);

size_type unique();
template<class BinaryPredicate> size_type unique(BinaryPredicate binary_pred);

void merge(forward_list& x);
void merge(forward_list&& x);
template<class Compare> void merge(forward_list& x, Compare comp);
template<class Compare> void merge(forward_list&& x, Compare comp);

void sort();
template<class Compare> void sort(Compare comp);

void reverse() noexcept;
};

template<class InputIterator, class Allocator = allocator<iter-value-type<InputIterator>>>
forward_list(InputIterator, InputIterator, Allocator = Allocator())
    -> forward_list<iter-value-type<InputIterator>, Allocator>;

template<ranges::input_range R, class Allocator = allocator<ranges::range_value_t<R>>>
forward_list(from_range_t, R&&, Allocator = Allocator())
    -> forward_list<ranges::range_value_t<R>, Allocator>;
}

```

- ⁴ An incomplete type T may be used when instantiating `forward_list` if the allocator meets the allocator completeness requirements (16.4.4.6.2). T shall be complete before any member of the resulting specialization of `forward_list` is referenced.

24.3.9.2 Constructors, copy, and assignment

[`forward.list.cons`]

`explicit forward_list(const Allocator&);`

- 1 *Effects:* Constructs an empty `forward_list` object using the specified allocator.

- 2 *Complexity:* Constant.

`explicit forward_list(size_type n, const Allocator& = Allocator());`

- 3 *Preconditions:* T is `Cpp17DefaultInsertable` into `*this`.

- 4 *Effects:* Constructs a `forward_list` object with n default-inserted elements using the specified allocator.

- 5 *Complexity:* Linear in n.

`forward_list(size_type n, const T& value, const Allocator& = Allocator());`

- 6 *Preconditions:* T is `Cpp17CopyInsertable` into `*this`.

- 7 *Effects:* Constructs a `forward_list` object with n copies of value using the specified allocator.

- 8 *Complexity:* Linear in n.

```

template<class InputIterator>
forward_list(InputIterator first, InputIterator last, const Allocator& = Allocator());
9   Effects: Constructs a forward_list object equal to the range [first, last).
10  Complexity: Linear in distance(first, last).
template<container-compatible-range<T> R>
forward_list(from_range_t, R&& rg, const Allocator& = Allocator());
11  Effects: Constructs a forward_list object with the elements of the range rg.
12  Complexity: Linear in ranges::distance(rg).

```

24.3.9.3 Iterators

[forward.list.iter]

```

iterator before_begin() noexcept;
const_iterator before_begin() const noexcept;
const_iterator cbefore_begin() const noexcept;
1   Effects: cbefore_begin() is equivalent to const_cast<forward_list const&>(*this).before_-begin().
2   Returns: A non-dereferenceable iterator that, when incremented, is equal to the iterator returned by begin().
3   Remarks: before_begin() == end() shall equal false.

```

24.3.9.4 Element access

[forward.list.access]

```

reference front();
const_reference front() const;
1   Returns: *begin()

```

24.3.9.5 Modifiers

[forward.list.modifiers]

- 1 None of the overloads of **insert_after** shall affect the validity of iterators and references, and **erase_after** shall invalidate only iterators and references to the erased elements. If an exception is thrown during **insert_after** there shall be no effect. Inserting **n** elements into a **forward_list** is linear in **n**, and the number of calls to the copy or move constructor of **T** is exactly equal to **n**. Erasing **n** elements from a **forward_list** is linear in **n** and the number of calls to the destructor of type **T** is exactly equal to **n**.

```

template<class... Args> reference emplace_front(Args&&... args);
2   Effects: Inserts an object of type value_type constructed with value_type(std::forward<Args>(args)...) at the beginning of the list.

```

```

void push_front(const T& x);
void push_front(T&& x);
3   Effects: Inserts a copy of x at the beginning of the list.

```

```

template<container-compatible-range<T> R>
void prepend_range(R&& rg);
4   Effects: Inserts a copy of each element of rg at the beginning of the list.

```

NOTE: The order of elements is not reversed.

```

void pop_front();
5   Effects: As if by erase_after(before_begin()).

```

```

iterator insert_after(const_iterator position, const T& x);

```

- 6 Preconditions: **T** is *Cpp17CopyInsertable* into **forward_list**. **position** is **before_begin()** or is a dereferenceable iterator in the range [**begin()**, **end()**).

7 Effects: Inserts a copy of **x** after **position**.

- 8 Returns: An iterator pointing to the copy of **x**.

```

iterator insert_after(const_iterator position, T&& x);
9   Preconditions: T is Cpp17MoveInsertable into forward_list. position is before_begin() or is a
derefenceable iterator in the range [begin(), end()].
10  Effects: Inserts a copy of x after position.
11  Returns: An iterator pointing to the copy of x.

iterator insert_after(const_iterator position, size_type n, const T& x);
12  Preconditions: T is Cpp17CopyInsertable into forward_list. position is before_begin() or is a
derefenceable iterator in the range [begin(), end()].
13  Effects: Inserts n copies of x after position.
14  Returns: An iterator pointing to the last inserted copy of x, or position if n == 0 is true.

template<class InputIterator>
iterator insert_after(const_iterator position, InputIterator first, InputIterator last);
15  Preconditions: T is Cpp17EmplaceConstructible into forward_list from *first. position is before_-
begin() or is a dereferenceable iterator in the range [begin(), end()]. Neither first nor last are
iterators in *this.
16  Effects: Inserts copies of elements in [first, last) after position.
17  Returns: An iterator pointing to the last inserted element, or position if first == last is true.

template<container-compatible-range<T> R>
iterator insert_range_after(const_iterator position, R&& rg);
18  Preconditions: T is Cpp17EmplaceConstructible into forward_list from *ranges::begin(rg). posi-
tion is before_begin() or is a dereferenceable iterator in the range [begin(), end()]. rg and *this
do not overlap.
19  Effects: Inserts copies of elements in the range rg after position.
20  Returns: An iterator pointing to the last inserted element, or position if rg is empty.

iterator insert_after(const_iterator position, initializer_list<T> il);
21  Effects: Equivalent to: return insert_after(position, il.begin(), il.end());

template<class... Args>
iterator emplace_after(const_iterator position, Args&&... args);
22  Preconditions: T is Cpp17EmplaceConstructible into forward_list from std::forward<Args>(
args)... position is before_begin() or is a dereferenceable iterator in the range [begin(), end()].
23  Effects: Inserts an object of type value_type direct-non-list-initialized with std::forward<Args>(
args)... after position.
24  Returns: An iterator pointing to the new object.

iterator erase_after(const_iterator position);
25  Preconditions: The iterator following position is dereferenceable.
26  Effects: Erases the element pointed to by the iterator following position.
27  Returns: An iterator pointing to the element following the one that was erased, or end() if no such
element exists.
28  Throws: Nothing.

iterator erase_after(const_iterator position, const_iterator last);
29  Preconditions: All iterators in the range (position, last) are dereferenceable.
30  Effects: Erases the elements in the range (position, last).
31  Returns: last.
32  Throws: Nothing.

```

```

void resize(size_type sz);
33   Preconditions: T is Cpp17DefaultInsertable into *this.
34   Effects: If sz < distance(begin(), end()), erases the last distance(begin(), end()) - sz elements from the list. Otherwise, inserts sz - distance(begin(), end()) default-inserted elements at the end of the list.

void resize(size_type sz, const value_type& c);
35   Preconditions: T is Cpp17CopyInsertable into *this.
36   Effects: If sz < distance(begin(), end()), erases the last distance(begin(), end()) - sz elements from the list. Otherwise, inserts sz - distance(begin(), end()) copies of c at the end of the list.

void clear() noexcept;
37   Effects: Erases all elements in the range [begin(), end()].
38   Remarks: Does not invalidate past-the-end iterators.

```

24.3.9.6 Operations

[forward.list.ops]

- 1 In this subclause, arguments for a template parameter named **Predicate** or **BinaryPredicate** shall meet the corresponding requirements in 27.2. The semantics of $i + n$, where i is an iterator into the list and n is an integer, are the same as those of `next(i, n)`. The expression $i - n$, where i is an iterator into the list and n is an integer, means an iterator j such that $j + n == i$ is true. For `merge` and `sort`, the definitions and requirements in 27.8 apply.

```

void splice_after(const_iterator position, forward_list& x);
void splice_after(const_iterator position, forward_list&& x);

```

- 2 *Preconditions:* position is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end()]`. `get_allocator() == x.get_allocator()` is true. `addressof(x) != this` is true.
 3 *Effects:* Inserts the contents of x after position, and x becomes empty. Pointers and references to the moved elements of x now refer to those same elements but as members of *this. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into *this, not into x.

4 *Throws:* Nothing.

5 *Complexity:* $\mathcal{O}(\text{distance}(x.begin(), x.end()))$

```

void splice_after(const_iterator position, forward_list& x, const_iterator i);
void splice_after(const_iterator position, forward_list&& x, const_iterator i);

```

- 6 *Preconditions:* position is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end()]`. The iterator following i is a dereferenceable iterator in x. `get_allocator() == x.get_allocator()` is true.

- 7 *Effects:* Inserts the element following i into *this, following position, and removes it from x. The result is unchanged if `position == i` or `position == ++i`. Pointers and references to `++i` continue to refer to the same element but as a member of *this. Iterators to `++i` continue to refer to the same element, but now behave as iterators into *this, not into x.

8 *Throws:* Nothing.

9 *Complexity:* $\mathcal{O}(1)$

```

void splice_after(const_iterator position, forward_list& x,
                  const_iterator first, const_iterator last);
void splice_after(const_iterator position, forward_list&& x,
                  const_iterator first, const_iterator last);

```

- 10 *Preconditions:* position is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end()]`. `(first, last)` is a valid range in x, and all iterators in the range `(first, last)` are dereferenceable. position is not an iterator in the range `(first, last)`. `get_allocator() == x.get_allocator()` is true.

11 *Effects:* Inserts elements in the range (`first, last`) after `position` and removes the elements from `x`. Pointers and references to the moved elements of `x` now refer to those same elements but as members of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.

12 *Complexity:* $\mathcal{O}(\text{distance}(\text{first}, \text{last}))$

```
size_type remove(const T& value);
template<class Predicate> size_type remove_if(Predicate pred);
```

13 *Effects:* Erases all the elements in the list referred to by a list iterator `i` for which the following conditions hold: `*i == value` (for `remove()`), `pred(*i)` is `true` (for `remove_if()`). Invalidates only the iterators and references to the erased elements.

14 *Returns:* The number of elements erased.

15 *Throws:* Nothing unless an exception is thrown by the equality comparison or the predicate.

16 *Complexity:* Exactly `distance(begin(), end())` applications of the corresponding predicate.

17 *Remarks:* Stable (16.4.6.8).

```
size_type unique();
template<class BinaryPredicate> size_type unique(BinaryPredicate binary_pred);
```

18 Let `binary_pred` be `equal_to<>{}` for the first overload.

19 *Preconditions:* `binary_pred` is an equivalence relation.

20 *Effects:* Erases all but the first element from every consecutive group of equivalent elements. That is, for a nonempty list, erases all elements referred to by the iterator `i` in the range `[begin() + 1, end()]` for which `binary_pred(*i, *(i - 1))` is `true`. Invalidates only the iterators and references to the erased elements.

21 *Returns:* The number of elements erased.

22 *Throws:* Nothing unless an exception is thrown by the predicate.

23 *Complexity:* If `empty()` is `false`, exactly `distance(begin(), end()) - 1` applications of the corresponding predicate, otherwise no applications of the predicate.

```
void merge(forward_list& x);
void merge(forward_list&& x);
template<class Compare> void merge(forward_list& x, Compare comp);
template<class Compare> void merge(forward_list&& x, Compare comp);
```

24 Let `comp` be `less<>` for the first two overloads.

25 *Preconditions:* `*this` and `x` are both sorted with respect to the comparator `comp`, and `get_allocator() == x.get_allocator()` is `true`.

26 *Effects:* If `addressof(x) == this`, there are no effects. Otherwise, merges the two sorted ranges `[begin(), end()]` and `[x.begin(), x.end()]`. The result is a range that is sorted with respect to the comparator `comp`. Pointers and references to the moved elements of `x` now refer to those same elements but as members of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.

27 *Complexity:* At most `distance(begin(), end()) + distance(x.begin(), x.end()) - 1` comparisons if `addressof(x) != this`; otherwise, no comparisons are performed.

28 *Remarks:* Stable (16.4.6.8). If `addressof(x) != this`, `x` is empty after the merge. No elements are copied by this operation. If an exception is thrown other than by a comparison, there are no effects.

```
void sort();
template<class Compare> void sort(Compare comp);
```

29 *Effects:* Sorts the list according to the `operator<` or the `comp` function object. If an exception is thrown, the order of the elements in `*this` is unspecified. Does not affect the validity of iterators and references.

30 *Complexity:* Approximately $N \log N$ comparisons, where N is `distance(begin(), end())`.

31 *Remarks:* Stable (16.4.6.8).

void reverse() noexcept;

32 *Effects:* Reverses the order of the elements in the list. Does not affect the validity of iterators and references.

33 *Complexity:* Linear time.

24.3.9.7 Erasure

[forward.list.erase]

```
template<class T, class Allocator, class U>
typename forward_list<T, Allocator>::size_type
erase(forward_list<T, Allocator>& c, const U& value);
```

1 *Effects:* Equivalent to: `return erase_if(c, [&](auto& elem) { return elem == value; });`

```
template<class T, class Allocator, class Predicate>
typename forward_list<T, Allocator>::size_type
erase_if(forward_list<T, Allocator>& c, Predicate pred);
```

2 *Effects:* Equivalent to: `return c.remove_if(pred);`

24.3.10 Class template list

[list]

24.3.10.1 Overview

[list.overview]

- 1 A **list** is a sequence container that supports bidirectional iterators and allows constant time insert and erase operations anywhere within the sequence, with storage management handled automatically. Unlike vectors (24.3.11) and deques (24.3.8), fast random access to list elements is not supported, but many algorithms only need sequential access anyway.
- 2 A **list** meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), and of a sequence container, including most of the optional sequence container requirements (24.2.4). The exceptions are the operator[] and at member functions, which are not provided.²¹⁰ Descriptions are provided here only for operations on **list** that are not described in one of these tables or for operations where there is additional semantic information.

```
namespace std {
    template<class T, class Allocator = allocator<T>>
    class list {
        public:
            // types
            using value_type           = T;
            using allocator_type        = Allocator;
            using pointer               = typename allocator_traits<Allocator>::pointer;
            using const_pointer         = typename allocator_traits<Allocator>::const_pointer;
            using reference              = value_type&;
            using const_reference       = const value_type&;
            using size_type             = implementation-defined; // see 24.2
            using difference_type       = implementation-defined; // see 24.2
            using iterator              = implementation-defined; // see 24.2
            using const_iterator         = implementation-defined; // see 24.2
            using reverse_iterator       = std::reverse_iterator<iterator>;
            using const_reverse_iterator = std::reverse_iterator<const_iterator>;

            // 24.3.10.2, construct/copy/destroy
            list() : list(Allocator{}) {}
            explicit list(const Allocator&);
            explicit list(size_type n, const Allocator& = Allocator());
            list(size_type n, const T& value, const Allocator& = Allocator());
            template<class InputIterator>
            list(InputIterator first, InputIterator last, const Allocator& = Allocator());
            template<container-compatible-range<T> R>
            list(from_range_t, R&& rg, const Allocator& = Allocator());
            list(const list& x);
            list(list&& x);
            list(const list&, const type_identity_t<Allocator>&);
```

²¹⁰ These member functions are only provided by containers whose iterators are random access iterators.

```

list(list&&, const type_identity_t<Allocator>&);
list(initializer_list<T>, const Allocator& = Allocator());
~list();
list& operator=(const list& x);
list& operator=(list&& x)
    noexcept(allocator_traits<Allocator>::is_always_equal::value);
list& operator=(initializer_list<T>);
template<class InputIterator>
    void assign(InputIterator first, InputIterator last);
template<container-compatible-range<T> R>
    void assign_range(R&& rg);
void assign(size_type n, const T& t);
void assign(initializer_list<T>);
allocator_type get_allocator() const noexcept;

// iterators
iterator begin() noexcept;
const_iterator begin() const noexcept;
iterator end() noexcept;
const_iterator end() const noexcept;
reverse_iterator rbegin() noexcept;
const_reverse_iterator rbegin() const noexcept;

template<class InputIterator, class Allocator = allocator<iter-value-type<InputIterator>>>
list(InputIterator, InputIterator, Allocator = Allocator())
    -> list<iter-value-type<InputIterator>, Allocator>;

template<ranges::input_range R, class Allocator = allocator<ranges::range_value_t<R>>>
list(from_range_t, R&&, Allocator = Allocator())
    -> list<ranges::range_value_t<R>, Allocator>;
}

```

- ³ An incomplete type T may be used when instantiating `list` if the allocator meets the allocator completeness requirements (16.4.4.6.2). T shall be complete before any member of the resulting specialization of `list` is referenced.

24.3.10.2 Constructors, copy, and assignment

[list.cons]

`explicit list(const Allocator&);`

- 1 *Effects:* Constructs an empty `list`, using the specified allocator.

- 2 *Complexity:* Constant.

`explicit list(size_type n, const Allocator& = Allocator());`

- 3 *Preconditions:* T is *Cpp17DefaultInsertable* into `*this`.

- 4 *Effects:* Constructs a `list` with n default-inserted elements using the specified allocator.

- 5 *Complexity:* Linear in n.

`list(size_type n, const T& value, const Allocator& = Allocator());`

- 6 *Preconditions:* T is *Cpp17CopyInsertable* into `*this`.

- 7 *Effects:* Constructs a `list` with n copies of value, using the specified allocator.

8 *Complexity:* Linear in n .

```
template<class InputIterator>
list(InputIterator first, InputIterator last, const Allocator& = Allocator());
```

9 *Effects:* Constructs a list equal to the range [first, last).

10 *Complexity:* Linear in $\text{distance}(\text{first}, \text{last})$.

```
template<container-compatible-range<T> R>
list(from_range_t, R&& rg, const Allocator& = Allocator());
```

11 *Effects:* Constructs a list object with the elements of the range rg.

12 *Complexity:* Linear in $\text{ranges}::\text{distance}(\text{rg})$.

24.3.10.3 Capacity

[list.capacity]

```
void resize(size_type sz);
```

1 *Preconditions:* T is Cpp17DefaultInsertable into *this.

2 *Effects:* If $\text{size}() < \text{sz}$, appends $\text{sz} - \text{size}()$ default-inserted elements to the sequence. If $\text{sz} \leq \text{size}()$, equivalent to:

```
list<T>::iterator it = begin();
advance(it, sz);
erase(it, end());
```

```
void resize(size_type sz, const T& c);
```

3 *Preconditions:* T is Cpp17CopyInsertable into *this.

4 *Effects:* As if by:

```
if (sz > size())
    insert(end(), sz-size(), c);
else if (sz < size()) {
    iterator i = begin();
    advance(i, sz);
    erase(i, end());
}
else
    ; // do nothing
```

24.3.10.4 Modifiers

[list.modifiers]

```
iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
iterator insert(const_iterator position, InputIterator first,
               InputIterator last);
template<container-compatible-range<T> R>
iterator insert_range(const_iterator position, R&& rg);
iterator insert(const_iterator position, initializer_list<T>);

template<class... Args> reference emplace_front(Args&&... args);
template<class... Args> reference emplace_back(Args&&... args);
template<class... Args> iterator emplace(const_iterator position, Args&&... args);
void push_front(const T& x);
void push_front(T&& x);
template<container-compatible-range<T> R>
    void prepend_range(R&& rg);
void push_back(const T& x);
void push_back(T&& x);
template<container-compatible-range<T> R>
    void append_range(R&& rg);
```

1 *Complexity:* Insertion of a single element into a list takes constant time and exactly one call to a constructor of T. Insertion of multiple elements into a list is linear in the number of elements inserted,

and the number of calls to the copy constructor or move constructor of T is exactly equal to the number of elements inserted.

- 2 *Remarks:* Does not affect the validity of iterators and references. If an exception is thrown there are no effects.

```
iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);

void pop_front();
void pop_back();
void clear() noexcept;
```

- 3 *Effects:* Invalidates only the iterators and references to the erased elements.

- 4 *Throws:* Nothing.

- 5 *Complexity:* Erasing a single element is a constant time operation with a single call to the destructor of T. Erasing a range in a list is linear time in the size of the range and the number of calls to the destructor of type T is exactly equal to the size of the range.

24.3.10.5 Operations

[list.ops]

- 1 Since lists allow fast insertion and erasing from the middle of a list, certain operations are provided specifically for them.²¹¹ In this subclause, arguments for a template parameter named **Predicate** or **BinaryPredicate** shall meet the corresponding requirements in 27.2. The semantics of $i + n$ and $i - n$, where i is an iterator into the list and n is an integer, are the same as those of `next(i, n)` and `prev(i, n)`, respectively. For `merge` and `sort`, the definitions and requirements in 27.8 apply.
- 2 list provides three splice operations that destructively move elements from one list to another. The behavior of splice operations is undefined if `get_allocator() != x.get_allocator()`.

```
void splice(const_iterator position, list& x);
void splice(const_iterator position, list&& x);
```

- 3 *Preconditions:* `addressof(x) != this` is true.

- 4 *Effects:* Inserts the contents of x before position and x becomes empty. Pointers and references to the moved elements of x now refer to those same elements but as members of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into x.

- 5 *Throws:* Nothing.

- 6 *Complexity:* Constant time.

```
void splice(const_iterator position, list& x, const_iterator i);
void splice(const_iterator position, list&& x, const_iterator i);
```

- 7 *Preconditions:* i is a valid dereferenceable iterator of x.

- 8 *Effects:* Inserts an element pointed to by i from list x before position and removes the element from x. The result is unchanged if `position == i` or `position == ++i`. Pointers and references to `*i` continue to refer to this same element but as a member of `*this`. Iterators to `*i` (including i itself) continue to refer to the same element, but now behave as iterators into `*this`, not into x.

- 9 *Throws:* Nothing.

- 10 *Complexity:* Constant time.

```
void splice(const_iterator position, list& x, const_iterator first,
           const_iterator last);
void splice(const_iterator position, list&& x, const_iterator first,
           const_iterator last);
```

- 11 *Preconditions:* [first, last) is a valid range in x. position is not an iterator in the range [first, last).

- 12 *Effects:* Inserts elements in the range [first, last) before position and removes the elements from x. Pointers and references to the moved elements of x now refer to those same elements but as members

²¹¹) As specified in 16.4.4.6, the requirements in this Clause apply only to lists whose allocators compare equal.

of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.

13 *Throws:* Nothing.

14 *Complexity:* Constant time if `addressof(x) == this`; otherwise, linear time.

```
size_type remove(const T& value);
template<class Predicate> size_type remove_if(Predicate pred);
```

15 *Effects:* Erases all the elements in the list referred to by a list iterator `i` for which the following conditions hold: `*i == value`, `pred(*i) != false`. Invalidates only the iterators and references to the erased elements.

16 *Returns:* The number of elements erased.

17 *Throws:* Nothing unless an exception is thrown by `*i == value` or `pred(*i) != false`.

18 *Complexity:* Exactly `size()` applications of the corresponding predicate.

19 *Remarks:* Stable (16.4.6.8).

```
size_type unique();
template<class BinaryPredicate> size_type unique(BinaryPredicate binary_pred);
```

20 Let `binary_pred` be `equal_to<>{}` for the first overload.

21 *Preconditions:* `binary_pred` is an equivalence relation.

22 *Effects:* Erases all but the first element from every consecutive group of equivalent elements. That is, for a nonempty list, erases all elements referred to by the iterator `i` in the range `[begin() + 1, end()]` for which `binary_pred(*i, *(i - 1))` is `true`. Invalidates only the iterators and references to the erased elements.

23 *Returns:* The number of elements erased.

24 *Throws:* Nothing unless an exception is thrown by the predicate.

25 *Complexity:* If `empty()` is `false`, exactly `size() - 1` applications of the corresponding predicate, otherwise no applications of the predicate.

```
void merge(list& x);
void merge(list&& x);
template<class Compare> void merge(list& x, Compare comp);
template<class Compare> void merge(list&& x, Compare comp);
```

26 Let `comp` be `less<>` for the first two overloads.

27 *Preconditions:* `*this` and `x` are both sorted with respect to the comparator `comp`, and `get_allocator() == x.get_allocator()` is `true`.

28 *Effects:* If `addressof(x) == this`, there are no effects. Otherwise, merges the two sorted ranges `[begin(), end()]` and `[x.begin(), x.end()]`. The result is a range that is sorted with respect to the comparator `comp`. Pointers and references to the moved elements of `x` now refer to those same elements but as members of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.

29 *Complexity:* At most `size() + x.size() - 1` comparisons if `addressof(x) != this`; otherwise, no comparisons are performed.

30 *Remarks:* Stable (16.4.6.8). If `addressof(x) != this`, `x` is empty after the merge. No elements are copied by this operation. If an exception is thrown other than by a comparison there are no effects.

```
void reverse() noexcept;
```

31 *Effects:* Reverses the order of the elements in the list. Does not affect the validity of iterators and references.

32 *Complexity:* Linear time.

```
void sort();
```

`template<class Compare> void sort(Compare comp);`

33 *Effects:* Sorts the list according to the `operator<` or a `Compare` function object. If an exception is thrown, the order of the elements in `*this` is unspecified. Does not affect the validity of iterators and references.

34 *Complexity:* Approximately $N \log N$ comparisons, where `N == size()`.

35 *Remarks:* Stable ([16.4.6.8](#)).

24.3.10.6 Erasure

[list.erasure]

```
template<class T, class Allocator, class U>
typename list<T, Allocator>::size_type
erase(list<T, Allocator>& c, const U& value);

1 Effects: Equivalent to: return erase_if(c, [&](auto& elem) { return elem == value; });

template<class T, class Allocator, class Predicate>
typename list<T, Allocator>::size_type
erase_if(list<T, Allocator>& c, Predicate pred);

2 Effects: Equivalent to: return c.remove_if(pred);
```

24.3.11 Class template vector

[vector]

24.3.11.1 Overview

[vector.overview]

- 1 A `vector` is a sequence container that supports (amortized) constant time insert and erase operations at the end; insert and erase in the middle take linear time. Storage management is handled automatically, though hints can be given to improve efficiency.
- 2 A `vector` meets all of the requirements of a container ([24.2.2.2](#)), of a reversible container ([24.2.2.3](#)), of an allocator-aware container ([24.2.2.5](#)), of a sequence container, including most of the optional sequence container requirements ([24.2.4](#)), and, for an element type other than `bool`, of a contiguous container ([24.2.2.2](#)). The exceptions are the `push_front`, `prepend_range`, `pop_front`, and `emplace_front` member functions, which are not provided. Descriptions are provided here only for operations on `vector` that are not described in one of these tables or for operations where there is additional semantic information.
- 3 The types `iterator` and `const_iterator` meet the `constexpr` iterator requirements ([25.3.1](#)).

```
namespace std {
    template<class T, class Allocator = allocator<T>>
    class vector {
        public:
            // types
            using value_type           = T;
            using allocator_type       = Allocator;
            using pointer               = typename allocator_traits<Allocator>::pointer;
            using const_pointer         = typename allocator_traits<Allocator>::const_pointer;
            using reference             = value_type&;
            using const_reference       = const value_type&;
            using size_type             = implementation-defined; // see 24.2
            using difference_type       = implementation-defined; // see 24.2
            using iterator              = implementation-defined; // see 24.2
            using const_iterator         = implementation-defined; // see 24.2
            using reverse_iterator       = std::reverse_iterator<iterator>;
            using const_reverse_iterator = std::reverse_iterator<const_iterator>;

            // 24.3.11.2, construct/copy/destroy
            constexpr vector() noexcept(noexcept(allocator{})) : vector(allocator{}) { }
            constexpr explicit vector(const Allocator&) noexcept;
            constexpr explicit vector(size_type n, const Allocator& = Allocator());
            constexpr vector(size_type n, const T& value, const Allocator& = Allocator());
            template<class InputIterator>
                constexpr vector(InputIterator first, InputIterator last, const Allocator& = Allocator());
            template<container-compatible-range<T> R>

constexpr void pop_back();

```

```

template<class... Args> constexpr iterator emplace(const_iterator position, Args&&... args);
constexpr iterator insert(const_iterator position, const T& x);
constexpr iterator insert(const_iterator position, T&& x);
constexpr iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
constexpr iterator insert(const_iterator position,
                        InputIterator first, InputIterator last);
template<container-compatible-range<T> R>
constexpr iterator insert_range(const_iterator position, R&& rg);
constexpr iterator insert(const_iterator position, initializer_list<T> il);
constexpr iterator erase(const_iterator position);
constexpr iterator erase(const_iterator first, const_iterator last);
constexpr void swap(vector&)
    noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value ||
              allocator_traits<Allocator>::is_always_equal::value);
constexpr void clear() noexcept;
};

template<class InputIterator, class Allocator = allocator<iter-value-type<InputIterator>>>
vector(InputIterator, InputIterator, Allocator = Allocator())
-> vector<iter-value-type<InputIterator>, Allocator>;
template<ranges::input_range R, class Allocator = allocator<ranges::range_value_t<R>>>
vector(from_range_t, R&&, Allocator = Allocator())
-> vector<ranges::range_value_t<R>, Allocator>;
}

```

- ⁴ An incomplete type T may be used when instantiating `vector` if the allocator meets the allocator completeness requirements (16.4.4.6.2). T shall be complete before any member of the resulting specialization of `vector` is referenced.

24.3.11.2 Constructors

[`vector.cons`]

`constexpr explicit vector(const Allocator&) noexcept;`

¹ *Effects:* Constructs an empty `vector`, using the specified allocator.

² *Complexity:* Constant.

`constexpr explicit vector(size_type n, const Allocator& = Allocator());`

³ *Preconditions:* T is *Cpp17DefaultInsertable* into `*this`.

⁴ *Effects:* Constructs a `vector` with n default-inserted elements using the specified allocator.

⁵ *Complexity:* Linear in n.

`constexpr vector(size_type n, const T& value,
 const Allocator& = Allocator());`

⁶ *Preconditions:* T is *Cpp17CopyInsertable* into `*this`.

⁷ *Effects:* Constructs a `vector` with n copies of `value`, using the specified allocator.

⁸ *Complexity:* Linear in n.

`template<class InputIterator>
constexpr vector(InputIterator first, InputIterator last,
 const Allocator& = Allocator());`

⁹ *Effects:* Constructs a `vector` equal to the range [first, last), using the specified allocator.

¹⁰ *Complexity:* Makes only N calls to the copy constructor of T (where N is the distance between `first` and `last`) and no reallocations if iterators `first` and `last` are of forward, bidirectional, or random access categories. It makes order N calls to the copy constructor of T and order log N reallocations if they are just input iterators.

`template<container-compatible-range<T> R>
constexpr vector(from_range_t, R&& rg, const Allocator& = Allocator());`

¹¹ *Effects:* Constructs a `vector` object with the elements of the range `rg`, using the specified allocator.

12 *Complexity:* Initializes exactly N elements from the results of dereferencing successive iterators of `rg`, where N is `ranges::distance(rg)`. Performs no reallocations if `R` models `ranges::forward_range` or `ranges::sized_range`; otherwise, performs order $\log N$ reallocations and order N calls to the copy or move constructor of `T`.

24.3.11.3 Capacity

[`vector.capacity`]

```
constexpr size_type capacity() const noexcept;
```

1 *Returns:* The total number of elements that the vector can hold without requiring reallocation.

2 *Complexity:* Constant time.

```
constexpr void reserve(size_type n);
```

3 *Preconditions:* `T` is *Cpp17MoveInsertable* into `*this`.

4 *Effects:* A directive that informs a `vector` of a planned change in size, so that it can manage the storage allocation accordingly. After `reserve()`, `capacity()` is greater or equal to the argument of `reserve` if reallocation happens; and equal to the previous value of `capacity()` otherwise. Reallocation happens at this point if and only if the current capacity is less than the argument of `reserve()`. If an exception is thrown other than by the move constructor of a non-*Cpp17CopyInsertable* type, there are no effects.

5 *Throws:* `length_error` if $n > \max_size()$.²¹²

6 *Complexity:* It does not change the size of the sequence and takes at most linear time in the size of the sequence.

7 *Remarks:* Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator.

NOTE 1: If no reallocation happens, they remain valid.

No reallocation shall take place during insertions that happen after a call to `reserve()` until an insertion would make the size of the vector greater than the value of `capacity()`.

```
constexpr void shrink_to_fit();
```

8 *Preconditions:* `T` is *Cpp17MoveInsertable* into `*this`.

9 *Effects:* `shrink_to_fit` is a non-binding request to reduce `capacity()` to `size()`.

NOTE 2: The request is non-binding to allow latitude for implementation-specific optimizations.

It does not increase `capacity()`, but may reduce `capacity()` by causing reallocation. If an exception is thrown other than by the move constructor of a non-*Cpp17CopyInsertable* `T` there are no effects.

10 *Complexity:* If reallocation happens, linear in the size of the sequence.

11 *Remarks:* Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence as well as the past-the-end iterator.

NOTE 3: If no reallocation happens, they remain valid.

```
constexpr void swap(vector& x)
    noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value ||
              allocator_traits<Allocator>::is_always_equal::value);
```

12 *Effects:* Exchanges the contents and `capacity()` of `*this` with that of `x`.

13 *Complexity:* Constant time.

```
constexpr void resize(size_type sz);
```

14 *Preconditions:* `T` is *Cpp17MoveInsertable* and *Cpp17DefaultInsertable* into `*this`.

15 *Effects:* If $sz < \text{size}()$, erases the last $\text{size}() - sz$ elements from the sequence. Otherwise, appends $sz - \text{size}()$ default-inserted elements to the sequence.

16 *Remarks:* If an exception is thrown other than by the move constructor of a non-*Cpp17CopyInsertable* `T` there are no effects.

²¹²) `reserve()` uses `Allocator::allocate()` which can throw an appropriate exception.

```
constexpr void resize(size_type sz, const T& c);
17  Preconditions: T is Cpp17CopyInsertable into *this.
18  Effects: If sz < size(), erases the last size() - sz elements from the sequence. Otherwise, appends sz - size() copies of c to the sequence.
19  Remarks: If an exception is thrown there are no effects.
```

24.3.11.4 Data

[vector.data]

```
constexpr T*      data() noexcept;
constexpr const T* data() const noexcept;
```

1 *Returns:* A pointer such that [data(), data() + size()] is a valid range. For a non-empty vector, data() == addressof(front()).

2 *Complexity:* Constant time.

24.3.11.5 Modifiers

[vector.modifiers]

```
constexpr iterator insert(const_iterator position, const T& x);
constexpr iterator insert(const_iterator position, T&& x);
constexpr iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
constexpr iterator insert(const_iterator position, InputIterator first, InputIterator last);
template<container-compatible-range<T> R>
constexpr iterator insert_range(const_iterator position, R&& rg);
constexpr iterator insert(const_iterator position, initializer_list<T>);

template<class... Args> constexpr reference emplace_back(Args&&... args);
template<class... Args> constexpr iterator emplace(const_iterator position, Args&&... args);
constexpr void push_back(const T& x);
constexpr void push_back(T&& x);
template<container-compatible-range<T> R>
constexpr void append_range(R&& rg);
```

1 *Complexity:* If reallocation happens, linear in the number of elements of the resulting vector; otherwise, linear in the number of elements inserted plus the distance to the end of the vector.

2 *Remarks:* Causes reallocation if the new size is greater than the old capacity. Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator. If no reallocation happens, then references, pointers, and iterators before the insertion point remain valid but those at or after the insertion point, including the past-the-end iterator, are invalidated. If an exception is thrown other than by the copy constructor, move constructor, assignment operator, or move assignment operator of T or by any *InputIterator* operation there are no effects. If an exception is thrown while inserting a single element at the end and T is *Cpp17CopyInsertable* or *is_nothrow_move_constructible_v<T>* is true, there are no effects. Otherwise, if an exception is thrown by the move constructor of a non-*Cpp17CopyInsertable* T, the effects are unspecified.

```
constexpr iterator erase(const_iterator position);
constexpr iterator erase(const_iterator first, const_iterator last);
constexpr void pop_back();
```

3 *Effects:* Invalidates iterators and references at or after the point of the erase.

4 *Throws:* Nothing unless an exception is thrown by the assignment operator or move assignment operator of T.

5 *Complexity:* The destructor of T is called the number of times equal to the number of the elements erased, but the assignment operator of T is called the number of times equal to the number of elements in the vector after the erased elements.

24.3.11.6 Erasure

[vector.erasure]

```
template<class T, class Allocator, class U>
constexpr typename vector<T, Allocator>::size_type
erase(vector<T, Allocator>& c, const U& value);
```

1 *Effects:* Equivalent to:

```

    auto it = remove(c.begin(), c.end(), value);
    auto r = distance(it, c.end());
    c.erase(it, c.end());
    return r;

template<class T, class Allocator, class Predicate>
constexpr typename vector<T, Allocator>::size_type
erase_if(vector<T, Allocator>& c, Predicate pred);

```

2 Effects: Equivalent to:

```

    auto it = remove_if(c.begin(), c.end(), pred);
    auto r = distance(it, c.end());
    c.erase(it, c.end());
    return r;

```

24.3.12 Specialization of vector for bool

[vector.bool]

24.3.12.1 Partial class template specialization `vector<bool, Allocator>` [vector.bool.pspc]

1 To optimize space allocation, a partial specialization of `vector` for `bool` elements is provided:

```

namespace std {
    template<class Allocator>
    class vector<bool, Allocator> {
public:
    // types
    using value_type          = bool;
    using allocator_type       = Allocator;
    using pointer              = implementation-defined;
    using const_pointer        = implementation-defined;
    using const_reference      = bool;
    using size_type            = implementation-defined; // see 24.2
    using difference_type     = implementation-defined; // see 24.2
    using iterator             = implementation-defined; // see 24.2
    using const_iterator        = implementation-defined; // see 24.2
    using reverse_iterator     = std::reverse_iterator<iterator>;
    using const_reverse_iterator = std::reverse_iterator<const_iterator>;

    // bit reference
    class reference {
        friend class vector;
        constexpr reference() noexcept;

public:
        constexpr reference(const reference&) = default;
        constexpr ~reference();
        constexpr operator bool() const noexcept;
        constexpr reference& operator=(bool x) noexcept;
        constexpr reference& operator=(const reference& x) noexcept;
        constexpr const reference& operator=(bool x) const noexcept;
        constexpr void flip() noexcept; // flips the bit
    };

    // construct/copy/destroy
    constexpr vector() noexcept(noexcept(Allocator())) : vector(Allocator()) { }
    constexpr explicit vector(const Allocator&) noexcept;
    constexpr explicit vector(size_type n, const Allocator& = Allocator());
    constexpr vector(size_type n, const bool& value, const Allocator& = Allocator());
    template<class InputIterator>
        constexpr vector(InputIterator first, InputIterator last, const Allocator& = Allocator());
    template<container-compatible-range<bool> R>
        constexpr vector(from_range_t, R&& rg, const Allocator& = Allocator());
    constexpr vector(const vector& x);
    constexpr vector(vector&& x) noexcept;
    constexpr vector(const vector&, const type_identity_t<Allocator>&);
    constexpr vector(vector&&, const type_identity_t<Allocator>&);
}

```

```

constexpr vector(initializer_list<bool>, const Allocator& = Allocator());
constexpr ~vector();
constexpr vector& operator=(const vector& x);
constexpr vector& operator=(vector&& x)
    noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value || 
              allocator_traits<Allocator>::is_always_equal::value);
constexpr vector& operator=(initializer_list<bool>);
template<class InputIterator>
    constexpr void assign(InputIterator first, InputIterator last);
template<container-compatible-range<bool> R>
    constexpr void assign_range(R&& rg);
constexpr void assign(size_type n, const bool& t);
constexpr void assign(initializer_list<bool>);
constexpr allocator_type get_allocator() const noexcept;

// iterators
constexpr iterator begin() noexcept;
constexpr const_iterator begin() const noexcept;
constexpr iterator end() noexcept;
constexpr const_iterator end() const noexcept;
constexpr reverse_iterator rbegin() noexcept;
constexpr const_reverse_iterator rbegin() const noexcept;
constexpr reverse_iterator rend() noexcept;
constexpr const_reverse_iterator rend() const noexcept;

constexpr const_iterator cbegin() const noexcept;
constexpr const_iterator cend() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept;
constexpr const_reverse_iterator crend() const noexcept;

// capacity
[[nodiscard]] constexpr bool empty() const noexcept;
constexpr size_type size() const noexcept;
constexpr size_type max_size() const noexcept;
constexpr size_type capacity() const noexcept;
constexpr void resize(size_type sz, bool c = false);
constexpr void reserve(size_type n);
constexpr void shrink_to_fit();

// element access
constexpr reference operator[](size_type n);
constexpr const_reference operator[](size_type n) const;
constexpr const_reference at(size_type n) const;
constexpr reference at(size_type n);
constexpr reference front();
constexpr const_reference front() const;
constexpr reference back();
constexpr const_reference back() const;

// modifiers
template<class... Args> constexpr reference emplace_back(Args&&... args);
constexpr void push_back(const bool& x);
template<container-compatible-range<bool> R>
    constexpr void append_range(R&& rg);
constexpr void pop_back();
template<class... Args> constexpr iterator emplace(const_iterator position, Args&&... args);
constexpr iterator insert(const_iterator position, const bool& x);
constexpr iterator insert(const_iterator position, size_type n, const bool& x);
template<class InputIterator>
    constexpr iterator insert(const_iterator position,
                           InputIterator first, InputIterator last);
template<container-compatible-range<bool> R>
    constexpr iterator insert_range(const_iterator position, R&& rg);
constexpr iterator insert(const_iterator position, initializer_list<bool> il);

```

```

    constexpr iterator erase(const_iterator position);
    constexpr iterator erase(const_iterator first, const_iterator last);
    constexpr void swap(vector&)
        noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value || 
                  allocator_traits<Allocator>::is_always_equal::value);
    static constexpr void swap(reference x, reference y) noexcept;
    constexpr void flip() noexcept;      // flips all bits
    constexpr void clear() noexcept;
};

}

```

- 2 Unless described below, all operations have the same requirements and semantics as the primary `vector` template, except that operations dealing with the `bool` value type map to bit values in the container storage and `allocator_traits::construct` (20.2.9.3) is not used to construct these values.
- 3 There is no requirement that the data be stored as a contiguous allocation of `bool` values. A space-optimized representation of bits is recommended instead.
- 4 `reference` is a class that simulates the behavior of references of a single bit in `vector<bool>`. The conversion function returns `true` when the bit is set, and `false` otherwise. The assignment operators set the bit when the argument is (convertible to) `true` and clear it otherwise. `flip` reverses the state of the bit.

`constexpr void flip() noexcept;`

- 5 *Effects:* Replaces each element in the container with its complement.

`static constexpr void swap(reference x, reference y) noexcept;`

- 6 *Effects:* Exchanges the contents of `x` and `y` as if by:

```

    bool b = x;
    x = y;
    y = b;

```

`template<class Allocator> struct hash<vector<bool, Allocator>>;`

- 7 The specialization is enabled (22.10.19).

`template<class T>
constexpr bool is-vector-bool-reference = see below;`

- 8 The expression `is-vector-bool-reference<T>` is true if `T` denotes the type `vector<bool, Alloc>::reference` for some type `Alloc` and `vector<bool, Alloc>` is not a program-defined specialization.

24.3.12.2 Formatter specialization for `vector<bool>`

[`vector.bool(fmt)`]

```

namespace std {
    template<class T, class charT>
        requires is-vector-bool-reference<T>
    struct formatter<T, charT> {
        private:
            formatter<bool, charT> underlying_;           // exposition only

        public:
            template<class ParseContext>
                constexpr typename ParseContext::iterator
                    parse(ParseContext& ctx);

            template<class FormatContext>
                typename FormatContext::iterator
                    format(const T& ref, FormatContext& ctx) const;
    };
}

template<class ParseContext>
constexpr typename ParseContext::iterator
parse(ParseContext& ctx);

```

- 1 Equivalent to: `return underlying_.parse(ctx);`

```

template<class FormatContext>
typename FormatContext::iterator
format(const T& ref, FormatContext& ctx) const;
2 Equivalent to: return underlying_.format(ref, ctx);

```

24.4 Associative containers

[associative]

24.4.1 In general

[associative.general]

- ¹ The header <map> defines the class templates `map` and `multimap`; the header <set> defines the class templates `set` and `multiset`.
- 2 The following exposition-only alias templates may appear in deduction guides for associative containers:

```

template<class InputIterator>
using iter-value-type =
    typename iterator_traits<InputIterator>::value_type; // exposition only
template<class InputIterator>
using iter-key-type = remove_const_t<
    tuple_element_t<0, iter-value-type<InputIterator>>>; // exposition only
template<class InputIterator>
using iter-mapped-type =
    tuple_element_t<1, iter-value-type<InputIterator>>; // exposition only
template<class InputIterator>
using iter-to-alloc-type = pair<
    add_const_t<tuple_element_t<0, iter-value-type<InputIterator>>>,
    tuple_element_t<1, iter-value-type<InputIterator>>>; // exposition only
template<ranges::input_range Range>
using range-key-type =
    remove_const_t<typename ranges::range_value_t<Range>::first_type>; // exposition only
template<ranges::input_range Range>
using range-mapped-type = typename ranges::range_value_t<Range>::second_type; // exposition only
template<ranges::input_range Range>
using range-to-alloc-type =
    pair<add_const_t<typename ranges::range_value_t<Range>::first_type>,
        typename ranges::range_value_t<Range>::second_type>; // exposition only

```

24.4.2 Header <map> synopsis

[associative.map.syn]

```

#include <compare> // see 17.11.1
#include <initializer_list> // see 17.10.2

namespace std {
// 24.4.4, class template map
    template<class Key, class T, class Compare = less<Key>,
             class Allocator = allocator<pair<const Key, T>>>
        class map;

    template<class Key, class T, class Compare, class Allocator>
        bool operator==(const map<Key, T, Compare, Allocator>& x,
                          const map<Key, T, Compare, Allocator>& y);
    template<class Key, class T, class Compare, class Allocator>
        synth-three-way-result<pair<const Key, T>>
        operator<=>(const map<Key, T, Compare, Allocator>& x,
                      const map<Key, T, Compare, Allocator>& y);

    template<class Key, class T, class Compare, class Allocator>
        void swap(map<Key, T, Compare, Allocator>& x,
                  map<Key, T, Compare, Allocator>& y)
            noexcept(noexcept(x.swap(y)));
}

// 24.4.4.5, erasure for map
template<class Key, class T, class Compare, class Allocator, class Predicate>
    typename map<Key, T, Compare, Allocator>::size_type
        erase_if(map<Key, T, Compare, Allocator>& c, Predicate pred);

```

```

// 24.4.5, class template multimap
template<class Key, class T, class Compare = less<Key>,
         class Allocator = allocator<pair<const Key, T>>>
class multimap;

template<class Key, class T, class Compare, class Allocator>
bool operator==(const multimap<Key, T, Compare, Allocator>& x,
                  const multimap<Key, T, Compare, Allocator>& y);
template<class Key, class T, class Compare, class Allocator>
synth-three-way-result<pair<const Key, T>>
operator<=>(const multimap<Key, T, Compare, Allocator>& x,
              const multimap<Key, T, Compare, Allocator>& y);

template<class Key, class T, class Compare, class Allocator>
void swap(multimap<Key, T, Compare, Allocator>& x,
          multimap<Key, T, Compare, Allocator>& y)
noexcept(noexcept(x.swap(y)));

// 24.4.5.4, erasure for multimap
template<class Key, class T, class Compare, class Allocator, class Predicate>
typename multimap<Key, T, Compare, Allocator>::size_type
erase_if(multimap<Key, T, Compare, Allocator>& c, Predicate pred);

namespace pmr {
    template<class Key, class T, class Compare = less<Key>>
    using map = std::map<Key, T, Compare,
                         polymorphic_allocator<pair<const Key, T>>>;
    template<class Key, class T, class Compare = less<Key>>
    using multimap = std::multimap<Key, T, Compare,
                                    polymorphic_allocator<pair<const Key, T>>>;
}
}

```

24.4.3 Header <set> synopsis

[associative.set.syn]

```

#include <compare>           // see 17.11.1
#include <initializer_list>   // see 17.10.2

namespace std {
    // 24.4.6, class template set
    template<class Key, class Compare = less<Key>, class Allocator = allocator<Key>>
    class set;

    template<class Key, class Compare, class Allocator>
    bool operator==(const set<Key, Compare, Allocator>& x,
                      const set<Key, Compare, Allocator>& y);
    template<class Key, class Compare, class Allocator>
    synth-three-way-result<Key> operator<=>(const set<Key, Compare, Allocator>& x,
                                                const set<Key, Compare, Allocator>& y);

    template<class Key, class Compare, class Allocator>
    void swap(set<Key, Compare, Allocator>& x,
              set<Key, Compare, Allocator>& y)
    noexcept(noexcept(x.swap(y)));
}

// 24.4.6.3, erasure for set
template<class Key, class Compare, class Allocator, class Predicate>
typename set<Key, Compare, Allocator>::size_type
erase_if(set<Key, Compare, Allocator>& c, Predicate pred);

// 24.4.7, class template multiset
template<class Key, class Compare = less<Key>, class Allocator = allocator<Key>>
class multiset;

```

```

template<class Key, class Compare, class Allocator>
bool operator==(const multiset<Key, Compare, Allocator>& x,
                  const multiset<Key, Compare, Allocator>& y);
template<class Key, class Compare, class Allocator>
synth-three-way-result<Key> operator<=>(const multiset<Key, Compare, Allocator>& x,
                                              const multiset<Key, Compare, Allocator>& y);

template<class Key, class Compare, class Allocator>
void swap(multiset<Key, Compare, Allocator>& x,
          multiset<Key, Compare, Allocator>& y)
    noexcept(noexcept(x.swap(y)));
// 24.4.7.3, erasure for multiset
template<class Key, class Compare, class Allocator, class Predicate>
typename multiset<Key, Compare, Allocator>::size_type
erase_if(multiset<Key, Compare, Allocator>& c, Predicate pred);

namespace pmr {
    template<class Key, class Compare = less<Key>>
    using set = std::set<Key, Compare, polymorphic_allocator<Key>>;
    template<class Key, class Compare = less<Key>>
    using multiset = std::multiset<Key, Compare, polymorphic_allocator<Key>>;
}
}

```

24.4.4 Class template `map`

[map]

24.4.4.1 Overview

[map.overview]

- ¹ A `map` is an associative container that supports unique keys (i.e., contains at most one of each key value) and provides for fast retrieval of values of another type `T` based on the keys. The `map` class supports bidirectional iterators.
- 2 A `map` meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), and of an associative container (24.2.7). A `map` also provides most operations described in 24.2.7 for unique keys. This means that a `map` supports the `a_uniq` operations in 24.2.7 but not the `a_eq` operations. For a `map<Key,T>` the `key_type` is `Key` and the `value_type` is `pair<const Key, T>`. Descriptions are provided here only for operations on `map` that are not described in one of those tables or for operations where there is additional semantic information.

```

namespace std {
    template<class Key, class T, class Compare = less<Key>,
             class Allocator = allocator<pair<const Key, T>>>
    class map {
        public:
            // types
            using key_type           = Key;
            using mapped_type         = T;
            using value_type          = pair<const Key, T>;
            using key_compare          = Compare;
            using allocator_type       = Allocator;
            using pointer              = typename allocator_traits<Allocator>::pointer;
            using const_pointer         = typename allocator_traits<Allocator>::const_pointer;
            using reference             = value_type&;
            using const_reference       = const value_type&;
            using size_type             = implementation-defined; // see 24.2
            using difference_type       = implementation-defined; // see 24.2
            using iterator              = implementation-defined; // see 24.2
            using const_iterator         = implementation-defined; // see 24.2
            using reverse_iterator       = std::reverse_iterator<iterator>;
            using const_reverse_iterator = std::reverse_iterator<const_iterator>;
            using node_type             = unspecified;
            using insert_return_type     = insert-return-type<iterator, node_type>;
    }
}

```

```

class value_compare {
    friend class map;
protected:
    Compare comp;
    value_compare(Compare c) : comp(c) {}

public:
    bool operator()(const value_type& x, const value_type& y) const {
        return comp(x.first, y.first);
    }

}

```

24.4.4.2 Constructors, copy, and assignment

[map.cons]

```
explicit map(const Compare& comp, const Allocator& = Allocator());
```

1 *Effects:* Constructs an empty `map` using the specified comparison object and allocator.

2 *Complexity:* Constant.

```
template<class InputIterator>
map(InputIterator first, InputIterator last,
     const Compare& comp = Compare(), const Allocator& = Allocator());
```

3 *Effects:* Constructs an empty `map` using the specified comparison object and allocator, and inserts elements from the range `[first, last)`.

4 *Complexity:* Linear in N if the range `[first, last)` is already sorted with respect to `comp` and otherwise $N \log N$, where N is `last - first`.

```
template<container-compatible-range<value_type> R>
map(from_range_t, R&& rg, const Compare& comp = Compare(), const Allocator& = Allocator());
```

5 *Effects:* Constructs an empty `map` using the specified comparison object and allocator, and inserts elements from the range `rg`.

6 *Complexity:* Linear in N if `rg` is already sorted with respect to `comp` and otherwise $N \log N$, where N is `ranges::distance(rg)`.

24.4.4.3 Element access

[map.access]

```
mapped_type& operator[](const key_type& x);
```

1 *Effects:* Equivalent to: `return try_emplace(x).first->second;`

```
mapped_type& operator[](key_type&& x);
```

2 *Effects:* Equivalent to: `return try_emplace(std::move(x)).first->second;`

```
mapped_type& at(const key_type& x);
const mapped_type& at(const key_type& x) const;
```

3 *Returns:* A reference to the `mapped_type` corresponding to `x` in `*this`.

4 *Throws:* An exception object of type `out_of_range` if no such element is present.

5 *Complexity:* Logarithmic.

24.4.4.4 Modifiers

[map.modifiers]

```
template<class P>
pair<iterator, bool> insert(P&& x);
template<class P>
iterator insert(const_iterator position, P&& x);
```

1 *Constraints:* `is_constructible_v<value_type, P&&>` is `true`.

2 *Effects:* The first form is equivalent to `return emplace(std::forward<P>(x))`. The second form is equivalent to `return emplace_hint(position, std::forward<P>(x))`.

```
template<class... Args>
pair<iterator, bool> try_emplace(const key_type& k, Args&&... args);
template<class... Args>
iterator try_emplace(const_iterator hint, const key_type& k, Args&&... args);
```

3 *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into `map` from `piecewise_construct`, `forward_as_tuple(k)`, `forward_as_tuple(std::forward<Args>(args)...`.

4 *Effects:* If the map already contains an element whose key is equivalent to `k`, there is no effect. Otherwise inserts an object of type `value_type` constructed with `piecewise_construct`, `forward_as_tuple(k)`, `forward_as_tuple(std::forward<Args>(args)...`.

5 *Returns:* In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

6 *Complexity:* The same as `emplace` and `emplace_hint`, respectively.

```

template<class... Args>
pair<iterator, bool> try_emplace(key_type&& k, Args&&... args);
template<class... Args>
iterator try_emplace(const_iterator hint, key_type&& k, Args&&... args);

7   Preconditions: value_type is Cpp17EmplaceConstructible into map from piecewise_construct, forward_as_tuple(std::move(k)), forward_as_tuple(std::forward<Args>(args)...).

8   Effects: If the map already contains an element whose key is equivalent to k, there is no effect. Otherwise inserts an object of type value_type constructed with piecewise_construct, forward_as_tuple(std::move(k)), forward_as_tuple(std::forward<Args>(args)...).

9   Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to k.

10  Complexity: The same as emplace and emplace_hint, respectively.

template<class M>
pair<iterator, bool> insert_or_assign(const key_type& k, M&& obj);
template<class M>
iterator insert_or_assign(const_iterator hint, const key_type& k, M&& obj);

11  Mandates: is_assignable_v<mapped_type&, M&&> is true.

12  Preconditions: value_type is Cpp17EmplaceConstructible into map from k, std::forward<M>(obj).

13  Effects: If the map already contains an element e whose key is equivalent to k, assigns std::forward<M>(obj) to e.second. Otherwise inserts an object of type value_type constructed with k, std::forward<M>(obj).

14  Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to k.

15  Complexity: The same as emplace and emplace_hint, respectively.

template<class M>
pair<iterator, bool> insert_or_assign(key_type&& k, M&& obj);
template<class M>
iterator insert_or_assign(const_iterator hint, key_type&& k, M&& obj);

16  Mandates: is_assignable_v<mapped_type&, M&&> is true.

17  Preconditions: value_type is Cpp17EmplaceConstructible into map from std::move(k), std::forward<M>(obj).

18  Effects: If the map already contains an element e whose key is equivalent to k, assigns std::forward<M>(obj) to e.second. Otherwise inserts an object of type value_type constructed with std::move(k), std::forward<M>(obj).

19  Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to k.

20  Complexity: The same as emplace and emplace_hint, respectively.

```

24.4.4.5 Erasure

[map.erasure]

```

template<class Key, class T, class Compare, class Allocator, class Predicate>
typename map<Key, T, Compare, Allocator>::size_type
erase_if(map<Key, T, Compare, Allocator>& c, Predicate pred);

1   Effects: Equivalent to:
    auto original_size = c.size();
    for (auto i = c.begin(), last = c.end(); i != last; ) {
        if (pred(*i)) {
            i = c.erase(i);
        } else {
            ++i;
        }
    }
    return original_size - c.size();

```

24.4.5 Class template `multimap`

[`multimap`]

24.4.5.1 Overview

[`multimap.overview`]

- ¹ A `multimap` is an associative container that supports equivalent keys (i.e., possibly containing multiple copies of the same key value) and provides for fast retrieval of values of another type `T` based on the keys. The `multimap` class supports bidirectional iterators.
- 2 A `multimap` meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), and of an associative container (24.2.7). A `multimap` also provides most operations described in 24.2.7 for equal keys. This means that a `multimap` supports the `a_eq` operations in 24.2.7 but not the `a_uniq` operations. For a `multimap<Key, T>` the `key_type` is `Key` and the `value_type` is `pair<const Key, T>`. Descriptions are provided here only for operations on `multimap` that are not described in one of those tables or for operations where there is additional semantic information.

```

namespace std {
    template<class Key, class T, class Compare = less<Key>,
              class Allocator = allocator<pair<const Key, T>>>
    class multimap {
        public:
            // types
            using key_type           = Key;
            using mapped_type         = T;
            using value_type          = pair<const Key, T>;
            using key_compare         = Compare;
            using allocator_type      = Allocator;
            using pointer              = typename allocator_traits<Allocator>::pointer;
            using const_pointer        = typename allocator_traits<Allocator>::const_pointer;
            using reference             = value_type&;
            using const_reference      = const value_type&;

24.4.5.2 Constructors

[multimap.cons]

```
explicit multimap(const Compare& comp, const Allocator& = Allocator());
```

1 *Effects*: Constructs an empty `multimap` using the specified comparison object and allocator.

2 *Complexity*: Constant.

```

template<class InputIterator>
multimap(InputIterator first, InputIterator last,
         const Compare& comp = Compare(),
         const Allocator& = Allocator());

```

3 *Effects*: Constructs an empty `multimap` using the specified comparison object and allocator, and inserts elements from the range `[first, last)`.

4 *Complexity*: Linear in N if the range `[first, last)` is already sorted with respect to `comp` and otherwise $N \log N$, where N is `last - first`.

```
template<container-compatible-range<value_type> R>
multimap(from_range_t, R&& rg, const Compare& comp = Compare(), const Allocator& = Allocator());
```

5 *Effects*: Constructs an empty `multimap` using the specified comparison object and allocator, and inserts elements from the range `rg`.

6 *Complexity*: Linear in N if `rg` is already sorted with respect to `comp` and otherwise $N \log N$, where N is `ranges::distance(rg)`.

24.4.5.3 Modifiers

[multimap.modifiers]

```
template<class P> iterator insert(P&& x);
template<class P> iterator insert(const_iterator position, P&& x);
```

1 *Constraints*: `is_constructible_v<value_type, P&&>` is true.

2 *Effects*: The first form is equivalent to `return emplace(std::forward<P>(x))`. The second form is equivalent to `return emplace_hint(position, std::forward<P>(x))`.

24.4.5.4 Erasure

[multimap.erasure]

```
template<class Key, class T, class Compare, class Allocator, class Predicate>
typename multimap<Key, T, Compare, Allocator>::size_type
erase_if(multimap<Key, T, Compare, Allocator>& c, Predicate pred);
```

1 *Effects*: Equivalent to:

```

auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {

```

```

        ++i;
    }
}

return original_size - c.size();

```

24.4.6 Class template set

[set]

24.4.6.1 Overview

[set.overview]

- ¹ A **set** is an associative container that supports unique keys (i.e., contains at most one of each key value) and provides for fast retrieval of the keys themselves. The **set** class supports bidirectional iterators.
- ² A **set** meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), and of an associative container (24.2.7). A **set** also provides most operations described in 24.2.7 for unique keys. This means that a **set** supports the **a_uniq** operations in 24.2.7 but not the **a_eq** operations. For a **set<Key>** both the **key_type** and **value_type** are **Key**. Descriptions are provided here only for operations on **set** that are not described in one of these tables and for operations where there is additional semantic information.

```

namespace std {
    template<class Key, class Compare = less<Key>,
              class Allocator = allocator<Key>>
    class set {
        public:
            // types
            using key_type           = Key;
            using key_compare         = Compare;
            using value_type          = Key;
            using value_compare        = Compare;
            using allocator_type      = Allocator;
            using pointer              = typename allocator_traits<Allocator>::pointer;
            using const_pointer         = typename allocator_traits<Allocator>::const_pointer;
            using reference             = value_type&;
            using const_reference       = const value_type&;
            using size_type             = implementation-defined; // see 24.2
            using difference_type       = implementation-defined; // see 24.2
            using iterator              = implementation-defined; // see 24.2
            using const_iterator         = implementation-defined; // see 24.2
            using reverse_iterator       = std::reverse_iterator<iterator>;

24.4.6.2 Constructors, copy, and assignment

[set.cons]

```
explicit set(const Compare& comp, const Allocator& = Allocator());
```

1 *Effects*: Constructs an empty `set` using the specified comparison object and allocator.

2 *Complexity*: Constant.

```
template<class InputIterator>
    set(InputIterator first, InputIterator last,
        const Compare& comp = Compare(), const Allocator& = Allocator());
```

3 *Effects*: Constructs an empty `set` using the specified comparison object and allocator, and inserts elements from the range `[first, last)`.

4 *Complexity*: Linear in N if the range `[first, last)` is already sorted with respect to `comp` and otherwise $N \log N$, where N is `last - first`.

```
template<container-compatible-range<value_type> R>
    set(from_range_t, R&& rg, const Compare& comp = Compare(), const Allocator& = Allocator());
```

5 *Effects*: Constructs an empty `set` using the specified comparison object and allocator, and inserts elements from the range `rg`.

6 *Complexity*: Linear in N if `rg` is already sorted with respect to `comp` and otherwise $N \log N$, where N is `ranges::distance(rg)`.

24.4.6.3 Erasure

[set.erasure]

```
template<class Key, class Compare, class Allocator, class Predicate>
    typename set<Key, Compare, Allocator>::size_type
        erase_if(set<Key, Compare, Allocator>& c, Predicate pred);
```

1 *Effects*: Equivalent to:

```
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
}
return original_size - c.size();
```

24.4.7 Class template `multiset`

[multiset]

24.4.7.1 Overview

[multiset.overview]

- 1 A `multiset` is an associative container that supports equivalent keys (i.e., possibly contains multiple copies of the same key value) and provides for fast retrieval of the keys themselves. The `multiset` class supports bidirectional iterators.
- 2 A `multiset` meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), of an associative container (24.2.7). `multiset` also provides most operations described in 24.2.7 for duplicate keys. This means that a `multiset` supports the `a_eq` operations in 24.2.7 but not the `a_uniq` operations. For a `multiset<Key>` both the `key_type` and `value_type` are `Key`. Descriptions are provided here only for operations on `multiset` that are not described in one of these tables and for operations where there is additional semantic information.

```
namespace std {
    template<class Key, class Compare = less<Key>,
              class Allocator = allocator<Key>>
    class multiset {
        public:
            // types
            using key_type           = Key;

```

24.4.7.2 Constructors

[multiset.cons]

```
explicit multiset(const Compare& comp, const Allocator& = Allocator());
```

1 *Effects*: Constructs an empty `multiset` using the specified comparison object and allocator.

2 *Complexity*: Constant.

```
template<class InputIterator>
multiset(InputIterator first, InputIterator last,
         const Compare& comp = Compare(), const Allocator& = Allocator());
```

3 *Effects*: Constructs an empty `multiset` using the specified comparison object and allocator, and inserts elements from the range `[first, last)`.

4 *Complexity*: Linear in N if the range `[first, last)` is already sorted with respect to `comp` and otherwise $N \log N$, where N is `last - first`.

```
template<container-compatible-range<value_type> R>
multiset(from_range_t, R&& rg, const Compare& comp = Compare(), const Allocator& = Allocator());
```

5 *Effects*: Constructs an empty `multiset` using the specified comparison object and allocator, and inserts elements from the range `rg`.

6 *Complexity:* Linear in N if `rg` is already sorted with respect to `comp` and otherwise $N \log N$, where N is `ranges::distance(rg)`.

24.4.7.3 Erasure

[`multiset.erasure`]

```
template<class Key, class Compare, class Allocator, class Predicate>
typename multiset<Key, Compare, Allocator>::size_type
erase_if(multiset<Key, Compare, Allocator>& c, Predicate pred);
```

1 *Effects:* Equivalent to:

```
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
}
return original_size - c.size();
```

24.5 Unordered associative containers

[`unord`]

24.5.1 In general

[`unord.general`]

- 1 The header `<unordered_map>` defines the class templates `unordered_map` and `unordered_multimap`; the header `<unordered_set>` defines the class templates `unordered_set` and `unordered_multiset`.
- 2 The exposition-only alias templates `iter-value-type`, `iter-key-type`, `iter-mapped-type`, `iter-to-alloc-type`, `range-key-type`, `range-mapped-type`, and `range-to-alloc-type` defined in 24.4.1 may appear in deduction guides for unordered containers.

24.5.2 Header `<unordered_map>` synopsis

[`unord.map.syn`]

```
#include <compare>           // see 17.11.1
#include <initializer_list>   // see 17.10.2

namespace std {
    // 24.5.4, class template unordered_map
    template<class Key,
              class T,
              class Hash = hash<Key>,

24.5.4 Class template `unordered_map`

[unord.map]

24.5.4.1 Overview

[unord.map.overview]

- ¹ An `unordered_map` is an unordered associative container that supports unique keys (an `unordered_map` contains at most one of each key value) and that associates values of another type `mapped_type` with the keys. The `unordered_map` class supports forward iterators.
- ² An `unordered_map` meets all of the requirements of a container (24.2.2.2), of an allocator-aware container (24.2.2.5), and of an unordered associative container (24.2.8). It provides the operations described in the preceding requirements table for unique keys; that is, an `unordered_map` supports the `a_uniq` operations in that table, not the `a_eq` operations. For an `unordered_map<Key, T>` the `key_type` is `Key`, the `mapped_type` is `T`, and the `value_type` is `pair<const Key, T>`.
- ³ Subclause 24.5.4 only describes operations on `unordered_map` that are not described in one of the requirement tables, or for which there is additional semantic information.

```

namespace std {
    template<class Key,
              class T,
              class Hash = hash<Key>,
              class Pred = equal_to<Key>,
              class Allocator = allocator<pair<const Key, T>>>
        class unordered_map {
    public:
        // types
        using key_type           = Key;
        using mapped_type         = T;
        using value_type          = pair<const Key, T>;
        using hasher              = Hash;
        using key_equal           = Pred;
}
}

```

```

using allocator_type      = Allocator;
using pointer             = typename allocator_traits<Allocator>::pointer;

             Allocator)
    -> unordered_map<Key, T, Hash, equal_to<Key>, Allocator>;
}

```

- ⁴ A `size_type` parameter type in an `unordered_map` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

24.5.4.2 Constructors

[unord.map.cnstr]

```

unordered_map() : unordered_map(size_type(see below)) { }
explicit unordered_map(size_type n,
                      const hasher& hf = hasher(),
                      const key_equal& eql = key_equal(),
                      const allocator_type& a = allocator_type());

```

- ¹ *Effects:* Constructs an empty `unordered_map` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. For the default constructor, the number of buckets is implementation-defined. `max_load_factor()` returns 1.0.

- ² *Complexity:* Constant.

```

template<class InputIterator>
unordered_map(InputIterator f, InputIterator l,
              size_type n = see below,
              const hasher& hf = hasher(),
              const key_equal& eql = key_equal(),
              const allocator_type& a = allocator_type());
template<container-compatible-range<value_type> R>
unordered_map(from_range_t, R&& rg,
              size_type n = see below,
              const hasher& hf = hasher(),
              const key_equal& eql = key_equal(),
              const allocator_type& a = allocator_type());
unordered_map(initializer_list<value_type> il,
              size_type n = see below,
              const hasher& hf = hasher(),
              const key_equal& eql = key_equal(),
              const allocator_type& a = allocator_type());

```

- ³ *Effects:* Constructs an empty `unordered_map` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. If `n` is not provided, the number of buckets is implementation-defined. Then inserts elements from the range `[f, l)`, `rg`, or `il`, respectively. `max_load_factor()` returns 1.0.

- ⁴ *Complexity:* Average case linear, worst case quadratic.

24.5.4.3 Element access

[unord.map.elem]

```
mapped_type& operator[](const key_type& k);
```

- ¹ *Effects:* Equivalent to: `return try_emplace(k).first->second;`

```
mapped_type& operator[](key_type&& k);
```

- ² *Effects:* Equivalent to: `return try_emplace(std::move(k)).first->second;`

```
mapped_type& at(const key_type& k);
const mapped_type& at(const key_type& k) const;
```

- ³ *Returns:* A reference to `x.second`, where `x` is the (unique) element whose key is equivalent to `k`.

- ⁴ *Throws:* An exception object of type `out_of_range` if no such element is present.

24.5.4.4 Modifiers

[unord.map.modifiers]

```

template<class P>
pair<iterator, bool> insert(P&& obj);

```

- ¹ *Constraints:* `is_constructible_v<value_type, P&&>` is true.

2 *Effects:* Equivalent to: `return emplace(std::forward<P>(obj));`

```
template<class P>
iterator insert(const_iterator hint, P&& obj);
```

3 *Constraints:* `is_constructible_v<value_type, P&&>` is true.

4 *Effects:* Equivalent to: `return emplace_hint(hint, std::forward<P>(obj));`

```
template<class... Args>
pair<iterator, bool> try_emplace(const key_type& k, Args&&... args);
template<class... Args>
iterator try_emplace(const_iterator hint, const key_type& k, Args&&... args);
```

5 *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into `unordered_map` from `piecewise_construct, forward_as_tuple(k), forward_as_tuple(std::forward<Args>(args))...`.

6 *Effects:* If the map already contains an element whose key is equivalent to `k`, there is no effect. Otherwise inserts an object of type `value_type` constructed with `piecewise_construct, forward_as_tuple(k), forward_as_tuple(std::forward<Args>(args))...`.

7 *Returns:* In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

8 *Complexity:* The same as `emplace` and `emplace_hint`, respectively.

```
template<class... Args>
pair<iterator, bool> try_emplace(key_type&& k, Args&&... args);
template<class... Args>
iterator try_emplace(const_iterator hint, key_type&& k, Args&&... args);
```

9 *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into `unordered_map` from `piecewise_construct, forward_as_tuple(std::move(k)), forward_as_tuple(std::forward<Args>(args))...`.

10 *Effects:* If the map already contains an element whose key is equivalent to `k`, there is no effect. Otherwise inserts an object of type `value_type` constructed with `piecewise_construct, forward_as_tuple(std::move(k)), forward_as_tuple(std::forward<Args>(args))...`.

11 *Returns:* In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

12 *Complexity:* The same as `emplace` and `emplace_hint`, respectively.

```
template<class M>
pair<iterator, bool> insert_or_assign(const key_type& k, M&& obj);
template<class M>
iterator insert_or_assign(const_iterator hint, const key_type& k, M&& obj);
```

13 *Mandates:* `is_assignable_v<mapped_type&, M&&>` is true.

14 *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into `unordered_map` from `k, std::forward<M>(obj)`.

15 *Effects:* If the map already contains an element `e` whose key is equivalent to `k`, assigns `std::forward<M>(obj)` to `e.second`. Otherwise inserts an object of type `value_type` constructed with `k, std::forward<M>(obj)`.

16 *Returns:* In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

17 *Complexity:* The same as `emplace` and `emplace_hint`, respectively.

```
template<class M>
pair<iterator, bool> insert_or_assign(key_type&& k, M&& obj);
template<class M>
iterator insert_or_assign(const_iterator hint, key_type&& k, M&& obj);
```

18 *Mandates:* `is_assignable_v<mapped_type&, M&&>` is true.

19 *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into `unordered_map` from `std::move(k), std::forward<M>(obj)`.

20 *Effects:* If the map already contains an element `e` whose key is equivalent to `k`, assigns `std::forward<M>(obj)` to `e.second`. Otherwise inserts an object of type `value_type` constructed with `std::move(k)`, `std::forward<M>(obj)`.

21 *Returns:* In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

22 *Complexity:* The same as `emplace` and `emplace_hint`, respectively.

24.5.4.5 Erasure

[unord.map.erasure]

```
template<class K, class T, class H, class P, class A, class Predicate>
typename unordered_map<K, T, H, P, A>::size_type
erase_if(unordered_map<K, T, H, P, A>& c, Predicate pred);
```

1 *Effects:* Equivalent to:

```
auto original_size = c.size();

    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
}
return original_size - c.size();
```

24.5.5 Class template `unordered_multimap`

[unord.multimap]

24.5.5.1 Overview

[unord.multimap.overview]

- 1 An `unordered_multimap` is an unordered associative container that supports equivalent keys (an instance of `unordered_multimap` may contain multiple copies of each key value) and that associates values of another type `mapped_type` with the keys. The `unordered_multimap` class supports forward iterators.
- 2 An `unordered_multimap` meets all of the requirements of a container (24.2.2.2), of an allocator-aware container (24.2.2.5), and of an unordered associative container (24.2.8). It provides the operations described in the preceding requirements table for equivalent keys; that is, an `unordered_multimap` supports the `a_eq` operations in that table, not the `a_uniq` operations. For an `unordered_multimap<Key, T>` the `key_type` is `Key`, the `mapped_type` is `T`, and the `value_type` is `pair<const Key, T>`.
- 3 Subclause 24.5.5 only describes operations on `unordered_multimap` that are not described in one of the requirement tables, or for which there is additional semantic information.

```
namespace std {
    template<class Key,
             class T,
             class Hash = hash<Key>,
             class Pred = equal_to<Key>,
             class Allocator = allocator<pair<const Key, T>>>
    class unordered_multimap {
public:
    // types
    using key_type           = Key;
    using mapped_type         = T;
    using value_type          = pair<const Key, T>;
    using hasher              = Hash;
    using key_equal           = Pred;
    using allocator_type      = Allocator;
    using pointer              = typename allocator_traits<Allocator>::pointer;
    using const_pointer        = typename allocator_traits<Allocator>::const_pointer;

}

```

- ⁴ A `size_type` parameter type in an `unordered_multimap` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

24.5.5.2 Constructors

[unord.multimap.cnstr]

```

unordered_multimap() : unordered_multimap(size_type(see below)) { }
explicit unordered_multimap(size_type n,
    const hasher& hf = hasher(),
    const key_equal& eql = key_equal(),
    const allocator_type& a = allocator_type());

```

- 1 *Effects:* Constructs an empty `unordered_multimap` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. For the default constructor, the number of buckets is implementation-defined. `max_load_factor()` returns 1.0.
- 2 *Complexity:* Constant.

```

template<class InputIterator>
unordered_multimap(InputIterator f, InputIterator l,
    size_type n = see below,
    const hasher& hf = hasher(),
    const key_equal& eql = key_equal(),
    const allocator_type& a = allocator_type());

```

```
template<container-compatible-range<value_type> R>
    unordered_multimap(from_range_t, R&& rg,
                        size_type n = see below,
                        const hasher& hf = hasher(),
                        const key_equal& eql = key_equal(),
                        const allocator_type& a = allocator_type());
unordered_multimap(initializer_list<value_type> il,
                    size_type n = see below,
                    const hasher& hf = hasher(),
                    const key_equal& eql = key_equal(),
                    const allocator_type& a = allocator_type());
```

3 *Effects:* Constructs an empty `unordered_multimap` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. If `n` is not provided, the number of buckets is implementation-defined. Then inserts elements from the range `[f, l)`, `rg`, or `il`, respectively. `max_load_factor()` returns 1.0.

4 *Complexity:* Average case linear, worst case quadratic.

24.5.5.3 Modifiers

[`unord.multimap.modifiers`]

```
template<class P>
    iterator insert(P&& obj);

1     Constraints: is_constructible_v<value_type, P&&> is true.

2     Effects: Equivalent to: return emplace(std::forward<P>(obj));
```

```
template<class P>
    iterator insert(const_iterator hint, P&& obj);

3     Constraints: is_constructible_v<value_type, P&&> is true.

4     Effects: Equivalent to: return emplace_hint(hint, std::forward<P>(obj));
```

24.5.5.4 Erasure

[`unord.multimap.erasure`]

```
template<class K, class T, class H, class P, class A, class Predicate>
    typename unordered_multimap<K, T, H, P, A>::size_type
        erase_if(unordered_multimap<K, T, H, P, A>& c, Predicate pred);

1     Effects: Equivalent to:
```

```
        auto original_size = c.size();
        for (auto i = c.begin(), last = c.end(); i != last; ) {
            if (pred(*i)) {
                i = c.erase(i);
            } else {
                ++i;
            }
        }
        return original_size - c.size();
```

24.5.6 Class template `unordered_set`

[`unord.set`]

24.5.6.1 Overview

[`unord.set.overview`]

- 1 An `unordered_set` is an unordered associative container that supports unique keys (an `unordered_set` contains at most one of each key value) and in which the elements' keys are the elements themselves. The `unordered_set` class supports forward iterators.
- 2 An `unordered_set` meets all of the requirements of a container (24.2.2.2), of an allocator-aware container (24.2.2.5), of an unordered associative container (24.2.8). It provides the operations described in the preceding requirements table for unique keys; that is, an `unordered_set` supports the `a_uniq` operations in that table, not the `a_eq` operations. For an `unordered_set<Key>` the `key_type` and the `value_type` are both `Key`. The `iterator` and `const_iterator` types are both constant iterator types. It is unspecified whether they are the same type.
- 3 Subclause 24.5.6 only describes operations on `unordered_set` that are not described in one of the requirement tables, or for which there is additional semantic information.

```

namespace std {
    template<class Key,
              class Hash = hash<Key>,

}

```

⁴ A `size_type` parameter type in an `unordered_set` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

24.5.6.2 Constructors

[unord.set.cnstr]

```

unordered_set() : unordered_set(size_type(see below)) { }
explicit unordered_set(size_type n,
                      const hasher& hf = hasher(),
                      const key_equal& eql = key_equal(),
                      const allocator_type& a = allocator_type());

```

¹ *Effects:* Constructs an empty `unordered_set` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. For the default constructor, the number of buckets is

implementation-defined. `max_load_factor()` returns 1.0.

2 *Complexity:* Constant.

```
template<class InputIterator>
unordered_set(InputIterator f, InputIterator l,
             size_type n = see below,
             const hasher& hf = hasher(),
             const key_equal& eql = key_equal(),
             const allocator_type& a = allocator_type());
template<container-compatible-range<value_type> R>
unordered_multiset(from_range_t, R&& rg,
                   size_type n = see below,
                   const hasher& hf = hasher(),
                   const key_equal& eql = key_equal(),
                   const allocator_type& a = allocator_type());
unordered_set(initializer_list<value_type> il,
             size_type n = see below,
             const hasher& hf = hasher(),
             const key_equal& eql = key_equal(),
             const allocator_type& a = allocator_type());
```

3 *Effects:* Constructs an empty `unordered_set` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. If `n` is not provided, the number of buckets is implementation-defined. Then inserts elements from the range `[f, l]`, `rg`, or `il`, respectively. `max_load_factor()` returns 1.0.

4 *Complexity:* Average case linear, worst case quadratic.

24.5.6.3 Erasure

[unord.set.erasure]

```
template<class K, class H, class P, class A, class Predicate>
typename unordered_set<K, H, P, A>::size_type
erase_if(unordered_set<K, H, P, A>& c, Predicate pred);
```

1 *Effects:* Equivalent to:

```
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
}
return original_size - c.size();
```

24.5.7 Class template `unordered_multiset`

[unord.multiset]

24.5.7.1 Overview

[unord.multiset.overview]

- 1 An `unordered_multiset` is an unordered associative container that supports equivalent keys (an instance of `unordered_multiset` may contain multiple copies of the same key value) and in which each element's key is the element itself. The `unordered_multiset` class supports forward iterators.
- 2 An `unordered_multiset` meets all of the requirements of a container (24.2.2.2), of an allocator-aware container (24.2.2.5), and of an unordered associative container (24.2.8). It provides the operations described in the preceding requirements table for equivalent keys; that is, an `unordered_multiset` supports the `a_eq` operations in that table, not the `a_uniq` operations. For an `unordered_multiset<Key>` the `key_type` and the `value_type` are both `Key`. The `iterator` and `const_iterator` types are both constant iterator types. It is unspecified whether they are the same type.
- 3 Subclause 24.5.7 only describes operations on `unordered_multiset` that are not described in one of the requirement tables, or for which there is additional semantic information.

```
namespace std {
    template<class Key,
              class Hash = hash<Key>,
              class Pred = equal_to<Key>,
```

```

template<ranges::input_range R, class Hash, class Allocator>
unordered_multiset(from_range_t, R&&, typename see below::size_type, Hash, Allocator)
-> unordered_multiset<ranges::range_value_t<R>, Hash, equal_to<ranges::range_value_t<R>>,
                     Allocator>;

template<class T, class Allocator>
unordered_multiset(initializer_list<T>, typename see below::size_type, Allocator)
-> unordered_multiset<T, hash<T>, equal_to<T>, Allocator>;

template<class T, class Hash, class Allocator>
unordered_multiset(initializer_list<T>, typename see below::size_type, Hash, Allocator)
-> unordered_multiset<T, Hash, equal_to<T>, Allocator>;
}

```

⁴ A `size_type` parameter type in an `unordered_multiset` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

24.5.7.2 Constructors

[unord.multiset.cnstr]

```

unordered_multiset() : unordered_multiset(size_type(see below)) { }
explicit unordered_multiset(size_type n,
                           const hasher& hf = hasher(),
                           const key_equal& eql = key_equal(),
                           const allocator_type& a = allocator_type());

```

¹ *Effects:* Constructs an empty `unordered_multiset` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. For the default constructor, the number of buckets is implementation-defined. `max_load_factor()` returns 1.0.

² *Complexity:* Constant.

```

template<class InputIterator>
unordered_multiset(InputIterator f, InputIterator l,
                   size_type n = see below,
                   const hasher& hf = hasher(),
                   const key_equal& eql = key_equal(),
                   const allocator_type& a = allocator_type());
template<container-compatible-range<value_type> R>
unordered_multiset(from_range_t, R&& rg,
                   size_type n = see below,
                   const hasher& hf = hasher(),
                   const key_equal& eql = key_equal(),
                   const allocator_type& a = allocator_type());
unordered_multiset(initializer_list<value_type> il,
                   size_type n = see below,
                   const hasher& hf = hasher(),
                   const key_equal& eql = key_equal(),
                   const allocator_type& a = allocator_type());

```

- 3 *Effects:* Constructs an empty `unordered_multiset` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. If `n` is not provided, the number of buckets is implementation-defined. Then inserts elements from the range `[f, l)`, `rg`, or `il`, respectively. `max_load_factor()` returns 1.0.

- 4 *Complexity:* Average case linear, worst case quadratic.

24.5.7.3 Erasure

[`unord.multiset.erasure`]

```

template<class K, class H, class P, class A, class Predicate>
typename unordered_multiset<K, H, P, A>::size_type
erase_if(unordered_multiset<K, H, P, A>& c, Predicate pred);

```

- 1 *Effects:* Equivalent to:

```

auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
}
return original_size - c.size();

```

24.6 Container adaptors

[`container.adaptors`]

24.6.1 In general

[`container.adaptors.general`]

- 1 The headers `<queue>`, `<stack>`, `<flat_map>`, and `<flat_set>` define the container adaptors `queue` and `priority_queue`, `stack`, `flat_map` and `flat_multimap`, and `flat_set` and `flat_multiset`, respectively.
- 2 Each container adaptor takes one or more template parameters named `Container`, `KeyContainer`, or `MappedContainer` that denote the types of containers that the container adaptor adapts. Each container adaptor has at least one constructor that takes a reference argument to one or more such template parameters. For each constructor reference argument to a container `C`, the constructor copies the container into the container adaptor. If `C` takes an allocator, then a compatible allocator may be passed in to the adaptor's constructor. Otherwise, normal copy or move construction is used for the container argument. For the container adaptors that take a single container template parameter `Container`, the first template parameter `T` of the container adaptor shall denote the same type as `Container::value_type`.
- 3 For container adaptors, no `swap` function throws an exception unless that exception is thrown by the swap of the adaptor's `Container`, `KeyContainer`, `MappedContainer`, or `Compare` object (if any).
- 4 A constructor template of a container adaptor shall not participate in overload resolution if it has an `InputIterator` template parameter and a type that does not qualify as an input iterator is deduced for that parameter.

- ⁵ For container adaptors that have them, the `insert`, `emplace`, and `erase` members affect the validity of iterators, references, and pointers to the adaptor's container(s) in the same way that the containers' respective `insert`, `emplace`, and `erase` members do.

EXAMPLE: A call to `flat_map<Key, T>::insert` can invalidate all iterators to the `flat_map`.

- ⁶ A deduction guide for a container adaptor shall not participate in overload resolution if any of the following are true:

- (6.1) — It has an `InputIterator` template parameter and a type that does not qualify as an input iterator is deduced for that parameter.
- (6.2) — It has a `Compare` template parameter and a type that qualifies as an allocator is deduced for that parameter.
- (6.3) — It has a `Container`, `KeyContainer`, or `MappedContainer` template parameter and a type that qualifies as an allocator is deduced for that parameter.
- (6.4) — It has no `Container`, `KeyContainer`, or `MappedContainer` template parameter, and it has an `Allocator` template parameter, and a type that does not qualify as an allocator is deduced for that parameter.
- (6.5) — It has both `Container` and `Allocator` template parameters, and `uses_allocator_v<Container, Allocator>` is `false`.
- (6.6) — It has both `KeyContainer` and `Allocator` template parameters, and `uses_allocator_v<KeyContainer, Allocator>` is `false`.
- (6.7) — It has both `KeyContainer` and `Compare` template parameters, and

```
    is_invocable_v<const Compare&,
                  const typename KeyContainer::value_type&,
                  const typename KeyContainer::value_type&>
```

is not a valid expression or is `false`.

- (6.8) — It has both `MappedContainer` and `Allocator` template parameters, and `uses_allocator_v<MappedContainer, Allocator>` is `false`.
- ⁷ The exposition-only alias template `iter-value-type` defined in 24.3.1 and the exposition-only alias templates `iter-key-type`, `iter-mapped-type`, `range-key-type`, and `range-mapped-type` defined in 24.4.1 may appear in deduction guides for container adaptors.
- ⁸ The following exposition-only alias template may appear in deduction guides for container adaptors:

```
template<class Allocator, class T>
using alloc_rebind =                                // exposition only
    typename allocator_traits<Allocator>::template rebind_alloc<T>;
```

24.6.2 Header <queue> synopsis

[queue.syn]

```
#include <compare>                                // see 17.11.1

}
```

24.6.6 Class template queue

[queue]

24.6.6.1 Definition

[queue.defn]

- ¹ Any sequence container supporting operations `front()`, `back()`, `push_back()` and `pop_front()` can be used to instantiate `queue`. In particular, `list` (24.3.10) and `deque` (24.3.8) can be used.

```
namespace std {
    template<class T, class Container = deque<T>>
        class queue {
            public:
                using value_type      = typename Container::value_type;
                using reference       = typename Container::reference;
                using const_reference = typename Container::const_reference;
                using size_type       = typename Container::size_type;
                using container_type  =           Container;

            protected:
                Container c;

            public:
                queue() : queue(Container{}) {}
                explicit queue(const Container&);
                explicit queue(Container&&);

                template<class InputIterator> queue(InputIterator first, InputIterator last);
                template<container-compatible-range<T> R> queue(from_range_t, R&& rg);
                template<class Alloc> explicit queue(const Alloc&);
                template<class Alloc> queue(const Container&, const Alloc&);
                template<class Alloc> queue(Container&&, const Alloc&);
                template<class Alloc> queue(const queue&, const Alloc&);
                template<class Alloc> queue(queue&&, const Alloc&);

                template<class InputIterator, class Alloc>
                    queue(InputIterator first, InputIterator last, const Alloc&);

                template<container-compatible-range<T> R, class Alloc>
                    queue(from_range_t, R&& rg, const Alloc&);

                [[nodiscard]] bool empty() const { return c.empty(); }
                size_type      size()  const { return c.size(); }
                reference     front() const { return c.front(); }
                const_reference front() const { return c.front(); }
                reference     back()  const { return c.back(); }
                const_reference back() const { return c.back(); }

                void push(const value_type& x) { c.push_back(x); }
                void push(value_type&& x) { c.push_back(std::move(x)); }

                template<container-compatible-range<T> R> void push_range(R&& rg);

                template<class... Args>
                    decltype(auto) emplace(Args&&... args)
                        { return c.emplace_back(std::forward<Args>(args)...); }

                void pop() { c.pop_front(); }

                void swap(queue& q) noexcept(is_nothrow_swappable_v<Container>)
                    { using std::swap; swap(c, q.c); }

};

template<class Container>
queue(Container) -> queue<typename Container::value_type, Container>;

template<class InputIterator>
queue(InputIterator, InputIterator) -> queue<iter-value-type<InputIterator>>;
```

```

template<ranges::input_range R>
queue(from_range_t, R&&) -> queue<ranges::range_value_t<R>>;

template<class Container, class Allocator>
queue(Container, Allocator) -> queue<typename Container::value_type, Container>;

template<class InputIterator, class Allocator>
queue(InputIterator, InputIterator, Allocator)
-> queue<iter-value-type<InputIterator>, deque<iter-value-type<InputIterator>,
Allocator>>;

template<ranges::input_range R, class Allocator>
queue(from_range_t, R&&, Allocator)
-> queue<ranges::range_value_t<R>, deque<ranges::range_value_t<R>, Allocator>>;

template<class T, class Container, class Alloc>
struct uses_allocator<queue<T, Container>, Alloc>
: uses_allocator<Container, Alloc>::type { };
}

```

24.6.6.2 Constructors

[queue.cons]

```

explicit queue(const Container& cont);
1   Effects: Initializes c with cont.

explicit queue(Container&& cont);
2   Effects: Initializes c with std::move(cont).

```

```

template<class InputIterator>
queue(InputIterator first, InputIterator last);

```

3 Effects: Initializes c with first as the first argument and last as the second argument.

```

template<container-compatible-range<T> R>
queue(from_range_t, R&& rg);

```

4 Effects: Initializes c with ranges::to<Container>(std::forward<R>(rg)).

24.6.6.3 Constructors with allocators

[queue.cons.alloc]

1 If `uses_allocator_v<container_type, Alloc>` is false the constructors in this subclause shall not participate in overload resolution.

```

template<class Alloc> explicit queue(const Alloc& a);

```

2 Effects: Initializes c with a.

```

template<class Alloc> queue(const container_type& cont, const Alloc& a);

```

3 Effects: Initializes c with cont as the first argument and a as the second argument.

```

template<class Alloc> queue(container_type&& cont, const Alloc& a);

```

4 Effects: Initializes c with std::move(cont) as the first argument and a as the second argument.

```

template<class Alloc> queue(const queue& q, const Alloc& a);

```

5 Effects: Initializes c with q.c as the first argument and a as the second argument.

```

template<class Alloc> queue(queue&& q, const Alloc& a);

```

6 Effects: Initializes c with std::move(q.c) as the first argument and a as the second argument.

```

template<class InputIterator, class Alloc>
queue(InputIterator first, InputIterator last, const Alloc& alloc);

```

7 Effects: Initializes c with first as the first argument, last as the second argument, and alloc as the third argument.

```
template<container-compatible-range<T> R, class Alloc>
queue(from_range_t, R&& rg, const Alloc& a);
```

8 *Effects:* Initializes *c* with `ranges::to<Container>(std::forward<R>(rg), a)`.

24.6.6.4 Modifiers

[queue.mod]

```
template<container-compatible-range<T> R>
void push_range(R&& rg);
```

1 *Effects:* Equivalent to `c.append_range(std::forward<R>(rg))` if that is a valid expression, otherwise `ranges::copy(rg, back_inserter(c))`.

24.6.6.5 Operators

[queue.ops]

```
template<class T, class Container>
bool operator==(const queue<T, Container>& x, const queue<T, Container>& y);
```

1 *Returns:* `x.c == y.c`.

```
template<class T, class Container>
bool operator!=(const queue<T, Container>& x, const queue<T, Container>& y);
```

2 *Returns:* `x.c != y.c`.

```
template<class T, class Container>
bool operator< (const queue<T, Container>& x, const queue<T, Container>& y);
```

3 *Returns:* `x.c < y.c`.

```
template<class T, class Container>
bool operator> (const queue<T, Container>& x, const queue<T, Container>& y);
```

4 *Returns:* `x.c > y.c`.

```
template<class T, class Container>
bool operator<=(const queue<T, Container>& x, const queue<T, Container>& y);
```

5 *Returns:* `x.c <= y.c`.

```
template<class T, class Container>
bool operator>=(const queue<T, Container>& x,
                 const queue<T, Container>& y);
```

6 *Returns:* `x.c >= y.c`.

```
template<class T, three_way_comparable Container>
compare_three_way_result_t<Container>
operator<=>(const queue<T, Container>& x, const queue<T, Container>& y);
```

7 *Returns:* `x.c <=> y.c`.

24.6.6.6 Specialized algorithms

[queue.special]

```
template<class T, class Container>
void swap(queue<T, Container>& x, queue<T, Container>& y) noexcept(noexcept(x.swap(y)));
```

1 *Constraints:* `is_swappable_v<Container>` is true.

2 *Effects:* As if by `x.swap(y)`.

24.6.7 Class template priority_queue

[priority.queue]

24.6.7.1 Overview

[priqueue.overview]

1 Any sequence container with random access iterator and supporting operations `front()`, `push_back()` and `pop_back()` can be used to instantiate `priority_queue`. In particular, `vector` (24.3.11) and `deque` (24.3.8) can be used. Instantiating `priority_queue` also involves supplying a function or function object for making priority comparisons; the library assumes that the function or function object defines a strict weak ordering (27.8).

```

namespace std {
    template<class T, class Container = vector<T>,
              class Compare = less<typename Container::value_type>>
    class priority_queue {
public:
    using value_type      = typename Container::value_type;
    using reference       = typename Container::reference;
    using const_reference = typename Container::const_reference;
    using size_type        = typename Container::size_type;
    using container_type   = Container;
    using value_compare    = Compare;

protected:
    Container c;
    Compare comp;

public:
    priority_queue() : priority_queue(Compare{}) {}
    explicit priority_queue(const Compare& x) : priority_queue(x, Container{}) {}
    priority_queue(const Compare& x, const Container&);
    priority_queue(const Compare& x, Container&&);

    template<class InputIterator>
    priority_queue(InputIterator first, InputIterator last, const Compare& x = Compare());
    template<class InputIterator>
    priority_queue(InputIterator first, InputIterator last, const Compare& x,
                  const Container&);

    template<class InputIterator>
    priority_queue(InputIterator first, InputIterator last, const Compare& x,
                  Container&&);

    template<container-compatible-range<T> R>
    priority_queue(from_range_t, R&& rg, const Compare& x = Compare());
    template<class Alloc> explicit priority_queue(const Alloc&);

```

24.6.7.2 Constructors

[priqueue.cons]

```

priority_queue(const Compare& x, const Container& y);
priority_queue(const Compare& x, Container&& y);

```

¹ *Preconditions:* x defines a strict weak ordering (27.8).

² *Effects:* Initializes comp with x and c with y (copy constructing or move constructing as appropriate); calls make_heap(c.begin(), c.end(), comp).

```

template<class InputIterator>
priority_queue(InputIterator first, InputIterator last, const Compare& x = Compare());

```

³ *Preconditions:* x defines a strict weak ordering (27.8).

⁴ *Effects:* Initializes c with first as the first argument and last as the second argument, and initializes comp with x; then calls make_heap(c.begin(), c.end(), comp).

```

template<class InputIterator>
priority_queue(InputIterator first, InputIterator last, const Compare& x, const Container& y);
template<class InputIterator>
priority_queue(InputIterator first, InputIterator last, const Compare& x, Container&& y);

5   Preconditions: x defines a strict weak ordering (27.8).
6   Effects: Initializes comp with x and c with y (copy constructing or move constructing as appropriate);  

    calls c.insert(c.end(), first, last); and finally calls make_heap(c.begin(), c.end(), comp).

```

```

template<container-compatible-range<T> R>
priority_queue(from_range_t, R&& rg, const Compare& x = Compare());
7   Preconditions: x defines a strict weak ordering (27.8).
8   Effects: Initializes comp with x and c with ranges::to<Container>(std::forward<R>(rg)) and  

    finally calls make_heap(c.begin(), c.end(), comp).

```

24.6.7.3 Constructors with allocators

[priqueue.cons.alloc]

1 If `uses_allocator_v<container_type, Alloc>` is false the constructors in this subclause shall not participate in overload resolution.

```
template<class Alloc> explicit priority_queue(const Alloc& a);
```

2 *Effects:* Initializes c with a and value-initializes comp.

```
template<class Alloc> priority_queue(const Compare& compare, const Alloc& a);
```

3 *Effects:* Initializes c with a and initializes comp with compare.

```
template<class Alloc>
priority_queue(const Compare& compare, const Container& cont, const Alloc& a);
```

4 *Effects:* Initializes c with cont as the first argument and a as the second argument, and initializes comp with compare; calls make_heap(c.begin(), c.end(), comp).

```
template<class Alloc>
priority_queue(const Compare& compare, Container&& cont, const Alloc& a);
```

5 *Effects:* Initializes c with std::move(cont) as the first argument and a as the second argument, and initializes comp with compare; calls make_heap(c.begin(), c.end(), comp).

```
template<class Alloc> priority_queue(const priority_queue& q, const Alloc& a);
```

6 *Effects:* Initializes c with q.c as the first argument and a as the second argument, and initializes comp with q.compare.

```
template<class Alloc> priority_queue(priority_queue&& q, const Alloc& a);
```

7 *Effects:* Initializes c with std::move(q.c) as the first argument and a as the second argument, and initializes comp with std::move(q.compare).

```
template<class InputIterator, class Alloc>
priority_queue(InputIterator first, InputIterator last, const Alloc& a);
```

8 *Effects:* Initializes c with first as the first argument, last as the second argument, and a as the third argument, and value-initializes comp; calls make_heap(c.begin(), c.end(), comp).

```
template<class InputIterator, class Alloc>
priority_queue(InputIterator first, InputIterator last, const Compare& compare, const Alloc& a);
```

9 *Effects:* Initializes c with first as the first argument, last as the second argument, and a as the third argument, and initializes comp with compare; calls make_heap(c.begin(), c.end(), comp).

```
template<class InputIterator, class Alloc>
priority_queue(InputIterator first, InputIterator last, const Compare& compare,
              const Container& cont, const Alloc& a);
```

10 *Effects:* Initializes c with cont as the first argument and a as the second argument, and initializes comp with compare; calls c.insert(c.end(), first, last); and finally calls make_heap(c.begin(), c.end(), comp).

```

template<class InputIterator, class Alloc>
priority_queue(InputIterator first, InputIterator last, const Compare& compare, Container&& cont,
               const Alloc& a);

11   Effects: Initializes c with std::move(cont) as the first argument and a as the second argument, and initializes comp with compare; calls c.insert(c.end(), first, last); and finally calls make_heap(c.begin(), c.end(), comp).

template<container-compatible-range<T> R, class Alloc>
priority_queue(from_range_t, R&& rg, const Compare& compare, const Alloc& a);

12   Effects: Initializes comp with compare and c with ranges::to<Container>(std::forward<R>(rg), a); calls make_heap(c.begin(), c.end(), comp).

template<container-compatible-range<T> R, class Alloc>
priority_queue(from_range_t, R&& rg, const Alloc& a);

13   Effects: Initializes c with ranges::to<Container>(std::forward<R>(rg), a); calls make_heap(c.begin(), c.end(), comp).

```

24.6.7.4 Members

[priqueue.members]

```
void push(const value_type& x);
```

1 Effects: As if by:

```
c.push_back(x);
push_heap(c.begin(), c.end(), comp);
```

```
void push(value_type&& x);
```

2 Effects: As if by:

```
c.push_back(std::move(x));
push_heap(c.begin(), c.end(), comp);
```

```
template<container-compatible-range<T> R>
void push_range(R&& rg);
```

3 Effects: Inserts all elements of rg in c via c.append_range(std::forward<R>(rg)) if that is a valid expression, or ranges::copy(rg, back_inserter(c)) otherwise. Then restores the heap property as if by make_heap(c.begin(), c.end(), comp).

4 Postconditions: `is_heap(c.begin(), c.end(), comp)` is true.

```
template<class... Args> void emplace(Args&&... args);
```

5 Effects: As if by:

```
c.emplace_back(std::forward<Args>(args)...);
push_heap(c.begin(), c.end(), comp);
```

```
void pop();
```

6 Effects: As if by:

```
pop_heap(c.begin(), c.end(), comp);
c.pop_back();
```

24.6.7.5 Specialized algorithms

[priqueue.special]

```
template<class T, class Container, class Compare>
void swap(priority_queue<T, Container, Compare>& x,
          priority_queue<T, Container, Compare>& y) noexcept(noexcept(x.swap(y)));
```

1 Constraints: `is_swappable_v<Container>` is true and `is_swappable_v<Compare>` is true.

2 Effects: As if by `x.swap(y)`.

24.6.8 Class template stack

[stack]

24.6.8.1 General

[stack.general]

1 Any sequence container supporting operations `back()`, `push_back()` and `pop_back()` can be used to instantiate `stack`. In particular, `vector` (24.3.11), `list` (24.3.10) and `deque` (24.3.8) can be used.

24.6.8.2 Definition

[stack.defn]

```

namespace std {
    template<class T, class Container = deque<T>>
    class stack {
        public:
            using value_type      = typename Container::value_type;
            using reference       = typename Container::reference;
            using const_reference = typename Container::const_reference;
            using size_type       = typename Container::size_type;
            using container_type  = Container;

        protected:
            Container c;

        public:
            stack() : stack(Container{}) {}
            explicit stack(const Container&);
            explicit stack(Container&&);

            template<class InputIterator> stack(InputIterator first, InputIterator last);
            template<container-compatible-range<T> R> stack(from_range_t, R&& rg);
            template<class Alloc> explicit stack(const Alloc&);
            template<class Alloc> stack(const Container&, const Alloc&);

        template<class Container, class Allocator>
            stack(Container, Allocator) -> stack<typename Container::value_type, Container>;
        template<class InputIterator, class Allocator>
            stack(InputIterator, InputIterator, Allocator)
                -> stack<iter-value-type<InputIterator>, deque<iter-value-type<InputIterator>,
                    Allocator>>;
    };
}

```

```

template<ranges::input_range R, class Allocator>
stack(from_range_t, R&&, Allocator)
    -> stack<ranges::range_value_t<R>, deque<ranges::range_value_t<R>, Allocator>>;
}

template<class T, class Container, class Alloc>
struct uses_allocator<stack<T, Container>, Alloc>
    : uses_allocator<Container, Alloc>::type { };
}

```

24.6.8.3 Constructors

[stack.cons]

```

explicit stack(const Container& cont);
1   Effects: Initializes c with cont.

explicit stack(Container&& cont);
2   Effects: Initializes c with std::move(cont).

```

```

template<class InputIterator>
stack(InputIterator first, InputIterator last);

```

3 Effects: Initializes c with first as the first argument and last as the second argument.

```

template<container-compatible-range<T> R>
stack(from_range_t, R&& rg);

```

4 Effects: Initializes c with ranges::to<Container>(std::forward<R>(rg)).

24.6.8.4 Constructors with allocators

[stack.cons.alloc]

1 If `uses_allocator_v<container_type, Alloc>` is false the constructors in this subclause shall not participate in overload resolution.

```
template<class Alloc> explicit stack(const Alloc& a);
```

2 Effects: Initializes c with a.

```
template<class Alloc> stack(const container_type& cont, const Alloc& a);
```

3 Effects: Initializes c with cont as the first argument and a as the second argument.

```
template<class Alloc> stack(container_type&& cont, const Alloc& a);
```

4 Effects: Initializes c with std::move(cont) as the first argument and a as the second argument.

```
template<class Alloc> stack(const stack& s, const Alloc& a);
```

5 Effects: Initializes c with s.c as the first argument and a as the second argument.

```
template<class Alloc> stack(stack&& s, const Alloc& a);
```

6 Effects: Initializes c with std::move(s.c) as the first argument and a as the second argument.

```
template<class InputIterator, class Alloc>
stack(InputIterator first, InputIterator last, const Alloc& alloc);
```

7 Effects: Initializes c with first as the first argument, last as the second argument, and alloc as the third argument.

```
template<container-compatible-range<T> R, class Alloc>
stack(from_range_t, R&& rg, const Alloc& a);
```

8 Effects: Initializes c with ranges::to<Container>(std::forward<R>(rg), a).

24.6.8.5 Modifiers

[stack.mod]

```

template<container-compatible-range<T> R>
void push_range(R&& rg);

```

1 Effects: Equivalent to c.append_range(std::forward<R>(rg)) if that is a valid expression, otherwise ranges::copy(rg, back_inserter(c)).

24.6.8.6 Operators

[stack.ops]

```

template<class T, class Container>
bool operator==(const stack<T, Container>& x, const stack<T, Container>& y);
1   Returns: x.c == y.c.

template<class T, class Container>
bool operator!=(const stack<T, Container>& x, const stack<T, Container>& y);
2   Returns: x.c != y.c.

template<class T, class Container>
bool operator< (const stack<T, Container>& x, const stack<T, Container>& y);
3   Returns: x.c < y.c.

template<class T, class Container>
bool operator> (const stack<T, Container>& x, const stack<T, Container>& y);
4   Returns: x.c > y.c.

template<class T, class Container>
bool operator<=(const stack<T, Container>& x, const stack<T, Container>& y);
5   Returns: x.c <= y.c.

template<class T, class Container>
bool operator>=(const stack<T, Container>& x, const stack<T, Container>& y);
6   Returns: x.c >= y.c.

template<class T, three_way_comparable Container>
compare_three_way_result_t<Container>
operator<=>(const stack<T, Container>& x, const stack<T, Container>& y);
7   Returns: x.c <=> y.c.

```

24.6.8.7 Specialized algorithms

[stack.special]

```

template<class T, class Container>
void swap(stack<T, Container>& x, stack<T, Container>& y) noexcept(noexcept(x.swap(y)));
1   Constraints: is_swappable_v<Container> is true.
2   Effects: As if by x.swap(y).

```

24.6.9 Class template flat_map

[flat.map]

24.6.9.1 Overview

[flat.map.overview]

- 1 A **flat_map** is a container adaptor that provides an associative container interface that supports unique keys (i.e., contains at most one of each key value) and provides for fast retrieval of values of another type **T** based on the keys. **flat_map** supports iterators that meet the *Cpp17InputIterator* requirements and model the *random_access_iterator* concept (25.3.4.13).
- 2 A **flat_map** meets all of the requirements of a container (24.2.2.2) and of a reversible container (24.2.2.3), plus the optional container requirements (24.2.2.4). **flat_map** meets the requirements of an associative container (24.2.7), except that:
 - (2.1) — it does not meet the requirements related to node handles (24.2.5),
 - (2.2) — it does not meet the requirements related to iterator invalidation, and
 - (2.3) — the time complexity of the operations that insert or erase a single element from the map is linear, including the ones that take an insertion position iterator.

NOTE 1: A **flat_map** does not meet the additional requirements of an allocator-aware container (24.2.2.5).

- 3 A **flat_map** also provides most operations described in 24.2.7 for unique keys. This means that a **flat_map** supports the **a_uniq** operations in 24.2.7 but not the **a_eq** operations. For a **flat_map<Key, T>** the **key_type** is **Key** and the **value_type** is **pair<Key, T>**.
- 4 Descriptions are provided here only for operations on **flat_map** that are not described in one of those sets of requirements or for operations where there is additional semantic information.

- 5 A `flat_map` maintains the following invariants:
- (5.1) — it contains the same number of keys and values;
 - (5.2) — the keys are sorted with respect to the comparison object; and
 - (5.3) — the value at offset `off` within the value container is the value associated with the key at offset `off` within the key container.
- 6 If any member function in [24.6.9.2](#) exits via an exception the invariants are restored.
- NOTE 2: This can result in the `flat_map` being emptied.
- 7 Any type `C` that meets the sequence container requirements ([24.2.4](#)) can be used to instantiate `flat_map`, as long as `C::iterator` meets the *Cpp17RandomAccessIterator* requirements and invocations of member functions `C::size` and `C::max_size` do not exit via an exception. In particular, `vector` ([24.3.11](#)) and `deque` ([24.3.8](#)) can be used.
- NOTE 3: `vector<bool>` is not a sequence container.
- 8 The program is ill-formed if `Key` is not the same type as `KeyContainer::value_type` or `T` is not the same type as `MappedContainer::value_type`.
- 9 The effect of calling a constructor that takes both `key_container_type` and `mapped_container_type` arguments with containers of different sizes is undefined.
- 10 The effect of calling a constructor or member function that takes a `sorted_unique_t` argument with a container, containers, or range that is not sorted with respect to `key_comp()`, or that contains equal elements, is undefined.

24.6.9.2 Definition

[**flat.map.defn**]

```
namespace std {
    template<class Key, class T, class Compare = less<Key>,
              class KeyContainer = vector<Key>, class MappedContainer = vector<T>>
    class flat_map {
        public:
            // types
            using key_type           = Key;
            using mapped_type         = T;
            using value_type          = pair<key_type, mapped_type>;
            using key_compare          = Compare;
            using reference           = pair<const key_type&, mapped_type&>;
            using const_reference       = pair<const key_type&, const mapped_type&>;
            using size_type            = size_t;
            using difference_type      = ptrdiff_t;
            using iterator             = implementation-defined; // see 24.2
            using const_iterator        = implementation-defined; // see 24.2
            using reverse_iterator      = std::reverse_iterator<iterator>;
            using const_reverse_iterator = std::reverse_iterator<const_iterator>;
            using key_container_type    = KeyContainer;
            using mapped_container_type = MappedContainer;

            class value_compare {
                private:
                    key_compare comp;                                // exposition only
                    value_compare(key_compare c) : comp(c) {}           // exposition only

                public:
                    bool operator()(const_reference x, const_reference y) const {
                        return comp(x.first, y.first);
                    }
            };

            struct containers {
                key_container_type keys;
                mapped_container_type values;
            };
    };
}
```

```

// 24.6.9.3, construct/copy/destroy
flat_map() : flat_map(key_compare()) { }

flat_map(key_container_type key_cont, mapped_container_type mapped_cont,
         const key_compare& comp = key_compare());
template<class Allocator>
flat_map(const key_container_type& key_cont, const mapped_container_type& mapped_cont,
         const Allocator& a);

```

- ¹ The member type `containers` has the data members and special members specified above. It has no base classes or members other than those specified.

24.6.9.3 Constructors

[[flat.map.cons](#)]

- ```
flat_map(key_container_type key_cont, mapped_container_type mapped_cont,
 const key_compare& comp = key_compare());

```
- <sup>1</sup> *Effects:* Initializes `c.keys` with `std::move(key_cont)`, `c.values` with `std::move(mapped_cont)`, and `compare` with `comp`; sorts the range `[begin(), end()]` with respect to `value_comp()`; and finally erases the duplicate elements as if by:

```

auto zv = ranges::zip_view(c.keys, c.values);
auto it = ranges::unique(zv, key_equiv(compare)).begin();
auto dist = distance(zv.begin(), it);
c.keys.erase(c.keys.begin() + dist, c.keys.end());
c.values.erase(c.values.begin() + dist, c.values.end());

```

- <sup>2</sup> *Complexity:* Linear in  $N$  if the container arguments are already sorted with respect to `value_comp()` and otherwise  $N \log N$ , where  $N$  is the value of `key_cont.size()` before this call.

```
template<class Allocator>
flat_map(const key_container_type& key_cont, const mapped_container_type& mapped_cont,
 const Allocator& a);
```

template<class Allocator>  
 flat\_map(const key\_container\_type& key\_cont, const mapped\_container\_type& mapped\_cont,  
 const key\_compare& comp, const Allocator& a);

3     *Constraints:* uses\_allocator\_v<key\_container\_type, Allocator> is true and uses\_allocator\_v<mapped\_container\_type, Allocator> is true.

4     *Effects:* Equivalent to flat\_map(key\_cont, mapped\_cont) and flat\_map(key\_cont, mapped\_cont, comp), respectively, except that c.keys and c.values are constructed with uses-allocator construction (20.2.8.2).

5     *Complexity:* Same as flat\_map(key\_cont, mapped\_cont) and flat\_map(key\_cont, mapped\_cont, comp), respectively.

flat\_map(sorted\_unique\_t, key\_container\_type key\_cont, mapped\_container\_type mapped\_cont,  
 const key\_compare& comp = key\_compare());

6     *Effects:* Initializes c.keys with std::move(key\_cont), c.values with std::move(mapped\_cont), and compare with comp.

7     *Complexity:* Constant.

template<class Allocator>  
 flat\_map(sorted\_unique\_t s, const key\_container\_type& key\_cont,  
 const mapped\_container\_type& mapped\_cont, const Allocator& a);

template<class Allocator>  
 flat\_map(sorted\_unique\_t s, const key\_container\_type& key\_cont,  
 const mapped\_container\_type& mapped\_cont, const key\_compare& comp,  
 const Allocator& a);

8     *Constraints:* uses\_allocator\_v<key\_container\_type, Allocator> is true and uses\_allocator\_v<mapped\_container\_type, Allocator> is true.

9     *Effects:* Equivalent to flat\_map(s, key\_cont, mapped\_cont) and flat\_map(s, key\_cont, mapped\_cont, comp), respectively, except that c.keys and c.values are constructed with uses-allocator construction (20.2.8.2).

10    *Complexity:* Linear.

template<class Allocator>  
 flat\_map(const key\_compare& comp, const Allocator& a);

template<class Allocator>  
 explicit flat\_map(const Allocator& a);

template<class InputIterator, class Allocator>

template<class InputIterator, class Allocator>  
 flat\_map(sorted\_unique\_t, InputIterator first, InputIterator last,  
 const key\_compare& comp, const Allocator& a);

template<class InputIterator, class Allocator>  
 flat\_map(sorted\_unique\_t, InputIterator first, InputIterator last, const Allocator& a);

template<class Allocator>  
 flat\_map(initializer\_list<value\_type> il, const key\_compare& comp, const Allocator& a);

template<class Allocator>  
 flat\_map(initializer\_list<value\_type> il, const Allocator& a);

template<class Allocator>  
 flat\_map(sorted\_unique\_t, initializer\_list<value\_type> il,  
 const key\_compare& comp, const Allocator& a);

template<class Allocator>  
 flat\_map(sorted\_unique\_t, initializer\_list<value\_type> il, const Allocator& a);

11    *Constraints:* uses\_allocator\_v<key\_container\_type, Allocator> is true and uses\_allocator\_v<mapped\_container\_type, Allocator> is true.

12     *Effects:* Equivalent to the corresponding non-allocator constructors except that `c.keys` and `c.values` are constructed with uses-allocator construction (20.2.8.2).

#### 24.6.9.4 Capacity

[flat.map.capacity]

`size_type size() const noexcept;`

1     *Returns:* `c.keys.size()`.

`size_type max_size() const noexcept;`

2     *Returns:* `min<size_type>(c.keys.max_size(), c.values.max_size())`.

#### 24.6.9.5 Access

[flat.map.access]

`mapped_type& operator[](const key_type& x);`

1     *Effects:* Equivalent to: `return try_emplace(x).first->second;`

`mapped_type& operator[](key_type&& x);`

2     *Effects:* Equivalent to: `return try_emplace(std::move(x)).first->second;`

`template<class K> mapped_type& operator[](K&& x);`

3     *Constraints:* The qualified-id `Compare::is_transparent` is valid and denotes a type.

4     *Effects:* Equivalent to: `return try_emplace(std::forward<K>(x)).first->second;`

`mapped_type& at(const key_type& x);`

`const mapped_type& at(const key_type& x) const;`

5     *Returns:* A reference to the `mapped_type` corresponding to `x` in `*this`.

6     *Throws:* An exception object of type `out_of_range` if no such element is present.

7     *Complexity:* Logarithmic.

`template<class K> mapped_type& at(const K& x);`

`template<class K> const mapped_type& at(const K& x) const;`

8     *Constraints:* The qualified-id `Compare::is_transparent` is valid and denotes a type.

9     *Preconditions:* The expression `find(x)` is well-formed and has well-defined behavior.

10    *Returns:* A reference to the `mapped_type` corresponding to `x` in `*this`.

11    *Throws:* An exception object of type `out_of_range` if no such element is present.

12    *Complexity:* Logarithmic.

#### 24.6.9.6 Modifiers

[flat.map.modifiers]

`template<class... Args> pair<iterator, bool> emplace(Args&&... args);`

1     *Constraints:* `is_constructible_v<pair<key_type, mapped_type>, Args...>` is true.

2     *Effects:* Initializes an object `t` of type `pair<key_type, mapped_type>` with `std::forward<Args>(args)...`; if the map already contains an element whose key is equivalent to `t.first`, `*this` is unchanged. Otherwise, equivalent to:

```
auto key_it = ranges::upper_bound(c.keys, t.first, compare);
auto value_it = c.values.begin() + distance(c.keys.begin(), key_it);
c.keys.insert(key_it, std::move(t.first));
c.values.insert(value_it, std::move(t.second));
```

3     *Returns:* The `bool` component of the returned pair is `true` if and only if the insertion took place, and the iterator component of the pair points to the element with key equivalent to `t.first`.

`template<class P> pair<iterator, bool> insert(P&& x);`

`template<class P> iterator insert(const_iterator position, P&& x);`

4     *Constraints:* `is_constructible_v<pair<key_type, mapped_type>, P>` is true.

5     *Effects:* The first form is equivalent to `return emplace(std::forward<P>(x));`. The second form is equivalent to `return emplace_hint(position, std::forward<P>(x));`.

```
template<class InputIterator>
void insert(InputIterator first, InputIterator last);
```

6    *Effects:* Adds elements to c as if by:

```
for (; first != last; ++first) {
 value_type value = *first;
 c.keys.insert(c.keys.end(), std::move(value.first));
 c.values.insert(c.values.end(), std::move(value.second));
}
```

Then, sorts the range of newly inserted elements with respect to `value_comp()`; merges the resulting sorted range and the sorted range of pre-existing elements into a single sorted range; and finally erases the duplicate elements as if by:

```
auto zv = ranges::zip_view(c.keys, c.values);
auto it = ranges::unique(zv, key_equiv(compare)).begin();
auto dist = distance(zv.begin(), it);
c.keys.erase(c.keys.begin() + dist, c.keys.end());
c.values.erase(c.values.begin() + dist, c.values.end());
```

7    *Complexity:*  $N + M \log M$ , where  $N$  is `size()` before the operation and  $M$  is `distance(first, last)`.

8    *Remarks:* Since this operation performs an in-place merge, it may allocate memory.

```
template<class InputIterator>
void insert(sorted_unique_t, InputIterator first, InputIterator last);
```

9    *Effects:* Adds elements to c as if by:

```
for (; first != last; ++first) {
 value_type value = *first;
 c.keys.insert(c.keys.end(), std::move(value.first));
 c.values.insert(c.values.end(), std::move(value.second));
}
```

Then, merges the sorted range of newly added elements and the sorted range of pre-existing elements into a single sorted range; and finally erases the duplicate elements as if by:

```
auto zv = ranges::zip_view(c.keys, c.values);
auto it = ranges::unique(zv, key_equiv(compare)).begin();
auto dist = distance(zv.begin(), it);
c.keys.erase(c.keys.begin() + dist, c.keys.end());
c.values.erase(c.values.begin() + dist, c.values.end());
```

10    *Complexity:* Linear in  $N$ , where  $N$  is `size()` after the operation.

11    *Remarks:* Since this operation performs an in-place merge, it may allocate memory.

```
template<container-compatible-range<value_type> R>
void insert_range(R&& rg);
```

12    *Effects:* Adds elements to c as if by:

```
for (const auto& e : rg) {
 c.keys.insert(c.keys.end(), e.first);
 c.values.insert(c.values.end(), e.second);
}
```

Then, sorts the range of newly inserted elements with respect to `value_comp()`; merges the resulting sorted range and the sorted range of pre-existing elements into a single sorted range; and finally erases the duplicate elements as if by:

```
auto zv = ranges::zip_view(c.keys, c.values);
auto it = ranges::unique(zv, key_equiv(compare)).begin();
auto dist = distance(zv.begin(), it);
c.keys.erase(c.keys.begin() + dist, c.keys.end());
c.values.erase(c.values.begin() + dist, c.values.end());
```

13    *Complexity:*  $N + M \log M$ , where  $N$  is `size()` before the operation and  $M$  is `ranges::distance(rg)`.

14    *Remarks:* Since this operation performs an in-place merge, it may allocate memory.

```

template<class... Args>
 pair<iterator, bool> try_emplace(const key_type& k, Args&&... args);
template<class... Args>
 pair<iterator, bool> try_emplace(key_type&& k, Args&&... args);
template<class... Args>
 iterator try_emplace(const_iterator hint, const key_type& k, Args&&... args);
template<class... Args>
 iterator try_emplace(const_iterator hint, key_type&& k, Args&&... args);

15 Constraints: is_constructible_v<mapped_type, Args...> is true.

16 Effects: If the map already contains an element whose key is equivalent to k, *this and args... are unchanged. Otherwise equivalent to:
 auto key_it = ranges::upper_bound(c.keys, k, compare);
 auto value_it = c.values.begin() + distance(c.keys.begin(), key_it);
 c.keys.insert(key_it, std::forward<decltype(k)>(k));
 c.values.emplace(value_it, std::forward<Args>(args)...);

17 Returns: In the first two overloads, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to k.

18 Complexity: The same as emplace for the first two overloads, and the same as emplace_hint for the last two overloads.

template<class K, class... Args>
 pair<iterator, bool> try_emplace(K&& k, Args&&... args);
template<class K, class... Args>
 iterator try_emplace(const_iterator hint, K&& k, Args&&... args);

19 Constraints:
(19.1) — The qualified-id Compare::is_transparent is valid and denotes a type.
(19.2) — is_constructible_v<key_type, K> is true.
(19.3) — is_constructible_v<mapped_type, Args...> is true.
(19.4) — For the first overload, is_convertible_v<K&&, const_iterator> and is_convertible_v<K&&, iterator> are both false.

20 Preconditions: The conversion from k into key_type constructs an object u, for which find(k) == find(u) is true.

21 Effects: If the map already contains an element whose key is equivalent to k, *this and args... are unchanged. Otherwise equivalent to:
 auto key_it = ranges::upper_bound(c.keys, k, compare);
 auto value_it = c.values.begin() + distance(c.keys.begin(), key_it);
 c.keys.emplace(key_it, std::forward<K>(k));
 c.values.emplace(value_it, std::forward<Args>(args)...);

22 Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to k.

23 Complexity: The same as emplace and emplace_hint, respectively.

template<class M>
 pair<iterator, bool> insert_or_assign(const key_type& k, M&& obj);
template<class M>
 pair<iterator, bool> insert_or_assign(key_type&& k, M&& obj);
template<class M>
 iterator insert_or_assign(const_iterator hint, const key_type& k, M&& obj);
template<class M>
 iterator insert_or_assign(const_iterator hint, key_type&& k, M&& obj);

24 Constraints: is_assignable_v<mapped_type&, M> is true and is_constructible_v<mapped_type, M> is true.

25 Effects: If the map already contains an element e whose key is equivalent to k, assigns std::forward<M>(obj) to e.second. Otherwise, equivalent to
 try_emplace(std::forward<decltype(k)>(k), std::forward<M>(obj))

```

for the first two overloads or

```
try_emplace(hint, std::forward<decltype(k)>(k), std::forward<M>(obj))
```

for the last two overloads.

26     *Returns:* In the first two overloads, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

27     *Complexity:* The same as `emplace` for the first two overloads and the same as `emplace_hint` for the last two overloads.

```
template<class K, class M>
pair<iterator, bool> insert_or_assign(K&& k, M&& obj);
template<class K, class M>
iterator insert_or_assign(const_iterator hint, K&& k, M&& obj);
```

28     *Constraints:*

- (28.1) — The *qualified-id* `Compare::is_transparent` is valid and denotes a type.
- (28.2) — `is_constructible_v<key_type, K>` is `true`.
- (28.3) — `isAssignable_v<mapped_type&, M>` is `true`.
- (28.4) — `isConstructible_v<mapped_type, M>` is `true`.

29     *Preconditions:* The conversion from `k` into `key_type` constructs an object `u`, for which `find(k) == find(u)` is `true`.

30     *Effects:* If the map already contains an element `e` whose key is equivalent to `k`, assigns `std::forward<M>(obj)` to `e.second`. Otherwise, equivalent to

```
try_emplace(std::forward<K>(k), std::forward<M>(obj))
```

for the first overload or

```
try_emplace(hint, std::forward<K>(k), std::forward<M>(obj))
```

for the second overload.

31     *Returns:* In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

32     *Complexity:* The same as `emplace` and `emplace_hint`, respectively.

```
void swap(flat_map& y) noexcept;
```

33     *Effects:* Equivalent to:

```
ranges::swap(compare, y.compare);
ranges::swap(c.keys, y.c.keys);
ranges::swap(c.values, y.c.values);
```

```
containers extract() &&;
```

34     *Postconditions:* `*this` is emptied, even if the function exits via an exception.

35     *Returns:* `std::move(c)`.

```
void replace(key_container_type&& key_cont, mapped_container_type&& mapped_cont);
```

36     *Preconditions:* `key_cont.size() == mapped_cont.size()` is `true`, the elements of `key_cont` are sorted with respect to `compare`, and `key_cont` contains no equal elements.

37     *Effects:* Equivalent to:

```
c.keys = std::move(key_cont);
c.values = std::move(mapped_cont);
```

#### 24.6.9.7 Erasure

[flat.map.erasure]

```
template<class Key, class T, class Compare, class KeyContainer, class MappedContainer,
 class Predicate>
typename flat_map<Key, T, Compare, KeyContainer, MappedContainer>::size_type
erase_if(flat_map<Key, T, Compare, KeyContainer, MappedContainer>& c, Predicate pred);
```

1     *Preconditions:* Key and `T` meet the `Cpp17MoveAssignable` requirements.

2     *Effects:* Let  $E$  be `bool(pred(pair<const Key&, const T&>(e)))`. Erases all elements  $e$  in  $c$  for which  $E$  holds.

3     *Returns:* The number of elements erased.

4     *Complexity:* Exactly  $c.size()$  applications of the predicate.

5     *Remarks:* Stable (16.4.6.8). If an invocation of `erase_if` exits via an exception,  $c$  is in a valid but unspecified state (3.67).

NOTE:  $c$  still meets its invariants, but can be empty.

## 24.6.10 Class template flat\_multimap

[flat.multimap]

### 24.6.10.1 Overview

[flat.multimap.overview]

1 A `flat_multimap` is a container adaptor that provides an associative container interface that supports equivalent keys (i.e., possibly containing multiple copies of the same key value) and provides for fast retrieval of values of another type  $T$  based on the keys. `flat_multimap` supports iterators that meet the *Cpp17InputIterator* requirements and model the *random\_access\_iterator* concept (25.3.4.13).

2 A `flat_multimap` meets all of the requirements for a container (24.2.2.2) and for a reversible container (24.2.2.3), plus the optional container requirements (24.2.2.4). `flat_multimap` meets the requirements of an associative container (24.2.7), except that:

- (2.1) — it does not meet the requirements related to node handles (24.2.5),
- (2.2) — it does not meet the requirements related to iterator invalidation, and
- (2.3) — the time complexity of the operations that insert or erase a single element from the map is linear, including the ones that take an insertion position iterator.

NOTE 1: A `flat_multimap` does not meet the additional requirements of an allocator-aware container (24.2.2.5).

3 A `flat_multimap` also provides most operations described in 24.2.7 for equal keys. This means that a `flat_multimap` supports the `a_eq` operations in 24.2.7 but not the `a_uniq` operations. For a `flat_multimap<Key, T>` the `key_type` is `Key` and the `value_type` is `pair<Key, T>`.

4 Except as otherwise noted, operations on `flat_multimap` are equivalent to those of `flat_map`, except that `flat_multimap` operations do not remove or replace elements with equal keys.

EXAMPLE: `flat_multimap` constructors and `emplace` do not erase non-unique elements after sorting them.

5 A `flat_multimap` maintains the following invariants:

- (5.1) — it contains the same number of keys and values;
- (5.2) — the keys are sorted with respect to the comparison object; and
- (5.3) — the value at offset `off` within the value container is the value associated with the key at offset `off` within the key container.

6 If any member function in 24.6.10.2 exits via an exception, the invariants are restored.

NOTE 2: This can result in the `flat_multimap` being emptied.

7 Any type  $C$  that meets the sequence container requirements (24.2.4) can be used to instantiate `flat_multimap`, as long as  $C::iterator$  meets the *Cpp17RandomAccessIterator* requirements and invocations of member functions  $C::size$  and  $C::max_size$  do not exit via an exception. In particular, `vector` (24.3.11) and `deque` (24.3.8) can be used.

NOTE 3: `vector<bool>` is not a sequence container.

8 The program is ill-formed if `Key` is not the same type as `KeyContainer::value_type` or `T` is not the same type as `MappedContainer::value_type`.

9 The effect of calling a constructor that takes both `key_container_type` and `mapped_container_type` arguments with containers of different sizes is undefined.

10 The effect of calling a constructor or member function that takes a `sorted_equivalent_t` argument with a container, containers, or range that are not sorted with respect to `key_comp()` is undefined.

### 24.6.10.2 Definition

[flat.multimap.defn]

```
namespace std {
 template<class Key, class T, class Compare = less<Key>,
 class KeyContainer = vector<Key>, class MappedContainer = vector<T>>
```

```

class flat_multimap {
public:

```

<sup>1</sup> The member type `containers` has the data members and special members specified above. It has no base classes or members other than those specified.

#### 24.6.10.3 Constructors

[`flat_multimap.cons`]

```
flat_multimap(key_container_type key_cont, mapped_container_type mapped_cont,
 const key_compare& comp = key_compare());
```

- <sup>1</sup> *Effects:* Initializes `c.keys` with `std::move(key_cont)`, `c.values` with `std::move(mapped_cont)`, and `compare` with `comp`; sorts the range `[begin(), end()]` with respect to `value_comp()`.
- <sup>2</sup> *Complexity:* Linear in  $N$  if the container arguments are already sorted with respect to `value_comp()` and otherwise  $N \log N$ , where  $N$  is the value of `key_cont.size()` before this call.

```
template<class Allocator>
flat_multimap(const key_container_type& key_cont, const mapped_container_type& mapped_cont,
 const Allocator& a);
template<class Allocator>
flat_multimap(const key_container_type& key_cont, const mapped_container_type& mapped_cont,
 const key_compare& comp, const Allocator& a);
```

- <sup>3</sup> *Constraints:* `uses_allocator_v<key_container_type, Allocator>` is true and `uses_allocator_v<mapped_container_type, Allocator>` is true.

4     *Effects:* Equivalent to `flat_multimap(key_cont, mapped_cont)` and `flat_multimap(key_cont, mapped_cont, comp)`, respectively, except that `c.keys` and `c.values` are constructed with uses-allocator construction (20.2.8.2).

5     *Complexity:* Same as `flat_multimap(key_cont, mapped_cont)` and `flat_multimap(key_cont, mapped_cont, comp)`, respectively.

```
flat_multimap(sorted_equivalent_t, key_container_type key_cont, mapped_container_type mapped_cont,
 const key_compare& comp = key_compare());
```

6     *Effects:* Initializes `c.keys` with `std::move(key_cont)`, `c.values` with `std::move(mapped_cont)`, and `compare` with `comp`.

7     *Complexity:* Constant.

```
template<class Allocator>
flat_multimap(sorted_equivalent_t s, const key_container_type& key_cont,
 const mapped_container_type& mapped_cont, const Allocator& a);
template<class Allocator>
flat_multimap(sorted_equivalent_t s, const key_container_type& key_cont,
 const mapped_container_type& mapped_cont, const key_compare& comp,
 const Allocator& a);
```

8     *Constraints:* `uses_allocator_v<key_container_type, Allocator>` is true and `uses_allocator_v<mapped_container_type, Allocator>` is true.

9     *Effects:* Equivalent to `flat_multimap(s, key_cont, mapped_cont)` and `flat_multimap(s, key_cont, mapped_cont, comp)`, respectively, except that `c.keys` and `c.values` are constructed with uses-allocator construction (20.2.8.2).

10    *Complexity:* Linear.

```
template<class Allocator>
flat_multimap(const key_compare& comp, const Allocator& a);
template<class Allocator>
explicit flat_multimap(const Allocator& a);
template<class InputIterator, class Allocator>
flat_multimap(InputIterator first, InputIterator last, const key_compare& comp,
 const Allocator& a);
template<class InputIterator, class Allocator>
flat_multimap(InputIterator first, InputIterator last, const Allocator& a);
template<container-compatible-range<value_type> R, class Allocator>
flat_multimap(from_range_t, R&& rg, const Allocator& a);
template<container-compatible-range<value_type> R, class Allocator>
flat_multimap(from_range_t, R&& rg, const key_compare& comp, const Allocator& a);
template<class InputIterator, class Allocator>
flat_multimap(sorted_equivalent_t, InputIterator first, InputIterator last,
 const key_compare& comp, const Allocator& a);
template<class InputIterator, class Allocator>
flat_multimap(sorted_equivalent_t, InputIterator first, InputIterator last,
 const Allocator& a);
template<class Allocator>
flat_multimap(initializer_list<value_type> il, const key_compare& comp, const Allocator& a);
template<class Allocator>
flat_multimap(initializer_list<value_type> il, const Allocator& a);
template<class Allocator>
flat_multimap(sorted_equivalent_t, initializer_list<value_type> il,
 const key_compare& comp, const Allocator& a);
template<class Allocator>
flat_multimap(sorted_equivalent_t, initializer_list<value_type> il, const Allocator& a);
```

11    *Constraints:* `uses_allocator_v<key_container_type, Allocator>` is true and `uses_allocator_v<mapped_container_type, Allocator>` is true.

12    *Effects:* Equivalent to the corresponding non-allocator constructors except that `c.keys` and `c.values` are constructed with uses-allocator construction (20.2.8.2).

**24.6.10.4 Erasure**

[flat.multimap.erasure]

```
template<class Key, class T, class Compare, class KeyContainer, class MappedContainer,
 class Predicate>
typename flat_multimap<Key, T, Compare, KeyContainer, MappedContainer>::size_type
erase_if(flat_multimap<Key, T, Compare, KeyContainer, MappedContainer>& c, Predicate pred);
```

*1 Preconditions:* Key and T meet the *Cpp17MoveAssignable* requirements.

*2 Effects:* Let E be `bool(pair<const Key&, const T&>(e))`. Erases all elements e in c for which E holds.

*3 Returns:* The number of elements erased.

*4 Complexity:* Exactly c.size() applications of the predicate.

*5 Remarks:* Stable (16.4.6.8). If an invocation of `erase_if` exits via an exception, c is in a valid but unspecified state (3.67).

NOTE: c still meets its invariants, but can be empty.

**24.6.11 Class template flat\_set**

[flat.set]

**24.6.11.1 Overview**

[flat.set.overview]

- 1 A `flat_set` is a container adaptor that provides an associative container interface that supports unique keys (i.e., contains at most one of each key value) and provides for fast retrieval of the keys themselves. `flat_set` supports iterators that model the `random_access_iterator` concept (25.3.4.13).
- 2 A `flat_set` meets all of the requirements for a container (24.2.2.2) and for a reversible container (24.2.2.3), plus the optional container requirements (24.2.2.4). `flat_set` meets the requirements of an associative container (24.2.7), except that:
  - (2.1) — it does not meet the requirements related to node handles (24.2.5.1),
  - (2.2) — it does not meet the requirements related to iterator invalidation, and
  - (2.3) — the time complexity of the operations that insert or erase a single element from the set is linear, including the ones that take an insertion position iterator.

NOTE 1: A `flat_set` does not meet the additional requirements of an allocator-aware container, as described in 24.2.2.5.

- 3 A `flat_set` also provides most operations described in 24.2.7 for unique keys. This means that a `flat_set` supports the `a_uniq` operations in 24.2.7 but not the `a_eq` operations. For a `flat_set<Key>`, both the `key_type` and `value_type` are `Key`.
- 4 Descriptions are provided here only for operations on `flat_set` that are not described in one of those sets of requirements or for operations where there is additional semantic information.
- 5 A `flat_set` maintains the invariant that the keys are sorted with respect to the comparison object.
- 6 If any member function in 24.6.11.2 exits via an exception, the invariant is restored.

NOTE 2: This can result in the `flat_set`'s being emptied.

- 7 Any sequence container (24.2.4) supporting *Cpp17RandomAccessIterator* can be used to instantiate `flat_set`. In particular, `vector` (24.3.11) and `deque` (24.3.8) can be used.

NOTE 3: `vector<bool>` is not a sequence container.

- 8 The program is ill-formed if Key is not the same type as `KeyContainer::value_type`.
- 9 The effect of calling a constructor or member function that takes a `sorted_unique_t` argument with a range that is not sorted with respect to `key_comp()`, or that contains equal elements, is undefined.

**24.6.11.2 Definition**

```

#### 24.6.11.3 Constructors

[flat.set.cons]

```
explicit flat_set(container_type cont, const key_compare& comp = key_compare());
```

<sup>1</sup> *Effects:* Initializes *c* with `std::move(cont)` and *compare* with *comp*, sorts the range `[begin(), end()]` with respect to *compare*, and finally erases all but the first element from each group of consecutive equivalent elements.

2     *Complexity:* Linear in  $N$  if `cont` is sorted with respect to `compare` and otherwise  $N \log N$ , where  $N$  is the value of `cont.size()` before this call.

```
template<class Allocator>
flat_set(const container_type& cont, const Allocator& a);
template<class Allocator>
flat_set(const container_type& cont, const key_compare& comp, const Allocator& a);

3 Constraints: uses_allocator_v<container_type, Allocator> is true.

4 Effects: Equivalent to flat_set(cont) and flat_set(cont, comp), respectively, except that c is constructed with uses-allocator construction (20.2.8.2).

5 Complexity: Same as flat_set(cont) and flat_set(cont, comp), respectively.
```

```
template<class Allocator>
flat_set(sorted_unique_t s, const container_type& cont, const Allocator& a);
template<class Allocator>
flat_set(sorted_unique_t s, const container_type& cont,
 const key_compare& comp, const Allocator& a);

6 Constraints: uses_allocator_v<container_type, Allocator> is true.

7 Effects: Equivalent to flat_set(s, cont) and flat_set(s, cont, comp), respectively, except that c is constructed with uses-allocator construction (20.2.8.2).

8 Complexity: Linear.
```

```
template<class Allocator>
flat_set(const key_compare& comp, const Allocator& a);
template<class Allocator>
explicit flat_set(const Allocator& a);
template<class InputIterator, class Allocator>
flat_set(InputIterator first, InputIterator last, const key_compare& comp, const Allocator& a);
template<class InputIterator, class Allocator>
flat_set(InputIterator first, InputIterator last, const Allocator& a);
template<container-compatible-range<value_type> R, class Allocator>
flat_set(from_range_t, R&& rg, const Allocator& a);
template<container-compatible-range<value_type> R, class Allocator>
flat_set(from_range_t, R&& rg, const key_compare& comp, const Allocator& a);
template<class InputIterator, class Allocator>
flat_set(sorted_unique_t, InputIterator first, InputIterator last,
 const key_compare& comp, const Allocator& a);
template<class InputIterator, class Allocator>
flat_set(sorted_unique_t, InputIterator first, InputIterator last, const Allocator& a);
template<class Allocator>
flat_set(initializer_list<value_type> il, const key_compare& comp, const Allocator& a);
template<class Allocator>
flat_set(initializer_list<value_type> il, const Allocator& a);
template<class Allocator>
flat_set(sorted_unique_t, initializer_list<value_type> il,
 const key_compare& comp, const Allocator& a);
template<class Allocator>
flat_set(sorted_unique_t, initializer_list<value_type> il, const Allocator& a);

9 Constraints: uses_allocator_v<container_type, Allocator> is true.

10 Effects: Equivalent to the corresponding non-allocator constructors except that c is constructed with uses-allocator construction (20.2.8.2).
```

#### 24.6.11.4 Modifiers

[**flat.set.modifiers**]

```
template<class K> pair<iterator, bool> insert(K&& x);
template<class K> iterator insert(const_iterator hint, K&& x);

1 Constraints: The qualified-id Compare::is_transparent is valid and denotes a type. is_constructible_v<value_type, K> is true.

2 Preconditions: The conversion from x into value_type constructs an object u, for which find(x) == find(u) is true.
```

3     *Effects:* If the set already contains an element equivalent to `x`, `*this` and `x` are unchanged. Otherwise, inserts a new element as if by `emplace(std::forward<K>(x))`.

4     *Returns:* In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the element whose key is equivalent to `x`.

```
template<class InputIterator>
void insert(InputIterator first, InputIterator last);
```

5     *Effects:* Adds elements to `c` as if by:

```
 c.insert(c.end(), first, last);
```

Then, sorts the range of newly inserted elements with respect to `compare`; merges the resulting sorted range and the sorted range of pre-existing elements into a single sorted range; and finally erases all but the first element from each group of consecutive equivalent elements.

6     *Complexity:*  $N + M \log M$ , where `N` is `size()` before the operation and `M` is `distance(first, last)`.

7     *Remarks:* Since this operation performs an in-place merge, it may allocate memory.

```
template<class InputIterator>
void insert(sorted_unique_t, InputIterator first, InputIterator last);
```

8     *Effects:* Equivalent to `insert(first, last)`.

9     *Complexity:* Linear.

```
template<container-compatible-range<value_type> R>
void insert_range(R&& rg);
```

10    *Effects:* Adds elements to `c` as if by:

```
 for (const auto& e : rg) {
 c.insert(c.end(), e);
 }
```

Then, sorts the range of newly inserted elements with respect to `compare`; merges the resulting sorted range and the sorted range of pre-existing elements into a single sorted range; and finally erases all but the first element from each group of consecutive equivalent elements.

11    *Complexity:*  $N + M \log M$ , where `N` is `size()` before the operation and `M` is `ranges::distance(rg)`.

12    *Remarks:* Since this operation performs an in-place merge, it may allocate memory.

```
void swap(flat_set& y) noexcept;
```

13    *Effects:* Equivalent to:

```
 ranges::swap(compare, y.compare);
 ranges::swap(c, y.c);
```

```
 container_type extract() &&;
```

14    *Postconditions:* `*this` is emptied, even if the function exits via an exception.

15    *Returns:* `std::move(c)`.

```
void replace(container_type&& cont);
```

16    *Preconditions:* The elements of `cont` are sorted with respect to `compare`, and `cont` contains no equal elements.

17    *Effects:* Equivalent to: `c = std::move(cont)`;

#### 24.6.11.5 Erasure

[flat.set.erasure]

```
template<class Key, class Compare, class KeyContainer, class Predicate>
typename flat_set<Key, Compare, KeyContainer>::size_type
erase_if(flat_set<Key, Compare, KeyContainer>& c, Predicate pred);
```

1     *Preconditions:* `Key` meets the `Cpp17MoveAssignable` requirements.

2     *Effects:* Let `E` be `bool(pred(as_const(e)))`. Erases all elements `e` in `c` for which `E` holds.

3     >Returns: The number of elements erased.  
 4     *Complexity*: Exactly `c.size()` applications of the predicate.  
 5     *Remarks*: Stable (16.4.6.8). If an invocation of `erase_if` exits via an exception, `c` is in a valid but unspecified state (3.67).  
 NOTE: `c` still meets its invariants, but can be empty.

## 24.6.12 Class template flat\_multiset

[flat.multiset]

### 24.6.12.1 Overview

[flat.multiset.overview]

- 1 A `flat_multiset` is a container adaptor that provides an associative container interface that supports equivalent keys (i.e., possibly containing multiple copies of the same key value) and provides for fast retrieval of the keys themselves. `flat_multiset` supports iterators that model the `random_access_iterator` concept (25.3.4.13).
- 2 A `flat_multiset` meets all of the requirements for a container (24.2.2.2) and for a reversible container (24.2.2.3), plus the optional container requirements (24.2.2.4). `flat_multiset` meets the requirements of an associative container (24.2.7), except that:
  - (2.1) — it does not meet the requirements related to node handles (24.2.5.1),
  - (2.2) — it does not meet the requirements related to iterator invalidation, and
  - (2.3) — the time complexity of the operations that insert or erase a single element from the set is linear, including the ones that take an insertion position iterator.

NOTE 1: A `flat_multiset` does not meet the additional requirements of an allocator-aware container, as described in 24.2.2.5.

- 3 A `flat_multiset` also provides most operations described in 24.2.7 for equal keys. This means that a `flat_multiset` supports the `a_eq` operations in 24.2.7 but not the `a_uniq` operations. For a `flat_multiset<Key>`, both the `key_type` and `value_type` are `Key`.
  - 4 Descriptions are provided here only for operations on `flat_multiset` that are not described in one of the general sections or for operations where there is additional semantic information.
  - 5 A `flat_multiset` maintains the invariant that the keys are sorted with respect to the comparison object.
  - 6 If any member function in 24.6.12.2 exits via an exception, the invariant is restored.
- NOTE 2: This can result in the `flat_multiset`'s being emptied.
- 7 Any sequence container (24.2.4) supporting `Cpp17RandomAccessIterator` can be used to instantiate `flat_multiset`. In particular, `vector` (24.3.11) and `deque` (24.3.8) can be used.
- NOTE 3: `vector<bool>` is not a sequence container.
- 8 The program is ill-formed if `Key` is not the same type as `KeyContainer::value_type`.
  - 9 The effect of calling a constructor or member function that takes a `sorted_equivalent_t` argument with a range that is not sorted with respect to `key_comp()` is undefined.

```

#### 24.6.12.3 Constructors

[flat.multiset.cons]

```
explicit flat_multiset(container_type cont, const key_compare& comp = key_compare());
```

- 1 *Effects:* Initializes *c* with `std::move(cont)` and *compare* with *comp*, and sorts the range [`begin()`, `end()`] with respect to *compare*.
- 2 *Complexity:* Linear in *N* if *cont* is sorted with respect to *compare* and otherwise *N log N*, where *N* is the value of *cont.size()* before this call.

```

template<class Allocator>
flat_multiset(const container_type& cont, const Allocator& a);
template<class Allocator>
flat_multiset(const container_type& cont, const key_compare& comp, const Allocator& a);

```

- 3 *Constraints:* `uses_allocator_v<container_type, Allocator>` is true.

4     *Effects:* Equivalent to `flat_multiset(cont)` and `flat_multiset(cont, comp)`, respectively, except  
that `c` is constructed with uses-allocator construction ([20.2.8.2](#)).

5     *Complexity:* Same as `flat_multiset(cont)` and `flat_multiset(cont, comp)`, respectively.

```
template<class Allocator>
flat_multiset(sorted_equivalent_t s, const container_type& cont, const Allocator& a);
template<class Allocator>
flat_multiset(sorted_equivalent_t s, const container_type& cont,
 const key_compare& comp, const Allocator& a);

6 Constraints: uses_allocator_v<container_type, Allocator> is true.

7 Effects: Equivalent to flat_multiset(s, cont) and flat_multiset(s, cont, comp), respectively,
except that c is constructed with uses-allocator construction (20.2.8.2).

8 Complexity: Linear.
```

```
template<class Allocator>
flat_multiset(const key_compare& comp, const Allocator& a);
template<class Allocator>
explicit flat_multiset(const Allocator& a);
template<class InputIterator, class Allocator>
flat_multiset(InputIterator first, InputIterator last,
 const key_compare& comp, const Allocator& a);
template<class InputIterator, class Allocator>
flat_multiset(InputIterator first, InputIterator last, const Allocator& a);
template<container-compatible-range<value_type> R, class Allocator>
flat_multiset(from_range_t, R&& rg, const Allocator& a);
template<container-compatible-range<value_type> R, class Allocator>
flat_multiset(from_range_t, R&& rg, const key_compare& comp, const Allocator& a);
template<class InputIterator, class Allocator>
flat_multiset(sorted_equivalent_t, InputIterator first, InputIterator last,
 const key_compare& comp, const Allocator& a);
template<class InputIterator, class Allocator>
flat_multiset(sorted_equivalent_t, InputIterator first, InputIterator last, const Allocator& a);
template<class Allocator>
flat_multiset(initializer_list<value_type> il, const key_compare& comp, const Allocator& a);
template<class Allocator>
flat_multiset(initializer_list<value_type> il, const Allocator& a);
template<class Allocator>
flat_multiset(sorted_equivalent_t, initializer_list<value_type> il,
 const key_compare& comp, const Allocator& a);
template<class Allocator>
flat_multiset(sorted_equivalent_t, initializer_list<value_type> il, const Allocator& a);

9 Constraints: uses_allocator_v<container_type, Allocator> is true.

10 Effects: Equivalent to the corresponding non-allocator constructors except that c is constructed with
uses-allocator construction (20.2.8.2).
```

#### 24.6.12.4 Modifiers

[[flat.multiset.modifiers](#)]

```
template<class... Args> iterator emplace(Args&&... args);
1 Constraints: is_constructible_v<value_type, Args...> is true.

2 Effects: First, initializes an object t of type value_type with std::forward<Args>(args)..., then
inserts t as if by:
```

```
 auto it = ranges::upper_bound(c, t, compare);
 c.insert(it, std::move(t));
```

3     *Returns:* An iterator that points to the inserted element.

```
template<class InputIterator>
void insert(InputIterator first, InputIterator last);
```

4     *Effects:* Adds elements to `c` as if by:

```
 c.insert(c.end(), first, last);
```

Then, sorts the range of newly inserted elements with respect to *compare*, and merges the resulting sorted range and the sorted range of pre-existing elements into a single sorted range.

*Complexity:*  $N + M \log M$ , where  $N$  is `size()` before the operation and  $M$  is `distance(first, last)`.

*Remarks:* Since this operation performs an in-place merge, it may allocate memory.

```
template<class InputIterator>
void insert(sorted_equivalent_t, InputIterator first, InputIterator last);
Effects: Equivalent to insert(first, last).
Complexity: Linear.
```

```
void swap(flat_multiset& y) noexcept;
```

*Effects:* Equivalent to:

```
ranges::swap(compare, y.compare);
ranges::swap(c, y.c);
```

```
container_type extract() &&;
```

*Postconditions:* `*this` is emptied, even if the function exits via an exception.

*Returns:* `std::move(c)`.

```
void replace(container_type&& cont);
```

*Preconditions:* The elements of `cont` are sorted with respect to *compare*.

*Effects:* Equivalent to: `c = std::move(cont)`;

#### 24.6.12.5 Erasure

[`flat.multiset.erasure`]

```
template<class Key, class Compare, class KeyContainer, class Predicate>
typename flat_multiset<Key, Compare, KeyContainer>::size_type
erase_if(flat_multiset<Key, Compare, KeyContainer>& c, Predicate pred);
```

*Preconditions:* Key meets the *Cpp17MoveAssignable* requirements.

*Effects:* Let  $E$  be `bool(pred(as_const(e))). Erases all elements e in c for which  $E$  holds.`

*Returns:* The number of elements erased.

*Complexity:* Exactly `c.size()` applications of the predicate.

*Remarks:* Stable (16.4.6.8). If an invocation of `erase_if` exits via an exception, `c` is in a valid but unspecified state (3.67).

NOTE: `c` still meets its invariants, but can be empty.

#### 24.6.13 Container adaptors formatting

[`container.adaptors.format`]

- <sup>1</sup> For each of `queue`, `priority_queue`, and `stack`, the library provides the following formatter specialization where *adaptor-type* is the name of the template:

```
namespace std {
 template<class charT, class T, formattable<charT> Container, class... U>
 struct formatter<iostream::format::adaptor-type<T, Container, U...>, charT> {
 private:
 using maybe-const-container =
 fmt-maybe-const<Container, charT>; // exposition only
 using maybe-const-adaptor =
 maybe-const<is_const_v<maybe-const-container>, adaptor-type<T, Container, U...>>; // exposition only // see 26.2
 formatter<ranges::ref_view<maybe-const-container>, charT> underlying_; // exposition only

 public:
 template<class ParseContext>
 constexpr typename ParseContext::iterator
 parse(ParseContext& ctx);
```

```

 template<class FormatContext>
 typename FormatContext::iterator
 format(maybe-const-adaptor& r, FormatContext& ctx) const;
 };
}

template<class ParseContext>
constexpr typename ParseContext::iterator
parse(ParseContext& ctx);
2 Effects: Equivalent to: return underlying_.parse(ctx);

template<class FormatContext>
typename FormatContext::iterator
format(maybe-const-adaptor& r, FormatContext& ctx) const;
3 Effects: Equivalent to: return underlying_.format(r.c, ctx);

```

## 24.7 Views

[views]

### 24.7.1 General

[views.general]

- <sup>1</sup> The header <span> defines the view span. The header <mdspan> defines the class template mdspan and other facilities for interacting with these multidimensional views.

### 24.7.2 Contiguous access

[views.contiguous]

#### 24.7.2.1 Header <span> synopsis

[span.syn]

```

namespace std {
 // constants
 inline constexpr size_t dynamic_extent = numeric_limits<size_t>::max();

 // 24.7.2.2, class template span
 template<class ElementType, size_t Extent = dynamic_extent>
 class span;

 template<class ElementType, size_t Extent>
 constexpr bool ranges::enable_view<span<ElementType, Extent>> = true;
 template<class ElementType, size_t Extent>
 constexpr bool ranges::enable_borrowed_range<span<ElementType, Extent>> = true;

 // 24.7.2.3, views of object representation
 template<class ElementType, size_t Extent>
 span<const byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
 as_bytes(span<ElementType, Extent> s) noexcept;

 template<class ElementType, size_t Extent>
 span<byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
 as_writable_bytes(span<ElementType, Extent> s) noexcept;
}

```

#### 24.7.2.2 Class template span

[views.span]

##### 24.7.2.2.1 Overview

[span.overview]

- <sup>1</sup> A span is a view over a contiguous sequence of objects, the storage of which is owned by some other object.  
<sup>2</sup> All member functions of span have constant time complexity.

```

namespace std {
 template<class ElementType, size_t Extent = dynamic_extent>
 class span {
 public:
 // constants and types
 using element_type = ElementType;
 using value_type = remove_cv_t<ElementType>;
 using size_type = size_t;
 using difference_type = ptrdiff_t;
 using pointer = element_type*;

```

```

using const_pointer = const element_type*;
using reference = element_type&;
using const_reference = const element_type&;
using iterator = implementation-defined; // see 24.7.2.2.7
using const_iterator = std::const_iterator<iterator>;
using reverse_iterator = std::reverse_iterator<iterator>;
using const_reverse_iterator = std::const_iterator<reverse_iterator>;
static constexpr size_type extent = Extent;

// 24.7.2.2.2, constructors, copy, and assignment
constexpr span() noexcept;
template<class It>
constexpr explicit(extent != dynamic_extent) span(It first, size_type count);
template<class It, class End>
constexpr explicit(extent != dynamic_extent) span(It first, End last);
template<size_t N>
constexpr span(type_identity_t<element_type> (&arr)[N]) noexcept;
template<class T, size_t N>
constexpr span(array<T, N>& arr) noexcept;
template<class T, size_t N>
constexpr span(const array<T, N>& arr) noexcept;
template<class R>
constexpr explicit(extent != dynamic_extent) span(R&& r);
constexpr span(const span& other) noexcept = default;
template<class OtherElementType, size_t OtherExtent>
constexpr explicit(see below) span(const span<OtherElementType, OtherExtent>& s) noexcept;

~span() noexcept = default;

constexpr span& operator=(const span& other) noexcept = default;

// 24.7.2.2.4, subviews
template<size_t Count>
constexpr span<element_type, Count> first() const;
template<size_t Count>
constexpr span<element_type, Count> last() const;
template<size_t Offset, size_t Count = dynamic_extent>
constexpr span<element_type, see below> subspan() const;

constexpr span<element_type, dynamic_extent> first(size_type count) const;
constexpr span<element_type, dynamic_extent> last(size_type count) const;
constexpr span<element_type, dynamic_extent> subspan(
 size_type offset, size_type count = dynamic_extent) const;

// 24.7.2.2.5, observers
constexpr size_type size() const noexcept;
constexpr size_type size_bytes() const noexcept;
[[nodiscard]] constexpr bool empty() const noexcept;

// 24.7.2.2.6, element access
constexpr reference operator[](size_type idx) const;
constexpr reference front() const;
constexpr reference back() const;
constexpr pointer data() const noexcept;

// 24.7.2.2.7, iterator support
constexpr iterator begin() const noexcept;
constexpr iterator end() const noexcept;
constexpr const_iterator cbegin() const noexcept { return begin(); }
constexpr const_iterator cend() const noexcept { return end(); }
constexpr reverse_iterator rbegin() const noexcept;
constexpr reverse_iterator rend() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept { return rbegin(); }
constexpr const_reverse_iterator crend() const noexcept { return rend(); }

```

```

private:
 pointer data_; // exposition only
 size_type size_; // exposition only
};

template<class It, class EndOrSize>
span(It, EndOrSize) -> span<remove_reference_t<iter_reference_t<It>>>;
template<class T, size_t N>
span(T (&)[N]) -> span<T, N>;
template<class T, size_t N>
span(array<T, N>&) -> span<T, N>;
template<class T, size_t N>
span(const array<T, N>&) -> span<const T, N>;
template<class R>
span(R&&) -> span<remove_reference_t<ranges::range_reference_t<R>>>;
}

```

<sup>3</sup> `span<ElementType, Extent>` is a trivially copyable type (6.8.1).

<sup>4</sup> `ElementType` is required to be a complete object type that is not an abstract class type.

#### 24.7.2.2.2 Constructors, copy, and assignment

[span.cons]

`constexpr span()` noexcept;

- <sup>1</sup> *Constraints:* `Extent == dynamic_extent || Extent == 0` is true.
- <sup>2</sup> *Postconditions:* `size() == 0 && data() == nullptr`.

`template<class It>`

`constexpr explicit(extent != dynamic_extent) span(It first, size_type count);`

<sup>3</sup> *Constraints:* Let U be `remove_reference_t<iter_reference_t<It>>`.

— It satisfies `contiguous_iterator`.

— `is_convertible_v<U(*), element_type(*)[]>` is true.

NOTE 1: The intent is to allow only qualification conversions of the iterator reference type to `element_type`.

*Preconditions:*

— `[first, first + count)` is a valid range.

— It models `contiguous_iterator`.

— If `extent` is not equal to `dynamic_extent`, then `count` is equal to `extent`.

<sup>5</sup> *Effects:* Initializes `data_` with `to_address(first)` and `size_` with `count`.

<sup>6</sup> *Throws:* Nothing.

`template<class It, class End>`

`constexpr explicit(extent != dynamic_extent) span(It first, End last);`

<sup>7</sup> *Constraints:* Let U be `remove_reference_t<iter_reference_t<It>>`.

— `is_convertible_v<U(*), element_type(*)[]>` is true.

NOTE 2: The intent is to allow only qualification conversions of the iterator reference type to `element_type`.

— It satisfies `contiguous_iterator`.

— `End` satisfies `sized_sentinel_for<It>`.

— `is_convertible_v<End, size_t>` is false.

*Preconditions:*

— If `extent` is not equal to `dynamic_extent`, then `last - first` is equal to `extent`.

— `[first, last)` is a valid range.

— It models `contiguous_iterator`.

— `End` models `sized_sentinel_for<It>`.

9     *Effects:* Initializes `data_` with `to_address(first)` and `size_` with `last - first`.  
 10    *Throws:* When and what `last - first` throws.

```
template<size_t N> constexpr span(type_identity_t<element_type> (&arr)[N]) noexcept;
template<class T, size_t N> constexpr span(array<T, N>& arr) noexcept;
template<class T, size_t N> constexpr span(const array<T, N>& arr) noexcept;
```

11    *Constraints:* Let U be `remove_pointer_t<decltype(data(arr))>`.

(11.1)   — `extent == dynamic_extent || N == extent` is true, and

(11.2)   — `is_convertible_v<U(*)[], element_type(*)[]>` is true.

NOTE 3: The intent is to allow only qualification conversions of the array element type to `element_type`.

12    *Effects:* Constructs a `span` that is a view over the supplied array.

NOTE 4: `type_identity_t` affects class template argument deduction.

13    *Postconditions:* `size() == N && data() == data(arr)` is true.

```
template<class R> constexpr explicit(extent != dynamic_extent) span(R&& r);
```

14    *Constraints:* Let U be `remove_reference_t<ranges::range_reference_t<R>>`.

(14.1)   — R satisfies `ranges::contiguous_range` and `ranges::sized_range`.

(14.2)   — Either R satisfies `ranges::borrowed_range` or `is_const_v<element_type>` is true.

(14.3)   — `remove_cvref_t<R>` is not a specialization of `span`.

(14.4)   — `remove_cvref_t<R>` is not a specialization of `array`.

(14.5)   — `is_array_v<remove_cvref_t<R>>` is false.

(14.6)   — `is_convertible_v<U(*)[], element_type(*)[]>` is true.

NOTE 5: The intent is to allow only qualification conversions of the range reference type to `element_type`.

15    *Preconditions:*

(15.1)   — If `extent` is not equal to `dynamic_extent`, then `ranges::size(r)` is equal to `extent`.

(15.2)   — R models `ranges::contiguous_range` and `ranges::sized_range`.

(15.3)   — If `is_const_v<element_type>` is false, R models `ranges::borrowed_range`.

16    *Effects:* Initializes `data_` with `ranges::data(r)` and `size_` with `ranges::size(r)`.

17    *Throws:* What and when `ranges::data(r)` and `ranges::size(r)` throw.

```
constexpr span(const span& other) noexcept = default;
```

18    *Postconditions:* `other.size() == size() && other.data() == data()`.

```
template<class OtherElementType, size_t OtherExtent>
```

```
constexpr explicit(see below) span(const span<OtherElementType, OtherExtent>& s) noexcept;
```

19    *Constraints:*

(19.1)   — `extent == dynamic_extent || OtherExtent == dynamic_extent || extent == OtherExtent` is true, and

(19.2)   — `is_convertible_v<OtherElementType(*)[], element_type(*)[]>` is true.

NOTE 6: The intent is to allow only qualification conversions of the `OtherElementType` to `element_type`.

20    *Preconditions:* If `extent` is not equal to `dynamic_extent`, then `s.size()` is equal to `extent`.

21    *Effects:* Constructs a `span` that is a view over the range `[s.data(), s.data() + s.size()]`.

22    *Postconditions:* `size() == s.size() && data() == s.data()`.

23    *Remarks:* The expression inside `explicit` is equivalent to:

```
extent != dynamic_extent && OtherExtent == dynamic_extent
```

```
constexpr span& operator=(const span& other) noexcept = default;
```

24    *Postconditions:* `size() == other.size() && data() == other.data()`.

### 24.7.2.2.3 Deduction guides

[span.deduct]

```
template<class It, class EndOrSize>
span(It, EndOrSize) -> span<remove_reference_t<iter_reference_t<It>>>;
```

1     *Constraints:* It satisfies contiguous\_iterator.

```
template<class R>
span(R&&) -> span<remove_reference_t<ranges::range_reference_t<R>>>;
```

2     *Constraints:* R satisfies ranges::contiguous\_range.

### 24.7.2.2.4 Subviews

[span.sub]

```
template<size_t Count> constexpr span<element_type, Count> first() const;
```

1     *Mandates:* Count <= Extent is true.

2     *Preconditions:* Count <= size() is true.

3     *Effects:* Equivalent to: return R{data(), Count}; where R is the return type.

```
template<size_t Count> constexpr span<element_type, Count> last() const;
```

4     *Mandates:* Count <= Extent is true.

5     *Preconditions:* Count <= size() is true.

6     *Effects:* Equivalent to: return R{data() + (size() - Count), Count}; where R is the return type.

```
template<size_t Offset, size_t Count = dynamic_extent>
constexpr span<element_type, see below> subspan() const;
```

7     *Mandates:*

Offset <= Extent && (Count == dynamic\_extent || Count <= Extent - Offset)  
is true.

8     *Preconditions:*

Offset <= size() && (Count == dynamic\_extent || Count <= size() - Offset)  
is true.

9     *Effects:* Equivalent to:

return span<ElementType, see below>(
 data() + Offset, Count != dynamic\_extent ? Count : size() - Offset);

10    *Remarks:* The second template argument of the returned span type is:

Count != dynamic\_extent ? Count
 : (Extent != dynamic\_extent ? Extent - Offset
 : dynamic\_extent)

```
constexpr span<element_type, dynamic_extent> first(size_type count) const;
```

11    *Preconditions:* count <= size() is true.

12    *Effects:* Equivalent to: return {data(), count};

```
constexpr span<element_type, dynamic_extent> last(size_type count) const;
```

13    *Preconditions:* count <= size() is true.

14    *Effects:* Equivalent to: return {data() + (size() - count), count};

```
constexpr span<element_type, dynamic_extent> subspan(
 size_type offset, size_type count = dynamic_extent) const;
```

15    *Preconditions:*

offset <= size() && (count == dynamic\_extent || count <= size() - offset)  
is true.

16    *Effects:* Equivalent to:

return {data() + offset, count == dynamic\_extent ? size() - offset : count};

**24.7.2.2.5 Observers**

[span.obs]

```
constexpr size_type size() const noexcept;
1 Effects: Equivalent to: return size_;

constexpr size_type size_bytes() const noexcept;
2 Effects: Equivalent to: return size() * sizeof(element_type);

[[nodiscard]] constexpr bool empty() const noexcept;
3 Effects: Equivalent to: return size() == 0;
```

**24.7.2.2.6 Element access**

[span.elem]

```
constexpr reference operator[](size_type idx) const;
1 Preconditions: idx < size() is true.
2 Effects: Equivalent to: return *(data() + idx);

constexpr reference front() const;
3 Preconditions: empty() is false.
4 Effects: Equivalent to: return *data();

constexpr reference back() const;
5 Preconditions: empty() is false.
6 Effects: Equivalent to: return *(data() + (size() - 1));

constexpr pointer data() const noexcept;
7 Effects: Equivalent to: return data_;
```

**24.7.2.2.7 Iterator support**

[span.iterators]

```
using iterator = implementation-defined;
```

- 1 The type models `contiguous_iterator` (25.3.4.14), meets the `Cpp17RandomAccessIterator` requirements (25.3.5.7), and meets the requirements for `constexpr` iterators (25.3.1), whose value type is `value_type` and whose reference type is `reference`.
- 2 All requirements on container iterators (24.2.2.2) apply to `span::iterator` as well.

```
constexpr iterator begin() const noexcept;
```

- 3 Returns: An iterator referring to the first element in the span. If `empty()` is `true`, then it returns the same value as `end()`.

```
constexpr iterator end() const noexcept;
```

- 4 Returns: An iterator which is the past-the-end value.

```
constexpr reverse_iterator rbegin() const noexcept;
```

- 5 Effects: Equivalent to: return reverse\_iterator(end());

```
constexpr reverse_iterator rend() const noexcept;
```

- 6 Effects: Equivalent to: return reverse\_iterator(begin());

**24.7.2.3 Views of object representation**

[span.objectrep]

```
template<class ElementType, size_t Extent>
span<const byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
 as_bytes(span<ElementType, Extent> s) noexcept;
1 Effects: Equivalent to: return R{reinterpret_cast<const byte*>(s.data()), s.size_bytes()};
where R is the return type.
```

```

template<class ElementType, size_t Extent>
span<byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
 as_writable_bytes(span<ElementType, Extent> s) noexcept;

2 Constraints: is_const_v<ElementType> is false.

3 Effects: Equivalent to: return R{reinterpret_cast<byte*>(s.data()), s.size_bytes()}; where
R is the return type.

```

### 24.7.3 Multidimensional access

[views.multidim]

#### 24.7.3.1 Overview

[mdspan.overview]

- <sup>1</sup> A *multidimensional index space* is a Cartesian product of integer intervals. Each interval can be represented by a half-open range  $[L_i, U_i]$ , where  $L_i$  and  $U_i$  are the lower and upper bounds of the  $i^{\text{th}}$  dimension. The *rank* of a multidimensional index space is the number of intervals it represents. The *size of a multidimensional index space* is the product of  $U_i - L_i$  for each dimension  $i$  if its rank is greater than 0, and 1 otherwise.
- <sup>2</sup> An integer  $r$  is a *rank index* of an index space  $S$  if  $r$  is in the range  $[0, \text{rank of } S]$ .
- <sup>3</sup> A pack of integers `idx` is a *multidimensional index* in a multidimensional index space  $S$  (or representation thereof) if both of the following are true:
  - (3.1) — `sizeof...(idx)` is equal to the rank of  $S$ , and
  - (3.2) — for every rank index  $i$  of  $S$ , the  $i^{\text{th}}$  value of `idx` is an integer in the interval  $[L_i, U_i]$  of  $S$ .

#### 24.7.3.2 Header <mdspan> synopsis

[mdspan.syn]

```

namespace std {
 // 24.7.3.3, class template extents
 template<class IndexType, size_t... Extents>

 class AccessorPolicy = default_accessor<ElementType>>
 class mdspan;
}

```

#### 24.7.3.3 Class template extents

[mdspan.extents]

##### 24.7.3.3.1 Overview

[mdspan.extents.overview]

The class template `extents` represents a multidimensional index space of rank equal to `sizeof...(Extents)`. In subclause (24.7), `extents` is used synonymously with multidimensional index space.

```

namespace std {
 template<class IndexType, size_t... Extents>
 class extents {
 public:
 using index_type = IndexType;
 using size_type = make_unsigned_t<index_type>;
 using rank_type = size_t;

```

```

// 24.7.3.3.4, observers of the multidimensional index space
static constexpr rank_type rank() noexcept { return sizeof...(Extents); }
static constexpr rank_type rank_dynamic() noexcept { return dynamic-index(rank()); }
static constexpr size_t static_extent(rank_type) noexcept;
constexpr index_type extent(rank_type) const noexcept;

// 24.7.3.3.3, constructors
constexpr extents() noexcept = default;

template<class OtherIndexType, size_t... OtherExtents>
constexpr explicit(see below)
 extents(const extents<OtherIndexType, OtherExtents...>&) noexcept;
template<class... OtherIndexTypes>
constexpr explicit extents(OtherIndexTypes...) noexcept;
template<class OtherIndexType, size_t N>
constexpr explicit(N != rank_dynamic())
 extents(span<OtherIndexType, N>) noexcept;
template<class OtherIndexType, size_t N>
constexpr explicit(N != rank_dynamic())
 extents(const array<OtherIndexType, N>&) noexcept;

// 24.7.3.3.5, comparison operators
template<class OtherIndexType, size_t... OtherExtents>
friend constexpr bool operator==(const extents&,
 const extents<OtherIndexType, OtherExtents...>&) noexcept;

// 24.7.3.3.2, exposition-only helpers
constexpr size_t fwd-prod-of-extents(rank_type) const noexcept; // exposition only
constexpr size_t rev-prod-of-extents(rank_type) const noexcept; // exposition only
template<class OtherIndexType>
static constexpr auto index-cast(OtherIndexType&&) noexcept; // exposition only

private:
 static constexpr rank_type dynamic-index(rank_type) noexcept; // exposition only
 static constexpr rank_type dynamic-index-inv(rank_type) noexcept; // exposition only
 array<index_type, rank_dynamic()> dynamic-extents{}; // exposition only
};

template<class... Integrals>
explicit extents(Integrals...)
 -> see below;
}

1 Mandates:
(1.1) — IndexType is a signed or unsigned integer type, and
(1.2) — each element of Extents is either equal to dynamic_extent, or is representable as a value of type IndexType.
2 Each specialization of extents models regular and is trivially copyable.
3 Let E_r be the r^{th} element of Extents. E_r is a dynamic extent if it is equal to dynamic_extent, otherwise E_r is a static extent. Let D_r be the value of dynamic-extents [dynamic-index(r)] if E_r is a dynamic extent, otherwise E_r .
4 The r^{th} interval of the multidimensional index space represented by an extents object is $[0, D_r)$.

```

#### 24.7.3.3.2 Exposition-only helpers

[mdspan.extents.expo]

```
static constexpr rank_type dynamic-index(rank_type i) noexcept;
```

1 *Preconditions:*  $i \leq \text{rank}()$  is true.

2 *Returns:* The number of  $E_r$  with  $r < i$  for which  $E_r$  is a dynamic extent.

```
static constexpr rank_type dynamic-index-inv(rank_type i) noexcept;
```

3 *Preconditions:*  $i < \text{rank\_dynamic}()$  is true.

4        *Returns:* The minimum value of  $r$  such that `dynamic-index(r + 1) == i + 1` is true.

```
constexpr size_t fwd-prod-of-extents(rank_type i) const noexcept;
```

5        *Preconditions:* `i <= rank()` is true.

6        *Returns:* If `i > 0` is true, the product of `extent(k)` for all  $k$  in the range  $[0, i)$ , otherwise 1.

```
constexpr size_t rev-prod-of-extents(rank_type i) const noexcept;
```

7        *Preconditions:* `i < rank()` is true.

8        *Returns:* If `i + 1 < rank()` is true, the product of `extent(k)` for all  $k$  in the range  $[i + 1, \text{rank}())$ , otherwise 1.

```
template<class OtherIndexType>
static constexpr auto index-cast(OtherIndexType&& i) noexcept;
```

9        *Effects:*

- (9.1)     — If `OtherIndexType` is an integral type other than `bool`, then equivalent to `return i;`,
- (9.2)     — otherwise, equivalent to `return static_cast<index_type>(i);`.

NOTE: This function will always return an integral type other than `bool`. Since this function's call sites are constrained on convertibility of `OtherIndexType` to `index_type`, integer-class types can use the `static_cast` branch without loss of precision.

#### 24.7.3.3.3 Constructors

[mdspan.extents.cons]

```
template<class OtherIndexType, size_t... OtherExtents>
constexpr explicit(see below)
extents(const extents<OtherIndexType, OtherExtents...>& other) noexcept;
```

1        *Constraints:*

(1.1)     — `sizeof...(OtherExtents) == rank()` is true.

(1.2)     — `((OtherExtents == dynamic_extent || Extents == dynamic_extent || OtherExtents == Extents) && ...)` is true.

2        *Preconditions:*

(2.1)     — `other.extent(r)` equals  $E_r$  for each  $r$  for which  $E_r$  is a static extent, and

(2.2)     — either

(2.2.1)     — `sizeof...(OtherExtents) is zero`, or

(2.2.2)     — `other.extent(r)` is representable as a value of type `index_type` for every rank index  $r$  of `other`.

3        *Postconditions:* `*this == other` is true.

4        *Remarks:* The expression inside `explicit` is equivalent to:

```
((Extents != dynamic_extent) && (OtherExtents == dynamic_extent)) || ...) ||
(numeric_limits<index_type>::max() < numeric_limits<OtherIndexType>::max())
```

```
template<class... OtherIndexTypes>
constexpr explicit extents(OtherIndexTypes... exts) noexcept;
```

5        Let  $N$  be `sizeof...(OtherIndexTypes)`, and let `exts_arr` be `array<index_type, N>{static_cast<index_type>(std::move(exts))...}`.

6        *Constraints:*

- (6.1)     — `(is_convertible_v<OtherIndexTypes, index_type> && ...)` is true,
- (6.2)     — `(is_nothrow_constructible_v<index_type, OtherIndexTypes> && ...)` is true, and
- (6.3)     — `N == rank_dynamic() || N == rank()` is true.

NOTE: One can construct `extents` from just dynamic extents, which are all the values getting stored, or from all the extents with a precondition.

7        *Preconditions:*

- (7.1)     — If `N != rank_dynamic()` is true, `exts_arr[r]` equals  $E_r$  for each  $r$  for which  $E_r$  is a static extent, and
- (7.2)     — either
  - (7.2.1)     — `sizeof...(exts) == 0` is true, or
  - (7.2.2)     — each element of `exts` is nonnegative and is representable as a value of type `index_type`.

8        *Postconditions:* `*this == extents(exts_arr)` is true.

```
template<class OtherIndexType, size_t N>
constexpr explicit(N != rank_dynamic())
 extents(span<OtherIndexType, N> exts) noexcept;
template<class OtherIndexType, size_t N>
constexpr explicit(N != rank_dynamic())
 extents(const array<OtherIndexType, N>& exts) noexcept;
```

9        *Constraints:*

- (9.1)     — `is_convertible_v<const OtherIndexType&, index_type>` is true,
- (9.2)     — `is_nothrow_constructible_v<index_type, const OtherIndexType&>` is true, and
- (9.3)     — `N == rank_dynamic() || N == rank()` is true.

10      *Preconditions:*

- (10.1)     — If `N != rank_dynamic()` is true, `exts[r]` equals  $E_r$  for each  $r$  for which  $E_r$  is a static extent, and
- (10.2)     — either
  - (10.2.1)     — `N` is zero, or
  - (10.2.2)     — `exts[r]` is nonnegative and is representable as a value of type `index_type` for every rank index  $r$ .

11      *Effects:*

- (11.1)     — If `N` equals `dynamic_rank()`, for all  $d$  in the range  $[0, \text{rank\_dynamic}())$ , direct-non-list-initializes `dynamic-extents[d]` with `as_const(exts[d])`.
- (11.2)     — Otherwise, for all  $d$  in the range  $[0, \text{rank\_dynamic}())$ , direct-non-list-initializes `dynamic-extents[d]` with `as_const(exts[dynamic-index-inv(d)])`.

```
template<class... Integrals>
explicit extents(Integrals...) -> see below;
```

12      *Constraints:* `(is_convertible_v<Integrals, size_t> && ...)` is true.

13      *Remarks:* The deduced type is `dextents<size_t, sizeof...(Integrals)>`.

#### 24.7.3.3.4 Observers of the multidimensional index space

[mdspan.extents.obs]

```
static constexpr size_t static_extent(rank_type i) noexcept;
```

1        *Preconditions:* `i < rank()` is true.

2        *Returns:*  $E_i$ .

```
constexpr index_type extent(rank_type i) const noexcept;
```

3        *Preconditions:* `i < rank()` is true.

4        *Returns:*  $D_i$ .

#### 24.7.3.3.5 Comparison operators

[mdspan.extents.cmp]

```
template<class OtherIndexType, size_t... OtherExtents>
friend constexpr bool operator==(const extents& lhs,
 const extents<OtherIndexType, OtherExtents...>& rhs) noexcept;
```

1        *Returns:* true if `lhs.rank()` equals `rhs.rank()` and if `lhs.extent(r)` equals `rhs.extent(r)` for every rank index  $r$  of `rhs`, otherwise false.

**24.7.3.3.6 Alias template `dextents`**[`mdspan.extents.dextents`]

```
template<class IndexType, size_t Rank>
using dextents = see below;
```

- <sup>1</sup> *Result:* A type E that is a specialization of `extents` such that `E::rank() == Rank && E::rank() == E::rank_dynamic()` is true, and `E::index_type` denotes `IndexType`.

**24.7.3.4 Layout mapping**[`mdspan.layout`]**24.7.3.4.1 General**[`mdspan.layout.general`]

- <sup>1</sup> In subclauses [24.7.3.4.2](#) and [24.7.3.4.3](#):

- (1.1) — M denotes a layout mapping class.
- (1.2) — m denotes a (possibly const) value of type M.
- (1.3) — i and j are packs of (possibly const) integers that are multidimensional indices in m.`extents()` ([24.7.3.1](#)).  
NOTE: The type of each element of the packs can be a different integer type.
- (1.4) — r is a (possibly const) rank index of `typename M::extents_type`.
- (1.5) — dr is a pack of (possibly const) integers for which `sizeof...(dr) == M::extents_type::rank()` is true, the  $r^{\text{th}}$  element is equal to 1, and all other elements are equal to 0.

- <sup>2</sup> In subclauses [24.7.3.4.2](#) through [24.7.3.4.7](#), let *is-mapping-of* be the exposition-only variable template defined as follows:

```
template<class Layout, class Mapping>
constexpr bool is-mapping-of = // exposition only
 is_same_v<typename Layout::template mapping<typename Mapping::extents_type>, Mapping>;
```

**24.7.3.4.2 Requirements**[`mdspan.layout.reqmts`]

- <sup>1</sup> A type M meets the *layout mapping* requirements if

- (1.1) — M models `copyable` and `equality_comparable`,
- (1.2) — `is_nothrow_move_constructible_v<M>` is true,
- (1.3) — `is_nothrow_move_assignable_v<M>` is true,
- (1.4) — `is_nothrow_swappable_v<M>` is true, and
- (1.5) — the following types and expressions are well-formed and have the specified semantics.

```
typename M::extents_type
```

- <sup>2</sup> *Result:* A type that is a specialization of `extents`.

```
typename M::index_type
```

- <sup>3</sup> *Result:* `typename M::extents_type::index_type`.

```
typename M::rank_type
```

- <sup>4</sup> *Result:* `typename M::extents_type::rank_type`.

```
typename M::layout_type
```

- <sup>5</sup> *Result:* A type MP that meets the layout mapping policy requirements ([24.7.3.4.3](#)) and for which `is-mapping-of<MP, M>` is true.

```
m.extents()
```

- <sup>6</sup> *Result:* `const typename M::extents_type&`

```
m(i...)
```

- <sup>7</sup> *Result:* `typename M::index_type`

- <sup>8</sup> *Returns:* A nonnegative integer less than `numeric_limits<typename M::index_type>::max()` and less than or equal to `numeric_limits<size_t>::max()`.

```

m(i...) == m(static_cast<typename M::index_type>(i...))
9 Result: bool
10 Returns: true

m.required_span_size()
11 Result: typename M::index_type
12 Returns: If the size of the multidimensional index space m.extents() is 0, then 0, else 1 plus the
maximum value of m(i...) for all i.

m.is_unique()
13 Result: bool
14 Returns: true only if for every i and j where (i != j || ...) is true, m(i...) != m(j...) is true.
NOTE 1: A mapping can return false even if the condition is met. For certain layouts, it is possibly not feasible
to determine efficiently whether the layout is unique.

m.is_exhaustive()
15 Result: bool
16 Returns: true only if for all k in the range [0,m.required_span_size()) there exists an i such that
m(i...) equals k.
NOTE 2: A mapping can return false even if the condition is met. For certain layouts, it is possibly not feasible
to determine efficiently whether the layout is exhaustive.

m.is_strided()
17 Result: bool
18 Returns: true only if for every rank index r of m.extents() there exists an integer sr such that, for all
i where (i + dr) is a multidimensional index in m.extents() (24.7.3.1), m((i + dr)...) - m(i...)
equals sr.
NOTE 3: This implies that for a strided layout m(i0,...,ik) = m(0,...,0) + i0 × s0 + ⋯ + ik × sk.
NOTE 4: A mapping can return false even if the condition is met. For certain layouts, it is possibly not feasible
to determine efficiently whether the layout is strided.

m.stride(r)
19 Preconditions: m.is_strided() is true.
20 Result: typename M::index_type
21 Returns: sr as defined in m.is_strided() above.

M::is_always_unique()
22 Result: A constant expression (7.7) of type bool.
23 Returns: true only if m.is_unique() is true for all possible objects m of type M.
NOTE 5: A mapping can return false even if the above condition is met. For certain layout mappings, it is
possibly not feasible to determine whether every instance is unique.

M::is_always_exhaustive()
24 Result: A constant expression (7.7) of type bool.
25 Returns: true only if m.is_exhaustive() is true for all possible objects m of type M.
NOTE 6: A mapping can return false even if the above condition is met. For certain layout mappings, it is
possibly not feasible to determine whether every instance is exhaustive.

M::is_always_strided()
26 Result: A constant expression (7.7) of type bool.
27 Returns: true only if m.is_strided() is true for all possible objects m of type M.
NOTE 7: A mapping can return false even if the above condition is met. For certain layout mappings, it is
possibly not feasible to determine whether every instance is strided.

```

**24.7.3.4.3 Layout mapping policy requirements**

[mdspan.layout.policy.reqmts]

- <sup>1</sup> A type MP meets the *layout mapping policy* requirements if for a type E that is a specialization of `extents`, `MP::mapping<E>` is valid and denotes a type X that meets the layout mapping requirements (24.7.3.4.2), and for which the *qualified-id* `X::layout_type` is valid and denotes the type MP and the *qualified-id* `X::extents_type` denotes E.

**24.7.3.4.4 Layout mapping policies**

[mdspan.layout.policy.overview]

```
namespace std {
 struct layout_left {
 template<class Extents>
 class mapping;
 };
 struct layout_right {
 template<class Extents>
 class mapping;
 };
 struct layout_stride {
 template<class Extents>
 class mapping;
 };
}
```

- <sup>1</sup> Each of `layout_left`, `layout_right`, and `layout_stride` meets the layout mapping policy requirements and is a trivial type.

**24.7.3.4.5 Class template layout\_left::mapping**

[mdspan.layout.left]

**24.7.3.4.5.1 Overview**

[mdspan.layout.left.overview]

- <sup>1</sup> `layout_left` provides a layout mapping where the leftmost extent has stride 1, and strides increase left-to-right as the product of extents.

```
namespace std {
 template<class Extents>
 class layout_left::mapping {
 public:
 using extents_type = Extents;
 using index_type = typename extents_type::index_type;
 using size_type = typename extents_type::size_type;
 using rank_type = typename extents_type::rank_type;
 using layout_type = layout_left;

 // 24.7.3.4.5.2, constructors
 constexpr mapping() noexcept = default;
 constexpr mapping(const mapping&) noexcept = default;
 constexpr mapping(const extents_type&) noexcept;
 template<class OtherExtents>
 constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
 mapping(const mapping<OtherExtents>&) noexcept;
 template<class OtherExtents>
 constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
 mapping(const layout_right::mapping<OtherExtents>&) noexcept;
 template<class OtherExtents>
 constexpr explicit(extents_type::rank() > 0)
 mapping(const layout_stride::mapping<OtherExtents>&);

 constexpr mapping& operator=(const mapping&) noexcept = default;

 // 24.7.3.4.5.3, observers
 constexpr const extents_type& extents() const noexcept { return extents_; }

 constexpr index_type required_span_size() const noexcept;

 template<class... Indices>
 constexpr index_type operator()(Indices...) const noexcept;
 };
}
```

```

 static constexpr bool is_always_unique() noexcept { return true; }
 static constexpr bool is_always_exhaustive() noexcept { return true; }
 static constexpr bool is_always_strided() noexcept { return true; }

 static constexpr bool is_unique() noexcept { return true; }
 static constexpr bool is_exhaustive() noexcept { return true; }
 static constexpr bool is_strided() noexcept { return true; }

 constexpr index_type stride(rank_type) const noexcept;

 template<class OtherExtents>
 friend constexpr bool operator==(const mapping&, const mapping<OtherExtents>&) noexcept;

 private:
 extents_type extents_{}; // exposition only
 };
}

```

- 2 If Extents is not a specialization of `extents`, then the program is ill-formed.  
 3 `layout_left::mapping<E>` is a trivially copyable type that models `regular` for each E.  
 4 *Mandates:* If `Extents::rank_dynamic() == 0` is true, then the size of the multidimensional index space `Extents()` is representable as a value of type `typename Extents::index_type`.

#### 24.7.3.4.5.2 Constructors

[`mdspan.layout.left.cons`]

`constexpr mapping(const extents_type& e) noexcept;`

- 1 *Preconditions:* The size of the multidimensional index space e is representable as a value of type `index_type` (6.8.2).  
 2 *Effects:* Direct-non-list-initializes `extents_` with e.

```

template<class OtherExtents>
constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
 mapping(const mapping<OtherExtents>& other) noexcept;

3 Constraints: is_constructible_v<extents_type, OtherExtents> is true.
4 Preconditions: other.required_span_size() is representable as a value of type index_type (6.8.2).
5 Effects: Direct-non-list-initializes extents_ with other.extents().

```

```

template<class OtherExtents>
constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
 mapping(const layout_right::mapping<OtherExtents>& other) noexcept;

```

- 6 *Constraints:*  
 (6.1) — `extents_type::rank() <= 1` is true, and  
 (6.2) — `is_constructible_v<extents_type, OtherExtents>` is true.  
 7 *Preconditions:* `other.required_span_size()` is representable as a value of type `index_type` (6.8.2).  
 8 *Effects:* Direct-non-list-initializes `extents_` with `other.extents()`.

```

template<class OtherExtents>
constexpr explicit(extents_type::rank() > 0)
 mapping(const layout_stride::mapping<OtherExtents>& other);

```

- 9 *Constraints:* `is_constructible_v<extents_type, OtherExtents>` is true.  
 10 *Preconditions:*  
 (10.1) — If `extents_type::rank() > 0` is true, then for all r in the range  $[0, \text{extents\_type::rank}())$ ,  
       `other.stride(r)` equals `other.extents().fwd-prod-of-extents(r)`, and  
 (10.2) — `other.required_span_size()` is representable as a value of type `index_type` (6.8.2).  
 11 *Effects:* Direct-non-list-initializes `extents_` with `other.extents()`.

#### 24.7.3.4.5.3 Observers

[mdspan.layout.left.obs]

```
constexpr index_type required_span_size() const noexcept;
1 Returns: extents().fwd-prod-of-extents(extents_type::rank()).

template<class... Indices>
constexpr index_type operator()(Indices... i) const noexcept;
2 Constraints:
(2.1) — sizeof...(Indices) == extents_type::rank() is true,
(2.2) — (is_convertible_v<Indices, index_type> && ...) is true, and
(2.3) — (is_nothrow_constructible_v<index_type, Indices> && ...) is true.
3 Preconditions: extents_type::index-cast(i) is a multidimensional index in extents_ (24.7.3.1).
4 Effects: Let P be a parameter pack such that
 is_same_v<index_sequence_for<Indices...>, index_sequence<P...>>
is true. Equivalent to:
 return ((static_cast<index_type>(i) * stride(P)) + ... + 0);

constexpr index_type stride(rank_type i) const;
5 Constraints: extents_type::rank() > 0 is true.
6 Preconditions: i < extents_type::rank() is true.
7 Returns: extents().fwd-prod-of-extents(i).

template<class OtherExtents>
friend constexpr bool operator==(const mapping& x, const mapping<OtherExtents>& y) noexcept;
8 Constraints: extents_type::rank() == OtherExtents::rank() is true.
9 Effects: Equivalent to: return x.extents() == y.extents();
```

#### 24.7.3.4.6 Class template layout\_right::mapping

[mdspan.layout.right]

##### 24.7.3.4.6.1 Overview

[mdspan.layout.right.overview]

- 1 layout\_right provides a layout mapping where the rightmost extent is stride 1, and strides increase right-to-left as the product of extents.

```
namespace std {
 template<class Extents>
 class layout_right::mapping {
 public:
 using extents_type = Extents;
 using index_type = typename extents_type::index_type;
 using size_type = typename extents_type::size_type;
 using rank_type = typename extents_type::rank_type;
 using layout_type = layout_right;

 // 24.7.3.4.6.2, constructors
 constexpr mapping() noexcept = default;
 constexpr mapping(const mapping&) noexcept = default;
 constexpr mapping(const extents_type&) noexcept;
 template<class OtherExtents>
 constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
 mapping(const mapping<OtherExtents>&) noexcept;
 template<class OtherExtents>
 constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
 mapping(const layout_left::mapping<OtherExtents>&) noexcept;
 template<class OtherExtents>
 constexpr explicit(extents_type::rank() > 0)
 mapping(const layout_stride::mapping<OtherExtents>&) noexcept;

 constexpr mapping& operator=(const mapping&) noexcept = default;
```

```

// 24.7.3.4.6.3, observers
constexpr const extents_type& extents() const noexcept { return extents_; }

constexpr index_type required_span_size() const noexcept;

template<class... Indices>
constexpr index_type operator()(Indices...) const noexcept;

static constexpr bool is_always_unique() noexcept { return true; }
static constexpr bool is_always_exhaustive() noexcept { return true; }
static constexpr bool is_always_strided() noexcept { return true; }

static constexpr bool is_unique() noexcept { return true; }
static constexpr bool is_exhaustive() noexcept { return true; }
static constexpr bool is_strided() noexcept { return true; }

constexpr index_type stride(rank_type) const noexcept;

template<class OtherExtents>
friend constexpr bool operator==(const mapping&, const mapping<OtherExtents>&) noexcept;

private:
 extents_type extents_{}; // exposition only
};

}

2 If Extents is not a specialization of extents, then the program is ill-formed.
3 layout_right::mapping<E> is a trivially copyable type that models regular for each E.
4 Mandates: If Extents::rank_dynamic() == 0 is true, then the size of the multidimensional index space Extents() is representable as a value of type typename Extents::index_type.

```

#### 24.7.3.4.6.2 Constructors

[mdspan.layout.right.cons]

`constexpr mapping(const extents_type& e) noexcept;`

1 *Preconditions:* The size of the multidimensional index space `e` is representable as a value of type `index_type` (6.8.2).

2 *Effects:* Direct-non-list-initializes `extents_` with `e`.

```

template<class OtherExtents>
constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
 mapping(const mapping<OtherExtents>& other) noexcept;

```

3 *Constraints:* `is_constructible_v<extents_type, OtherExtents>` is true.

4 *Preconditions:* `other.required_span_size()` is representable as a value of type `index_type` (6.8.2).

5 *Effects:* Direct-non-list-initializes `extents_` with `other.extents()`.

```

template<class OtherExtents>
constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
 mapping(const layout_left::mapping<OtherExtents>& other) noexcept;

```

6 *Constraints:*

(6.1) — `extents_type::rank() <= 1` is true, and

(6.2) — `is_constructible_v<extents_type, OtherExtents>` is true.

7 *Preconditions:* `other.required_span_size()` is representable as a value of type `index_type` (6.8.2).

8 *Effects:* Direct-non-list-initializes `extents_` with `other.extents()`.

```

template<class OtherExtents>
constexpr explicit(extents_type::rank() > 0)
 mapping(const layout_stride::mapping<OtherExtents>& other) noexcept;

```

9 *Constraints:* `is_constructible_v<extents_type, OtherExtents>` is true.

10        *Preconditions:*

(10.1)     — If `extents_type::rank() > 0` is true, then for all  $r$  in the range  $[0, \text{extents\_type}::\text{rank}())$ ,  
             `other.stride(r)` equals `other.extents().rev-prod-of-extents(r)`.

(10.2)     — `other.required_span_size()` is representable as a value of type `index_type` (6.8.2).

11        *Effects:* Direct-non-list-initializes `extents_` with `other.extents()`.

**24.7.3.4.6.3 Observers**

[mdspan.layout.right.obs]

```
index_type required_span_size() const noexcept;
1 Returns: extents().fwd-prod-of-extents(extents_type::rank()).
```

```
template<class... Indices>
constexpr index_type operator()(Indices... i) const noexcept;
```

2        *Constraints:*

(2.1)     — `sizeof...(Indices) == extents_type::rank()` is true,

(2.2)     — `(is_convertible_v<Indices, index_type> && ...)` is true, and

(2.3)     — `(is_nothrow_constructible_v<index_type, Indices> && ...)` is true.

3        *Preconditions:* `extents_type::index-cast(i)` is a multidimensional index in `extents_` (24.7.3.1).

4        *Effects:* Let  $P$  be a parameter pack such that

```
is_same_v<index_sequence_for<Indices...>, index_sequence<P...>>
is true. Equivalent to:
```

```
return ((static_cast<index_type>(i) * stride(P)) + ... + 0);
```

```
constexpr index_type stride(rank_type i) const noexcept;
```

5        *Constraints:* `extents_type::rank() > 0` is true.

6        *Preconditions:*  $i < \text{extents\_type}::\text{rank}()$  is true.

7        *Returns:* `extents().rev-prod-of-extents(i)`.

```
template<class OtherExtents>
friend constexpr bool operator==(const mapping& x, const mapping<OtherExtents>& y) noexcept;
```

8        *Constraints:* `extents_type::rank() == OtherExtents::rank()` is true.

9        *Effects:* Equivalent to: `return x.extents() == y.extents();`

**24.7.3.4.7 Class template layout\_stride::mapping**

[mdspan.layout.stride]

**24.7.3.4.7.1 Overview**

[mdspan.layout.stride.overview]

1        `layout_stride` provides a layout mapping where the strides are user-defined.

```
namespace std {
 template<class Extents>
 class layout_stride::mapping {
public:
 using extents_type = Extents;
 using index_type = typename extents_type::index_type;
 using size_type = typename extents_type::size_type;
 using rank_type = typename extents_type::rank_type;
 using layout_type = layout_stride;

private:
 static constexpr rank_type rank_ = extents_type::rank(); // exposition only

public:
 // 24.7.3.4.7.3, constructors
 constexpr mapping() noexcept;
 constexpr mapping(const mapping&) noexcept = default;
 template<class OtherIndexType>
 constexpr mapping(const extents_type&, span<OtherIndexType, rank_>) noexcept;
```

```

template<class OtherIndexType>
constexpr mapping(const extents_type&, const array<OtherIndexType, rank_>&) noexcept;

template<class StridedLayoutMapping>
constexpr explicit(see below) mapping(const StridedLayoutMapping&) noexcept;

constexpr mapping& operator=(const mapping&) noexcept = default;

// 24.7.3.4.7.4, observers
constexpr const extents_type& extents() const noexcept { return extents_; }
constexpr array<index_type, rank_> strides() const noexcept { return strides_; }

constexpr index_type required_span_size() const noexcept;

template<class... Indices>
constexpr index_type operator()(Indices...) const noexcept;

static constexpr bool is_always_unique() noexcept { return true; }
static constexpr bool is_always_exhaustive() noexcept { return false; }
static constexpr bool is_always_strided() noexcept { return true; }

static constexpr bool is_unique() noexcept { return true; }
constexpr bool is_exhaustive() const noexcept;
static constexpr bool is_strided() noexcept { return true; }

constexpr index_type stride(rank_type i) const noexcept { return strides_[i]; }

template<class OtherMapping>
friend constexpr bool operator==(const mapping&, const OtherMapping&) noexcept;

private:
 extents_type extents_{}; // exposition only
 array<index_type, rank_> strides_{}; // exposition only
};

}

2 If Extents is not a specialization of extents, then the program is ill-formed.
3 layout_stride::mapping<E> is a trivially copyable type that models regular for each E.
4 Mandates: If Extents::rank_dynamic() == 0 is true, then the size of the multidimensional index space Extents() is representable as a value of type typename Extents::index_type.

```

#### 24.7.3.4.7.2 Exposition-only helpers

[mdspan.layout.stride.expo]

- 1 Let REQUIRED-SPAN-SIZE(e, strides) be:

- (1.1) — 1, if e.rank() == 0 is true,
- (1.2) — otherwise 0, if the size of the multidimensional index space e is 0,
- (1.3) — otherwise 1 plus the sum of products of (e.extent(r) - 1) and strides[r] for all r in the range [0, e.rank()).

- 2 Let OFFSET(m) be:

- (2.1) — m(), if e.rank() == 0 is true,
- (2.2) — otherwise 0, if the size of the multidimensional index space e is 0,
- (2.3) — otherwise m(z...) for a pack of integers z that is a multidimensional index in m.extents() and each element of z equals 0.

- 3 Let is-extents be the exposition-only variable template defined as follows:

```

template<class T>
constexpr bool is-extents = false; // exposition only
template<class IndexType, size_t... Args>
constexpr bool is-extents<extents<IndexType, Args...>> = true; // exposition only

```

- 4 Let layout-mapping-alike be the exposition-only concept defined as follows:

```
template<class M>
concept layout-mapping-alike = requires {
 requires is-extents<typename M::extents_type>;
 { M::is_always_strided() } -> same_as<bool>;
 { M::is_always_exhaustive() } -> same_as<bool>;
 { M::is_always_unique() } -> same_as<bool>;
 bool_constant<M::is_always_strided()>::value;
 bool_constant<M::is_always_exhaustive()>::value;
 bool_constant<M::is_always_unique()>::value;
};

// exposition only
```

NOTE: This concept checks that the functions `M::is_always_strided()`, `M::is_always_exhaustive()`, and `M::is_always_unique()` exist, are constant expressions, and have a return type of `bool`.

#### 24.7.3.4.7.3 Constructors

[mdspan.layout.stride.cons]

`constexpr mapping() noexcept;`

1    *Preconditions:* `layout_right::mapping<extents_type>().required_span_size()` is representable as a value of type `index_type` (6.8.2).

2    *Effects:* Direct-non-list-initializes `extents_` with `extents_type()`, and for all `d` in the range  $[0, \text{rank}_\text{ }]$ , direct-non-list-initializes `strides_[d]` with `layout_right::mapping<extents_type>().stride(d)`.

```
template<class OtherIndexType>
constexpr mapping(const extents_type& e, span<OtherIndexType, rank_> s) noexcept;
template<class OtherIndexType>
constexpr mapping(const extents_type& e, const array<OtherIndexType, rank_>& s) noexcept;
```

3    *Constraints:*

(3.1) — `is_convertible_v<const OtherIndexType&, index_type>` is true, and

(3.2) — `is_nothrow_constructible_v<index_type, const OtherIndexType&>` is true.

4    *Preconditions:*

(4.1) — `s[i] > 0` is true for all `i` in the range  $[0, \text{rank}_\text{ }]$ .

(4.2) — `REQUIRED-SPAN-SIZE(e, s)` is representable as a value of type `index_type` (6.8.2).

(4.3) — If `rank_` is greater than 0, then there exists a permutation `P` of the integers in the range  $[0, \text{rank}_\text{ }]$ , such that `s[p_i] >= s[p_{i-1}] * e.extent(p_{i-1})` is true for all `i` in the range  $[1, \text{rank}_\text{ }]$ , where `p_i` is the  $i^{\text{th}}$  element of `P`.

NOTE: For `layout_stride`, this condition is necessary and sufficient for `is_unique()` to be true.

5    *Effects:* Direct-non-list-initializes `extents_` with `e`, and for all `d` in the range  $[0, \text{rank}_\text{ }]$ , direct-non-list-initializes `strides_[d]` with `as_const(s[d])`.

```
template<class StridedLayoutMapping>
constexpr explicit(see below)
 mapping(const StridedLayoutMapping& other) noexcept;
```

6    *Constraints:*

(6.1) — `layout-mapping-alike<StridedLayoutMapping>` is satisfied.

(6.2) — `is_constructible_v<extents_type, typename StridedLayoutMapping::extents_type>` is true.

(6.3) — `StridedLayoutMapping::is_always_unique()` is true.

(6.4) — `StridedLayoutMapping::is_always_strided()` is true.

7    *Preconditions:*

(7.1) — `StridedLayoutMapping` meets the layout mapping requirements (24.7.3.4.3),

(7.2) — `other.stride(r) > 0` is true for every rank index `r` of `extents()`,

(7.3) — `other.required_span_size()` is representable as a value of type `index_type` (6.8.2), and

(7.4) — `OFFSET(other) == 0` is true.

8     *Effects:* Direct-non-list-initializes `extents_` with `other.extents()`, and for all  $d$  in the range  $[0, rank_{\_})$ ,  
direct-non-list-initializes `strides_[d]` with `other.stride(d)`.

9     *Remarks:* The expression inside `explicit` is equivalent to:

```
!(is_convertible_v<typename StridedLayoutMapping::extents_type, extents_type> &&
 (is-mapping-of<layout_left, LayoutStrideMapping> ||
 is-mapping-of<layout_right, LayoutStrideMapping> ||
 is-mapping-of<layout_stride, LayoutStrideMapping>))
```

#### 24.7.3.4.7.4 Observers

[mdspan.layout.stride.obs]

```
constexpr index_type required_span_size() const noexcept;
```

1     *Returns:* REQUIRED-SPAN-SIZE(`extents()`, `strides_`).

```
template<class... Indices>
```

```
constexpr index_type operator()(Indices... i) const noexcept;
```

2     *Constraints:*

(2.1)   — `sizeof...(Indices) == rank_{\_}` is true,

(2.2)   — `(is_convertible_v<Indices, index_type> && ...)` is true, and

(2.3)   — `(is_nothrow_constructible_v<index_type, Indices> && ...)` is true.

3     *Preconditions:* `extents_type::index-cast(i)` is a multidimensional index in `extents_` (24.7.3.1).

4     *Effects:* Let  $P$  be a parameter pack such that

```
is_same_v<index_sequence_for<Indices...>, index_sequence<P...>>
```

is true. Equivalent to:

```
return ((static_cast<index_type>(i) * stride(P)) + ... + 0);
```

```
constexpr bool is_exhaustive() const noexcept;
```

5     *Returns:*

(5.1)   — true if `rank_{\_}` is 0.

(5.2)   — Otherwise, true if there is a permutation  $P$  of the integers in the range  $[0, rank_{\_})$  such that  
`stride( $p_0$ )` equals 1, and `stride( $p_i$ )` equals `stride( $p_{i-1}$ ) * extents().extent( $p_{i-1}$ )` for  $i$  in  
the range  $[1, rank_{\_})$ , where  $p_i$  is the  $i^{\text{th}}$  element of  $P$ .

(5.3)   — Otherwise, false.

```
template<class OtherMapping>
```

```
friend constexpr bool operator==(const mapping& x, const OtherMapping& y) noexcept;
```

6     *Constraints:*

(6.1)   — `layout-mapping-alike<OtherMapping>` is satisfied.

(6.2)   — `rank_{\_} == OtherMapping::extents_type::rank()` is true.

(6.3)   — `OtherMapping::is_always_strided()` is true.

7     *Preconditions:* `OtherMapping` meets the layout mapping requirements (24.7.3.4.3).

8     *Returns:* true if `x.extents() == y.extents()` is true, `OFFSET(y) == 0` is true, and each of  
`x.stride(r) == y.stride(r)` is true for  $r$  in the range  $[0, x.extents().rank())$ . Otherwise, false.

#### 24.7.3.5 Accessor policy

[mdspan.accessor]

##### 24.7.3.5.1 General

[mdspan.accessor.general]

1     An *accessor policy* defines types and operations by which a reference to a single object is created from an abstract data handle to a number of such objects and an index.

2     A range of indices  $[0, N)$  is an *accessible range* of a given data handle and an accessor if, for each  $i$  in the range, the accessor policy's `access` function produces a valid reference to an object.

3     In subclause 24.7.3.5.2,

(3.1)   — A denotes an accessor policy.

- (3.2) — `a` denotes a value of type `A` or `const A`.
- (3.3) — `p` denotes a value of type `A::data_handle_type` or `const A::data_handle_type`.  
NOTE: The type `A::data_handle_type` need not be dereferenceable.
- (3.4) — `n`, `i`, and `j` each denote values of type `size_t`.

#### 24.7.3.5.2 Requirements

[mdspan.accessor.reqmts]

- <sup>1</sup> A type `A` meets the accessor policy requirements if

- (1.1) — `A` models `copyable`,
- (1.2) — `is_nothrow_move_constructible_v<A>` is `true`,
- (1.3) — `is_nothrow_move_assignable_v<A>` is `true`,
- (1.4) — `is_nothrow_swappable_v<A>` is `true`, and
- (1.5) — the following types and expressions are well-formed and have the specified semantics.

`typename A::element_type`

- <sup>2</sup> *Result:* A complete object type that is not an abstract class type.

`typename A::data_handle_type`

- <sup>3</sup> *Result:* A type that models `copyable`, and for which `is_nothrow_move_constructible_v<A::data_handle_type>` is `true`, `is_nothrow_move_assignable_v<A::data_handle_type>` is `true`, and `is_nothrow_swappable_v<A::data_handle_type>` is `true`.

NOTE 1: The type of `data_handle_type` need not be `element_type*`.

`typename A::reference`

- <sup>4</sup> *Result:* A type that models `common_reference_with<A::reference&&, A::element_type&>`.

NOTE 2: The type of `reference` need not be `element_type&`.

`typename A::offset_policy`

- <sup>5</sup> *Result:* A type `OP` such that:

- (5.1) — `OP` meets the accessor policy requirements,
- (5.2) — `constructible_from<OP, const A&>` is modeled, and
- (5.3) — `is_same_v<typename OP::element_type, typename A::element_type>` is `true`.

`a.access(p, i)`

- <sup>6</sup> *Result:* `A::reference`

- <sup>7</sup> *Remarks:* The expression is equality preserving.

- <sup>8</sup> NOTE 3: Concrete accessor policies can impose preconditions for their `access` function. However, they might not. For example, an accessor where `p` is `span<A::element_type, dynamic_extent>` and `access(p, i)` returns `p[i % p.size()]` does not need to impose a precondition on `i`.

`a.offset(p, i)`

- <sup>9</sup> *Result:* `A::offset_policy::data_handle_type`

- <sup>10</sup> *Returns:* `q` such that for `b` being `A::offset_policy(a)`, and any integer `n` for which  $[0, n)$  is an accessible range of `p` and `a`:

- (10.1) —  $[0, n - i)$  is an accessible range of `q` and `b`; and
- (10.2) — `b.access(q, j)` provides access to the same element as `a.access(p, i + j)`, for every `j` in the range  $[0, n - i)$ .

- <sup>11</sup> *Remarks:* The expression is equality-preserving.

#### 24.7.3.5.3 Class template `default_accessor`

[mdspan.accessor.default]

##### 24.7.3.5.3.1 Overview

[mdspan.accessor.default.overview]

```
namespace std {
 template<class ElementType>
```

```

 struct default_accessor {
 using offset_policy = default_accessor;
 using element_type = ElementType;
 using reference = ElementType&;
 using data_handle_type = ElementType*;

 constexpr default_accessor() noexcept = default;
 template<class OtherElementType>
 constexpr default_accessor(default_accessor<OtherElementType>) noexcept;
 constexpr reference access(data_handle_type p, size_t i) const noexcept;
 constexpr data_handle_type offset(data_handle_type p, size_t i) const noexcept;
 };
}

```

<sup>1</sup> `default_accessor` meets the accessor policy requirements.

<sup>2</sup> `ElementType` is required to be a complete object type that is neither an abstract class type nor an array type.

<sup>3</sup> Each specialization of `default_accessor` is a trivially copyable type that models `semiregular`.

<sup>4</sup>  $[0, n)$  is an accessible range for an object `p` of type `data_handle_type` and an object of type `default_accessor` if and only if  $[p, p + n)$  is a valid range.

#### 24.7.3.5.3.2 Members

[`mdspan.accessor.default.members`]

```

template<class OtherElementType>
constexpr default_accessor(default_accessor<OtherElementType>) noexcept {}

1 Constraints: is_convertible_v<OtherElementType(*)[], element_type(*)[]> is true.

constexpr reference access(data_handle_type p, size_t i) const noexcept;
2 Effects: Equivalent to: return p[i];

constexpr data_handle_type offset(data_handle_type p, size_t i) const noexcept;
3 Effects: Equivalent to: return p + i;

```

#### 24.7.3.6 Class template `mdspan`

[`mdspan.mdspan`]

##### 24.7.3.6.1 Overview

[`mdspan.mdspan.overview`]

<sup>1</sup> `mdspan` is a view of a multidimensional array of elements.

```

namespace std {
 template<class ElementType, class Extents, class LayoutPolicy = layout_right,
 class AccessorPolicy = default_accessor<ElementType>>
 class mdspan {
 public:
 using extents_type = Extents;
 using layout_type = LayoutPolicy;
 using accessor_type = AccessorPolicy;
 using mapping_type = typename layout_type::template mapping<extents_type>;
 using element_type = ElementType;
 using value_type = remove_cv_t<element_type>;
 using index_type = typename extents_type::index_type;
 using size_type = typename extents_type::size_type;
 using rank_type = typename extents_type::rank_type;
 using data_handle_type = typename accessor_type::data_handle_type;
 using reference = typename accessor_type::reference;

 static constexpr rank_type rank() noexcept { return extents_type::rank(); }
 static constexpr rank_type rank_dynamic() noexcept { return extents_type::rank_dynamic(); }
 static constexpr size_t static_extent(rank_type r) noexcept
 { return extents_type::static_extent(r); }
 constexpr index_type extent(rank_type r) const noexcept { return extents_type::extent(r); }

 // 24.7.3.6.2, constructors
 constexpr mdspan();
 constexpr mdspan(const mdspan& rhs) = default;
 };
}

```

```

constexpr mdspan(mdspan&& rhs) = default;

template<class... OtherIndexTypes>
constexpr explicit mdspan(data_handle_type ptr, OtherIndexTypes... exts);
template<class OtherIndexType, size_t N>
constexpr explicit(N != rank_dynamic())
 mdspan(data_handle_type p, span<OtherIndexType, N> exts);

-> mdspan<ElementType, typename MappingType::extents_type,
typename MappingType::layout_type>;

template<class MappingType, class AccessorType>
mdspan(const typename AccessorType::data_handle_type&, const MappingType&,
const AccessorType&)
-> mdspan<typename AccessorType::element_type, typename MappingType::extents_type,
typename MappingType::layout_type, AccessorType>;
}

2 Mandates:

(2.1) — ElementType is a complete object type that is neither an abstract class type nor an array type,
(2.2) — Extents is a specialization of extents, and
(2.3) — is_same_v<ElementType, typename AccessorPolicy::element_type> is true.

3 LayoutPolicy shall meet the layout mapping policy requirements (24.7.3.4.3), and AccessorPolicy shall meet the accessor policy requirements (24.7.3.5.2).

4 Each specialization MDS of mdspan models copyable and
(4.1) — is_nothrow_move_constructible_v<MDS> is true,
(4.2) — is_nothrow_move_assignable_v<MDS> is true, and
(4.3) — is_nothrow_swappable_v<MDS> is true.

5 A specialization of mdspan is a trivially copyable type if its accessor_type, mapping_type, and data_handle_type are trivially copyable types.

```

#### 24.7.3.6.2 Constructors

[mdspan.mdspan.cons]

```
constexpr mdspan();
```

1 *Constraints:*

- (1.1) — rank\_dynamic() > 0 is true.
- (1.2) — is\_default\_constructible\_v<data\_handle\_type> is true.

(1.3) — `is_default_constructible_v<mapping_type>` is true.

(1.4) — `is_default_constructible_v<accessor_type>` is true.

2 *Preconditions:* [0, `map_.required_span_size()`) is an accessible range of `ptr_` and `acc_` for the values of `map_` and `acc_` after the invocation of this constructor.

3 *Effects:* Value-initializes `ptr_`, `map_`, and `acc_`.

```
template<class... OtherIndexTypes>
constexpr explicit mdspan(data_handle_type p, OtherIndexTypes... exts);
```

4 Let N be `sizeof...(OtherIndexTypes)`.

5 *Constraints:*

(5.1) — `(is_convertible_v<OtherIndexTypes, index_type> && ...)` is true,

(5.2) — `(is_nothrow_constructible<index_type, OtherIndexTypes> && ...)` is true,

(5.3) — `N == rank() || N == rank_dynamic()` is true,

(5.4) — `is_constructible_v<mapping_type, extents_type>` is true, and

(5.5) — `is_default_constructible_v<accessor_type>` is true.

6 *Preconditions:* [0, `map_.required_span_size()`) is an accessible range of `p` and `acc_` for the values of `map_` and `acc_` after the invocation of this constructor.

7 *Effects:*

(7.1) — Direct-non-list-initializes `ptr_` with `std::move(p)`,

(7.2) — direct-non-list-initializes `map_` with `extents_type(static_cast<index_type>(std::move(exts)))`, and

(7.3) — value-initializes `acc_`.

```
template<class OtherIndexType, size_t N>
constexpr explicit(N != rank_dynamic())
 mdspan(data_handle_type p, span<OtherIndexType, N> exts);
template<class OtherIndexType, size_t N>
constexpr explicit(N != rank_dynamic())
 mdspan(data_handle_type p, const array<OtherIndexType, N>& exts);
```

8 *Constraints:*

(8.1) — `is_convertible_v<const OtherIndexType&, index_type>` is true,

(8.2) — `(is_nothrow_constructible<index_type, const OtherIndexType&> && ...)` is true,

(8.3) — `N == rank() || N == rank_dynamic()` is true,

(8.4) — `is_constructible_v<mapping_type, extents_type>` is true, and

(8.5) — `is_default_constructible_v<accessor_type>` is true.

9 *Preconditions:* [0, `map_.required_span_size()`) is an accessible range of `p` and `acc_` for the values of `map_` and `acc_` after the invocation of this constructor.

10 *Effects:*

(10.1) — Direct-non-list-initializes `ptr_` with `std::move(p)`,

(10.2) — direct-non-list-initializes `map_` with `extents_type(exts)`, and

(10.3) — value-initializes `acc_`.

```
constexpr mdspan(data_handle_type p, const extents_type& ext);
```

11 *Constraints:*

(11.1) — `is_constructible_v<mapping_type, const extents_type&>` is true, and

(11.2) — `is_default_constructible_v<accessor_type>` is true.

12 *Preconditions:* [0, `map_.required_span_size()`) is an accessible range of `p` and `acc_` for the values of `map_` and `acc_` after the invocation of this constructor.

13 *Effects:*

(13.1) — Direct-non-list-initializes *ptr\_* with `std::move(p)`,

(13.2) — direct-non-list-initializes *map\_* with *ext*, and

(13.3) — value-initializes *acc\_*.

```
constexpr mdspan(data_handle_type p, const mapping_type& m);
```

14     *Constraints*: `is_default_constructible_v<accessor_type>` is true.

15     *Preconditions*: `[0, m.required_span_size()]` is an accessible range of *p* and *acc\_* for the value of *acc\_* after the invocation of this constructor.

16     *Effects*:

(16.1) — Direct-non-list-initializes *ptr\_* with `std::move(p)`,

(16.2) — direct-non-list-initializes *map\_* with *m*, and

(16.3) — value-initializes *acc\_*.

```
constexpr mdspan(data_handle_type p, const mapping_type& m, const accessor_type& a);
```

17     *Preconditions*: `[0, m.required_span_size()]` is an accessible range of *p* and *a*.

18     *Effects*:

(18.1) — Direct-non-list-initializes *ptr\_* with `std::move(p)`,

(18.2) — direct-non-list-initializes *map\_* with *m*, and

(18.3) — direct-non-list-initializes *acc\_* with *a*.

```
template<class OtherElementType, class OtherExtents,
 class OtherLayoutPolicy, class OtherAccessor>
constexpr explicit(see below)
 mdspan(const mdspan<OtherElementType, OtherExtents,
 OtherLayoutPolicy, OtherAccessor>& other);
```

19     *Constraints*:

(19.1) — `is_constructible_v<mapping_type, const OtherLayoutPolicy::template mapping<OtherExtents>&>` is true, and

(19.2) — `is_constructible_v<accessor_type, const OtherAccessor&>` is true.

20     *Mandates*:

(20.1) — `is_constructible_v<data_handle_type, const OtherAccessor::data_handle_type&>` is true, and

(20.2) — `is_constructible_v<extents_type, OtherExtents>` is true.

21     *Preconditions*:

(21.1) — For each rank index *r* of *extents\_type*, `static_extent(r) == dynamic_extent || static_extent(r) == other.extent(r)` is true.

(21.2) — `[0, map_.required_span_size()]` is an accessible range of *ptr\_* and *acc\_* for values of *ptr\_*, *map\_*, and *acc\_* after the invocation of this constructor.

22     *Effects*:

(22.1) — Direct-non-list-initializes *ptr\_* with *other.ptr\_*,

(22.2) — direct-non-list-initializes *map\_* with *other.map\_*, and

(22.3) — direct-non-list-initializes *acc\_* with *other.acc\_*.

23     *Remarks*: The expression inside `explicit` is equivalent to:

```
!is_convertible_v<const OtherLayoutPolicy::template mapping<OtherExtents>&, mapping_type>
|| !is_convertible_v<const OtherAccessor&, accessor_type>
```

#### 24.7.3.6.3 Members

[**mdspan.mdspan.members**]

```
template<class... OtherIndexTypes>
constexpr reference operator[](OtherIndexTypes... indices) const;
```

1     *Constraints*:

(1.1) — `(is_convertible_v<OtherIndexTypes, index_type> && ...)` is true,  
 (1.2) — `(is_nothrow_constructible_v<index_type, OtherIndexTypes> && ...)` is true, and  
 (1.3) — `sizeof...(OtherIndexTypes) == rank()` is true.

2 Let I be `extents_type::index-cast(std::move(indices))`.

3 *Preconditions:* I is a multidimensional index in `extents()`.  
*NOTE:* This implies that `map_(I) < map_.required_span_size()` is true.

4 *Effects:* Equivalent to:

```
return acc_.access(ptr_, map_(static_cast<index_type>(std::move(indices))...));
```

template<class OtherIndexType>
 constexpr reference operator[](span<OtherIndexType, rank()> indices) const;

template<class OtherIndexType>
 constexpr reference operator[](const array<OtherIndexType, rank()>& indices) const;

5 *Constraints:*

(5.1) — `is_convertible_v<const OtherIndexType&, index_type>` is true, and  
 (5.2) — `is_nothrow_constructible_v<index_type, const OtherIndexType&>` is true.

6 *Effects:* Let P be a parameter pack such that

```
is_same_v<make_index_sequence<rank(), index_sequence<P...>>>
```

is true. Equivalent to:

```
return operator[](as_const(indices[P])...);
```

`constexpr size_type size() const noexcept;`

7 *Preconditions:* The size of the multidimensional index space `extents()` is representable as a value of type `size_type` (6.8.2).

8 *Returns:* `extents().fwd-prod-of-extents(rank())`.

`[[nodiscard]] constexpr bool empty() const noexcept;`

9 *Returns:* `true` if the size of the multidimensional index space `extents()` is 0, otherwise `false`.

`friend constexpr void swap(mspan& x, mspan& y) noexcept;`

10 *Effects:* Equivalent to:

```
swap(x.ptr_, y.ptr_);
swap(x.map_, y.map_);
swap(x.acc_, y.acc_);
```

# 25 Iterators library

# [iterators]

## 25.1 General

[[iterators.general](#)]

- <sup>1</sup> This Clause describes components that C++ programs may use to perform iterations over containers ([Clause 24](#)), streams ([31.7](#)), stream buffers ([31.6](#)), and other ranges ([Clause 26](#)).
- 2 The following subclauses describe iterator requirements, and components for iterator primitives, predefined iterators, and stream iterators, as summarized in [Table 84](#).

Table 84: Iterators library summary [tab:[iterators.summary](#)]

| Subclause            | Header                                             |
|----------------------|----------------------------------------------------|
| <a href="#">25.3</a> | Iterator requirements < <a href="#">iterator</a> > |
| <a href="#">25.4</a> | Iterator primitives                                |
| <a href="#">25.5</a> | Iterator adaptors                                  |
| <a href="#">25.6</a> | Stream iterators                                   |
| <a href="#">25.7</a> | Range access                                       |

## 25.3 Iterator requirements

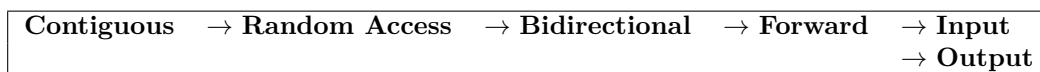

[[iterator.requirements](#)]

### 25.3.1 In general

[[iterator.requirements.general](#)]

- <sup>1</sup> Iterators are a generalization of pointers that allow a C++ program to work with different data structures (for example, containers and ranges) in a uniform manner. To be able to construct template algorithms that work correctly and efficiently on different types of data structures, the library formalizes not just the interfaces but also the semantics and complexity assumptions of iterators. An input iterator *i* supports the expression *\*i*, resulting in a value of some object type *T*, called the *value type* of the iterator. An output iterator *i* has a non-empty set of types that are *indirectly\_writable* to the iterator; for each such type *T*, the expression *\*i = o* is valid where *o* is a value of type *T*. For every iterator type *X*, there is a corresponding signed integer-like type ([25.3.4.4](#)) called the *difference type* of the iterator.
- <sup>2</sup> Since iterators are an abstraction of pointers, their semantics are a generalization of most of the semantics of pointers in C++. This ensures that every function template that takes iterators works as well with regular pointers. This document defines six categories of iterators, according to the operations defined on them: *input iterators*, *output iterators*, *forward iterators*, *bidirectional iterators*, *random access iterators*, and *contiguous iterators*, as shown in [Table 85](#).

Table 85: Relations among iterator categories    [tab:iterators.relations]

- <sup>3</sup> The six categories of iterators correspond to the iterator concepts

- (3.1) — *input\_iterator* ([25.3.4.9](#)),
- (3.2) — *output\_iterator* ([25.3.4.10](#)),
- (3.3) — *forward\_iterator* ([25.3.4.11](#)),
- (3.4) — *bidirectional\_iterator* ([25.3.4.12](#)),
- (3.5) — *random\_access\_iterator* ([25.3.4.13](#)), and
- (3.6) — *contiguous\_iterator* ([25.3.4.14](#)),

respectively. The generic term *iterator* refers to any type that models the *input\_or\_output\_iterator* concept ([25.3.4.6](#)).

- <sup>4</sup> Forward iterators meet all the requirements of input iterators and can be used whenever an input iterator is specified; Bidirectional iterators also meet all the requirements of forward iterators and can be used whenever a forward iterator is specified; Random access iterators also meet all the requirements of bidirectional iterators and can be used whenever a bidirectional iterator is specified; Contiguous iterators also meet all the requirements of random access iterators and can be used whenever a random access iterator is specified.
- <sup>5</sup> Iterators that further meet the requirements of output iterators are called *mutable iterators*. Nonmutable iterators are referred to as *constant iterators*.
- <sup>6</sup> In addition to the requirements in this subclause, the nested *typedef-names* specified in [25.3.2.3](#) shall be provided for the iterator type.

NOTE 1: Either the iterator type must provide the *typedef-names* directly (in which case *iterator\_traits* pick them up automatically), or an *iterator\_traits* specialization must provide them.

- <sup>7</sup> Just as a regular pointer to an array guarantees that there is a pointer value pointing past the last element of the array, so for any iterator type there is an iterator value that points past the last element of a corresponding sequence. Such a value is called a *past-the-end value*. Values of an iterator *i* for which the expression *\*i* is defined are called *dereferenceable*. The library never assumes that past-the-end values are dereferenceable. Iterators can also have singular values that are not associated with any sequence. Results of most expressions are undefined for singular values; the only exceptions are destroying an iterator that holds a singular value,

the assignment of a non-singular value to an iterator that holds a singular value, and, for iterators that meet the *Cpp17DefaultConstructible* requirements, using a value-initialized iterator as the source of a copy or move operation.

NOTE 2: This guarantee is not offered for default-initialization, although the distinction only matters for types with trivial default constructors such as pointers or aggregates holding pointers.

In these cases the singular value is overwritten the same way as any other value. Dereferenceable values are always non-singular.

- 8 Most of the library's algorithmic templates that operate on data structures have interfaces that use ranges. A *range* is an iterator and a *sentinel* that designate the beginning and end of the computation, or an iterator and a count that designate the beginning and the number of elements to which the computation is to be applied.<sup>213</sup>
- 9 An iterator and a sentinel denoting a range are comparable. A range  $[i, s)$  is empty if  $i == s$ ; otherwise,  $[i, s)$  refers to the elements in the data structure starting with the element pointed to by  $i$  and up to but not including the element, if any, pointed to by the first iterator  $j$  such that  $j == s$ .
- 10 A sentinel  $s$  is called *reachable from* an iterator  $i$  if and only if there is a finite sequence of applications of the expression  $++i$  that makes  $i == s$ . If  $s$  is reachable from  $i$ ,  $[i, s)$  denotes a *valid range*.
- 11 A *counted range*  $i + [0, n)$  is empty if  $n == 0$ ; otherwise,  $i + [0, n)$  refers to the  $n$  elements in the data structure starting with the element pointed to by  $i$  and up to but not including the element, if any, pointed to by the result of  $n$  applications of  $++i$ . A counted range  $i + [0, n)$  is *valid* if and only if  $n == 0$ ; or  $n$  is positive,  $i$  is dereferenceable, and  $++i + [0, --n)$  is valid.
- 12 The result of the application of library functions to invalid ranges is undefined.
- 13 All the categories of iterators require only those functions that are realizable for a given category in constant time (amortized). Therefore, requirement tables and concept definitions for the iterators do not specify complexity.
- 14 Destruction of a non-forward iterator may invalidate pointers and references previously obtained from that iterator.
- 15 An *invalid iterator* is an iterator that may be singular.<sup>214</sup>
- 16 Iterators are called *constexpr iterators* if all operations provided to meet iterator category requirements are *constexpr* functions.

NOTE 3: For example, the types “pointer to `int`” and `reverse_iterator<int*>` are *constexpr* iterators.

### 25.3.2 Associated types

**[iterator.assoc.types]**

#### 25.3.2.1 Incrementable traits

**[incrementable.traits]**

- 1 To implement algorithms only in terms of incrementable types, it is often necessary to determine the difference type that corresponds to a particular incrementable type. Accordingly, it is required that if `WI` is the name of a type that models the `weakly_incrementable` concept (25.3.4.4), the type

`iter_difference_t<WI>`

be defined as the incrementable type's difference type.

```
namespace std {
 template<class> struct incrementable_traits { };

 template<class T>
 requires is_object_v<T>
 struct incrementable_traits<T*> {
 using difference_type = ptrdiff_t;
 };

 template<class I>
 struct incrementable_traits<const I>
 : incrementable_traits<I> { };
}
```

213) The sentinel denoting the end of a range can have the same type as the iterator denoting the beginning of the range, or a different type.

214) This definition applies to pointers, since pointers are iterators. The effect of dereferencing an iterator that has been invalidated is undefined.

```

template<class T>
 requires requires { typename T::difference_type; }
struct incrementable_traits<T> {
 using difference_type = typename T::difference_type;
};

template<class T>
 requires (!requires { typename T::difference_type; } &&
 requires(const T& a, const T& b) { { a - b } -> integral; })
struct incrementable_traits<T> {
 using difference_type = make_signed_t<decltype(declval<T>() - declval<T>())>;
};

template<class T>
 using iter_difference_t = see below;
}

2 Let R_I be remove_cvref_t<I>. The type iter_difference_t<I> denotes
(2.1) — incrementable_traits<R_I>::difference_type if iterator_traits<R_I> names a specialization generated from the primary template, and
(2.2) — iterator_traits<R_I>::difference_type otherwise.
3 Users may specialize incrementable_traits on program-defined types.

```

### 25.3.2.2 Indirectly readable traits

[**readable.traits**]

- 1 To implement algorithms only in terms of indirectly readable types, it is often necessary to determine the value type that corresponds to a particular indirectly readable type. Accordingly, it is required that if  $R$  is the name of a type that models the `indirectly_readable` concept (25.3.4.2), the type

```
iter_value_t<R>
```

be defined as the indirectly readable type's value type.

```

template<class> struct cond-value-type { }; // exposition only
template<class T>
 requires is_object_v<T>
struct cond-value-type<T> {
 using value_type = remove_cv_t<T>;
};

template<class T>
concept has-member-value-type = requires { typename T::value_type; }; // exposition only

template<class T>
concept has-member-element-type = requires { typename T::element_type; }; // exposition only

template<class> struct indirectly_readable_traits { };

template<class T>
struct indirectly_readable_traits<T*>
 : cond-value-type<T> { };

template<class I>
 requires is_array_v<I>
struct indirectly_readable_traits<I> {
 using value_type = remove_cv_t<remove_extent_t<I>>;
};

template<class I>
struct indirectly_readable_traits<const I>
 : indirectly_readable_traits<I> { };

template<has-member-value-type T>
struct indirectly_readable_traits<T>
 : cond-value-type<typename T::value_type> { };

```

```

template<has-member-element-type T>
struct indirectly_readable_traits<T>
: cond-value-type<typename T::element_type> { };

template<has-member-value-type T>
requires has-member-element-type<T>
struct indirectly_readable_traits<T> { };

template<has-member-value-type T>
requires has-member-element-type<T> &&
same_as<remove_cv_t<typename T::element_type>, remove_cv_t<typename T::value_type>>
struct indirectly_readable_traits<T>
: cond-value-type<typename T::value_type> { };

template<class T> using iter_value_t = see below;

2 Let R_I be remove_cvref_t<I>. The type iter_value_t<I> denotes
(2.1) — indirectly_readable_traits<R_I>::value_type if iterator_traits<R_I> names a specialization
 generated from the primary template, and
(2.2) — iterator_traits<R_I>::value_type otherwise.

3 Class template indirectly_readable_traits may be specialized on program-defined types.

4 NOTE 1: Some legacy output iterators define a nested type named value_type that is an alias for void. These types
are not indirectly_readable and have no associated value types.

5 NOTE 2: Smart pointers like shared_ptr<int> are indirectly_readable and have an associated value type, but a
smart pointer like shared_ptr<void> is not indirectly_readable and has no associated value type.

```

### 25.3.2.3 Iterator traits

[**iterator.traits**]

- 1 To implement algorithms only in terms of iterators, it is sometimes necessary to determine the iterator category that corresponds to a particular iterator type. Accordingly, it is required that if  $I$  is the type of an iterator, the type

```
iterator_traits<I>::iterator_category
```

be defined as the iterator's iterator category. In addition, the types

```
iterator_traits<I>::pointer
iterator_traits<I>::reference
```

shall be defined as the iterator's pointer and reference types; that is, for an iterator object  $a$  of class type, the same type as `decltype(a.operator->())` and `decltype(*a)`, respectively. The type `iterator_traits<I>::pointer` shall be `void` for an iterator of class type  $I$  that does not support `operator->`. Additionally, in the case of an output iterator, the types

```
iterator_traits<I>::value_type
iterator_traits<I>::difference_type
iterator_traits<I>::reference
```

may be defined as `void`.

- 2 The definitions in this subclause make use of the following exposition-only concepts:

```

template<class I>
concept cpp17-iterator =
 requires(I i) {
 { *i } -> can-reference;
 { ++i } -> same_as<I&>;
 { *i++ } -> can-reference;
 } && copyable<I>;

template<class I>
concept cpp17-input-iterator =
 cpp17-iterator<I> && equality_comparable<I> && requires(I i) {
 typename incrementable_traits<I>::difference_type;
 typename indirectly_readable_traits<I>::value_type;
 typename common_reference_t<iter_reference_t<I>>&&;
 typename indirectly_readable_traits<I>::value_type>;
 }

```

```

typename common_reference_t<decltype(*i++)&&,
 typename indirectly_readable_traits<I>::value_type&>;
requires signed_integral<typename incrementable_traits<I>::difference_type>;
};

template<class I>
concept cpp17-forward-iterator =
 cpp17-input-iterator<I> && constructible_from<I> &&
 is_reference_v<iter_reference_t<I>> &&
 same_as<remove_cvref_t<iter_reference_t<I>>,
 typename indirectly_readable_traits<I>::value_type> &&
requires(I i) {
 { i++ } -> convertible_to<const I&>;
 { *i++ } -> same_as<iter_reference_t<I>>;
};

template<class I>
concept cpp17-bidirectional-iterator =
 cpp17-forward-iterator<I> && requires(I i) {
 { --i } -> same_as<I&>;
 { i-- } -> convertible_to<const I&>;
 { *i-- } -> same_as<iter_reference_t<I>>;
};

template<class I>
concept cpp17-random-access-iterator =
 cpp17-bidirectional-iterator<I> && totally_ordered<I> &&
 requires(I i, typename incrementable_traits<I>::difference_type n) {
 { i += n } -> same_as<I&>;
 { i -= n } -> same_as<I&>;
 { i + n } -> same_as<I>;
 { n + i } -> same_as<I>;
 { i - n } -> same_as<I>;
 { i - i } -> same_as<decltype(n)>;
 { i[n] } -> convertible_to<iter_reference_t<I>>;
 };
}

```

- 3 The members of a specialization `iterator_traits<I>` generated from the `iterator_traits` primary template are computed as follows:

- (3.1) — If `I` has valid (13.10.3) member types `difference_type`, `value_type`, `reference`, and `iterator_category`, then `iterator_traits<I>` has the following publicly accessible members:

```

using iterator_category = typename I::iterator_category;
using value_type = typename I::value_type;
using difference_type = typename I::difference_type;
using pointer = see below;
using reference = typename I::reference;

```

If the *qualified-id* `I::pointer` is valid and denotes a type, then `iterator_traits<I>::pointer` names that type; otherwise, it names `void`.

- (3.2) — Otherwise, if `I` satisfies the exposition-only concept `cpp17-input-iterator`, `iterator_traits<I>` has the following publicly accessible members:

```

using iterator_category = see below;
using value_type = typename indirectly_readable_traits<I>::value_type;
using difference_type = typename incrementable_traits<I>::difference_type;
using pointer = see below;
using reference = see below;

```

- (3.2.1) — If the *qualified-id* `I::pointer` is valid and denotes a type, `pointer` names that type. Otherwise, if `decltype(declval<I&>().operator->())` is well-formed, then `pointer` names that type. Otherwise, `pointer` names `void`.

- (3.2.2) — If the *qualified-id* `I::reference` is valid and denotes a type, `reference` names that type. Otherwise, `reference` names `iter_reference_t<I>`.

- (3.2.3) — If the *qualified-id* `I::iterator_category` is valid and denotes a type, `iterator_category` names that type. Otherwise, `iterator_category` names:
- (3.2.3.1) — `random_access_iterator_tag` if `I` satisfies `cpp17-random-access-iterator`, or otherwise
  - (3.2.3.2) — `bidirectional_iterator_tag` if `I` satisfies `cpp17-bidirectional-iterator`, or otherwise
  - (3.2.3.3) — `forward_iterator_tag` if `I` satisfies `cpp17-forward-iterator`, or otherwise
  - (3.2.3.4) — `input_iterator_tag`.

- (3.3) — Otherwise, if `I` satisfies the exposition-only concept `cpp17-iterator`, then `iterator_traits<I>` has the following publicly accessible members:

```
using iterator_category = output_iterator_tag;
using value_type = void;
using difference_type = see below;
using pointer = void;
using reference = void;
```

If the *qualified-id* `incrementable_traits<I>::difference_type` is valid and denotes a type, then `difference_type` names that type; otherwise, it names `void`.

- (3.4) — Otherwise, `iterator_traits<I>` has no members by any of the above names.

- <sup>4</sup> Explicit or partial specializations of `iterator_traits` may have a member type `iterator_concept` that is used to indicate conformance to the iterator concepts (25.3.4).

EXAMPLE 1: To indicate conformance to the `input_iterator` concept but a lack of conformance to the *Cpp17InputIterator* requirements (25.3.5.3), an `iterator_traits` specialization might have `iterator_concept` denote `input_iterator_tag` but not define `iterator_category`.

- <sup>5</sup> `iterator_traits` is specialized for pointers as

```
namespace std {
 template<class T>
 requires is_object_v<T>
 struct iterator_traits<T*> {
 using iterator_concept = contiguous_iterator_tag;
 using iterator_category = random_access_iterator_tag;
 using value_type = remove_cv_t<T>;
 using difference_type = ptrdiff_t;
 using pointer = T*;
 using reference = T&;
 };
}
```

- <sup>6</sup> EXAMPLE 2: To implement a generic `reverse` function, a C++ program can do the following:

```
template<class BI>
void reverse(BI first, BI last) {
 typename iterator_traits<BI>::difference_type n =
 distance(first, last);
 --n;
 while(n > 0) {
 typename iterator_traits<BI>::value_type
 tmp = *first;
 *first++ = *--last;
 *last = tmp;
 n -= 2;
 }
}
```

### 25.3.3 Customization point objects

[`iterator.cust`]

#### 25.3.3.1 `ranges::iter_move`

[`iterator.cust.move`]

- <sup>1</sup> The name `ranges::iter_move` denotes a customization point object (16.3.3.5). The expression `ranges::-iter_move(E)` for a subexpression `E` is expression-equivalent to:

- (1.1) — `iter_move(E)`, if `E` has class or enumeration type and `iter_move(E)` is a well-formed expression when treated as an unevaluated operand, where the meaning of `iter_move` is established as-if by performing argument-dependent lookup only (6.5.4).

- (1.2) — Otherwise, if the expression `*E` is well-formed:
  - (1.2.1) — if `*E` is an lvalue, `std::move(*E)`;
  - (1.2.2) — otherwise, `*E`.
- (1.3) — Otherwise, `ranges::iter_move(E)` is ill-formed.

NOTE: This case can result in substitution failure when `ranges::iter_move(E)` appears in the immediate context of a template instantiation.

- 2 If `ranges::iter_move(E)` is not equal to `*E`, the program is ill-formed, no diagnostic required.

### 25.3.3.2 `ranges::iter_swap`

[**iterator.cust.swap**]

- 1 The name `ranges::iter_swap` denotes a customization point object (16.3.3.3.5) that exchanges the values (18.4.9) denoted by its arguments.
- 2 Let `iter-exchange-move` be the exposition-only function:

```
template<class X, class Y>
constexpr iter_value_t<X> iter-exchange-move(X&& x, Y&& y)
 noexcept(noexcept(iter_value_t<X>(iter_move(x))) &&
 noexcept(*x = iter_move(y)));
```

- 3 *Effects*: Equivalent to:

```
iter_value_t<X> old_value(iter_move(x));
*x = iter_move(y);
return old_value;
```

- 4 The expression `ranges::iter_swap(E1, E2)` for subexpressions `E1` and `E2` is expression-equivalent to:

- (4.1) — `(void)iter_swap(E1, E2)`, if either `E1` or `E2` has class or enumeration type and `iter_swap(E1, E2)` is a well-formed expression with overload resolution performed in a context that includes the declaration

```
template<class I1, class I2>
void iter_swap(I1, I2) = delete;
```

and does not include a declaration of `ranges::iter_swap`. If the function selected by overload resolution does not exchange the values denoted by `E1` and `E2`, the program is ill-formed, no diagnostic required.

NOTE 1: This precludes calling unconstrained `std::iter_swap`. When the deleted overload is viable, program-defined overloads need to be more specialized (13.7.3) to be selected.

- (4.2) — Otherwise, if the types of `E1` and `E2` each model `indirectly_readable`, and if the reference types of `E1` and `E2` model `swappable_with` (18.4.9), then `ranges::swap(*E1, *E2)`.
- (4.3) — Otherwise, if the types `T1` and `T2` of `E1` and `E2` model `indirectly_movable_storable<T1, T2>` and `indirectly_movable_storable<T2, T1>`, then `(void)(*E1 = iter-exchange-move(E2, E1))`, except that `E1` is evaluated only once.
- (4.4) — Otherwise, `ranges::iter_swap(E1, E2)` is ill-formed.

NOTE 2: This case can result in substitution failure when `ranges::iter_swap(E1, E2)` appears in the immediate context of a template instantiation.

### 25.3.4 Iterator concepts

[**iterator.concepts**]

#### 25.3.4.1 General

[**iterator.concepts.general**]

- 1 For a type `I`, let `ITER_TRAITS(I)` denote the type `I` if `iterator_traits<I>` names a specialization generated from the primary template. Otherwise, `ITER_TRAITS(I)` denotes `iterator_traits<I>`.

- (1.1) — If the *qualified-id* `ITER_TRAITS(I)::iterator_concept` is valid and names a type, then `ITER_CONCEPT(I)` denotes that type.
- (1.2) — Otherwise, if the *qualified-id* `ITER_TRAITS(I)::iterator_category` is valid and names a type, then `ITER_CONCEPT(I)` denotes that type.
- (1.3) — Otherwise, if `iterator_traits<I>` names a specialization generated from the primary template, then `ITER_CONCEPT(I)` denotes `random_access_iterator_tag`.
- (1.4) — Otherwise, `ITER_CONCEPT(I)` does not denote a type.

- 2 NOTE: `ITER_TRAITS` enables independent syntactic determination of an iterator's category and concept.

EXAMPLE:

```
struct I {
 using value_type = int;
 using difference_type = int;

 int operator*() const;
 I& operator++();
 I operator++(int);
 I& operator--();
 I operator--(int);

 bool operator==(I) const;
};

iterator_traits<I>::iterator_category denotes input_iterator_tag, and ITER_CONCEPT(I) denotes random-access_iterator_tag.
```

#### 25.3.4.2 Concept indirectly\_readable

[*iterator.concept.readable*]

- <sup>1</sup> Types that are indirectly readable by applying *operator\** model the *indirectly\_readable* concept, including pointers, smart pointers, and iterators.

```
template<class In>
concept indirectly-readable-impl =
 requires(const In in) {
 typename iter_value_t<In>;
 typename iter_reference_t<In>;
 typename iter_rvalue_reference_t<In>;
 { *in } -> same_as<iter_reference_t<In>>;
 { ranges::iter_move(in) } -> same_as<iter_rvalue_reference_t<In>>;
 } &&
 common_reference_with<iter_reference_t<In>&&, iter_value_t<In>&> &&
 common_reference_with<iter_reference_t<In>&&, iter_rvalue_reference_t<In>&&> &&
 common_reference_with<iter_rvalue_reference_t<In>&&, const iter_value_t<In>&>;
};

template<class In>
concept indirectly_readable =
 indirectly-readable-impl<remove_cvref_t<In>>;
```

- <sup>2</sup> Given a value i of type I, I models *indirectly\_readable* only if the expression *\*i* is equality-preserving.

#### 25.3.4.3 Concept indirectly\_writable

[*iterator.concept.writable*]

- <sup>1</sup> The *indirectly\_writable* concept specifies the requirements for writing a value into an iterator's referenced object.

```
template<class Out, class T>
concept indirectly_writable =
 requires(Out&& o, T&& t) {
 *o = std::forward<T>(t); // not required to be equality-preserving
 *std::forward<Out>(o) = std::forward<T>(t); // not required to be equality-preserving
 const_cast<const iter_reference_t<Out>&&>(*o) =
 std::forward<T>(t); // not required to be equality-preserving
 const_cast<const iter_reference_t<Out>&&>(*std::forward<Out>(o)) =
 std::forward<T>(t); // not required to be equality-preserving
 };
```

- <sup>2</sup> Let E be an expression such that *decltype((E))* is T, and let o be a dereferenceable object of type Out. Out and T model *indirectly\_writable*<Out, T> only if

- (2.1) — If Out and T model *indirectly\_readable*<Out> && *same\_as*<iter\_value\_t<Out>, decay\_t<T>>, then *\*o* after any above assignment is equal to the value of E before the assignment.
- 3 After evaluating any above assignment expression, o is not required to be dereferenceable.
- 4 If E is an xvalue (7.2.1), the resulting state of the object it denotes is valid but unspecified (16.4.6.15).
- 5 NOTE 1: The only valid use of an *operator\** is on the left side of the assignment statement. Assignment through the same value of the indirectly writable type happens only once.

<sup>6</sup> NOTE 2: `indirectly_writable` has the awkward `const_cast` expressions to reject iterators with prvalue non-proxy reference types that permit rvalue assignment but do not also permit `const` rvalue assignment. Consequently, an iterator type `I` that returns `std::string` by value does not model `indirectly_writable<I, std::string>`.

#### 25.3.4.4 Concept `weakly_incrementable`

[`iterator.concept.winc`]

- <sup>1</sup> The `weakly_incrementable` concept specifies the requirements on types that can be incremented with the pre- and post-increment operators. The increment operations are not required to be equality-preserving, nor is the type required to be `equality_comparable`.

```
template<class T>
constexpr bool is-integer-like = see below; // exposition only

template<class T>
constexpr bool is-signed-integer-like = see below; // exposition only

template<class I>
concept weakly_incrementable =
 movable<I> &&
 requires(I i) {
 typename iter_difference_t<I>;
 requires is-signed-integer-like<iter_difference_t<I>>;
 { ++i } -> same_as<I&>; // not required to be equality-preserving
 i++; // not required to be equality-preserving
 };
}
```

- <sup>2</sup> A type `I` is an *integer-class type* if it is in a set of implementation-defined types that behave as integer types do, as defined below.

NOTE 1: An integer-class type is not necessarily a class type.

- <sup>3</sup> The range of representable values of an integer-class type is the continuous set of values over which it is defined. For any integer-class type, its range of representable values is either  $-2^{N-1}$  to  $2^{N-1} - 1$  (inclusive) for some integer  $N$ , in which case it is a *signed-integer-class type*, or 0 to  $2^N - 1$  (inclusive) for some integer  $N$ , in which case it is an *unsigned-integer-class type*. In both cases,  $N$  is called the *width* of the integer-class type. The width of an integer-class type is greater than that of every integral type of the same signedness.

- <sup>4</sup> A type `I` other than `cv bool` is *integer-like* if it models `integral`<`I`> or if it is an integer-class type. An integer-like type `I` is *signed-integer-like* if it models `signed_integral`<`I`> or if it is a signed-integer-class type. An integer-like type `I` is *unsigned-integer-like* if it models `unsigned_integral`<`I`> or if it is an unsigned-integer-class type.

- <sup>5</sup> For every integer-class type `I`, let `B(I)` be a unique hypothetical extended integer type of the same signedness with the same width (6.8.2) as `I`.

NOTE 2: The corresponding hypothetical specialization `numeric_limits`<`B(I)`> meets the requirements on `numeric_limits` specializations for integral types (17.3.5).

For every integral type `J`, let `B(J)` be the same type as `J`.

- <sup>6</sup> Expressions of integer-class type are explicitly convertible to any integer-like type, and implicitly convertible to any integer-class type of equal or greater width and the same signedness. Expressions of integral type are both implicitly and explicitly convertible to any integer-class type. Conversions between integral and integer-class types and between two integer-class types do not exit via an exception. The result of such a conversion is the unique value of the destination type that is congruent to the source modulo  $2^N$ , where  $N$  is the width of the destination type.

- <sup>7</sup> Let `a` be an object of integer-class type `I`, let `b` be an object of integer-like type `I2` such that the expression `b` is implicitly convertible to `I`, let `x` and `y` be, respectively, objects of type `B(I)` and `B(I2)` as described above that represent the same values as `a` and `b`, and let `c` be an lvalue of any integral type.

- (7.1) — The expressions `a++` and `a--` shall be prvalues of type `I` whose values are equal to that of `a` prior to the evaluation of the expressions. The expression `a++` shall modify the value of `a` by adding 1 to it. The expression `a--` shall modify the value of `a` by subtracting 1 from it.
- (7.2) — The expressions `++a`, `--a`, and `&a` shall be expression-equivalent to `a += 1`, `a -= 1`, and `addressof(a)`, respectively.

- (7.3) — For every *unary-operator*  $\circ$  other than  $\&$  for which the expression  $\circ x$  is well-formed,  $\circ a$  shall also be well-formed and have the same value, effects, and value category as  $\circ x$ . If  $\circ x$  has type `bool`, so too does  $\circ a$ ; if  $\circ x$  has type `B(I)`, then  $\circ a$  has type `I`.
- (7.4) — For every assignment operator  $\circ=$  for which  $c \circ= x$  is well-formed,  $c \circ= a$  shall also be well-formed and shall have the same value and effects as  $c \circ= x$ . The expression  $c \circ= a$  shall be an lvalue referring to  $c$ .
- (7.5) — For every assignment operator  $\circ=$  for which  $x \circ= y$  is well-formed,  $a \circ= b$  shall also be well-formed and shall have the same effects as  $x \circ= y$ , except that the value that would be stored into  $x$  is stored into  $a$ . The expression  $a \circ= b$  shall be an lvalue referring to  $a$ .
- (7.6) — For every non-assignment binary operator  $\circ$  for which  $x \circ y$  and  $y \circ x$  are well-formed,  $a \circ b$  and  $b \circ a$  shall also be well-formed and shall have the same value, effects, and value category as  $x \circ y$  and  $y \circ x$ , respectively. If  $x \circ y$  or  $y \circ x$  has type `B(I)`, then  $a \circ b$  or  $b \circ a$ , respectively, has type `I`; if  $x \circ y$  or  $y \circ x$  has type `B(I2)`, then  $a \circ b$  or  $b \circ a$ , respectively, has type `I2`; if  $x \circ y$  or  $y \circ x$  has any other type, then  $a \circ b$  or  $b \circ a$ , respectively, has that type.
- 8 An expression `E` of integer-class type `I` is contextually convertible to `bool` as if by `bool(E != I(0))`.
- 9 All integer-class types model `regular` (18.6) and `three_way_comparable<strong_ordering>` (17.11.4).
- 10 A value-initialized object of integer-class type has value 0.
- 11 For every (possibly cv-qualified) integer-class type `I`, `numeric_limits<I>` is specialized such that each static data member `m` has the same value as `numeric_limits<B(I)>::m`, and each static member function `f` returns `I(numeric_limits<B(I)>::f())`.
- 12 For any two integer-like types `I1` and `I2`, at least one of which is an integer-class type, `common_type_t<I1, I2>` denotes an integer-class type whose width is not less than that of `I1` or `I2`. If both `I1` and `I2` are signed-integer-like types, then `common_type_t<I1, I2>` is also a signed-integer-like type.
- 13 `is-integer-like<I>` is `true` if and only if `I` is an integer-like type. `is-signed-integer-like<I>` is `true` if and only if `I` is a signed-integer-like type.
- 14 Let `i` be an object of type `I`. When `i` is in the domain of both pre- and post-increment, `i` is said to be *incrementable*. `I` models `weakly_incrementable<I>` only if
- (14.1) — The expressions `++i` and `i++` have the same domain.
  - (14.2) — If `i` is incrementable, then both `++i` and `i++` advance `i` to the next element.
  - (14.3) — If `i` is incrementable, then `addressof(++i)` is equal to `addressof(i)`.

15 *Recommended practice:* The implementaton of an algorithm on a weakly incrementable type should never attempt to pass through the same incrementable value twice; such an algorithm should be a single-pass algorithm.

NOTE 3: For `weakly_incrementable` types, `a` equals `b` does not imply that `++a` equals `++b`. (Equality does not guarantee the substitution property or referential transparency.) Such algorithms can be used with istreams as the source of the input data through the `istream_iterator` class template.

### 25.3.4.5 Concept `incrementable`

[`iterator.concept.inc`]

1 The `incrementable` concept specifies requirements on types that can be incremented with the pre- and post-increment operators. The increment operations are required to be equality-preserving, and the type is required to be `equality_comparable`.

NOTE 1: This supersedes the annotations on the increment expressions in the definition of `weakly_incrementable`.

```
template<class I>
concept incrementable =
 regular<I> &&
 weakly_incrementable<I> &&
 requires(I i) {
 { i++ } -> same_as<I>;
 };
}
```

2 Let `a` and `b` be incrementable objects of type `I`. `I` models `incrementable` only if

- (2.1) — If `bool(a == b)` then `bool(a++ == b)`.
- (2.2) — If `bool(a == b)` then `bool((void)a++, a) == ++b)`.

- <sup>3</sup> NOTE 2: The requirement that **a** equals **b** implies **++a** equals **++b** (which is not true for weakly incrementable types) allows the use of multi-pass one-directional algorithms with types that model **incrementable**.

#### 25.3.4.6 Concept `input_or_output_iterator`

[`iterator.concept.iterator`]

- <sup>1</sup> The `input_or_output_iterator` concept forms the basis of the iterator concept taxonomy; every iterator models `input_or_output_iterator`. This concept specifies operations for dereferencing and incrementing an iterator. Most algorithms will require additional operations to compare iterators with sentinels (25.3.4.7), to read (25.3.4.9) or write (25.3.4.10) values, or to provide a richer set of iterator movements (25.3.4.11, 25.3.4.12, 25.3.4.13).

```
template<class I>
concept input_or_output_iterator =
 requires(I i) {
 { *i } -> can-reference;
 } &&
 weakly_incrementable<I>;
```

- <sup>2</sup> NOTE: Unlike the *Cpp17Iterator* requirements, the `input_or_output_iterator` concept does not require copyability.

#### 25.3.4.7 Concept `sentinel_for`

[`iterator.concept.sentinel`]

- <sup>1</sup> The `sentinel_for` concept specifies the relationship between an `input_or_output_iterator` type and a semiregular type whose values denote a range.

```
template<class S, class I>
concept sentinel_for =
 semiregular<S> &&
 input_or_output_iterator<I> &&
 weakly-equality-comparable-with<S, I>; // see 18.5.4
```

- <sup>2</sup> Let **s** and **i** be values of type **S** and **I** such that  $[i, s)$  denotes a range. Types **S** and **I** model `sentinel_for<S, I>` only if

- (2.1) — **i == s** is well-defined.
- (2.2) — If `bool(i != s)` then **i** is dereferenceable and  $[++i, s)$  denotes a range.
- (2.3) — `assignable_from<I&, S>` is either modeled or not satisfied.

- <sup>3</sup> The domain of `==` is not static. Given an iterator **i** and sentinel **s** such that  $[i, s)$  denotes a range and **i != s**, **i** and **s** are not required to continue to denote a range after incrementing any other iterator equal to **i**. Consequently, **i == s** is no longer required to be well-defined.

#### 25.3.4.8 Concept `sized_sentinel_for`

[`iterator.concept.sizedsentinel`]

- <sup>1</sup> The `sized_sentinel_for` concept specifies requirements on an `input_or_output_iterator` type **I** and a corresponding `sentinel_for<I>` that allow the use of the `-` operator to compute the distance between them in constant time.

```
template<class S, class I>
concept sized_sentinel_for =
 sentinel_for<S, I> &&
 !disable_sized_sentinel_for<remove_cv_t<S>, remove_cv_t<I>> &&
 requires(const I& i, const S& s) {
 { s - i } -> same_as<iter_difference_t<I>>;
 { i - s } -> same_as<iter_difference_t<I>>;
 };
```

- <sup>2</sup> Let **i** be an iterator of type **I**, and **s** a sentinel of type **S** such that  $[i, s)$  denotes a range. Let **N** be the smallest number of applications of `++i` necessary to make `bool(i == s)` be `true`. **S** and **I** model `sized_sentinel_for<S, I>` only if

- (2.1) — If **N** is representable by `iter_difference_t<I>`, then **s - i** is well-defined and equals **N**.
- (2.2) — If  $-N$  is representable by `iter_difference_t<I>`, then **i - s** is well-defined and equals  $-N$ .

```
template<class S, class I>
constexpr bool disable_sized_sentinel_for = false;
```

<sup>3</sup> *Remarks:* Pursuant to 16.4.5.2.1, users may specialize `disable_sized_sentinel_for` for cv-unqualified non-array object types `S` and `I` if `S` and/or `I` is a program-defined type. Such specializations shall be usable in constant expressions (7.7) and have type `const bool`.

<sup>4</sup> NOTE: `disable_sized_sentinel_for` allows use of sentinels and iterators with the library that satisfy but do not in fact model `sized_sentinel_for`.

<sup>5</sup> EXAMPLE: The `sized_sentinel_for` concept is modeled by pairs of `random_access_iterators` (25.3.4.13) and by counted iterators and their sentinels (25.5.7.1).

#### 25.3.4.9 Concept `input_iterator`

[`iterator.concept.input`]

<sup>1</sup> The `input_iterator` concept defines requirements for a type whose referenced values can be read (from the requirement for `indirectly_readable` (25.3.4.2)) and which can be both pre- and post-incremented.

NOTE: Unlike the *Cpp17InputIterator* requirements (25.3.5.3), the `input_iterator` concept does not need equality comparison since iterators are typically compared to sentinels.

```
template<class I>
concept input_iterator =
 input_or_output_iterator<I> &&
 indirectly_readable<I> &&
 requires { typename ITER_CONCEPT(I); } &&
 derived_from<ITER_CONCEPT(I), input_iterator_tag>;
```

#### 25.3.4.10 Concept `output_iterator`

[`iterator.concept.output`]

<sup>1</sup> The `output_iterator` concept defines requirements for a type that can be used to write values (from the requirement for `indirectly_writable` (25.3.4.3)) and which can be both pre- and post-incremented.

NOTE: Output iterators are not required to model `equality_comparable`.

```
template<class I, class T>
concept output_iterator =
 input_or_output_iterator<I> &&
 indirectly_writable<I, T> &&
 requires(I i, T& t) {
 *i++ = std::forward<T>(t); // not required to be equality-preserving
 };
```

<sup>2</sup> Let `E` be an expression such that `decltype((E))` is `T`, and let `i` be a dereferenceable object of type `I`. `I` and `T` model `output_iterator<I, T>` only if `*i++ = E;` has effects equivalent to:

```
*i = E;
++i;
```

<sup>3</sup> *Recommended practice:* The implementation of an algorithm on output iterators should never attempt to pass through the same iterator twice; such an algorithm should be a single-pass algorithm.

#### 25.3.4.11 Concept `forward_iterator`

[`iterator.concept.forward`]

<sup>1</sup> The `forward_iterator` concept adds copyability, equality comparison, and the multi-pass guarantee, specified below.

```
template<class I>
concept forward_iterator =
 input_iterator<I> &&
 derived_from<ITER_CONCEPT(I), forward_iterator_tag> &&
 incrementable<I> &&
 sentinel_for<I, I>;
```

<sup>2</sup> The domain of `==` for forward iterators is that of iterators over the same underlying sequence. However, value-initialized iterators of the same type may be compared and shall compare equal to other value-initialized iterators of the same type.

NOTE 1: Value-initialized iterators behave as if they refer past the end of the same empty sequence.

<sup>3</sup> Pointers and references obtained from a forward iterator into a range `[i, s)` shall remain valid while `[i, s)` continues to denote a range.

<sup>4</sup> Two dereferenceable iterators `a` and `b` of type `X` offer the *multi-pass guarantee* if:

- (4.1) —  $a == b$  implies  $++a == ++b$  and
- (4.2) — the expression  $((void)[](X x)\{++x;\}(a), *a)$  is equivalent to the expression  $*a$ .

<sup>5</sup> NOTE 2: The requirement that  $a == b$  implies  $++a == ++b$  and the removal of the restrictions on the number of assignments through a mutable iterator (which applies to output iterators) allow the use of multi-pass one-directional algorithms with forward iterators.

#### 25.3.4.12 Concept bidirectional\_iterator

[iterator.concept.bidir]

- <sup>1</sup> The **bidirectional\_iterator** concept adds the ability to move an iterator backward as well as forward.

```
template<class I>
concept bidirectional_iterator =
 forward_iterator<I> &&
 derived_from<ITER_CONCEPT(I), bidirectional_iterator_tag> &&
 requires(I i) {
 { --i } -> same_as<I&>;
 { i-- } -> same_as<I>;
 };
```

<sup>2</sup> A bidirectional iterator  $r$  is decrementable if and only if there exists some  $q$  such that  $++q == r$ . Decrementable iterators  $r$  shall be in the domain of the expressions  $--r$  and  $r--$ .

<sup>3</sup> Let  $a$  and  $b$  be equal objects of type  $I$ .  $I$  models **bidirectional\_iterator** only if:

- (3.1) — If  $a$  and  $b$  are decrementable, then all of the following are true:
  - (3.1.1) —  $\text{addressof}(--a) == \text{addressof}(a)$
  - (3.1.2) —  $\text{bool}(a-- == b)$
  - (3.1.3) — after evaluating both  $a--$  and  $--b$ ,  $\text{bool}(a == b)$  is still true
  - (3.1.4) —  $\text{bool}(++(--a) == b)$
- (3.2) — If  $a$  and  $b$  are incrementable, then  $\text{bool}(--(++a) == b)$ .

#### 25.3.4.13 Concept random\_access\_iterator

[iterator.concept.random.access]

- <sup>1</sup> The **random\_access\_iterator** concept adds support for constant-time advancement with  $+=$ ,  $+$ ,  $-=$ , and  $-$ , as well as the computation of distance in constant time with  $-$ . Random access iterators also support array notation via subscripting.

```
template<class I>
concept random_access_iterator =
 bidirectional_iterator<I> &&
 derived_from<ITER_CONCEPT(I), random_access_iterator_tag> &&
 totally_ordered<I> &&
 sized_sentinel_for<I, I> &&
 requires(I i, const I j, const iter_difference_t<I> n) {
 { i += n } -> same_as<I&>;
 { j + n } -> same_as<I>;
 { n + j } -> same_as<I>;
 { i -= n } -> same_as<I&>;
 { j - n } -> same_as<I>;
 { j[n] } -> same_as<iter_reference_t<I>>;
 };
```

<sup>2</sup> Let  $a$  and  $b$  be valid iterators of type  $I$  such that  $b$  is reachable from  $a$  after  $n$  applications of  $++a$ , let  $D$  be **iter\_difference\_t<I>**, and let  $n$  denote a value of type  $D$ .  $I$  models **random\_access\_iterator** only if

- (2.1) —  $(a += n)$  is equal to  $b$ .
- (2.2) —  $\text{addressof}(a += n)$  is equal to  $\text{addressof}(a)$ .
- (2.3) —  $(a + n)$  is equal to  $(a += n)$ .
- (2.4) — For any two positive values  $x$  and  $y$  of type  $D$ , if  $(a + D(x + y))$  is valid, then  $(a + D(x + y))$  is equal to  $((a + x) + y)$ .
- (2.5) —  $(a + D(0))$  is equal to  $a$ .
- (2.6) — If  $(a + D(n - 1))$  is valid, then  $(a + n)$  is equal to  $[\](I c)\{ \text{return } ++c; \}(a + D(n - 1))$ .

- (2.7) —  $(b += D(-n))$  is equal to  $a$ .
- (2.8) —  $(b -= n)$  is equal to  $a$ .
- (2.9) — `addressof(b -= n)` is equal to `addressof(b)`.
- (2.10) —  $(b - n)$  is equal to  $(b -= n)$ .
- (2.11) — If  $b$  is dereferenceable, then  $a[n]$  is valid and is equal to  $*b$ .
- (2.12) — `bool(a <= b)` is `true`.

#### 25.3.4.14 Concept contiguous\_iterator

[`iterator.concept.contiguous`]

- <sup>1</sup> The `contiguous_iterator` concept provides a guarantee that the denoted elements are stored contiguously in memory.

```
template<class I>
concept contiguous_iterator =
 random_access_iterator<I> &&
 derived_from<ITER_CONCEPT(I), contiguous_iterator_tag> &&
 is_lvalue_reference_v<iter_reference_t<I>> &&
 same_as<iter_value_t<I>, remove_cvref_t<iter_reference_t<I>>> &&
 requires(const I& i) {
 { to_address(i) } -> same_as<add_pointer_t<iter_reference_t<I>>>;
 };
```

- <sup>2</sup> Let  $a$  and  $b$  be dereferenceable iterators and  $c$  be a non-dereferenceable iterator of type  $I$  such that  $b$  is reachable from  $a$  and  $c$  is reachable from  $b$ , and let  $D$  be `iter_difference_t<I>`. The type  $I$  models `contiguous_iterator` only if

- (2.1) — `to_address(a) == addressof(*a)`,
- (2.2) — `to_address(b) == to_address(a) + D(b - a)`,
- (2.3) — `to_address(c) == to_address(a) + D(c - a)`,
- (2.4) — `ranges::iter_move(a)` has the same type, value category, and effects as `std::move(*a)`, and
- (2.5) — if `ranges::iter_swap(a, b)` is well-formed, it has effects equivalent to `ranges::swap(*a, *b)`.

#### 25.3.5 C++17 iterator requirements

[`iterator.cpp17`]

##### 25.3.5.1 General

[`iterator.cpp17.general`]

- <sup>1</sup> In the following sections,  $a$  and  $b$  denote values of type  $X$  or `const X`, `difference_type` and `reference` refer to the types `iterator_traits<X>::difference_type` and `iterator_traits<X>::reference`, respectively,  $n$  denotes a value of `difference_type`,  $u$ ,  $tmp$ , and  $m$  denote identifiers,  $r$  denotes a value of  $X\&$ ,  $t$  denotes a value of value type  $T$ ,  $\circ$  denotes a value of some type that is writable to the output iterator.

NOTE: For an iterator type  $X$  there must be an instantiation of `iterator_traits<X>` (25.3.2.3).

##### 25.3.5.2 Cpp17Iterator

[`iterator.iterators`]

- <sup>1</sup> The `Cpp17Iterator` requirements form the basis of the iterator taxonomy; every iterator meets the `Cpp17Iterator` requirements. This set of requirements specifies operations for dereferencing and incrementing an iterator. Most algorithms will require additional operations to read (25.3.5.3) or write (25.3.5.4) values, or to provide a richer set of iterator movements (25.3.5.5, 25.3.5.6, 25.3.5.7).
  - <sup>2</sup> A type  $X$  meets the `Cpp17Iterator` requirements if:
- (2.1) —  $X$  meets the `Cpp17CopyConstructible`, `Cpp17CopyAssignable`, `Cpp17Swappable`, and `Cpp17Destructible` requirements (16.4.4.2, 16.4.4.3), and
  - (2.2) — `iterator_traits<X>::difference_type` is a signed integer type or `void`, and
  - (2.3) — the expressions in Table 86 are valid and have the indicated semantics.

##### 25.3.5.3 Input iterators

[`input.iterators`]

- <sup>1</sup> A class or pointer type  $X$  meets the requirements of an input iterator for the value type  $T$  if  $X$  meets the `Cpp17Iterator` (25.3.5.2) and `Cpp17EqualityComparable` (Table 28) requirements and the expressions in Table 87 are valid and have the indicated semantics.
- <sup>2</sup> In Table 87, the term *the domain of ==* is used in the ordinary mathematical sense to denote the set of values over which == is (required to be) defined. This set can change over time. Each algorithm places additional

Table 86: *Cpp17Iterator* requirements [tab:iterator]

| Expression       | Return type         | Operational semantics | Assertion/note pre-/post-condition          |
|------------------|---------------------|-----------------------|---------------------------------------------|
| <code>*r</code>  | unspecified         |                       | <i>Preconditions:</i> r is dereferenceable. |
| <code>++r</code> | <code>X&amp;</code> |                       |                                             |

requirements on the domain of `==` for the iterator values it uses. These requirements can be inferred from the uses that algorithm makes of `==` and `!=`.

EXAMPLE: The call `find(a,b,x)` is defined only if the value of `a` has the property `p` defined as follows: `b` has property `p` and a value `i` has property `p` if `(*i==x)` or if `(*i!=x` and `++i` has property `p`).

Table 87: *Cpp17InputIterator* requirements (in addition to *Cpp17Iterator*) [tab:inputiterator]

| Expression             | Return type                                                                    | Operational semantics                                                         | Assertion/note pre-/post-condition                                                                                                                                                                                                                          |
|------------------------|--------------------------------------------------------------------------------|-------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>a != b</code>    | <code>decltype(a != !(a == b))</code><br>b) models<br><i>boolean-test-able</i> |                                                                               | <i>Preconditions:</i> (a, b) is in the domain of <code>==</code> .                                                                                                                                                                                          |
| <code>*a</code>        | <code>reference,</code><br>convertible to T                                    |                                                                               | <i>Preconditions:</i> a is dereferenceable.<br>The expression <code>(void)*a, *a</code> is equivalent to <code>*a</code> .<br>If <code>a == b</code> and (a, b) is in the domain of <code>==</code> then <code>*a</code> is equivalent to <code>*b</code> . |
| <code>a-&gt;m</code>   | <code>(*a).m</code>                                                            |                                                                               | <i>Preconditions:</i> a is dereferenceable.                                                                                                                                                                                                                 |
| <code>++r</code>       | <code>X&amp;</code>                                                            |                                                                               | <i>Preconditions:</i> r is dereferenceable.<br><i>Postconditions:</i> r is dereferenceable or r is past-the-end;<br>any copies of the previous value of r are no longer required to be dereferenceable nor to be in the domain of <code>==</code> .         |
| <code>(void)r++</code> |                                                                                |                                                                               | equivalent to <code>(void)++r</code>                                                                                                                                                                                                                        |
| <code>*r++</code>      | convertible to T                                                               | <code>{ T tmp = *r;</code><br><code>++r;</code><br><code>return tmp; }</code> |                                                                                                                                                                                                                                                             |

<sup>3</sup> Recommended practice: The implementation of an algorithm on input iterators should never attempt to pass through the same iterator twice; such an algorithm should be a single pass algorithm.

NOTE: For input iterators,  $a == b$  does not imply  $++a == ++b$ . (Equality does not guarantee the substitution property or referential transparency.) Value type  $T$  is not required to be a *Cpp17CopyAssignable* type ([Table 34](#)). Such an algorithm can be used with istreams as the source of the input data through the *istream\_iterator* class template.

#### 25.3.5.4 Output iterators

[[output.iterators](#)]

- <sup>1</sup> A class or pointer type  $X$  meets the requirements of an output iterator if  $X$  meets the *Cpp17Iterator* requirements ([25.3.5.2](#)) and the expressions in [Table 88](#) are valid and have the indicated semantics.

Table 88: *Cpp17OutputIterator* requirements (in addition to *Cpp17Iterator*) [[tab:outputiterator](#)]

| Expression | Return type                        | Operational semantics                                       | Assertion/note pre-/post-condition                                                                                                                                                  |
|------------|------------------------------------|-------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| $*r = o$   | result is not used                 |                                                             | <i>Remarks:</i> After this operation $r$ is not required to be dereferenceable.<br><i>Postconditions:</i> $r$ is incrementable.                                                     |
| $++r$      | $X\&$                              |                                                             | $\text{addressof}(r) == \text{addressof}(++r)$ .<br><i>Remarks:</i> After this operation $r$ is not required to be dereferenceable.<br><i>Postconditions:</i> $r$ is incrementable. |
| $r++$      | convertible to $\text{const } X\&$ | { $X \text{ tmp} = r;$<br>$++r;$<br>$\text{return tmp; }$ } | <i>Remarks:</i> After this operation $r$ is not required to be dereferenceable.<br><i>Postconditions:</i> $r$ is incrementable.                                                     |
| $*r++ = o$ | result is not used                 |                                                             | <i>Remarks:</i> After this operation $r$ is not required to be dereferenceable.<br><i>Postconditions:</i> $r$ is incrementable.                                                     |

- <sup>2</sup> *Recommended practice:* The implementation of an algorithm on output iterators should never attempt to pass through the same iterator twice; such an algorithm should be a single-pass algorithm.

NOTE: The only valid use of an *operator\** is on the left side of the assignment statement. Assignment through the same value of the iterator happens only once. Equality and inequality are not necessarily defined.

#### 25.3.5.5 Forward iterators

[[forward.iterators](#)]

- <sup>1</sup> A class or pointer type  $X$  meets the requirements of a forward iterator if

- (1.1) —  $X$  meets the *Cpp17InputIterator* requirements ([25.3.5.3](#)),
- (1.2) —  $X$  meets the *Cpp17DefaultConstructible* requirements ([16.4.4.2](#)),
- (1.3) — if  $X$  is a mutable iterator, *reference* is a reference to  $T$ ; if  $X$  is a constant iterator, *reference* is a reference to *const T*,
- (1.4) — the expressions in [Table 89](#) are valid and have the indicated semantics, and
- (1.5) — objects of type  $X$  offer the multi-pass guarantee, described below.

- <sup>2</sup> The domain of  $==$  for forward iterators is that of iterators over the same underlying sequence. However, value-initialized iterators may be compared and shall compare equal to other value-initialized iterators of the same type.

NOTE 1: Value-initialized iterators behave as if they refer past the end of the same empty sequence.

- <sup>3</sup> Two dereferenceable iterators  $a$  and  $b$  of type  $X$  offer the *multi-pass guarantee* if:

- (3.1) —  $a == b$  implies  $++a == ++b$  and

(3.2) —  $X$  is a pointer type or the expression `(void)++X(a)`,  $*a$  is equivalent to the expression  $*a$ .

<sup>4</sup> NOTE 2: The requirement that  $a == b$  implies  $++a == ++b$  (which is not true for input and output iterators) and the removal of the restrictions on the number of the assignments through a mutable iterator (which applies to output iterators) allows the use of multi-pass one-directional algorithms with forward iterators.

Table 89: *Cpp17ForwardIterator* requirements (in addition to *Cpp17InputIterator*) [tab:forwarditerator]

| Expression        | Return type                                 | Operational semantics                                | Assertion/note pre-/post-condition |
|-------------------|---------------------------------------------|------------------------------------------------------|------------------------------------|
| <code>r++</code>  | convertible to<br><code>const X&amp;</code> | <code>{ X tmp = r;<br/>++r;<br/>return tmp; }</code> |                                    |
| <code>*r++</code> | reference                                   |                                                      |                                    |

<sup>5</sup> If  $a$  and  $b$  are equal, then either  $a$  and  $b$  are both dereferenceable or else neither is dereferenceable.

<sup>6</sup> If  $a$  and  $b$  are both dereferenceable, then  $a == b$  if and only if  $*a$  and  $*b$  are bound to the same object.

### 25.3.5.6 Bidirectional iterators

[bidirectional.iterator]

<sup>1</sup> A class or pointer type  $X$  meets the requirements of a bidirectional iterator if, in addition to meeting the *Cpp17ForwardIterator* requirements, the following expressions are valid as shown in [Table 90](#).

Table 90: *Cpp17BidirectionalIterator* requirements (in addition to *Cpp17ForwardIterator*) [tab:bidirectionaliterator]

| Expression        | Return type                                 | Operational semantics                                | Assertion/note pre-/post-condition                                                                                                                                                                           |
|-------------------|---------------------------------------------|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>--r</code>  | $X\&$                                       |                                                      | <i>Preconditions:</i> there exists $s$ such that $r == ++s$ .<br><i>Postconditions:</i> $r$ is dereferenceable.<br>$--(++r) == r$ .<br>$--r == --s$ implies $r == s$ .<br>$addressof(r) == addressof(--r)$ . |
| <code>r--</code>  | convertible to<br><code>const X&amp;</code> | <code>{ X tmp = r;<br/>--r;<br/>return tmp; }</code> |                                                                                                                                                                                                              |
| <code>*r--</code> | reference                                   |                                                      |                                                                                                                                                                                                              |

<sup>2</sup> NOTE: Bidirectional iterators allow algorithms to move iterators backward as well as forward.

### 25.3.5.7 Random access iterators

[random.access.iterator]

<sup>1</sup> A class or pointer type  $X$  meets the requirements of a random access iterator if, in addition to meeting the *Cpp17BidirectionalIterator* requirements, the following expressions are valid as shown in [Table 91](#).

Table 91: *Cpp17RandomAccessIterator* requirements (in addition to *Cpp17BidirectionalIterator*)  
[tab:randomaccessiterator]

| Expression | Return type                                            | Operational semantics                                                                                        | Assertion/note pre-/post-condition                                                                                            |
|------------|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| $r += n$   | $X\&$                                                  | { difference_type m = n;<br>if (m >= 0)<br>while (m--)<br>++r;<br>else<br>while (m++)<br>--r;<br>return r; } |                                                                                                                               |
| $a + n$    | $X$                                                    | { X tmp = a;<br>return tmp += n; }                                                                           | $a + n == n + a.$                                                                                                             |
| $n + a$    |                                                        |                                                                                                              |                                                                                                                               |
| $r -= n$   | $X\&$                                                  | return $r += -n;$                                                                                            | <i>Preconditions:</i> the absolute value of $n$ is in the range of representable values of <i>difference_type</i> .           |
| $a - n$    | $X$                                                    | { X tmp = a;<br>return tmp -= n; }                                                                           |                                                                                                                               |
| $b - a$    | <i>difference_type</i>                                 | return $n;$                                                                                                  | <i>Preconditions:</i> there exists a value $n$ of type <i>difference_type</i> such that $a + n == b$ .<br>$b == a + (b - a).$ |
| $a[n]$     | convertible to reference                               | $*(a + n)$                                                                                                   |                                                                                                                               |
| $a < b$    | decltype( $a < b$ ) models boolean-testable            | <i>Effects:</i> Equivalent to: return $b - a > 0;$                                                           | $<$ is a total ordering relation                                                                                              |
| $a > b$    | decltype( $a > b$ ) models boolean-testable            |                                                                                                              | $>$ is a total ordering relation opposite to $<$ .                                                                            |
| $a \geq b$ | decltype( $a \geq ! (a < b)$ ) models boolean-testable |                                                                                                              |                                                                                                                               |
| $a \leq b$ | decltype( $a \leq ! (a > b)$ ) models boolean-testable |                                                                                                              |                                                                                                                               |

### 25.3.6 Indirect callable requirements

[**indirectcallable**]

#### 25.3.6.1 General

[**indirectcallable.general**]

- <sup>1</sup> There are several concepts that group requirements of algorithms that take callable objects (22.10.3) as arguments.

#### 25.3.6.2 Indirect callable traits

[**indirectcallable.traits**]

- <sup>1</sup> To implement algorithms taking projections, it is necessary to determine the projected type of an iterator's value type. For the exposition-only alias template *indirect-value-t*, *indirect-value-t*<T> denotes
- (1.1) — *invoke\_result\_t*<*Proj*&, *indirect-value-t*<I>> if T names *projected*<I, Proj>, and
  - (1.2) — *iter\_value\_t*<T>& otherwise.

### 25.3.6.3 Indirect callables

[indirectcallable.indirectinvocable]

- <sup>1</sup> The indirect callable concepts are used to constrain those algorithms that accept callable objects (22.10.3) as arguments.

```
namespace std {
 template<class F, class I>
 concept indirectly_unary_invocable =
 indirectly_readable<I> &&
 copy_constructible<F> &&
 invocable<F&, indirect_value_t<I>> &&
 invocable<F&, iter_reference_t<I>> &&
 invocable<F&, iter_common_reference_t<I>> &&
 common_reference_with<
 invoke_result_t<F&, indirect_value_t<I>>,
 invoke_result_t<F&, iter_reference_t<I>>>;
}

template<class F, class I>
concept indirectly_regular_unary_invocable =
 indirectly_readable<I> &&
 copy_constructible<F> &&
 regular_invocable<F&, indirect_value_t<I>> &&
 regular_invocable<F&, iter_reference_t<I>> &&
 regular_invocable<F&, iter_common_reference_t<I>> &&
 common_reference_with<
 invoke_result_t<F&, indirect_value_t<I>>,
 invoke_result_t<F&, iter_reference_t<I>>>;
}

template<class F, class I>
concept indirect Unary_predicate =
 indirectly_readable<I> &&
 copy_constructible<F> &&
 predicate<F&, indirect_value_t<I>> &&
 predicate<F&, iter_reference_t<I>> &&
 predicate<F&, iter_common_reference_t<I>>;
}

template<class F, class I1, class I2>
concept indirect_binary_predicate =
 indirectly_readable<I1> && indirectly_readable<I2> &&
 copy_constructible<F> &&
 predicate<F&, indirect_value_t<I1>, indirect_value_t<I2>> &&
 predicate<F&, indirect_value_t<I1>, iter_reference_t<I2>> &&
 predicate<F&, iter_reference_t<I1>, indirect_value_t<I2>> &&
 predicate<F&, iter_reference_t<I1>, iter_reference_t<I2>> &&
 predicate<F&, iter_common_reference_t<I1>, iter_common_reference_t<I2>>;
}

template<class F, class I1, class I2 = I1>
concept indirect_equivalence_relation =
 indirectly_readable<I1> && indirectly_readable<I2> &&
 copy_constructible<F> &&
 equivalence_relation<F&, indirect_value_t<I1>, indirect_value_t<I2>> &&
 equivalence_relation<F&, indirect_value_t<I1>, iter_reference_t<I2>> &&
 equivalence_relation<F&, iter_reference_t<I1>, indirect_value_t<I2>> &&
 equivalence_relation<F&, iter_reference_t<I1>, iter_reference_t<I2>> &&
 equivalence_relation<F&, iter_common_reference_t<I1>, iter_common_reference_t<I2>>;
}

template<class F, class I1, class I2 = I1>
concept indirect_strict_weak_order =
 indirectly_readable<I1> && indirectly_readable<I2> &&
 copy_constructible<F> &&
 strict_weak_order<F&, indirect_value_t<I1>, indirect_value_t<I2>> &&
 strict_weak_order<F&, indirect_value_t<I1>, iter_reference_t<I2>> &&
 strict_weak_order<F&, iter_reference_t<I1>, indirect_value_t<I2>> &&
 strict_weak_order<F&, iter_reference_t<I1>, iter_reference_t<I2>> &&
 strict_weak_order<F&, iter_common_reference_t<I1>, iter_common_reference_t<I2>>;
}
```

}

### 25.3.6.4 Class template projected

[projected]

- <sup>1</sup> Class template `projected` is used to constrain algorithms that accept callable objects and projections (3.44). It combines an `indirectly_readable` type `I` and a callable object type `Proj` into a new `indirectly_readable` type whose `reference` type is the result of applying `Proj` to the `iter_reference_t` of `I`.

```
namespace std {
 template<indirectly_readable I, indirectly_regular_unary_invocable<I> Proj>
 struct projected {
 using value_type = remove_cvref_t<indirect_result_t<Proj&, I>>;
 indirect_result_t<Proj&, I> operator*() const; // not defined
 };

 template<weakly_incrementable I, class Proj>
 struct incrementable_traits<projected<I, Proj>> {
 using difference_type = iter_difference_t<I>;
 };
}
```

### 25.3.7 Common algorithm requirements

[alg.req]

#### 25.3.7.1 General

[alg.req.general]

- <sup>1</sup> There are several additional iterator concepts that are commonly applied to families of algorithms. These group together iterator requirements of algorithm families. There are three relational concepts that specify how element values are transferred between `indirectly_readable` and `indirectly_writable` types: `indirectly_movable`, `indirectly_copyable`, and `indirectly_swappable`. There are three relational concepts for rearrangements: `permutable`, `mergeable`, and `sortable`. There is one relational concept for comparing values from different sequences: `indirectly_comparable`.
- <sup>2</sup> NOTE: The `ranges::less` function object type used in the concepts below imposes constraints on the concepts' arguments in addition to those that appear in the concepts' bodies (22.10.9).

#### 25.3.7.2 Concept indirectly\_movable

[alg.req.ind.move]

- <sup>1</sup> The `indirectly_movable` concept specifies the relationship between an `indirectly_readable` type and an `indirectly_writable` type between which values may be moved.

```
template<class In, class Out>
concept indirectly_movable =
 indirectly_readable<In> &&
 indirectly_writable<Out, iter_rvalue_reference_t<In>>;
```

- <sup>2</sup> The `indirectly_movable_storable` concept augments `indirectly_movable` with additional requirements enabling the transfer to be performed through an intermediate object of the `indirectly_readable` type's value type.

```
template<class In, class Out>
concept indirectly_movable_storable =
 indirectly_movable<In, Out> &&
 indirectly_writable<Out, iter_value_t<In>> &&
 movable<iter_value_t<In>> &&
 constructible_from<iter_value_t<In>, iter_rvalue_reference_t<In>> &&
 assignable_from<iter_value_t<In>&, iter_rvalue_reference_t<In>>;
```

- <sup>3</sup> Let `i` be a dereferenceable value of type `In`. `In` and `Out` model `indirectly_movable_storable<In, Out>` only if after the initialization of the object `obj` in

```
 iter_value_t<In> obj(ranges::iter_move(i));
```

`obj` is equal to the value previously denoted by `*i`. If `iter_rvalue_reference_t<In>` is an rvalue reference type, the resulting state of the value denoted by `*i` is valid but unspecified (16.4.6.15).

#### 25.3.7.3 Concept indirectly\_copyable

[alg.req.ind.copy]

- <sup>1</sup> The `indirectly_copyable` concept specifies the relationship between an `indirectly_readable` type and an `indirectly_writable` type between which values may be copied.

```
template<class In, class Out>
concept indirectly_copyable =
 indirectly_readable<In> &&
 indirectly_writable<Out, iter_reference_t<In>>;
```

- <sup>2</sup> The `indirectly_copyable_storable` concept augments `indirectly_copyable` with additional requirements enabling the transfer to be performed through an intermediate object of the `indirectly_readable` type's value type. It also requires the capability to make copies of values.

```
template<class In, class Out>
concept indirectly_copyable_storable =
 indirectly_copyable<In, Out> &&
 indirectly_writable<Out, iter_value_t<In>&> &&
 indirectly_writable<Out, const iter_value_t<In>&> &&
 indirectly_writable<Out, iter_value_t<In>&&> &&
 indirectly_writable<Out, const iter_value_t<In>&&> &&
 copyable<iter_value_t<In>> &&
 constructible_from<iter_value_t<In>, iter_reference_t<In>> &&
 assignable_from<iter_value_t<In>&, iter_reference_t<In>>;
```

- <sup>3</sup> Let `i` be a dereferenceable value of type `In`. `In` and `Out` model `indirectly_copyable_storable<In, Out>` only if after the initialization of the object `obj` in

```
iter_value_t<In> obj(*i);
```

`obj` is equal to the value previously denoted by `*i`. If `iter_reference_t<In>` is an rvalue reference type, the resulting state of the value denoted by `*i` is valid but unspecified (16.4.6.15).

#### 25.3.7.4 Concept indirectly\_swappable

[alg.req.ind.swap]

- <sup>1</sup> The `indirectly_swappable` concept specifies a swappable relationship between the values referenced by two `indirectly_readable` types.

```
template<class I1, class I2 = I1>
concept indirectly_swappable =
 indirectly_readable<I1> && indirectly_readable<I2> &&
 requires(const I1 i1, const I2 i2) {
 ranges::iter_swap(i1, i1);
 ranges::iter_swap(i2, i2);
 ranges::iter_swap(i1, i2);
 ranges::iter_swap(i2, i1);
 };
```

#### 25.3.7.5 Concept indirectly\_comparable

[alg.req.ind.cmp]

- <sup>1</sup> The `indirectly_comparable` concept specifies the common requirements of algorithms that compare values from two different sequences.

```
template<class I1, class I2, class R, class P1 = identity,
 class P2 = identity>
concept indirectly_comparable =
 indirect_binary_predicate<R, projected<I1, P1>, projected<I2, P2>>;
```

#### 25.3.7.6 Concept permutable

[alg.req.permutable]

- <sup>1</sup> The `permutable` concept specifies the common requirements of algorithms that reorder elements in place by moving or swapping them.

```
template<class I>
concept permutable =
 forward_iterator<I> &&
 indirectly_movable_storable<I, I> &&
 indirectly_swappable<I, I>;
```

#### 25.3.7.7 Concept mergeable

[alg.req.mergeable]

- <sup>1</sup> The `mergeable` concept specifies the requirements of algorithms that merge sorted sequences into an output sequence by copying elements.

```
template<class I1, class I2, class Out, class R = ranges::less,
 class P1 = identity, class P2 = identity>
concept mergeable =
 input_iterator<I1> &&
 input_iterator<I2> &&
 weakly_incrementable<Out> &&
 indirectly_copyable<I1, Out> &&
 indirectly_copyable<I2, Out> &&
 indirect_strict_weak_order<R, projected<I1, P1>, projected<I2, P2>>;
```

### 25.3.7.8 Concept sortable

[alg.req.sortable]

- <sup>1</sup> The sortable concept specifies the common requirements of algorithms that permute sequences into ordered sequences (e.g., `sort`).

```
template<class I, class R = ranges::less, class P = identity>
concept sortable =
 permutable<I> &&
 indirect_strict_weak_order<R, projected<I, P>>;
```

## 25.4 Iterator primitives

[iterator.primitives]

### 25.4.1 General

[iterator.primitives.general]

- <sup>1</sup> To simplify the use of iterators, the library provides several classes and functions.

### 25.4.2 Standard iterator tags

[std.iterator.tags]

- <sup>1</sup> It is often desirable for a function template specialization to find out what is the most specific category of its iterator argument, so that the function can select the most efficient algorithm at compile time. To facilitate this, the library introduces *category tag* classes which are used as compile time tags for algorithm selection. They are: `output_iterator_tag`, `input_iterator_tag`, `forward_iterator_tag`, `bidirectional_iterator_tag`, `random_access_iterator_tag`, and `contiguous_iterator_tag`. For every iterator of type `I`, `iterator_traits<I>::iterator_category` shall be defined to be a category tag that describes the iterator's behavior. Additionally, `iterator_traits<I>::iterator_concept` may be used to indicate conformance to the iterator concepts (25.3.4).

```
namespace std {
 struct output_iterator_tag { };
 struct input_iterator_tag { };
 struct forward_iterator_tag: public input_iterator_tag { };
 struct bidirectional_iterator_tag: public forward_iterator_tag { };
 struct random_access_iterator_tag: public bidirectional_iterator_tag { };
 struct contiguous_iterator_tag: public random_access_iterator_tag { };
}
```

- <sup>2</sup> EXAMPLE 1: A program-defined iterator `BinaryTreeIterator` can be included into the bidirectional iterator category by specializing the `iterator_traits` template:

```
template<class T> struct iterator_traits<BinaryTreeIterator<T>> {
 using iterator_category = bidirectional_iterator_tag;
 using difference_type = ptrdiff_t;
 using value_type = T;
 using pointer = T*;
 using reference = T&;
};
```

- <sup>3</sup> EXAMPLE 2: If `evolve()` is well-defined for bidirectional iterators, but can be implemented more efficiently for random access iterators, then the implementation is as follows:

```
template<class BidirectionalIterator>
inline void
evolve(BidirectionalIterator first, BidirectionalIterator last) {
 evolve(first, last,
 typename iterator_traits<BidirectionalIterator>::iterator_category());
}
```

```

template<class BidirectionalIterator>
void evolve(BidirectionalIterator first, BidirectionalIterator last,
 bidirectional_iterator_tag) {
 // more generic, but less efficient algorithm
}

template<class RandomAccessIterator>
void evolve(RandomAccessIterator first, RandomAccessIterator last,
 random_access_iterator_tag) {
 // more efficient, but less generic algorithm
}

```

### 25.4.3 Iterator operations

[iterator.operations]

- <sup>1</sup> Since only random access iterators provide + and - operators, the library provides two function templates `advance` and `distance`. These function templates use + and - for random access iterators (and are, therefore, constant time for them); for input, forward and bidirectional iterators they use ++ to provide linear time implementations.

```

template<class InputIterator, class Distance>
constexpr void advance(InputIterator& i, Distance n);

```

- <sup>2</sup> *Preconditions:* n is negative only for bidirectional iterators.

- <sup>3</sup> *Effects:* Increments i by n if n is non-negative, and decrements i by -n otherwise.

```

template<class InputIterator>
constexpr typename iterator_traits<InputIterator>::difference_type
distance(InputIterator first, InputIterator last);

```

- <sup>4</sup> *Preconditions:* last is reachable from first, or InputIterator meets the Cpp17RandomAccessIterator requirements and first is reachable from last.

- <sup>5</sup> *Effects:* If InputIterator meets the Cpp17RandomAccessIterator requirements, returns (last - first); otherwise, increments first until last is reached and returns the number of increments.

```

template<class InputIterator>
constexpr InputIterator next(InputIterator x,
 typename iterator_traits<InputIterator>::difference_type n = 1);

```

- <sup>6</sup> *Effects:* Equivalent to: `advance(x, n); return x;`

```

template<class BidirectionalIterator>
constexpr BidirectionalIterator prev(BidirectionalIterator x,
 typename iterator_traits<BidirectionalIterator>::difference_type n = 1);

```

- <sup>7</sup> *Effects:* Equivalent to: `advance(x, -n); return x;`

### 25.4.4 Range iterator operations

[range.iter.ops]

#### 25.4.4.1 General

[range.iter.ops.general]

- <sup>1</sup> The library includes the function templates `ranges::advance`, `ranges::distance`, `ranges::next`, and `ranges::prev` to manipulate iterators. These operations adapt to the set of operators provided by each iterator category to provide the most efficient implementation possible for a concrete iterator type.

EXAMPLE 1: `ranges::advance` uses the + operator to move a `random_access_iterator` forward n steps in constant time. For an iterator type that does not model `random_access_iterator`, `ranges::advance` instead performs n individual increments with the ++ operator.

- <sup>2</sup> The function templates defined in 25.4.4 are not found by argument-dependent name lookup (6.5.4). When found by unqualified (6.5.3) name lookup for the *postfix-expression* in a function call (7.6.1.3), they inhibit argument-dependent name lookup.

EXAMPLE 2:

```

void foo() {
 using namespace std::ranges;
 std::vector<int> vec{1,2,3};
 distance(begin(vec), end(vec)); // #1
}

```

The function call expression at #1 invokes `std::ranges::distance`, not `std::distance`, despite that (a) the iterator type returned from `begin(vec)` and `end(vec)` may be associated with namespace `std` and (b) `std::distance` is more specialized (13.7.7.3) than `std::ranges::distance` since the former requires its first two parameters to have the same type.

- 3 The number and order of deducible template parameters for the function templates defined in 25.4.4 is unspecified, except where explicitly stated otherwise.

#### 25.4.4.2 `ranges::advance`

[range.iter.op.advance]

```
template<input_or_output_iterator I>
constexpr void ranges::advance(I& i, iter_difference_t<I> n);
```

1 *Preconditions:* If `I` does not model `bidirectional_iterator`, `n` is not negative.

2 *Effects:*

- (2.1) — If `I` models `random_access_iterator`, equivalent to `i += n`.
- (2.2) — Otherwise, if `n` is non-negative, increments `i` by `n`.
- (2.3) — Otherwise, decrements `i` by `-n`.

```
template<input_or_output_iterator I, sentinel_for<I> S>
constexpr void ranges::advance(I& i, S bound);
```

3 *Preconditions:* Either `assignable_from<I&, S>` || `sized_sentinel_for<S, I>` is modeled, or `[i, bound)` denotes a range.

4 *Effects:*

- (4.1) — If `I` and `S` model `assignable_from<I&, S>`, equivalent to `i = std::move(bound)`.
- (4.2) — Otherwise, if `S` and `I` model `sized_sentinel_for<S, I>`, equivalent to `ranges::advance(i, bound - i)`.
- (4.3) — Otherwise, while `bool(i != bound)` is `true`, increments `i`.

```
template<input_or_output_iterator I, sentinel_for<I> S>
constexpr iter_difference_t<I> ranges::advance(I& i, iter_difference_t<I> n, S bound);
```

5 *Preconditions:* If `n > 0`, `[i, bound)` denotes a range. If `n == 0`, `[i, bound)` or `[bound, i)` denotes a range. If `n < 0`, `[bound, i)` denotes a range, `I` models `bidirectional_iterator`, and `I` and `S` model `same_as<I, S>`.

6 *Effects:*

- (6.1) — If `S` and `I` model `sized_sentinel_for<S, I>`:
  - (6.1.1) — If  $|n| \geq |bound - i|$ , equivalent to `ranges::advance(i, bound)`.
  - (6.1.2) — Otherwise, equivalent to `ranges::advance(i, n)`.
- (6.2) — Otherwise,
  - (6.2.1) — if `n` is non-negative, while `bool(i != bound)` is `true`, increments `i` but at most `n` times.
  - (6.2.2) — Otherwise, while `bool(i != bound)` is `true`, decrements `i` but at most `-n` times.

7 *Returns:* `n - M`, where `M` is the difference between the ending and starting positions of `i`.

#### 25.4.4.3 `ranges::distance`

[range.iter.op.distance]

```
template<class I, sentinel_for<I> S>
requires (!sized_sentinel_for<S, I>)
constexpr iter_difference_t<I> ranges::distance(I first, S last);
```

1 *Preconditions:* `[first, last)` denotes a range.

2 *Effects:* Increments `first` until `last` is reached and returns the number of increments.

```
template<class I, sized_sentinel_for<decay_t<I>> S>
constexpr iter_difference_t<decay_t<I>> ranges::distance(I&& first, S last);
```

3 *Effects:* Equivalent to: `return last - static_cast<const decay_t<I>&>(first);`

```
template<range R>
constexpr range_difference_t<R> ranges::distance(R&& r);

4 Effects: If R models sized_range, equivalent to:
 return static_cast<range_difference_t<R>>(ranges::size(r)); // 26.3.10

Otherwise, equivalent to:
 return ranges::distance(ranges::begin(r), ranges::end(r)); // 26.3
```

#### 25.4.4.4 ranges::next

[range.iter.op.next]

```
template<input_or_output_iterator I>
constexpr I ranges::next(I x);

1 Effects: Equivalent to: ++x; return x;

template<input_or_output_iterator I>
constexpr I ranges::next(I x, iter_difference_t<I> n);

2 Effects: Equivalent to: ranges::advance(x, n); return x;

template<input_or_output_iterator I, sentinel_for<I> S>
constexpr I ranges::next(I x, S bound);

3 Effects: Equivalent to: ranges::advance(x, bound); return x;

template<input_or_output_iterator I, sentinel_for<I> S>
constexpr I ranges::next(I x, iter_difference_t<I> n, S bound);

4 Effects: Equivalent to: ranges::advance(x, n, bound); return x;
```

#### 25.4.4.5 ranges::prev

[range.iter.op.prev]

```
template<bidirectional_iterator I>
constexpr I ranges::prev(I x);

1 Effects: Equivalent to: --x; return x;

template<bidirectional_iterator I>
constexpr I ranges::prev(I x, iter_difference_t<I> n);

2 Effects: Equivalent to: ranges::advance(x, -n); return x;

template<bidirectional_iterator I>
constexpr I ranges::prev(I x, iter_difference_t<I> n, I bound);

3 Effects: Equivalent to: ranges::advance(x, -n, bound); return x;
```

### 25.5 Iterator adaptors

[predef.iterator]

#### 25.5.1 Reverse iterators

[reverse.iterator]

##### 25.5.1.1 General

[reverse.iterator.general]

- 1 Class template `reverse_iterator` is an iterator adaptor that iterates from the end of the sequence defined by its underlying iterator to the beginning of that sequence.

##### 25.5.1.2 Class template reverse\_iterator

[reverse.iterator]

```
namespace std {
 template<class Iterator>
 class reverse_iterator {
 public:
 using iterator_type = Iterator;
 using iterator_concept = see below;
 using iterator_category = see below;
 using value_type = iter_value_t<Iterator>;
 using difference_type = iter_difference_t<Iterator>;
 using pointer = typename iterator_traits<Iterator>::pointer;
 using reference = iter_reference_t<Iterator>;
```

```

constexpr reverse_iterator();
constexpr explicit reverse_iterator(Iterator x);
template<class U> constexpr reverse_iterator(const reverse_iterator<U>& u);
template<class U> constexpr reverse_iterator& operator=(const reverse_iterator<U>& u);

constexpr Iterator base() const;
constexpr reference operator*() const;
constexpr pointer operator->() const requires see below;

constexpr reverse_iterator& operator++();
constexpr reverse_iterator operator++(int);
constexpr reverse_iterator& operator--();
constexpr reverse_iterator operator--(int);

constexpr reverse_iterator operator+ (difference_type n) const;
constexpr reverse_iterator& operator+=(difference_type n);
constexpr reverse_iterator operator- (difference_type n) const;
constexpr reverse_iterator& operator-=(difference_type n);
constexpr unspecified operator[](difference_type n) const;

friend constexpr iter_rvalue_reference_t<Iterator>
 iter_move(const reverse_iterator& i) noexcept(see below);
template<indirectly_swappable<Iterator> Iterator2>
 friend constexpr void
 iter_swap(const reverse_iterator& x,
 const reverse_iterator<Iterator2>& y) noexcept(see below);

protected:
 Iterator current;
};

}

1 The member typedef-name iterator_concept denotes
(1.1) — random_access_iterator_tag if Iterator models random_access_iterator, and
(1.2) — bidirectional_iterator_tag otherwise.

2 The member typedef-name iterator_category denotes
(2.1) — random_access_iterator_tag if the type iterator_traits<Iterator>::iterator_category models derived_from<random_access_iterator_tag>, and
(2.2) — iterator_traits<Iterator>::iterator_category otherwise.

```

### 25.5.1.3 Requirements

[reverse.iter.requirements]

- 1 The template parameter *Iterator* shall either meet the requirements of a *Cpp17BidirectionalIterator* (25.3.5.6) or model *bidirectional\_iterator* (25.3.4.12).
- 2 Additionally, *Iterator* shall either meet the requirements of a *Cpp17RandomAccessIterator* (25.3.5.7) or model *random\_access\_iterator* (25.3.4.13) if the definitions of any of the members
  - (2.1) — *operator+*, *operator-*, *operator+=*, *operator-=* (25.5.1.7), or
  - (2.2) — *operator[]* (25.5.1.6),
or the non-member operators (25.5.1.8)
- (2.3) — *operator<*, *operator>*, *operator<=*, *operator>=*, *operator-*, or *operator+* (25.5.1.9) are instantiated (13.9.2).

### 25.5.1.4 Construction and assignment

[reverse.iter.cons]

```
constexpr reverse_iterator();
```

- 1 *Effects:* Value-initializes *current*. Iterator operations applied to the resulting iterator have defined behavior if and only if the corresponding operations are defined on a value-initialized iterator of type *Iterator*.

```

constexpr explicit reverse_iterator(Iterator x);
2 Effects: Initializes current with x.

template<class U> constexpr reverse_iterator(const reverse_iterator<U>& u);
3 Constraints: is_same_v<U, Iterator> is false and const U& models convertible_to<Iterator>.
4 Effects: Initializes current with u.current.

template<class U>
constexpr reverse_iterator&
operator=(const reverse_iterator<U>& u);
5 Constraints: is_same_v<U, Iterator> is false, const U& models convertible_to<Iterator>, and
assignable_from<Iterator&, const U&> is modeled.
6 Effects: Assigns u.current to current.
7 Returns: *this.

```

### 25.5.1.5 Conversion

[reverse.iter.conv]

```
constexpr Iterator base() const;
```

1 Returns: current.

### 25.5.1.6 Element access

[reverse.iter.elem]

```
constexpr reference operator*() const;
```

1 Effects: As if by:

```
 Iterator tmp = current;
 return *--tmp;
```

```
constexpr pointer operator->() const
 requires (is_pointer_v<Iterator> ||
 requires(const Iterator i) { i.operator->(); });

```

2 Effects:

- (2.1) — If Iterator is a pointer type, equivalent to: `return prev(current);`
- (2.2) — Otherwise, equivalent to: `return prev(current).operator->();`

```
constexpr unspecified operator[](difference_type n) const;
```

3 Returns: `current[-n-1]`.

### 25.5.1.7 Navigation

[reverse.iter.nav]

```
constexpr reverse_iterator operator+(difference_type n) const;
```

1 Returns: `reverse_iterator(current+n)`.

```
constexpr reverse_iterator operator-(difference_type n) const;
```

2 Returns: `reverse_iterator(current-n)`.

```
constexpr reverse_iterator& operator++();
```

3 Effects: As if by: `--current`;

4 Returns: `*this`.

```
constexpr reverse_iterator operator++(int);
```

5 Effects: As if by:

```
 reverse_iterator tmp = *this;
 --current;
 return tmp;
```

```

constexpr reverse_iterator& operator--();
6 Effects: As if by ++current.
7 Returns: *this.

constexpr reverse_iterator operator--(int);
8 Effects: As if by:
9 reverse_iterator tmp = *this;
10 ++current;
11 return tmp;

constexpr reverse_iterator& operator+=(difference_type n);
12 Effects: As if by: current -= n;
13 Returns: *this.

constexpr reverse_iterator& operator-=(difference_type n);
14 Effects: As if by: current += n;
15 Returns: *this.

```

### 25.5.1.8 Comparisons

[reverse.iter.cmp]

```

template<class Iterator1, class Iterator2>
constexpr bool operator==(

 const reverse_iterator<Iterator1>& x,

 const reverse_iterator<Iterator2>& y);

1 Constraints: x.base() == y.base() is well-formed and convertible to bool.

2 Returns: x.base() == y.base().

```

```

template<class Iterator1, class Iterator2>
constexpr bool operator!=(

 const reverse_iterator<Iterator1>& x,

 const reverse_iterator<Iterator2>& y);

3 Constraints: x.base() != y.base() is well-formed and convertible to bool.

4 Returns: x.base() != y.base().

```

```

template<class Iterator1, class Iterator2>
constexpr bool operator<(

 const reverse_iterator<Iterator1>& x,

 const reverse_iterator<Iterator2>& y);

5 Constraints: x.base() > y.base() is well-formed and convertible to bool.

6 Returns: x.base() > y.base().

```

```

template<class Iterator1, class Iterator2>
constexpr bool operator>(

 const reverse_iterator<Iterator1>& x,

 const reverse_iterator<Iterator2>& y);

7 Constraints: x.base() < y.base() is well-formed and convertible to bool.

8 Returns: x.base() < y.base().

```

```

template<class Iterator1, class Iterator2>
constexpr bool operator<=(

 const reverse_iterator<Iterator1>& x,

 const reverse_iterator<Iterator2>& y);

9 Constraints: x.base() >= y.base() is well-formed and convertible to bool.

10 Returns: x.base() >= y.base().

```

```

template<class Iterator1, class Iterator2>
constexpr bool operator>=(
 const reverse_iterator<Iterator1>& x,
 const reverse_iterator<Iterator2>& y);

11 Constraints: x.base() <= y.base() is well-formed and convertible to bool.
12 Returns: x.base() <= y.base().

```

```

template<class Iterator1, three_way_comparable_with<Iterator1> Iterator2>
constexpr compare_three_way_result_t<Iterator1, Iterator2>
operator<=>(const reverse_iterator<Iterator1>& x,
 const reverse_iterator<Iterator2>& y);

13 Returns: y.base() <= x.base().

```

14 *NOTE:* The argument order in the *Returns:* element is reversed because this is a reverse iterator.

### 25.5.1.9 Non-member functions

[reverse.iterator.nonmember]

```

template<class Iterator1, class Iterator2>
constexpr auto operator-(
 const reverse_iterator<Iterator1>& x,
 const reverse_iterator<Iterator2>& y) -> decltype(y.base() - x.base());

1 Returns: y.base() - x.base().

```

```

template<class Iterator>
constexpr reverse_iterator<Iterator> operator+(
 iter_difference_t<Iterator> n,
 const reverse_iterator<Iterator>& x);

2 Returns: reverse_iterator<Iterator>(x.base() - n).

```

```

friend constexpr iter_rvalue_reference_t<Iterator>
iter_move(const reverse_iterator& i) noexcept(see below);

```

3 *Effects:* Equivalent to:

```

auto tmp = i.base();
return ranges::iter_move(--tmp);

```

4 *Remarks:* The exception specification is equivalent to:

```

is_nothrow_copy_constructible_v<Iterator> &&
noexcept(ranges::iter_move(--declval<Iterator&>()))

```

```

template<indirectly_swappable<Iterator> Iterator2>
friend constexpr void
iter_swap(const reverse_iterator& x,
 const reverse_iterator<Iterator2>& y) noexcept(see below);

```

5 *Effects:* Equivalent to:

```

auto xtmp = x.base();
auto ytmp = y.base();
ranges::iter_swap(--xtmp, --ytmp);

```

6 *Remarks:* The exception specification is equivalent to:

```

is_nothrow_copy_constructible_v<Iterator> &&
is_nothrow_copy_constructible_v<Iterator2> &&
noexcept(ranges::iter_swap(--declval<Iterator&>(), --declval<Iterator2&>()))

```

```

template<class Iterator>
constexpr reverse_iterator<Iterator> make_reverse_iterator(Iterator i);

7 Returns: reverse_iterator<Iterator>(i).

```

### 25.5.2 Insert iterators

[insert.iterators]

#### 25.5.2.1 General

[insert.iterators.general]

1 To make it possible to deal with insertion in the same way as writing into an array, a special kind of iterator adaptors, called *insert iterators*, are provided in the library. With regular iterator classes,

```
while (first != last) *result++ = *first++;
```

causes a range [first, last) to be copied into a range starting with result. The same code with `result` being an insert iterator will insert corresponding elements into the container. This device allows all of the copying algorithms in the library to work in the *insert mode* instead of the *regular overwrite mode*.

- 2 An insert iterator is constructed from a container and possibly one of its iterators pointing to where insertion takes place if it is neither at the beginning nor at the end of the container. Insert iterators meet the requirements of output iterators. `operator*` returns the insert iterator itself. The assignment `operator=(const T& x)` is defined on insert iterators to allow writing into them, it inserts `x` right before where the insert iterator is pointing. In other words, an insert iterator is like a cursor pointing into the container where the insertion takes place. `back_insert_iterator` inserts elements at the end of a container, `front_insert_iterator` inserts elements at the beginning of a container, and `insert_iterator` inserts elements where the iterator points to in a container. `back_inserter`, `front_inserter`, and `inserter` are three functions making the insert iterators out of a container.

### 25.5.2.2 Class template `back_insert_iterator`

[`back.insert.iterator`]

```
namespace std {
 template<class Container>
 class back_insert_iterator {
protected:
 Container* container;

public:
 using iterator_category = output_iterator_tag;
 using value_type = void;
 using difference_type = ptrdiff_t;
 using pointer = void;
 using reference = void;
 using container_type = Container;

 constexpr explicit back_insert_iterator(Container& x);
 constexpr back_insert_iterator& operator=(const typename Container::value_type& value);
 constexpr back_insert_iterator& operator=(typename Container::value_type&& value);

 constexpr back_insert_iterator& operator*();
 constexpr back_insert_iterator& operator++();
 constexpr back_insert_iterator operator++(int);
};

}
```

#### 25.5.2.2.1 Operations

[`back.insert.iter.ops`]

```
constexpr explicit back_insert_iterator(Container& x);
```

- 1 *Effects:* Initializes `container` with `addressof(x)`.

```
constexpr back_insert_iterator& operator=(const typename Container::value_type& value);
```

- 2 *Effects:* As if by: `container->push_back(value)`;

*Returns:* `*this`.

```
constexpr back_insert_iterator& operator=(typename Container::value_type&& value);
```

- 4 *Effects:* As if by: `container->push_back(std::move(value))`;

*Returns:* `*this`.

```
constexpr back_insert_iterator& operator*();
```

- 6 *Returns:* `*this`.

```
constexpr back_insert_iterator& operator++();
```

```
constexpr back_insert_iterator operator++(int);
```

- 7 *Returns:* `*this`.

**25.5.2.2.2 back\_inserter**

[back.inserter]

```
template<class Container>
constexpr back_insert_iterator<Container> back_inserter(Container& x);
```

1     *Returns:* back\_insert\_iterator<Container>(x).

**25.5.2.3 Class template front\_insert\_iterator**

[front.insert.iterator]

```
namespace std {
 template<class Container>
 class front_insert_iterator {
 protected:
 Container* container;

 public:
 using iterator_category = output_iterator_tag;
 using value_type = void;
 using difference_type = ptrdiff_t;
 using pointer = void;
 using reference = void;
 using container_type = Container;

 constexpr explicit front_insert_iterator(Container& x);
 constexpr front_insert_iterator& operator=(const typename Container::value_type& value);
 constexpr front_insert_iterator& operator=(typename Container::value_type&& value);

 constexpr front_insert_iterator& operator*();
 constexpr front_insert_iterator& operator++();
 constexpr front_insert_iterator operator++(int);
 };
}
```

**25.5.2.3.1 Operations**

[front.insert.iter.ops]

```
constexpr explicit front_insert_iterator(Container& x);
```

1     *Effects:* Initializes container with addressof(x).

```
constexpr front_insert_iterator& operator=(const typename Container::value_type& value);
```

2     *Effects:* As if by: container->push\_front(value);

3     *Returns:* \*this.

```
constexpr front_insert_iterator& operator=(typename Container::value_type&& value);
```

4     *Effects:* As if by: container->push\_front(std::move(value));

5     *Returns:* \*this.

```
constexpr front_insert_iterator& operator*();
```

6     *Returns:* \*this.

```
constexpr front_insert_iterator& operator++();
```

```
constexpr front_insert_iterator operator++(int);
```

7     *Returns:* \*this.

**25.5.2.3.2 front\_inserter**

[front.inserter]

```
template<class Container>
constexpr front_insert_iterator<Container> front_inserter(Container& x);
```

1     *Returns:* front\_insert\_iterator<Container>(x).

## 25.5.2.4 Class template insert\_iterator

[insert.iterator]

```

namespace std {
 template<class Container>
 class insert_iterator {
protected:
 Container* container;
 ranges::iterator_t<Container> iter;

public:
 using iterator_category = output_iterator_tag;
 using value_type = void;
 using difference_type = ptrdiff_t;
 using pointer = void;
 using reference = void;
 using container_type = Container;

 constexpr insert_iterator(Container& x, ranges::iterator_t<Container> i);
 constexpr insert_iterator& operator=(const typename Container::value_type& value);
 constexpr insert_iterator& operator=(typename Container::value_type&& value);

 constexpr insert_iterator& operator*();
 constexpr insert_iterator& operator++();
 constexpr insert_iterator& operator++(int);
};

}

```

## 25.5.2.4.1 Operations

[insert.iterator.ops]

```
constexpr insert_iterator(Container& x, ranges::iterator_t<Container> i);
```

1     *Effects:* Initializes container with addressof(x) and iter with i.

```
constexpr insert_iterator& operator=(const typename Container::value_type& value);
```

2     *Effects:* As if by:

```
 iter = container->insert(iter, value);
 ++iter;
```

3     *Returns:* \*this.

```
constexpr insert_iterator& operator=(typename Container::value_type&& value);
```

4     *Effects:* As if by:

```
 iter = container->insert(iter, std::move(value));
 ++iter;
```

5     *Returns:* \*this.

```
constexpr insert_iterator& operator*();
```

6     *Returns:* \*this.

```
constexpr insert_iterator& operator++();
```

```
constexpr insert_iterator& operator++(int);
```

7     *Returns:* \*this.

## 25.5.2.4.2 inserter

[inserter]

```

template<class Container>
constexpr insert_iterator<Container>
inserter(Container& x, ranges::iterator_t<Container> i);

```

1     *Returns:* insert\_iterator<Container>(x, i).

### 25.5.3 Constant iterators and sentinels

[const.iterators]

#### 25.5.3.1 General

[const.iterators.general]

- 1 Class template `basic_const_iterator` is an iterator adaptor with the same behavior as the underlying iterator except that its indirection operator implicitly converts the value returned by the underlying iterator's indirection operator to a type such that the adapted iterator is a constant iterator (25.3). Some generic algorithms can be called with constant iterators to avoid mutation.
- 2 Specializations of `basic_const_iterator` are constant iterators.

#### 25.5.3.2 Alias templates

[const.iterators.alias]

```
template<indirectly_readable It>
using iter_const_reference_t =
 common_reference_t<const iter_value_t<It>&&, iter_reference_t<It>>;

template<class It>
concept constant_iterator =
 input_iterator<It> && same_as<iter_const_reference_t<It>, iter_reference_t<It>>; // exposition only

template<input_iterator I>
using const_iterator = see below;
```

- 1 *Result:* If I models `constant_iterator`, I. Otherwise, `basic_const_iterator<I>`.

```
template<semiregular S>
using const_sentinel = see below;
```

- 2 *Result:* If S models `input_iterator`, `const_iterator<S>`. Otherwise, S.

#### 25.5.3.3 Class template `basic_const_iterator`

[const.iterators.iterator]

```
namespace std {
 template<class I>
 concept not-a-const-iterator = see below; // exposition only

 template<indirectly_readable I>
 using iter-const-rvalue-reference-t =
 common_reference_t<const iter_value_t<I>&&, iter_rvalue_reference_t<I>>; // exposition only

 template<input_iterator Iterator>
 class basic_const_iterator {
 Iterator current_ = Iterator(); // exposition only
 using reference = iter_const_reference_t<Iterator>; // exposition only
 using rvalue_reference =
 iter-const-rvalue-reference-t<Iterator>; // exposition only

 public:
 using iterator_concept = see below;
 using iterator_category = see below; // not always present
 using value_type = iter_value_t<Iterator>;
 using difference_type = iter_difference_t<Iterator>;

 basic_const_iterator() requires default_initializable<Iterator> = default;
 constexpr basic_const_iterator(Iterator current);
 template<convertible_to<Iterator> U>
 constexpr basic_const_iterator(basic_const_iterator<U> current);
 template<different_from<basic_const_iterator> T>
 requires convertible_to<T, Iterator>
 constexpr basic_const_iterator(T&& current);

 constexpr const Iterator& base() const & noexcept;
 constexpr Iterator base() &&

 constexpr reference operator*() const;
 };
}
```

```

constexpr const auto* operator->() const
 requires is_lvalue_reference_v<iter_reference_t<Iterator>> &&
 same_as<remove_cvref_t<iter_reference_t<Iterator>>, value_type>;

constexpr basic_const_iterator& operator++();
constexpr void operator++(int);
constexpr basic_const_iterator operator++(int) requires forward_iterator<Iterator>;

constexpr basic_const_iterator& operator--() requires bidirectional_iterator<Iterator>;
constexpr basic_const_iterator operator--(int) requires bidirectional_iterator<Iterator>;

constexpr basic_const_iterator& operator+=(difference_type n)
 requires random_access_iterator<Iterator>;
constexpr basic_const_iterator& operator-=(difference_type n)
 requires random_access_iterator<Iterator>;

constexpr reference operator[](difference_type n) const
 requires random_access_iterator<Iterator>;

template<sentinel_for<Iterator> S>
constexpr bool operator==(const S& s) const;

constexpr bool operator<(const basic_const_iterator& y) const
 requires random_access_iterator<Iterator>;
constexpr bool operator>(const basic_const_iterator& y) const
 requires random_access_iterator<Iterator>;
constexpr bool operator<=(const basic_const_iterator& y) const
 requires random_access_iterator<Iterator>;
constexpr bool operator>=(const basic_const_iterator& y) const

}
};

}

```

- <sup>1</sup> Given some type I, the concept *not-a-const-iterator* is defined as *false* if I is a specialization of `basic_const_iterator` and *true* otherwise.

#### 25.5.3.4 Member types

[`const.iterators.types`]

- <sup>1</sup> `basic_const_iterator<Iterator>::iterator_concept` is defined as follows:

- (1.1) — If `Iterator` models `contiguous_iterator`, then `iterator_concept` denotes `contiguous_iterator_tag`.
- (1.2) — Otherwise, if `Iterator` models `random_access_iterator`, then `iterator_concept` denotes `random_access_iterator_tag`.
- (1.3) — Otherwise, if `Iterator` models `bidirectional_iterator`, then `iterator_concept` denotes `bidirectional_iterator_tag`.
- (1.4) — Otherwise, if `Iterator` models `forward_iterator`, then `iterator_concept` denotes `forward_iterator_tag`.
- (1.5) — Otherwise, `iterator_concept` denotes `input_iterator_tag`.

- <sup>2</sup> The member `typedef-name iterator_category` is defined if and only if `Iterator` models `forward_iterator`. In that case, `basic_const_iterator<Iterator>::iterator_category` denotes the type `iterator_traits<Iterator>::iterator_category`.

#### 25.5.3.5 Operations

[`const.iterators.ops`]

```
constexpr basic_const_iterator(Iterator current);
```

- <sup>1</sup> *Effects*: Initializes `current_` with `std::move(current)`.

```
template<convertible_to<Iterator> U>
 constexpr basic_const_iterator(basic_const_iterator<U> current);
```

- <sup>2</sup> *Effects*: Initializes `current_` with `std::move(current.current_)`.

```
template<different_from<basic_const_iterator> T>
 requires convertible_to<T, Iterator>
 constexpr basic_const_iterator(T&& current);
```

- <sup>3</sup> *Effects*: Initializes `current_` with `std::forward<T>(current)`.

```
constexpr const Iterator& base() const & noexcept;
```

- <sup>4</sup> *Effects*: Equivalent to: `return current_;`

```
constexpr Iterator base() &&;
```

- <sup>5</sup> *Effects*: Equivalent to: `return std::move(current_);`

```

constexpr reference operator*() const;
6 Effects: Equivalent to: return static_cast<reference>(*current_);

constexpr const auto* operator->() const
 requires is_lvalue_reference_v<iter_reference_t<Iterator>> &&
 same_as<remove_cvref_t<iter_reference_t<Iterator>>, value_type>;
7 Returns: If Iterator models contiguous_iterator, to_address(current_); otherwise, address-
of(*current_).

constexpr basic_const_iterator& operator++();
8 Effects: Equivalent to:
 ++current_;
 return *this;

constexpr void operator++(int);
9 Effects: Equivalent to: ++current_;

constexpr basic_const_iterator operator++(int) requires forward_iterator<Iterator>;
10 Effects: Equivalent to:
 auto tmp = *this;
 ++*this;
 return tmp;

constexpr basic_const_iterator& operator--() requires bidirectional_iterator<Iterator>;
11 Effects: Equivalent to:
 --current_;
 return *this;

constexpr basic_const_iterator operator--(int) requires bidirectional_iterator<Iterator>;
12 Effects: Equivalent to:
 auto tmp = *this;
 --*this;
 return tmp;

constexpr basic_const_iterator& operator+=(difference_type n)
 requires random_access_iterator<Iterator>;
constexpr basic_const_iterator& operator-=(difference_type n)
 requires random_access_iterator<Iterator>;
13 Let op be the operator.
14 Effects: Equivalent to:
 current_ op n;
 return *this;

constexpr reference operator[](difference_type n) const requires random_access_iterator<Iterator>;
15 Effects: Equivalent to: return static_cast<reference>(current_[n]);

template<sentinel_for<Iterator> S>
constexpr bool operator==(const S& s) const;
16 Effects: Equivalent to: return current_ == s;

constexpr bool operator<(const basic_const_iterator& y) const
 requires random_access_iterator<Iterator>;
constexpr bool operator>(const basic_const_iterator& y) const
 requires random_access_iterator<Iterator>;
constexpr bool operator<=(const basic_const_iterator& y) const
 requires random_access_iterator<Iterator>;
constexpr bool operator>=(const basic_const_iterator& y) const
 requires random_access_iterator<Iterator>;

```

```

constexpr auto operator<=(const basic_const_iterator& y) const
 requires random_access_iterator<Iterator> && three_way_comparable<Iterator>;
17 Let op be the operator.
18 Effects: Equivalent to: return current_ op y.current_;

template<different_from<basic_const_iterator> I>
constexpr bool operator<(const I& y) const
 requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I>;
template<different_from<basic_const_iterator> I>
constexpr bool operator>(const I& y) const
 requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I>;
template<different_from<basic_const_iterator> I>
constexpr bool operator<=(const I& y) const
 requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I>;
template<different_from<basic_const_iterator> I>
constexpr bool operator>=(const I& y) const
 requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I>;
template<different_from<basic_const_iterator> I>
constexpr auto operator<=>(const I& y) const
 requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I> &&
 three_way_comparable_with<Iterator, I>;
19 Let op be the operator.
20 Effects: Equivalent to: return current_ op y;

template<not-a-const-iterator I>
friend constexpr bool operator<(const I& x, const basic_const_iterator& y)
 requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I>;
template<not-a-const-iterator I>
friend constexpr bool operator>(const I& x, const basic_const_iterator& y)
 requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I>;
template<not-a-const-iterator I>
friend constexpr bool operator<=(const I& x, const basic_const_iterator& y)
 requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I>;
template<not-a-const-iterator I>
friend constexpr bool operator>=(const I& x, const basic_const_iterator& y)
 requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I>;
 Let op be the operator.
21 Returns: Equivalent to: return x op y.current_;

friend constexpr basic_const_iterator operator+(const basic_const_iterator& i, difference_type n)
 requires random_access_iterator<Iterator>;
friend constexpr basic_const_iterator operator+(difference_type n, const basic_const_iterator& i)
 requires random_access_iterator<Iterator>;
22 Effects: Equivalent to: return basic_const_iterator(i.current_ + n);

friend constexpr basic_const_iterator operator-(const basic_const_iterator& i, difference_type n)
 requires random_access_iterator<Iterator>;
23 Effects: Equivalent to: return basic_const_iterator(i.current_ - n);

template<sized_sentinel_for<Iterator> S>
constexpr difference_type operator-(const S& y) const;
24 Effects: Equivalent to: return current_ - y;

template<not-a-const-iterator S>
requires sized_sentinel_for<S, Iterator>
friend constexpr difference_type operator-(const S& x, const basic_const_iterator& y);
25 Effects: Equivalent to: return x - y.current_;

```

## 25.5.4 Move iterators and sentinels

[move.iterators]

### 25.5.4.1 General

[move.iterators.general]

- <sup>1</sup> Class template `move_iterator` is an iterator adaptor with the same behavior as the underlying iterator except that its indirection operator implicitly converts the value returned by the underlying iterator's indirection operator to an rvalue. Some generic algorithms can be called with move iterators to replace copying with moving.

- <sup>2</sup> EXAMPLE:

```
list<string> s;
// populate the list s
vector<string> v1(s.begin(), s.end()); // copies strings into v1
vector<string> v2(make_move_iterator(s.begin()), make_move_iterator(s.end())); // moves strings into v2
```

### 25.5.4.2 Class template `move_iterator`

[move.iterator]

```
namespace std {
 template<class Iterator>
 class move_iterator {
 public:
 using iterator_type = Iterator;
 using iterator_concept = see below;
 using iterator_category = see below; // not always present
 using value_type = iter_value_t<Iterator>;
 using difference_type = iter_difference_t<Iterator>;
 using pointer = Iterator;
 using reference = iter_rvalue_reference_t<Iterator>;

 constexpr move_iterator();
 constexpr explicit move_iterator(Iterator i);
 template<class U> constexpr move_iterator(const move_iterator<U>& u);
 template<class U> constexpr move_iterator& operator=(const move_iterator<U>& u);

 constexpr const Iterator& base() const & noexcept;
 constexpr Iterator base() &&;
 constexpr reference operator*() const;

 constexpr move_iterator& operator++();
 constexpr auto operator++(int);
 constexpr move_iterator& operator--();
 constexpr move_iterator operator--(int);

 constexpr move_iterator operator+(difference_type n) const;
 constexpr move_iterator& operator+=(difference_type n);
 constexpr move_iterator operator-(difference_type n) const;
 constexpr move_iterator& operator-=(difference_type n);
 constexpr reference operator[](difference_type n) const;

 template<sentinel_for<Iterator> S>
 friend constexpr bool
 operator==(const move_iterator& x, const move_sentinel<S>& y);
 template<sized_sentinel_for<Iterator> S>
 friend constexpr iter_difference_t<Iterator>
 operator-(const move_sentinel<S>& x, const move_iterator& y);
 template<sized_sentinel_for<Iterator> S>
 friend constexpr iter_difference_t<Iterator>
 operator-(const move_iterator& x, const move_sentinel<S>& y);
 friend constexpr iter_rvalue_reference_t<Iterator>
 iter_move(const move_iterator& i)
 noexcept(noexcept(ranges::iter_move(i.current())));
 template<indirectly_swappable<Iterator> Iterator2>
 friend constexpr void
 iter_swap(const move_iterator& x, const move_iterator<Iterator2>& y)
 noexcept(noexcept(ranges::iter_swap(x.current, y.current)));
 };
}
```

```

 private:
 Iterator current; // exposition only
 };
}

```

- 1 The member `typedef-name iterator_concept` is defined as follows:
  - (1.1) — If `Iterator` models `random_access_iterator`, then `iterator_concept` denotes `random_access_iterator_tag`.
  - (1.2) — Otherwise, if `Iterator` models `bidirectional_iterator`, then `iterator_concept` denotes `bidirectional_iterator_tag`.
  - (1.3) — Otherwise, if `Iterator` models `forward_iterator`, then `iterator_concept` denotes `forward_iterator_tag`.
  - (1.4) — Otherwise, `iterator_concept` denotes `input_iterator_tag`.
- 2 The member `typedef-name iterator_category` is defined if and only if the `qualified-id iterator_traits<Iterator>::iterator_category` is valid and denotes a type. In that case, `iterator_category` denotes
  - (2.1) — `random_access_iterator_tag` if the type `iterator_traits<Iterator>::iterator_category` models `derived_from<random_access_iterator_tag>`, and
  - (2.2) — `iterator_traits<Iterator>::iterator_category` otherwise.

#### 25.5.4.3 Requirements

[move.iter.requirements]

- 1 The template parameter `Iterator` shall either meet the `Cpp17InputIterator` requirements (25.3.5.3) or model `input_iterator` (25.3.4.9). Additionally, if any of the bidirectional traversal functions are instantiated, the template parameter shall either meet the `Cpp17BidirectionalIterator` requirements (25.3.5.6) or model `bidirectional_iterator` (25.3.4.12). If any of the random access traversal functions are instantiated, the template parameter shall either meet the `Cpp17RandomAccessIterator` requirements (25.3.5.7) or model `random_access_iterator` (25.3.4.13).

#### 25.5.4.4 Construction and assignment

[move.iter.cons]

```

constexpr move_iterator();

1 Effects: Value-initializes current.

constexpr explicit move_iterator(Iterator i);

2 Effects: Initializes current with std::move(i).

template<class U> constexpr move_iterator(const move_iterator<U>& u);

3 Constraints: is_same_v<U, Iterator> is false and const U& models convertible_to<Iterator>.

4 Effects: Initializes current with u.current.

template<class U> constexpr move_iterator& operator=(const move_iterator<U>& u);

5 Constraints: is_same_v<U, Iterator> is false, const U& models convertible_to<Iterator>, and
 assignable_from<Iterator&, const U&> is modeled.

6 Effects: Assigns u.current to current.

7 Returns: *this.

```

#### 25.5.4.5 Conversion

[move.iter.op.conv]

```

constexpr const Iterator& base() const & noexcept;

1 Returns: current.

constexpr Iterator base() &&;

2 Returns: std::move(current).

```

#### 25.5.4.6 Element access

[move.iter.elem]

```

constexpr reference operator*() const;

1 Effects: Equivalent to: return ranges::iter_move(current);

```

```
constexpr reference operator[](difference_type n) const;
```

2     *Effects:* Equivalent to: `return ranges::iter_move(current + n);`

#### 25.5.4.7 Navigation

[move.iter.nav]

```
constexpr move_iterator& operator++();
```

1     *Effects:* As if by `++current`.

2     *Returns:* `*this`.

```
constexpr auto operator++(int);
```

3     *Effects:* If Iterator models `forward_iterator`, equivalent to:

```
move_iterator tmp = *this;
++current;
return tmp;
```

Otherwise, equivalent to `++current`.

```
constexpr move_iterator& operator--();
```

4     *Effects:* As if by `--current`.

5     *Returns:* `*this`.

```
constexpr move_iterator operator--(int);
```

6     *Effects:* As if by:

```
move_iterator tmp = *this;
--current;
return tmp;
```

```
constexpr move_iterator operator+(difference_type n) const;
```

7     *Returns:* `move_iterator(current + n)`.

```
constexpr move_iterator& operator+=(difference_type n);
```

8     *Effects:* As if by: `current += n`;

9     *Returns:* `*this`.

```
constexpr move_iterator operator-(difference_type n) const;
```

10    *Returns:* `move_iterator(current - n)`.

```
constexpr move_iterator& operator-=(difference_type n);
```

11    *Effects:* As if by: `current -= n`;

12    *Returns:* `*this`.

#### 25.5.4.8 Comparisons

[move.iter.op.comp]

```
template<class Iterator1, class Iterator2>
constexpr bool operator==(const move_iterator<Iterator1>& x,
 const move_iterator<Iterator2>& y);
template<sentinel_for<Iterator> S>
friend constexpr bool operator==(const move_iterator& x,
 const move_sentinel<S>& y);
```

1     *Constraints:* `x.base() == y.base()` is well-formed and convertible to `bool`.

2     *Returns:* `x.base() == y.base()`.

```
template<class Iterator1, class Iterator2>
constexpr bool operator<(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
```

3     *Constraints:* `x.base() < y.base()` is well-formed and convertible to `bool`.

4     *Returns:* `x.base() < y.base()`.

```

template<class Iterator1, class Iterator2>
constexpr bool operator>(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
5 Constraints: y.base() < x.base() is well-formed and convertible to bool.
6 Returns: y < x.

template<class Iterator1, class Iterator2>
constexpr bool operator<=(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
7 Constraints: y.base() < x.base() is well-formed and convertible to bool.
8 Returns: !(y < x).

template<class Iterator1, class Iterator2>
constexpr bool operator>=(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
9 Constraints: x.base() < y.base() is well-formed and convertible to bool.
10 Returns: !(x < y).

template<class Iterator1, three_way_comparable_with<Iterator1> Iterator2>
constexpr compare_three_way_result_t<Iterator1, Iterator2>
operator<=>(const move_iterator<Iterator1>& x,
 const move_iterator<Iterator2>& y);
11 Returns: x.base() <=> y.base().

```

#### 25.5.4.9 Non-member functions

[move.iter.nonmember]

```

template<class Iterator1, class Iterator2>
constexpr auto operator-
 const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y)
 -> decltype(x.base() - y.base());
template<sized_sentinel_for<Iterator> S>
friend constexpr iter_difference_t<Iterator>
operator-(const move_sentinel<S>& x, const move_iterator& y);
template<sized_sentinel_for<Iterator> S>
friend constexpr iter_difference_t<Iterator>
operator-(const move_iterator& x, const move_sentinel<S>& y);
1 Returns: x.base() - y.base().

template<class Iterator>
constexpr move_iterator<Iterator>
operator+(iter_difference_t<Iterator> n, const move_iterator<Iterator>& x);
2 Constraints: x.base() + n is well-formed and has type Iterator.
3 Returns: x + n.

friend constexpr iter_rvalue_reference_t<Iterator>
iter_move(const move_iterator& i)
 noexcept(noexcept(ranges::iter_move(i.current)));
4 Effects: Equivalent to: return ranges::iter_move(i.current);

template<indirectly_swappable<Iterator> Iterator2>
friend constexpr void
 iter_swap(const move_iterator& x, const move_iterator<Iterator2>& y)
 noexcept(noexcept(ranges::iter_swap(x.current, y.current)));
5 Effects: Equivalent to: ranges::iter_swap(x.current, y.current).

template<class Iterator>
constexpr move_iterator<Iterator> make_move_iterator(Iterator i);
6 Returns: move_iterator<Iterator>(std::move(i)).

```

**25.5.4.10 Class template move\_sentinel**

[move.sentinel]

- <sup>1</sup> Class template `move_sentinel` is a sentinel adaptor useful for denoting ranges together with `move_iterator`. When an input iterator type `I` and sentinel type `S` model `sentinel_for<S, I>`, `move_sentinel<S>` and `move_iterator<I>` model `sentinel_for<move_sentinel<S>, move_iterator<I>>` as well.
- <sup>2</sup> EXAMPLE: A `move_if` algorithm is easily implemented with `copy_if` using `move_iterator` and `move_sentinel`:

```
template<input_iterator I, sentinel_for<I> S, weakly_incrementable O,
 indirect_unary_predicate<I> Pred>
 requires indirectly_movable<I, O>
void move_if(I first, S last, O out, Pred pred) {
 ranges::copy_if(move_iterator<I>{std::move(first)}, move_sentinel<S>{last},
 std::move(out), pred);
}

namespace std {
 template<semiregular S>
 class move_sentinel {
public:
 constexpr move_sentinel();
 constexpr explicit move_sentinel(S s);
 template<class S2>
 requires convertible_to<const S2&, S>
 constexpr move_sentinel(const move_sentinel<S2>& s);
 template<class S2>
 requires assignable_from<S&, const S2&>
 constexpr move_sentinel& operator=(const move_sentinel<S2>& s);

 constexpr S base() const;

private:
 S last; // exposition only
 };
}
```

**25.5.4.11 Operations**

[move.sent.ops]

`constexpr move_sentinel();`

- <sup>1</sup> *Effects:* Value-initializes `last`. If `is_trivially_default_constructible_v<S>` is `true`, then this constructor is a `constexpr` constructor.

`constexpr explicit move_sentinel(S s);`

- <sup>2</sup> *Effects:* Initializes `last` with `std::move(s)`.

```
template<class S2>
 requires convertible_to<const S2&, S>
 constexpr move_sentinel(const move_sentinel<S2>& s);
```

- <sup>3</sup> *Effects:* Initializes `last` with `s.last`.

```
template<class S2>
 requires assignable_from<S&, const S2&>
 constexpr move_sentinel& operator=(const move_sentinel<S2>& s);
```

- <sup>4</sup> *Effects:* Equivalent to: `last = s.last; return *this;`

`constexpr S base() const;`

- <sup>5</sup> *Returns:* `last`.

**25.5.5 Common iterators**

[iterators.common]

**25.5.5.1 Class template common\_iterator**

[common.iterator]

- <sup>1</sup> Class template `common_iterator` is an iterator/sentinel adaptor that is capable of representing a non-common range of elements (where the types of the iterator and sentinel differ) as a common range (where they are the same). It does this by holding either an iterator or a sentinel, and implementing the equality comparison operators appropriately.

<sup>2</sup> NOTE: The `common_iterator` type is useful for interfacing with legacy code that expects the begin and end of a range to have the same type.

<sup>3</sup> EXAMPLE:

```

template<class ForwardIterator>
void fun(ForwardIterator begin, ForwardIterator end);

list<int> s;
// populate the list s
using CI = common_iterator<counted_iterator<list<int>::iterator>, default_sentinel_t>;
// call fun on a range of 10 ints
fun(CI(counted_iterator(s.begin(), 10)), CI(default_sentinel));

namespace std {
 template<input_or_output_iterator I, sentinel_for<I> S>
 requires (!same_as<I, S> && copyable<I>)
 class common_iterator {
 public:
 constexpr common_iterator() requires default_initializable<I> = default;
 constexpr common_iterator(I i);
 constexpr common_iterator(S s);
 template<class I2, class S2>
 requires convertible_to<const I2&, I> && convertible_to<const S2&, S>
 constexpr common_iterator(const common_iterator<I2, S2>& x);

 template<class I2, class S2>
 requires convertible_to<const I2&, I> && convertible_to<const S2&, S> &&
 assignable_from<I&, const I2&> && assignable_from<S&, const S2&>
 constexpr common_iterator& operator=(const common_iterator<I2, S2>& x);

 constexpr decltype(auto) operator*();
 constexpr decltype(auto) operator*() const
 requires dereferenceable<const I>;
 constexpr auto operator->() const
 requires see below;

 constexpr common_iterator& operator++();
 constexpr decltype(auto) operator++(int);

 template<class I2, sentinel_for<I> S2>
 requires sentinel_for<S, I2>
 friend constexpr bool operator==(const common_iterator& x, const common_iterator<I2, S2>& y);
 template<class I2, sentinel_for<I> S2>
 requires sentinel_for<S, I2> && equality_comparable_with<I, I2>
 friend constexpr bool operator==(const common_iterator& x, const common_iterator<I2, S2>& y);

 template<sized_sentinel_for<I> I2, sized_sentinel_for<I> S2>
 requires sized_sentinel_for<S, I2>
 friend constexpr iter_difference_t<I2> operator-(const common_iterator& x, const common_iterator<I2, S2>& y);

 friend constexpr iter_rvalue_reference_t<I> iter_move(const common_iterator& i)
 noexcept(noexcept(ranges::iter_move(declval<const I&>())))
 requires input_iterator<I>;
 template<indirectly_swappable<I> I2, class S2>
 friend constexpr void iter_swap(const common_iterator& x, const common_iterator<I2, S2>& y)
 noexcept(noexcept(ranges::iter_swap(declval<const I&>(), declval<const I2&>())));
 private:
 variant<I, S> v_; // exposition only
 };
}

```

```

template<class I, class S>
struct incrementable_traits<common_iterator<I, S>> {
 using difference_type = iter_difference_t<I>;
};

template<input_iterator I, class S>
struct iterator_traits<common_iterator<I, S>> {
 using iterator_concept = see below;
 using iterator_category = see below;
 using value_type = iter_value_t<I>;
 using difference_type = iter_difference_t<I>;
 using pointer = see below;
 using reference = iter_reference_t<I>;
};
}

```

### 25.5.5.2 Associated types

[common.iter.types]

- <sup>1</sup> The nested *typedef-names* of the specialization of `iterator_traits` for `common_iterator<I, S>` are defined as follows.
- (1.1) — `iterator_concept` denotes `forward_iterator_tag` if `I` models `forward_iterator`; otherwise it denotes `input_iterator_tag`.
  - (1.2) — `iterator_category` denotes `forward_iterator_tag` if the *qualified-id* `iterator_traits<I>::iterator_category` is valid and denotes a type that models `derived_from<forward_iterator_tag>`; otherwise it denotes `input_iterator_tag`.
  - (1.3) — Let `a` denote an lvalue of type `const common_iterator<I, S>`. If the expression `a.operator->()` is well-formed, then `pointer` denotes `decltype(a.operator->())`. Otherwise, `pointer` denotes `void`.

### 25.5.5.3 Constructors and conversions

[common.iter.const]

```

constexpr common_iterator(I i);
1 Effects: Initializes v_ as if by v_{in_place_type<I>, std::move(i)}.
constexpr common_iterator(S s);
2 Effects: Initializes v_ as if by v_{in_place_type<S>, std::move(s)}.
template<class I2, class S2>
 requires convertible_to<const I2&, I> && convertible_to<const S2&, S>
constexpr common_iterator(const common_iterator<I2, S2>& x);
3 Preconditions: x.v_.valueless_by_exception() is false.
4 Effects: Initializes v_ as if by v_{in_place_index<i>, get<i>(x.v_)}, where i is x.v_.index().
template<class I2, class S2>
 requires convertible_to<const I2&, I> && convertible_to<const S2&, S> &&
 assignable_from<I&, const I2&> && assignable_from<S&, const S2&>
constexpr common_iterator& operator=(const common_iterator<I2, S2>& x);
5 Preconditions: x.v_.valueless_by_exception() is false.
6 Effects: Equivalent to:
(6.1) — If v_.index() == x.v_.index(), then get<i>(v_) = get<i>(x.v_).
(6.2) — Otherwise, v_.emplace<i>(get<i>(x.v_)).
where i is x.v_.index().
7 Returns: *this

```

### 25.5.5.4 Accessors

[common.iter.access]

```

constexpr decltype(auto) operator*();
constexpr decltype(auto) operator*() const
 requires dereferenceable<const I>;
1 Preconditions: holds_alternative<I>(v_) is true.

```

2     *Effects:* Equivalent to: `return *get<I>(v_);`

```
constexpr auto operator->() const
 requires see below;
```

3     The expression in the *requires-clause* is equivalent to:

```
indirectly_readable<const I> &&
 (requires(const I& i) { i.operator->(); } ||
 is_reference_v<iter_reference_t<I>> ||
 constructible_from<iter_value_t<I>, iter_reference_t<I>>)
```

4     *Preconditions:* `holds_alternative<I>(v_)` is true.

5     *Effects:*

(5.1) — If I is a pointer type or if the expression `get<I>(v_).operator->()` is well-formed, equivalent to: `return get<I>(v_);`

(5.2) — Otherwise, if `iter_reference_t<I>` is a reference type, equivalent to:

```
auto&& tmp = *get<I>(v_);
return addressof(tmp);
```

(5.3) — Otherwise, equivalent to: `return proxy(*get<I>(v_));` where `proxy` is the exposition-only class:

```
class proxy {
 iter_value_t<I> keep_;
 constexpr proxy(iter_reference_t<I>&& x)
 : keep_(std::move(x)) {}
public:
 constexpr const iter_value_t<I>* operator->() const noexcept {
 return addressof(keep_);
 }
};
```

### 25.5.5.5 Navigation

[common.iterator.nav]

```
constexpr common_iterator& operator++();
```

1     *Preconditions:* `holds_alternative<I>(v_)` is true.

2     *Effects:* Equivalent to `++get<I>(v_)`.

3     *Returns:* `*this`.

```
constexpr decltype(auto) operator++(int);
```

4     *Preconditions:* `holds_alternative<I>(v_)` is true.

5     *Effects:* If I models `forward_iterator`, equivalent to:

```
common_iterator tmp = *this;
***this;
return tmp;
```

Otherwise, if `requires(I& i) { { *i++ } -> can-reference; }` is true or

```
indirectly_readable<I> && constructible_from<iter_value_t<I>, iter_reference_t<I>> &&
move_constructible<iter_value_t<I>>
```

is false, equivalent to:

```
return get<I>(v_)++;
```

Otherwise, equivalent to:

```
postfix-proxy p(**this);
***this;
return p;
```

where `postfix-proxy` is the exposition-only class:

```
class postfix-proxy {
 iter_value_t<I> keep_;
```

```

constexpr postfix-proxy(iter_reference_t<I>&& x)
 : keep_(std::forward<iter_reference_t<I>>(x)) {}
public:
 constexpr const iter_value_t<I>& operator*() const noexcept {
 return keep_;
 }
};

```

### 25.5.5.6 Comparisons

[common.iter.cmp]

```

template<class I2, sentinel_for<I> S2>
 requires sentinel_for<S, I2>
friend constexpr bool operator==(const common_iterator<I2, S2>& x, const common_iterator<I2, S2>& y);
1 Preconditions: x.v_.valueless_by_exception() and y.v_.valueless_by_exception() are each false.
2 Returns: true if i == j, and otherwise get<i>(x.v_) == get<j>(y.v_), where i is x.v_.index() and j is y.v_.index().

```

```

template<class I2, sentinel_for<I> S2>
 requires sentinel_for<S, I2> && equality_comparable_with<I, I2>
friend constexpr bool operator==(const common_iterator<I2, S2>& x, const common_iterator<I2, S2>& y);
3 Preconditions: x.v_.valueless_by_exception() and y.v_.valueless_by_exception() are each false.
4 Returns: true if i and j are each 1, and otherwise get<i>(x.v_) == get<j>(y.v_), where i is x.v_.index() and j is y.v_.index().

```

```

template<sized_sentinel_for<I> I2, sized_sentinel_for<I> S2>
 requires sized_sentinel_for<S, I2>
friend constexpr iter_difference_t<I2> operator-(const common_iterator<I2, S2>& x, const common_iterator<I2, S2>& y);
5 Preconditions: x.v_.valueless_by_exception() and y.v_.valueless_by_exception() are each false.
6 Returns: 0 if i and j are each 1, and otherwise get<i>(x.v_) - get<j>(y.v_), where i is x.v_.index() and j is y.v_.index().

```

### 25.5.5.7 Customizations

[common.iter.cust]

```

friend constexpr iter_rvalue_reference_t<I> iter_move(const common_iterator<I> i) noexcept(noexcept(ranges::iter_move(std::declval<const I&>())))
 requires input_iterator<I>;
1 Preconditions: holds_alternative<I>(i.v_) is true.
2 Effects: Equivalent to: return ranges::iter_move(get<I>(i.v_));

```

```

template<indirectly_swappable<I> I2, class S2>
 friend constexpr void iter_swap(const common_iterator<I2, S2>& x, const common_iterator<I2, S2>& y) noexcept(noexcept(ranges::iter_swap(std::declval<const I2&>(), std::declval<const I2&>())));
3 Preconditions: holds_alternative<I>(x.v_) and holds_alternative<I2>(y.v_) are each true.
4 Effects: Equivalent to ranges::iter_swap(get<I>(x.v_), get<I2>(y.v_)).
```

### 25.5.6 Default sentinel

[default.sentinel]

```

namespace std {
 struct default_sentinel_t { };
}

```

<sup>1</sup> Class `default_sentinel_t` is an empty type used to denote the end of a range. It can be used together with iterator types that know the bound of their range (e.g., `counted_iterator` (25.5.7.1)).

## 25.5.7 Counted iterators

[**iterators.counted**]

[**counted.iterator**]

- <sup>1</sup> Class template `counted_iterator` is an iterator adaptor with the same behavior as the underlying iterator except that it keeps track of the distance to the end of its range. It can be used together with `default_sentinel` in calls to generic algorithms to operate on a range of  $N$  elements starting at a given position without needing to know the end position a priori.

- <sup>2</sup> EXAMPLE:

```
list<string> s;
// populate the list s with at least 10 strings
vector<string> v;
// copies 10 strings into v:
ranges::copy(counted_iterator(s.begin(), 10), default_sentinel, back_inserter(v));
```

- <sup>3</sup> Two values  $i_1$  and  $i_2$  of types `counted_iterator<I1>` and `counted_iterator<I2>` refer to elements of the same sequence if and only if there exists some integer  $n$  such that `next(i1.base(), i1.count() + n)` and `next(i2.base(), i2.count() + n)` refer to the same (possibly past-the-end) element.

```
namespace std {
 template<input_or_output_iterator I>
 class counted_iterator {
 public:
 using iterator_type = I;
 using value_type = iter_value_t<I>; // present only
 // if I models indirectly_readable
 using difference_type = iter_difference_t<I>;
 using iterator_concept = typename I::iterator_concept; // present only
 // if the qualified-id I::iterator_concept is valid and denotes a type
 using iterator_category = typename I::iterator_category; // present only
 // if the qualified-id I::iterator_category is valid and denotes a type
 constexpr counted_iterator() requires default_initializable<I> = default;
 constexpr counted_iterator(I x, iter_difference_t<I> n);
 template<class I2>
 requires convertible_to<const I2&, I>
 constexpr counted_iterator(const counted_iterator<I2>& x);

 template<class I2>
 requires assignable_from<I&, const I2&>
 constexpr counted_iterator& operator=(const counted_iterator<I2>& x);

 constexpr const I& base() const & noexcept;
 constexpr I base() &&;
 constexpr iter_difference_t<I> count() const noexcept;
 constexpr decltype(auto) operator*();
 constexpr decltype(auto) operator*() const
 requires dereferenceable<const I>;

 constexpr auto operator->() const noexcept
 requires contiguous_iterator<I>;

 constexpr counted_iterator& operator++();
 constexpr decltype(auto) operator++(int);
 constexpr counted_iterator operator++(int)
 requires forward_iterator<I>;
 constexpr counted_iterator& operator--()
 requires bidirectional_iterator<I>;
 constexpr counted_iterator operator--(int)
 requires bidirectional_iterator<I>;

 constexpr counted_iterator operator+(iter_difference_t<I> n) const
 requires random_access_iterator<I>;
 friend constexpr counted_iterator operator+
 (iter_difference_t<I> n, const counted_iterator& x)
 requires random_access_iterator<I>;
 };
}
```

```

constexpr counted_iterator& operator+=(iter_difference_t<I> n)
 requires random_access_iterator<I>;

constexpr counted_iterator operator-(iter_difference_t<I> n) const
 requires random_access_iterator<I>;
template<common_with<I> I2>
 friend constexpr iter_difference_t<I2> operator-
 const counted_iterator& x, const counted_iterator<I2>& y);
friend constexpr iter_difference_t<I> operator-
 const counted_iterator& x, default_sentinel_t);
friend constexpr iter_difference_t<I> operator-
 default_sentinel_t, const counted_iterator& y);
constexpr counted_iterator& operator-=(iter_difference_t<I> n)
 requires random_access_iterator<I>;

constexpr decltype(auto) operator[](iter_difference_t<I> n) const
 requires random_access_iterator<I>;

template<common_with<I> I2>
 friend constexpr bool operator==(const counted_iterator& x, const counted_iterator<I2>& y);
friend constexpr bool operator==(const counted_iterator& x, default_sentinel_t);

template<common_with<I> I2>
 friend constexpr strong_ordering operator<=>(const counted_iterator& x, const counted_iterator<I2>& y);

friend constexpr iter_rvalue_reference_t<I> iter_move(const counted_iterator& i)
 noexcept(noexcept(ranges::iter_move(i.current)))
 requires input_iterator<I>;
template<indirectly_swappable<I> I2>
 friend constexpr void iter_swap(const counted_iterator& x, const counted_iterator<I2>& y)
 noexcept(noexcept(ranges::iter_swap(x.current, y.current)));

private:
 I current = I(); // exposition only
 iter_difference_t<I> length = 0; // exposition only
};

template<input_iterator I>
 requires same_as<ITER_TRAITS(I), iterator_traits<I>> // see 25.3.4.1
struct iterator_traits<counted_iterator<I>> : iterator_traits<I> {
 using pointer = conditional_t<contiguous_iterator<I>,
 add_pointer_t<iter_reference_t<I>>, void>;
};

}

```

### 25.5.7.2 Constructors and conversions

[counted.iter.const]

```
constexpr counted_iterator(I i, iter_difference_t<I> n);
```

*Preconditions:*  $n \geq 0$ .

*Effects:* Initializes `current` with `std::move(i)` and `length` with `n`.

```
template<class I2>
 requires convertible_to<const I2&, I>
 constexpr counted_iterator(const counted_iterator<I2>& x);

Effects: Initializes current with x.current and length with x.length.
```

```
template<class I2>
 requires assignable_from<I&, const I2&>
 constexpr counted_iterator& operator=(const counted_iterator<I2>& x);

Effects: Assigns x.current to current and x.length to length.
```

5        *Returns:* `*this`.

### 25.5.7.3 Accessors

[`counted.iter.access`]

```
constexpr const I& base() const & noexcept;
1 Effects: Equivalent to: return current;

constexpr I base() &&;
2 Returns: std::move(current).

constexpr iter_difference_t<I> count() const noexcept;
3 Effects: Equivalent to: return length;
```

### 25.5.7.4 Element access

[`counted.iter.elem`]

```
constexpr decltype(auto) operator*();
constexpr decltype(auto) operator*() const
 requires dereferenceable<const I>;
1 Preconditions: length > 0 is true.
2 Effects: Equivalent to: return *current;

constexpr auto operator->() const noexcept
 requires contiguous_iterator<I>;
3 Effects: Equivalent to: return to_address(current);

constexpr decltype(auto) operator[](iter_difference_t<I> n) const
 requires random_access_iterator<I>;
4 Preconditions: n < length.
5 Effects: Equivalent to: return current[n];
```

### 25.5.7.5 Navigation

[`counted.iter.nav`]

```
constexpr counted_iterator& operator++();
1 Preconditions: length > 0.
2 Effects: Equivalent to:
 ++current;
 --length;
 return *this;

constexpr decltype(auto) operator++(int);
3 Preconditions: length > 0.
4 Effects: Equivalent to:
 --length;
 try { return current++; }
 catch(...) { ++length; throw; }

constexpr counted_iterator operator++(int)
 requires forward_iterator<I>;
5 Effects: Equivalent to:
 counted_iterator tmp = *this;
 +++this;
 return tmp;

constexpr counted_iterator& operator--()
 requires bidirectional_iterator<I>;
6 Effects: Equivalent to:
 --current;
 ++length;
```

```

 return *this;

constexpr counted_iterator operator--(int)
 requires bidirectional_iterator<I>;
7 Effects: Equivalent to:
 counted_iterator tmp = *this;
 --*this;
 return tmp;

constexpr counted_iterator operator+(iter_difference_t<I> n) const
 requires random_access_iterator<I>;
8 Effects: Equivalent to: return counted_iterator(current + n, length - n);

friend constexpr counted_iterator operator+(
 iter_difference_t<I> n, const counted_iterator& x)
 requires random_access_iterator<I>;
9 Effects: Equivalent to: return x + n;

constexpr counted_iterator& operator+=(iter_difference_t<I> n)
 requires random_access_iterator<I>;
10 Preconditions: n <= length.

11 Effects: Equivalent to:
 current += n;
 length -= n;
 return *this;

constexpr counted_iterator operator-(iter_difference_t<I> n) const
 requires random_access_iterator<I>;
12 Effects: Equivalent to: return counted_iterator(current - n, length + n);

template<common_with<I> I2>
 friend constexpr iter_difference_t<I2> operator-(
 const counted_iterator& x, const counted_iterator<I2>& y);
13 Preconditions: x and y refer to elements of the same sequence (25.5.7.1).

14 Effects: Equivalent to: return y.length - x.length;

friend constexpr iter_difference_t<I> operator-(
 const counted_iterator& x, default_sentinel_t);
15 Effects: Equivalent to: return -x.length;

friend constexpr iter_difference_t<I> operator-(
 default_sentinel_t, const counted_iterator& y);
16 Effects: Equivalent to: return y.length;

constexpr counted_iterator& operator-=(iter_difference_t<I> n)
 requires random_access_iterator<I>;
17 Preconditions: -n <= length.

18 Effects: Equivalent to:
 current -= n;
 length += n;
 return *this;

```

**25.5.7.6 Comparisons**

[counted.iterator cmp]

```

template<common_with<I> I2>
 friend constexpr bool operator==(
 const counted_iterator& x, const counted_iterator<I2>& y);
1 Preconditions: x and y refer to elements of the same sequence (25.5.7.1).

```

2     *Effects:* Equivalent to: `return x.length == y.length;`

```
friend constexpr bool operator==(const counted_iterator& x, default_sentinel_t);
```

3     *Effects:* Equivalent to: `return x.length == 0;`

```
template<common_with<I> I2>
friend constexpr strong_ordering operator<=>(const counted_iterator& x, const counted_iterator<I2>& y);
```

4     *Preconditions:* `x` and `y` refer to elements of the same sequence (25.5.7.1).

5     *Effects:* Equivalent to: `return y.length <= x.length;`

6     *NOTE:* The argument order in the *Effects:* element is reversed because `length` counts down, not up.

### 25.5.7.7 Customizations

[counted.iter.cust]

```
friend constexpr iter_rvalue_reference_t<I>
iter_move(const counted_iterator& i)
 noexcept(noexcept(ranges::iter_move(i.current)))
 requires input_iterator<I>;
```

1     *Preconditions:* `i.length > 0` is true.

2     *Effects:* Equivalent to: `return ranges::iter_move(i.current);`

```
template<indirectly_swappable<I> I2>
friend constexpr void
iter_swap(const counted_iterator& x, const counted_iterator<I2>& y)
 noexcept(noexcept(ranges::iter_swap(x.current, y.current)));
```

3     *Preconditions:* Both `x.length > 0` and `y.length > 0` are true.

4     *Effects:* Equivalent to `ranges::iter_swap(x.current, y.current).`

### 25.5.8 Unreachable sentinel

[unreachable.sentinel]

- 1 Class `unreachable_sentinel_t` can be used with any `weakly_incrementable` type to denote the “upper bound” of an unbounded interval.
- 2 EXAMPLE:

```
char* p;
// set p to point to a character buffer containing newlines
char* nl = find(p, unreachable_sentinel, '\n');
```

Provided a newline character really exists in the buffer, the use of `unreachable_sentinel` above potentially makes the call to `find` more efficient since the loop test against the sentinel does not require a conditional branch.

```
namespace std {
 struct unreachable_sentinel_t {
 template<weakly_incrementable I>
 friend constexpr bool operator==(unreachable_sentinel_t, const I&) noexcept
 { return false; }
 };
}
```

## 25.6 Stream iterators

[stream.iterators]

### 25.6.1 General

[stream.iterators.general]

- 1 To make it possible for algorithmic templates to work directly with input/output streams, appropriate iterator-like class templates are provided.

EXAMPLE:

```
partial_sum(istream_iterator<double, char>(cin),
 istream_iterator<double, char>(),
 ostream_iterator<double, char>(cout, "\n"));
```

reads a file containing floating-point numbers from `cin`, and prints the partial sums onto `cout`.

## 25.6.2 Class template `istream_iterator`

[`istream.iterator`]

### 25.6.2.1 General

[`istream.iterator.general`]

- <sup>1</sup> The class template `istream_iterator` is an input iterator (25.3.5.3) that reads successive elements from the input stream for which it was constructed.

```
namespace std {
 template<class T, class charT = char, class traits = char_traits<charT>,
 class Distance = ptrdiff_t>
 class istream_iterator {
public:
 using iterator_category = input_iterator_tag;
 using value_type = T;
 using difference_type = Distance;
 using pointer = const T*;
 using reference = const T&;
 using char_type = charT;
 using traits_type = traits;
 using istream_type = basic_istream<charT,traits>;

 constexpr istream_iterator();
 constexpr istream_iterator(default_sentinel_t);
 istream_iterator(istream_type& s);
 constexpr istream_iterator(const istream_iterator& x) noexcept(see below);
 ~istream_iterator() = default;
 istream_iterator& operator=(const istream_iterator&) = default;

 const T& operator*() const;
 const T* operator->() const;
 istream_iterator& operator++();
 istream_iterator operator++(int);

 friend bool operator==(const istream_iterator& i, default_sentinel_t);

private:
 basic_istream<charT,traits>* in_stream; // exposition only
 T value; // exposition only
};
```

- <sup>2</sup> The type `T` shall meet the `Cpp17DefaultConstructible`, `Cpp17CopyConstructible`, and `Cpp17CopyAssignable` requirements.

### 25.6.2.2 Constructors and destructor

[`istream.iterator.cons`]

```
constexpr istream_iterator();
constexpr istream_iterator(default_sentinel_t);
```

- <sup>1</sup> *Effects:* Constructs the end-of-stream iterator, value-initializing `value`.

- <sup>2</sup> *Postconditions:* `in_stream == nullptr` is true.

- <sup>3</sup> *Remarks:* If the initializer `T()` in the declaration `auto x = T();` is a constant initializer (7.7), then these constructors are `constexpr` constructors.

```
istream_iterator(istream_type& s);
```

- <sup>4</sup> *Effects:* Initializes `in_stream` with `addressof(s)`, value-initializes `value`, and then calls `operator++()`.

```
constexpr istream_iterator(const istream_iterator& x) noexcept(see below);
```

- <sup>5</sup> *Effects:* Initializes `in_stream` with `x.in_stream` and initializes `value` with `x.value`.

- <sup>6</sup> *Remarks:* An invocation of this constructor may be used in a core constant expression if and only if the initialization of `value` from `x.value` is a constant subexpression (3.14). The exception specification is equivalent to `is_nothrow_copy_constructible_v<T>`.

```
~istream_iterator() = default;
```

- <sup>7</sup> *Remarks:* If `is_trivially_destructible_v<T>` is true, then this destructor is trivial.

### 25.6.2.3 Operations

[istream.iterator.ops]

```

const T& operator*() const;
1 Preconditions: in_stream != nullptr is true.
2 Returns: value.

const T* operator->() const;
3 Preconditions: in_stream != nullptr is true.
4 Returns: addressof(value).

istream_iterator& operator++();
5 Preconditions: in_stream != nullptr is true.
6 Effects: Equivalent to:
 if (!(*in_stream >> value))
 in_stream = nullptr;
7 Returns: *this.

istream_iterator operator++(int);
8 Preconditions: in_stream != nullptr is true.
9 Effects: Equivalent to:
 istream_iterator tmp = *this;
 ++*this;
 return tmp;

template<class T, class charT, class traits, class Distance>
bool operator==(const istream_iterator<T,charT,traits,Distance>& x,
 const istream_iterator<T,charT,traits,Distance>& y);
10 Returns: x.in_stream == y.in_stream.

friend bool operator==(const istream_iterator& i, default_sentinel_t);
11 Returns: !i.in_stream.

```

### 25.6.3 Class template ostream\_iterator

[ostream.iterator]

#### 25.6.3.1 General

[ostream.iterator.general]

- 1 *ostream\_iterator* writes (using `operator<<`) successive elements onto the output stream from which it was constructed. If it was constructed with `charT*` as a constructor argument, this string, called a *delimiter string*, is written to the stream after every `T` is written.

```

namespace std {
 template<class T, class charT = char, class traits = char_traits<charT>>
 class ostream_iterator {
 public:
 using iterator_category = output_iterator_tag;
 using value_type = void;
 using difference_type = ptrdiff_t;
 using pointer = void;
 using reference = void;
 using char_type = charT;
 using traits_type = traits;
 using ostream_type = basic_ostream<charT,traits>;
 ostream_iterator(ostream_type& s);
 ostream_iterator(ostream_type& s, const charT* delimiter);
 ostream_iterator(const ostream_iterator& x);
 ~ostream_iterator();
 ostream_iterator& operator=(const ostream_iterator&) = default;
 ostream_iterator& operator=(const T& value);
 };
}

```

```

ostream_iterator& operator*();
ostream_iterator& operator++();
ostream_iterator& operator++(int);

private:
 basic_ostream<charT,traits>* out_stream; // exposition only
 const charT* delim; // exposition only
};

}

```

**25.6.3.2 Constructors and destructor**

[ostream.iterator.cons.des]

`ostream_iterator(ostream_type& s);`

- 1     *Effects:* Initializes `out_stream` with `addressof(s)` and `delim` with `nullptr`.

`ostream_iterator(ostream_type& s, const charT* delimiter);`

- 2     *Effects:* Initializes `out_stream` with `addressof(s)` and `delim` with `delimiter`.

**25.6.3.3 Operations**

[ostream.iterator.ops]

`ostream_iterator& operator=(const T& value);`

- 1     *Effects:* As if by:

```

*out_stream << value;
if (delim)
 *out_stream << delim;
return *this;

```

`ostream_iterator& operator*();`

- 2     *Returns:* `*this`.

`ostream_iterator& operator++();`  
`ostream_iterator& operator++(int);`

- 3     *Returns:* `*this`.

**25.6.4 Class template istreambuf\_iterator**

[istreambuf.iterator]

**25.6.4.1 General**

[istreambuf.iterator.general]

- 1 The class template `istreambuf_iterator` defines an input iterator (25.3.5.3) that reads successive *characters* from the `streambuf` for which it was constructed. `operator*` provides access to the current input character, if any. Each time `operator++` is evaluated, the iterator advances to the next input character. If the end of stream is reached (`streambuf_type::sgetc()` returns `traits::eof()`), the iterator becomes equal to the *end-of-stream* iterator value. The default constructor `istreambuf_iterator()` and the constructor `istreambuf_iterator(nullptr)` both construct an end-of-stream iterator object suitable for use as an end-of-range. All specializations of `istreambuf_iterator` shall have a trivial copy constructor, a `constexpr` default constructor, and a trivial destructor.
- 2 The result of `operator*()` on an end-of-stream iterator is undefined. For any other iterator value a `char_type` value is returned. It is impossible to assign a character via an input iterator.

```

namespace std {
 template<class charT, class traits = char_traits<charT>>
 class istreambuf_iterator {
public:
 using iterator_category = input_iterator_tag;
 using value_type = charT;
 using difference_type = typename traits::off_type;
 using pointer = unspecified;
 using reference = charT;
 using char_type = charT;
 using traits_type = traits;
 using int_type = typename traits::int_type;
 using streambuf_type = basic_streambuf<charT,traits>;
 using istream_type = basic_istream<charT,traits>;

```

```

// 25.6.4.2, class istreambuf_iterator::proxy
class proxy; // exposition only

constexpr istreambuf_iterator() noexcept;
constexpr istreambuf_iterator(default_sentinel_t) noexcept;
istreambuf_iterator(const istreambuf_iterator&) noexcept = default;
~istreambuf_iterator() = default;
istreambuf_iterator(istream_type& s) noexcept;
istreambuf_iterator(streambuf_type* s) noexcept;
istreambuf_iterator(const proxy& p) noexcept;
istreambuf_iterator& operator=(const istreambuf_iterator&) noexcept = default;
charT operator*() const;
istreambuf_iterator& operator++();
proxy operator++(int);
bool equal(const istreambuf_iterator& b) const;

friend bool operator==(const istreambuf_iterator& i, default_sentinel_t s);

private:
 streambuf_type* sbuf_; // exposition only
};

}

```

#### 25.6.4.2 Class istreambuf\_iterator::proxy

[istreambuf.iterator.proxy]

- 1 Class `istreambuf_iterator<charT,traits>::proxy` is for exposition only. An implementation is permitted to provide equivalent functionality without providing a class with this name. Class `istreambuf_iterator<charT, traits>::proxy` provides a temporary placeholder as the return value of the post-increment operator (`operator++`). It keeps the character pointed to by the previous value of the iterator for some possible future access to get the character.

```

namespace std {
 template<class charT, class traits>
 class istreambuf_iterator<charT, traits>::proxy { // exposition only
 charT keep_;
 basic_streambuf<charT, traits>* sbuf_;
 proxy(charT c, basic_streambuf<charT, traits>* sbuf)
 : keep_(c), sbuf_(sbuf) { }
 public:
 charT operator*() { return keep_; }
 };
}

```

#### 25.6.4.3 Constructors

[istreambuf.iterator.cons]

- 1 For each `istreambuf_iterator` constructor in this subclause, an end-of-stream iterator is constructed if and only if the exposition-only member `sbuff_` is initialized with a null pointer value.

```

constexpr istreambuf_iterator() noexcept;
constexpr istreambuf_iterator(default_sentinel_t) noexcept;

```

- 2 *Effects:* Initializes `sbuff_` with `nullptr`.

```
istreambuf_iterator(istream_type& s) noexcept;
```

- 3 *Effects:* Initializes `sbuff_` with `s.rdbuf()`.

```
istreambuf_iterator(streambuf_type* s) noexcept;
```

- 4 *Effects:* Initializes `sbuff_` with `s`.

```
istreambuf_iterator(const proxy& p) noexcept;
```

- 5 *Effects:* Initializes `sbuff_` with `p.sbuff_`.

#### 25.6.4.4 Operations

[istreambuf.iterator.ops]

```
charT operator*() const;
```

- 1 *Returns:* The character obtained via the `streambuf` member `sbuff_->sgetc()`.

```

istreambuf_iterator& operator++();
2 Effects: As if by sbuf_->sbufpc().
3 Returns: *this.

proxy operator++(int);
4 Returns: proxy(sbuf_->sbufpc(), sbuf_).

bool equal(const istreambuf_iterator& b) const;
5 Returns: true if and only if both iterators are at end-of-stream, or neither is at end-of-stream, regardless
 of what streambuf object they use.

template<class charT, class traits>
 bool operator==(const istreambuf_iterator<charT,traits>& a,
 const istreambuf_iterator<charT,traits>& b);
6 Returns: a.equal(b).

friend bool operator==(const istreambuf_iterator& i, default_sentinel_t s);
7 Returns: i.equal(s).

```

## 25.6.5 Class template `ostreambuf_iterator`

[`ostreambuf.iterator`]

### 25.6.5.1 General

[`ostreambuf.iterator.general`]

- 1 The class template `ostreambuf_iterator` writes successive *characters* onto the output stream from which it was constructed.

```

namespace std {
 template<class charT, class traits = char_traits<charT>>
 class ostreambuf_iterator {
 public:
 using iterator_category = output_iterator_tag;
 using value_type = void;
 using difference_type = ptrdiff_t;
 using pointer = void;
 using reference = void;
 using char_type = charT;
 using traits_type = traits;
 using streambuf_type = basic_streambuf<charT,traits>;
 using ostream_type = basic_ostream<charT,traits>;

 ostreambuf_iterator(ostream_type& s) noexcept;
 ostreambuf_iterator(streambuf_type* s) noexcept;
 ostreambuf_iterator& operator=(charT c);

 ostreambuf_iterator& operator*();
 ostreambuf_iterator& operator++();
 ostreambuf_iterator& operator++(int);
 bool failed() const noexcept;

 private:
 streambuf_type* sbuf_; // exposition only
 };
}

```

### 25.6.5.2 Constructors

[`ostreambuf.iter.cons`]

```

ostreambuf_iterator(ostream_type& s) noexcept;
1 Preconditions: s.rdbuf() is not a null pointer.
2 Effects: Initializes sbuf_ with s.rdbuf().

ostreambuf_iterator(streambuf_type* s) noexcept;
3 Preconditions: s is not a null pointer.

```

4       *Effects:* Initializes `sbuf_` with `s`.

### 25.6.5.3 Operations

[`ostreambuf.iter.ops`]

```
ostreambuf_iterator& operator=(charT c);
```

1       *Effects:* If `failed()` yields `false`, calls `sbuf_->sputc(c)`; otherwise has no effect.

2       *Returns:* `*this`.

```
ostreambuf_iterator& operator*();
```

3       *Returns:* `*this`.

```
ostreambuf_iterator& operator++();
```

```
ostreambuf_iterator& operator++(int);
```

4       *Returns:* `*this`.

```
bool failed() const noexcept;
```

5       *Returns:* `true` if in any prior use of member `operator=`, the call to `sbuf_->sputc()` returned `traits::eof()`; or `false` otherwise.

## 25.7 Range access

[`iterator.range`]

1 In addition to being available via inclusion of the `<iterator>` header, the function templates in 25.7 are available when any of the following headers are included: `<array>` (24.3.2), `<deque>` (24.3.3), `<forward_list>` (24.3.4), `<list>` (24.3.5), `<map>` (24.4.2), `<regex>` (32.3), `<set>` (24.4.3), `<span>` (24.7.2.1), `<string>` (23.4.2), `<string_view>` (23.3.2), `<unordered_map>` (24.5.2), `<unordered_set>` (24.5.3), and `<vector>` (24.3.6).

```
template<class C> constexpr auto begin(C& c) -> decltype(c.begin());
```

```
template<class C> constexpr auto begin(const C& c) -> decltype(c.begin());
```

2       *Returns:* `c.begin()`.

```
template<class C> constexpr auto end(C& c) -> decltype(c.end());
```

```
template<class C> constexpr auto end(const C& c) -> decltype(c.end());
```

3       *Returns:* `c.end()`.

```
template<class T, size_t N> constexpr T* begin(T (&array)[N]) noexcept;
```

4       *Returns:* `array`.

```
template<class T, size_t N> constexpr T* end(T (&array)[N]) noexcept;
```

5       *Returns:* `array + N`.

```
template<class C> constexpr auto cbegin(const C& c) noexcept(noexcept(std::begin(c)))
-> decltype(std::begin(c));
```

6       *Returns:* `std::begin(c)`.

```
template<class C> constexpr auto cend(const C& c) noexcept(noexcept(std::end(c)))
-> decltype(std::end(c));
```

7       *Returns:* `std::end(c)`.

```
template<class C> constexpr auto rbegin(C& c) -> decltype(c.rbegin());
```

```
template<class C> constexpr auto rbegin(const C& c) -> decltype(c.rbegin());
```

8       *Returns:* `c.rbegin()`.

```
template<class C> constexpr auto rend(C& c) -> decltype(c.rend());
```

```
template<class C> constexpr auto rend(const C& c) -> decltype(c.rend());
```

9       *Returns:* `c.rend()`.

```
template<class T, size_t N> constexpr reverse_iterator<T*> rbegin(T (&array)[N]);
```

10      *Returns:* `reverse_iterator<T*>(array + N)`.

```

template<class T, size_t N> constexpr reverse_iterator<T*> rend(T (&array)[N]);
11 Returns: reverse_iterator<T*>(array).

template<class E> constexpr reverse_iterator<const E*> rbegin(initializer_list<E> il);
12 Returns: reverse_iterator<const E*>(il.end()).

template<class E> constexpr reverse_iterator<const E*> rend(initializer_list<E> il);
13 Returns: reverse_iterator<const E*>(il.begin()).

template<class C> constexpr auto crbegin(const C& c) -> decltype(std::rbegin(c));
14 Returns: std::rbegin(c).

template<class C> constexpr auto crend(const C& c) -> decltype(std::rend(c));
15 Returns: std::rend(c).

template<class C> constexpr auto size(const C& c) -> decltype(c.size());
16 Returns: c.size().

template<class T, size_t N> constexpr size_t size(const T (&array)[N]) noexcept;
17 Returns: N.

template<class C> constexpr auto ssize(const C& c)
-> common_type_t<ptrdiff_t, make_signed_t<decltype(c.size())>>;
18 Effects: Equivalent to:
 return static_cast<common_type_t<ptrdiff_t, make_signed_t<decltype(c.size())>>>(c.size());

template<class T, ptrdiff_t N> constexpr ptrdiff_t ssize(const T (&array)[N]) noexcept;
19 Returns: N.

template<class C> [[nodiscard]] constexpr auto empty(const C& c) -> decltype(c.empty());
20 Returns: c.empty().

template<class T, size_t N> [[nodiscard]] constexpr bool empty(const T (&array)[N]) noexcept;
21 Returns: false.

template<class E> [[nodiscard]] constexpr bool empty(initializer_list<E> il) noexcept;
22 Returns: il.size() == 0.

template<class C> constexpr auto data(C& c) -> decltype(c.data());
template<class C> constexpr auto data(const C& c) -> decltype(c.data());
23 Returns: c.data().

template<class T, size_t N> constexpr T* data(T (&array)[N]) noexcept;
24 Returns: array.

template<class E> constexpr const E* data(initializer_list<E> il) noexcept;
25 Returns: il.begin().

```

# 26 Ranges library

# [ranges]

## 26.1 General

[ranges.general]

- <sup>1</sup> This Clause describes components for dealing with ranges of elements.
- The following subclauses describe range and view requirements, and components for range primitives and range generators as summarized in [Table 92](#).

Table 92: Ranges library summary [tab:range.summary]

| Subclause                             | Header      |
|---------------------------------------|-------------|
| <a href="#">26.3</a> Range access     | <ranges>    |
| <a href="#">26.4</a> Requirements     |             |
| <a href="#">26.5</a> Range utilities  |             |
| <a href="#">26.6</a> Range factories  |             |
| <a href="#">26.7</a> Range adaptors   |             |
| <a href="#">26.8</a> Range generators | <generator> |

## 26.2 Header <ranges> synopsis

```

<sup>1</sup> Within this Clause, for an integer-like type X (25.3.4.4), *make-unsigned-like-t<X>* denotes *make\_unsigned\_t<X>* if X is an integer type; otherwise, it denotes a corresponding unspecified unsigned-integer-like type of the same width as X. For an expression x of type X, *to-unsigned-like(x)* is x explicitly converted to *make-unsigned-like-t<X>*.

- <sup>2</sup> Also within this Clause, *make-signed-like-t<X>* for an integer-like type X denotes *make\_signed\_t<X>* if X is an integer type; otherwise, it denotes a corresponding unspecified signed-integer-like type of the same width as X.

## 26.3 Range access

[range.access]

### 26.3.1 General

[range.access.general]

- <sup>1</sup> In addition to being available via inclusion of the <ranges> header, the customization point objects in 26.3 are available when <iterator> (25.2) is included.
- <sup>2</sup> Within 26.3, the *reified object* of a subexpression E denotes
  - (2.1) — the same object as E if E is a glvalue, or
  - (2.2) — the result of applying the temporary materialization conversion (7.3.5) to E otherwise.

### 26.3.2 ranges::begin

[range.access.begin]

- <sup>1</sup> The name `ranges::begin` denotes a customization point object (16.3.3.3.5).
- <sup>2</sup> Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:
  - (2.1) — If E is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is false, `ranges::begin(E)` is ill-formed.
  - (2.2) — Otherwise, if T is an array type (9.3.4.5) and `remove_all_extents_t<T>` is an incomplete type, `ranges::begin(E)` is ill-formed with no diagnostic required.
  - (2.3) — Otherwise, if T is an array type, `ranges::begin(E)` is expression-equivalent to `t + 0`.
  - (2.4) — Otherwise, if `auto(t.begin())` is a valid expression whose type models `input_or_output_iterator`, `ranges::begin(E)` is expression-equivalent to `auto(t.begin())`.
  - (2.5) — Otherwise, if T is a class or enumeration type and `auto(begin(t))` is a valid expression whose type models `input_or_output_iterator` where the meaning of `begin` is established as-if by performing argument-dependent lookup only (6.5.4), then `ranges::begin(E)` is expression-equivalent to that expression.
  - (2.6) — Otherwise, `ranges::begin(E)` is ill-formed.
- <sup>3</sup> NOTE 1: Diagnosable ill-formed cases above result in substitution failure when `ranges::begin(E)` appears in the immediate context of a template instantiation.
- <sup>4</sup> NOTE 2: Whenever `ranges::begin(E)` is a valid expression, its type models `input_or_output_iterator`.

### 26.3.3 ranges::end

[range.access.end]

- <sup>1</sup> The name `ranges::end` denotes a customization point object (16.3.3.3.5).
- <sup>2</sup> Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:
  - (2.1) — If E is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is false, `ranges::end(E)` is ill-formed.
  - (2.2) — Otherwise, if T is an array type (9.3.4.5) and `remove_all_extents_t<T>` is an incomplete type, `ranges::end(E)` is ill-formed with no diagnostic required.
  - (2.3) — Otherwise, if T is an array of unknown bound, `ranges::end(E)` is ill-formed.
  - (2.4) — Otherwise, if T is an array, `ranges::end(E)` is expression-equivalent to `t + extent_v<T>`.
  - (2.5) — Otherwise, if `auto(t.end())` is a valid expression whose type models `sentinel_for<iterator_t<T>>` then `ranges::end(E)` is expression-equivalent to `auto(t.end())`.
  - (2.6) — Otherwise, if T is a class or enumeration type and `auto(end(t))` is a valid expression whose type models `sentinel_for<iterator_t<T>>` where the meaning of `end` is established as-if by performing argument-dependent lookup only (6.5.4), then `ranges::end(E)` is expression-equivalent to that expression.
  - (2.7) — Otherwise, `ranges::end(E)` is ill-formed.
- <sup>3</sup> NOTE 1: Diagnosable ill-formed cases above result in substitution failure when `ranges::end(E)` appears in the immediate context of a template instantiation.
- <sup>4</sup> NOTE 2: Whenever `ranges::end(E)` is a valid expression, the types S and I of `ranges::end(E)` and `ranges::begin(E)` model `sentinel_for<S, I>`.

**26.3.4 ranges::cbegin**

[range.access.cbegin]

- <sup>1</sup> The name `ranges::cbegin` denotes a customization point object (16.3.3.5). Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:
  - (1.1) — If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>` is `false`, `ranges::cbegin(E)` is ill-formed.
  - (1.2) — Otherwise, let `U` be `ranges::begin(possibly-const-range(t))`. `ranges::cbegin(E)` is expression-equivalent to `const_iterator<decltype(U)>(U)`.
- <sup>2</sup> NOTE: Whenever `ranges::cbegin(E)` is a valid expression, its type models `input_or_output_iterator` and `const-iterator`.

**26.3.5 ranges::cend**

[range.access.cend]

- <sup>1</sup> The name `ranges::cend` denotes a customization point object (16.3.3.5). Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:
  - (1.1) — If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>` is `false`, `ranges::cend(E)` is ill-formed.
  - (1.2) — Otherwise, let `U` be `ranges::end(possibly-const-range(t))`. `ranges::cend(E)` is expression-equivalent to `const_sentinel<decltype(U)>(U)`.
- <sup>2</sup> NOTE: Whenever `ranges::cend(E)` is a valid expression, the types `S` and `I` of the expressions `ranges::cend(E)` and `ranges::cbegin(E)` model `sentinel_for<S, I>`. If `S` models `input_iterator`, then `S` also models `constant_iterator`.

**26.3.6 ranges::rbegin**

[range.access.rbegin]

- <sup>1</sup> The name `ranges::rbegin` denotes a customization point object (16.3.3.5).
- <sup>2</sup> Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:
  - (2.1) — If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>` is `false`, `ranges::rbegin(E)` is ill-formed.
  - (2.2) — Otherwise, if `T` is an array type (9.3.4.5) and `remove_all_extents_t<T>` is an incomplete type, `ranges::rbegin(E)` is ill-formed with no diagnostic required.
  - (2.3) — Otherwise, if `auto(t.rbegin())` is a valid expression whose type models `input_or_output_iterator`, `ranges::rbegin(E)` is expression-equivalent to `auto(t.rbegin())`.
  - (2.4) — Otherwise, if `T` is a class or enumeration type and `auto(rbegin(t))` is a valid expression whose type models `input_or_output_iterator` where the meaning of `rbegin` is established as-if by performing argument-dependent lookup only (6.5.4), then `ranges::rbegin(E)` is expression-equivalent to that expression.
  - (2.5) — Otherwise, if both `ranges::begin(t)` and `ranges::end(t)` are valid expressions of the same type which models `bidirectional_iterator` (25.3.4.12), `ranges::rbegin(E)` is expression-equivalent to `make_reverse_iterator(ranges::end(t))`.
  - (2.6) — Otherwise, `ranges::rbegin(E)` is ill-formed.
- <sup>3</sup> NOTE 1: Diagnosable ill-formed cases above result in substitution failure when `ranges::rbegin(E)` appears in the immediate context of a template instantiation.
- <sup>4</sup> NOTE 2: Whenever `ranges::rbegin(E)` is a valid expression, its type models `input_or_output_iterator`.

**26.3.7 ranges::rend**

[range.access.rend]

- <sup>1</sup> The name `ranges::rend` denotes a customization point object (16.3.3.5).
- <sup>2</sup> Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:
  - (2.1) — If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>` is `false`, `ranges::rend(E)` is ill-formed.
  - (2.2) — Otherwise, if `T` is an array type (9.3.4.5) and `remove_all_extents_t<T>` is an incomplete type, `ranges::rend(E)` is ill-formed with no diagnostic required.
  - (2.3) — Otherwise, if `auto(t.rend())` is a valid expression whose type models `sentinel_for<decltype(ranges::rbegin(E))>` then `ranges::rend(E)` is expression-equivalent to `auto(t.rend())`.

- (2.4) — Otherwise, if T is a class or enumeration type and `auto(rend(t))` is a valid expression whose type models `sentinel_for<decltype(ranges::rbegin(E))>` where the meaning of `rend` is established as-if by performing argument-dependent lookup only (6.5.4), then `ranges::rend(E)` is expression-equivalent to that expression.
- (2.5) — Otherwise, if both `ranges::begin(t)` and `ranges::end(t)` are valid expressions of the same type which models `bidirectional_iterator` (25.3.4.12), then `ranges::rend(E)` is expression-equivalent to `make_reverse_iterator(ranges::begin(t))`.
- (2.6) — Otherwise, `ranges::rend(E)` is ill-formed.
- <sup>3</sup> NOTE 1: Diagnosable ill-formed cases above result in substitution failure when `ranges::rend(E)` appears in the immediate context of a template instantiation.
- <sup>4</sup> NOTE 2: Whenever `ranges::rend(E)` is a valid expression, the types S and I of the expressions `ranges::rend(E)` and `ranges::rbegin(E)` model `sentinel_for<S, I>`.

### 26.3.8 ranges::crbegin

[range.access.crbegin]

- <sup>1</sup> The name `ranges::crbegin` denotes a customization point object (16.3.3.3.5). Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:
- (1.1) — If E is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is `false`, `ranges::crbegin(E)` is ill-formed.
- (1.2) — Otherwise, let U be `ranges::rbegin(possibly-const-range(t))`. `ranges::crbegin(E)` is expression-equivalent to `const_iterator<decltype(U)>(U)`.
- <sup>2</sup> NOTE: Whenever `ranges::crbegin(E)` is a valid expression, its type models `input_or_output_iterator` and `constant_iterator`.

### 26.3.9 ranges::crend

[range.access.crend]

- <sup>1</sup> The name `ranges::crend` denotes a customization point object (16.3.3.3.5). Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:
- (1.1) — If E is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is `false`, `ranges::crend(E)` is ill-formed.
- (1.2) — Otherwise, let U be `ranges::rend(possibly-const-range(t))`. `ranges::crend(E)` is expression-equivalent to `const_sentinel<decltype(U)>(U)`.
- <sup>2</sup> NOTE: Whenever `ranges::crend(E)` is a valid expression, the types S and I of the expressions `ranges::crend(E)` and `ranges::crbegin(E)` model `sentinel_for<S, I>`. If S models `input_iterator`, then S also models `constant_iterator`.

### 26.3.10 ranges::size

[range.prim.size]

- <sup>1</sup> The name `ranges::size` denotes a customization point object (16.3.3.3.5).
- <sup>2</sup> Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:
- (2.1) — If T is an array of unknown bound (9.3.4.5), `ranges::size(E)` is ill-formed.
- (2.2) — Otherwise, if T is an array type, `ranges::size(E)` is expression-equivalent to `auto(extent_v<T>)`.
- (2.3) — Otherwise, if `disable_sized_range<remove_cv_t<T>>` (26.4.3) is `false` and `auto(t.size())` is a valid expression of integer-like type (25.3.4.4), `ranges::size(E)` is expression-equivalent to `auto(t.size())`.
- (2.4) — Otherwise, if T is a class or enumeration type, `disable_sized_range<remove_cv_t<T>>` is `false` and `auto(size(t))` is a valid expression of integer-like type where the meaning of `size` is established as-if by performing argument-dependent lookup only (6.5.4), then `ranges::size(E)` is expression-equivalent to that expression.
- (2.5) — Otherwise, if `to-unsigned-like(ranges::end(t) - ranges::begin(t))` (26.2) is a valid expression and the types I and S of `ranges::begin(t)` and `ranges::end(t)` (respectively) model both `sized_sentinel_for<S, I>` (25.3.4.8) and `forward_iterator<I>`, then `ranges::size(E)` is expression-equivalent to `to-unsigned-like(ranges::end(t) - ranges::begin(t))`.
- (2.6) — Otherwise, `ranges::size(E)` is ill-formed.
- <sup>3</sup> NOTE 1: Diagnosable ill-formed cases above result in substitution failure when `ranges::size(E)` appears in the immediate context of a template instantiation.

<sup>4</sup> NOTE 2: Whenever `ranges::size(E)` is a valid expression, its type is integer-like.

### 26.3.11 `ranges::ssize`

[range.prim.ssize]

- <sup>1</sup> The name `ranges::ssize` denotes a customization point object (16.3.3.3.5).
- <sup>2</sup> Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. If `ranges::size(t)` is ill-formed, `ranges::ssize(E)` is ill-formed. Otherwise let D be `make-signed-like-t<decltype(ranges::size(t))>`, or `ptrdiff_t` if it is wider than that type; `ranges::ssize(E)` is expression-equivalent to `static_cast<D>(ranges::size(t))`.

### 26.3.12 `ranges::empty`

[range.prim.empty]

- <sup>1</sup> The name `ranges::empty` denotes a customization point object (16.3.3.3.5).
- <sup>2</sup> Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:
  - (2.1) — If T is an array of unknown bound (9.3.4.5), `ranges::empty(E)` is ill-formed.
  - (2.2) — Otherwise, if `bool(t.empty())` is a valid expression, `ranges::empty(E)` is expression-equivalent to `bool(t.empty())`.
  - (2.3) — Otherwise, if `(ranges::size(t) == 0)` is a valid expression, `ranges::empty(E)` is expression-equivalent to `(ranges::size(t) == 0)`.
  - (2.4) — Otherwise, if `bool(ranges::begin(t) == ranges::end(t))` is a valid expression and the type of `ranges::begin(t)` models `forward_iterator`, `ranges::empty(E)` is expression-equivalent to `bool(ranges::begin(t) == ranges::end(t))`.
  - (2.5) — Otherwise, `ranges::empty(E)` is ill-formed.
- <sup>3</sup> NOTE 1: Diagnosable ill-formed cases above result in substitution failure when `ranges::empty(E)` appears in the immediate context of a template instantiation.
- <sup>4</sup> NOTE 2: Whenever `ranges::empty(E)` is a valid expression, it has type `bool`.

### 26.3.13 `ranges::data`

[range.prim.data]

- <sup>1</sup> The name `ranges::data` denotes a customization point object (16.3.3.3.5).
- <sup>2</sup> Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:
  - (2.1) — If E is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is `false`, `ranges::data(E)` is ill-formed.
  - (2.2) — Otherwise, if T is an array type (9.3.4.5) and `remove_all_extents_t<T>` is an incomplete type, `ranges::data(E)` is ill-formed with no diagnostic required.
  - (2.3) — Otherwise, if `auto(t.data())` is a valid expression of pointer to object type, `ranges::data(E)` is expression-equivalent to `auto(t.data())`.
  - (2.4) — Otherwise, if `ranges::begin(t)` is a valid expression whose type models `contiguous_iterator`, `ranges::data(E)` is expression-equivalent to `to_address(ranges::begin(t))`.
  - (2.5) — Otherwise, `ranges::data(E)` is ill-formed.
- <sup>3</sup> NOTE 1: Diagnosable ill-formed cases above result in substitution failure when `ranges::data(E)` appears in the immediate context of a template instantiation.
- <sup>4</sup> NOTE 2: Whenever `ranges::data(E)` is a valid expression, it has pointer to object type.

### 26.3.14 `ranges::cdata`

[range.prim.cdata]

```
template<class T>
constexpr auto as-const-pointer(const T* p) { return p; } // exposition only
```

- <sup>1</sup> The name `ranges::cdata` denotes a customization point object (16.3.3.3.5). Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:
  - (1.1) — If E is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is `false`, `ranges::cdata(E)` is ill-formed.
  - (1.2) — Otherwise, `ranges::cdata(E)` is expression-equivalent to `as-const-pointer(ranges::data(possibly-const-range(t)))`.
- <sup>2</sup> NOTE: Whenever `ranges::cdata(E)` is a valid expression, it has pointer to constant object type.

## 26.4 Range requirements

### 26.4.1 General

[range.req]  
[range.req.general]

- 1 Ranges are an abstraction that allows a C++ program to operate on elements of data structures uniformly. Calling `ranges::begin` on a range returns an object whose type models `input_or_output_iterator` (25.3.4.6). Calling `ranges::end` on a range returns an object whose type `S`, together with the type `I` of the object returned by `ranges::begin`, models `sentinel_for<S, I>`. The library formalizes the interfaces, semantics, and complexity of ranges to enable algorithms and range adaptors that work efficiently on different types of sequences.
- 2 The `range` concept requires that `ranges::begin` and `ranges::end` return an iterator and a sentinel, respectively. The `sized_range` concept refines `range` with the requirement that `ranges::size` be amortized  $\mathcal{O}(1)$ . The `view` concept specifies requirements on a `range` type to provide operations with predictable complexity.
- 3 Several refinements of `range` group requirements that arise frequently in concepts and algorithms. Common ranges are ranges for which `ranges::begin` and `ranges::end` return objects of the same type. Random access ranges are ranges for which `ranges::begin` returns a type that models `random_access_iterator` (25.3.4.13). (Contiguous, bidirectional, forward, input, and output ranges are defined similarly.) Viewable ranges can be converted to views.

### 26.4.2 Ranges

[range.range]

- 1 The `range` concept defines the requirements of a type that allows iteration over its elements by providing an iterator and sentinel that denote the elements of the range.

```
template<class T>
concept range =
 requires(T& t) {
 ranges::begin(t); // sometimes equality-preserving (see below)
 ranges::end(t);
 };
```

- 2 The required expressions `ranges::begin(t)` and `ranges::end(t)` of the `range` concept do not require implicit expression variations (18.2).
- 3 Given an expression `t` such that `decltype((t))` is `T&`, `T` models `range` only if
  - (3.1) — `[ranges::begin(t), ranges::end(t)]` denotes a range (25.3.1),
  - (3.2) — both `ranges::begin(t)` and `ranges::end(t)` are amortized constant time and non-modifying, and
  - (3.3) — if the type of `ranges::begin(t)` models `forward_iterator`, `ranges::begin(t)` is equality-preserving.
- 4 NOTE 1: Equality preservation of both `ranges::begin` and `ranges::end` enables passing a range whose iterator type models `forward_iterator` to multiple algorithms and making multiple passes over the range by repeated calls to `ranges::begin` and `ranges::end`. Since `ranges::begin` is not required to be equality-preserving when the return type does not model `forward_iterator`, it is possible for repeated calls to not return equal values or to not be well-defined.

```
template<class T>
concept borrowed_range =
 range<T> && (is_lvalue_reference_v<T> || enable_borrowed_range<remove_cvref_t<T>>);
```

- 5 Let `U` be `remove_reference_t<T>` if `T` is an rvalue reference type, and `T` otherwise. Given a variable `u` of type `U`, `T` models `borrowed_range` only if the validity of iterators obtained from `u` is not tied to the lifetime of that variable.
- 6 NOTE 2: Since the validity of iterators is not tied to the lifetime of a variable whose type models `borrowed_range`, a function with a parameter of such a type can return iterators obtained from it without danger of dangling.

```
template<class>
constexpr bool enable_borrowed_range = false;
```

- 7 Remarks: Pursuant to 16.4.5.2.1, users may specialize `enable_borrowed_range` for cv-unqualified program-defined types. Such specializations shall be usable in constant expressions (7.7) and have type `const bool`.
- 8 EXAMPLE: Each specialization `S` of class template `subrange` (26.5.4) models `borrowed_range` because

- (8.1) — `enable_borrowed_range<S>` is specialized to have the value `true`, and  
 (8.2) — `S`'s iterators do not have validity tied to the lifetime of an `S` object because they are “borrowed” from some other range.

### 26.4.3 Sized ranges

[`range.sized`]

- <sup>1</sup> The `sized_range` concept refines `range` with the requirement that the number of elements in the range can be determined in amortized constant time using `ranges::size`.

```
template<class T>
concept sized_range =
 range<T> && requires(T& t) { ranges::size(t); };
```

- <sup>2</sup> Given an lvalue `t` of type `remove_reference_t<T>`, `T` models `sized_range` only if  
 (2.1) — `ranges::size(t)` is amortized  $\mathcal{O}(1)$ , does not modify `t`, and is equal to `ranges::distance(ranges::begin(t), ranges::end(t))`, and  
 (2.2) — if `iterator_t<T>` models `forward_iterator`, `ranges::size(t)` is well-defined regardless of the evaluation of `ranges::begin(t)`.

NOTE 1: `ranges::size(t)` is otherwise not required to be well-defined after evaluating `ranges::begin(t)`. For example, it is possible for `ranges::size(t)` to be well-defined for a `sized_range` whose iterator type does not model `forward_iterator` only if evaluated before the first call to `ranges::begin(t)`.

```
template<class>
constexpr bool disable_sized_range = false;
```

- <sup>3</sup> Remarks: Pursuant to 16.4.5.2.1, users may specialize `disable_sized_range` for cv-unqualified program-defined types. Such specializations shall be usable in constant expressions (7.7) and have type `const bool`.  
<sup>4</sup> NOTE 2: `disable_sized_range` allows use of range types with the library that satisfy but do not in fact model `sized_range`.

### 26.4.4 Views

[`range.view`]

- <sup>1</sup> The `view` concept specifies the requirements of a `range` type that has the semantic properties below, which make it suitable for use in constructing range adaptor pipelines (26.7).

```
template<class T>
concept view =
 range<T> && movable<T> && enable_view<T>;
```

- <sup>2</sup> `T` models `view` only if:  
 (2.1) — `T` has  $\mathcal{O}(1)$  move construction; and  
 (2.2) — move assignment of an object of type `T` is no more complex than destruction followed by move construction; and  
 (2.3) — if  $N$  copies and/or moves are made from an object of type `T` that contained  $M$  elements, then those  $N$  objects have  $\mathcal{O}(N + M)$  destruction; and  
 (2.4) — `copy_constructible<T>` is `false`, or `T` has  $\mathcal{O}(1)$  copy construction; and  
 (2.5) — `copyable<T>` is `false`, or copy assignment of an object of type `T` is no more complex than destruction followed by copy construction.

<sup>3</sup> NOTE: The constraints on copying and moving imply that a moved-from object of type `T` has  $\mathcal{O}(1)$  destruction.

<sup>4</sup> EXAMPLE: Examples of views are:

- (4.1) — A `range` type that wraps a pair of iterators.  
 (4.2) — A `range` type that holds its elements by `shared_ptr` and shares ownership with all its copies.  
 (4.3) — A `range` type that generates its elements on demand.

A container such as `vector<string>` does not meet the semantic requirements of `view` since copying the container copies all of the elements, which cannot be done in constant time.

- <sup>5</sup> Since the difference between `range` and `view` is largely semantic, the two are differentiated with the help of `enable_view`.

```
template<class T>
constexpr bool is-derived-from-view-interface = see below; // exposition only
template<class T>
constexpr bool enable_view =
 derived_from<T, view_base> || is-derived-from-view-interface<T>;
6 For a type T, is-derived-from-view-interface<T> is true if and only if T has exactly one public
 base class view_interface<U> for some type U and T has no base classes of type view_interface<V>
 for any other type V.
7 Remarks: Pursuant to 16.4.5.2.1, users may specialize enable_view to true for cv-unqualified program-
 defined types which model view, and false for types which do not. Such specializations shall be usable
 in constant expressions (7.7) and have type const bool.
```

#### 26.4.5 Other range refinements

[range.refinements]

- The *output\_range* concept specifies requirements of a *range* type for which *ranges*::begin returns a model of *output\_iterator* (25.3.4.10). *input\_range*, *forward\_range*, *bidirectional\_range*, and *random\_access\_range* are defined similarly.

```
template<class R, class T>
concept output_range =
 range<R> && output_iterator<iterator_t<R>, T>;
template<class T>
concept input_range =
 range<T> && input_iterator<iterator_t<T>>;
template<class T>
concept forward_range =
 input_range<T> && forward_iterator<iterator_t<T>>;
template<class T>
concept bidirectional_range =
 forward_range<T> && bidirectional_iterator<iterator_t<T>>;
template<class T>
concept random_access_range =
 bidirectional_range<T> && random_access_iterator<iterator_t<T>>;
```

- contiguous\_range* additionally requires that the *ranges*::data customization point object (26.3.13) is usable with the range.

```
template<class T>
concept contiguous_range =
 random_access_range<T> && contiguous_iterator<iterator_t<T>> &&
 requires(T& t) {
 { ranges::data(t) } -> same_as<add_pointer_t<range_reference_t<T>>>;
 };
```

- Given an expression t such that decltype((t)) is T&, T models *contiguous\_range* only if *to\_address(ranges::begin(t)) == ranges::data(t)* is true.

- The *common\_range* concept specifies requirements of a *range* type for which *ranges*::begin and *ranges*::end return objects of the same type.

EXAMPLE: The standard containers (Clause 24) model *common\_range*.

```
template<class T>
concept common_range =
 range<T> && same_as<iterator_t<T>, sentinel_t<T>>;
template<class R>
constexpr bool is-initializer-list = see below; // exposition only
```

- For a type R, *is-initializer-list*<R> is true if and only if *remove\_cvref\_t*<R> is a specialization of *initializer\_list*.

- <sup>6</sup> The `viewable_range` concept specifies the requirements of a `range` type that can be converted to a view safely.

```
template<class T>
concept viewable_range =
 range<T> &&
 ((view<remove_cvref_t<T>> && constructible_from<remove_cvref_t<T>, T>) ||
 (!view<remove_cvref_t<T>> &&
 (is_lvalue_reference_v<T> || (movable<remove_reference_t<T>> && !is-initializer-list<T>))));
```

- <sup>7</sup> The `constant_range` concept specifies the requirements of a `range` type whose elements are not modifiable.

```
template<class T>
concept constant_range =
 input_range<T> && constant_iterator<iterator_t<T>>;
```

## 26.5 Range utilities

[range.utility]

### 26.5.1 General

[range.utility.general]

- <sup>1</sup> The components in 26.5 are general utilities for representing and manipulating ranges.

### 26.5.2 Helper concepts

[range.utility.helpers]

- <sup>1</sup> Many of the types in subclause 26.5 are specified in terms of the following exposition-only concepts:

```
template<class R>
concept simple_view = // exposition only
 view<R> && range<const R> &&
 same_as<iterator_t<R>, iterator_t<const R>> &&
 same_as<sentinel_t<R>, sentinel_t<const R>>;
```

```
template<class I>
concept has-arrow = // exposition only
 input_iterator<I> && (is_pointer_v<I> || requires(I i) { i.operator->(); });
```

```
template<class T, class U>
concept different_from = // exposition only
 !same_as<remove_cvref_t<T>, remove_cvref_t<U>>;
```

```
template<class R>
concept range-with-movable-references = // exposition only
 input_range<R> && move_constructible<range_reference_t<R>> &&
 move_constructible<range_rvalue_reference_t<R>>;
```

### 26.5.3 View interface

[view.interface]

#### 26.5.3.1 General

[view.interface.general]

- <sup>1</sup> The class template `view_interface` is a helper for defining view-like types that offer a container-like interface. It is parameterized with the type that is derived from it.

```
namespace std::ranges {
 template<class D>
 requires is_class_v<D> && same_as<D, remove_cv_t<D>>
 class view_interface {
 private:
 constexpr D& derived() noexcept { // exposition only
 return static_cast<D&>(*this);
 }
 constexpr const D& derived() const noexcept { // exposition only
 return static_cast<const D&>(*this);
 }

 public:
 constexpr bool empty() requires sized_range<D> || forward_range<D> {
 if constexpr (sized_range<D>)
 return ranges::size(derived()) == 0;
 }
 };
}
```

```

 else
 return ranges::begin(derived()) == ranges::end(derived());
}
constexpr bool empty() const requires sized_range<const D> || forward_range<const D> {
 if constexpr (sized_range<const D>)
 return ranges::size(derived()) == 0;
 else
 return ranges::begin(derived()) == ranges::end(derived());
}

constexpr auto cbegin() requires input_range<D> {
 return ranges::cbegin(derived());
}
constexpr auto cbegin() const requires input_range<const D> {
 return ranges::cbegin(derived());
}
constexpr auto cend() requires input_range<D> {
 return ranges::cend(derived());
}
constexpr auto cend() const requires input_range<const D> {
 return ranges::cend(derived());
}

constexpr explicit operator bool()
 requires requires { ranges::empty(derived()); } {
 return !ranges::empty(derived());
 }
constexpr explicit operator bool() const
 requires requires { ranges::empty(derived()); } {
 return !ranges::empty(derived());
 }

constexpr auto data() requires contiguous_iterator<iterator_t<D>> {
 return to_address(ranges::begin(derived()));
}
constexpr auto data() const
 requires range<const D> && contiguous_iterator<iterator_t<const D>> {
 return to_address(ranges::begin(derived()));
 }

constexpr auto size() requires forward_range<D> &&
 sized_sentinel_for<sentinel_t<D>, iterator_t<D>> {
 return to-unsigned-like(ranges::end(derived()) - ranges::begin(derived()));
 }
constexpr auto size() const requires forward_range<const D> &&
 sized_sentinel_for<sentinel_t<const D>, iterator_t<const D>> {
 return to-unsigned-like(ranges::end(derived()) - ranges::begin(derived()));
 }

constexpr decltype(auto) front() requires forward_range<D>;
constexpr decltype(auto) front() const requires forward_range<const D>;

constexpr decltype(auto) back() requires bidirectional_range<D> && common_range<D>;
constexpr decltype(auto) back() const
 requires bidirectional_range<const D> && common_range<const D>;

template<random_access_range R = D>
constexpr decltype(auto) operator[](range_difference_t<R> n) {
 return ranges::begin(derived())[n];
}
template<random_access_range R = const D>
constexpr decltype(auto) operator[](range_difference_t<R> n) const {
 return ranges::begin(derived())[n];
}

```

```
};
}
```

- 2 The template parameter D for `view_interface` may be an incomplete type. Before any member of the resulting specialization of `view_interface` other than special member functions is referenced, D shall be complete, and model both `derived_from<view_interface<D>>` and `view`.

### 26.5.3.2 Members

[`view.interface.members`]

```
constexpr decltype(auto) front() requires forward_range<D>;
constexpr decltype(auto) front() const requires forward_range<const D>;
```

1 *Preconditions*: `!empty()` is true.

2 *Effects*: Equivalent to: `return *ranges::begin(derived());`

```
constexpr decltype(auto) back() requires bidirectional_range<D> && common_range<D>;
constexpr decltype(auto) back() const
 requires bidirectional_range<const D> && common_range<const D>;
```

3 *Preconditions*: `!empty()` is true.

4 *Effects*: Equivalent to: `return *ranges::prev(ranges::end(derived()));`

### 26.5.4 Sub-ranges

[`range.subrange`]

#### 26.5.4.1 General

[`range.subrange.general`]

- 1 The `subrange` class template combines together an iterator and a sentinel into a single object that models the `view` concept. Additionally, it models the `sized_range` concept when the final template parameter is `subrange_kind::sized`.

```
namespace std::ranges {
 template<class From, class To>
 concept uses-nonqualification-pointer-conversion = // exposition only
 is_pointer_v<From> && is_pointer_v<To> &&
 !convertible_to<remove_pointer_t<From>(*)[], remove_pointer_t<To>(*)[]>;

 template<class From, class To>
 concept convertible-to-non-slicing = // exposition only
 convertible_to<From, To> &&
 !uses-nonqualification-pointer-conversion<decay_t<From>, decay_t<To>>;

 template<class T, class U, class V>
 concept pair-like-convertible-from = // exposition only
 !range<T> && !is_reference_v<T> && pair-like<T> &&
 constructible_from<T, U, V> &&
 convertible-to-non-slicing<U, tuple_element_t<0, T>> &&
 convertible_to<V, tuple_element_t<1, T>>;

 template<input_or_output_iterator I, sentinel_for<I> S = I, subrange_kind K =
 sized_sentinel_for<S, I> ? subrange_kind::sized : subrange_kind::unsized>
 requires (K == subrange_kind::sized || !sized_sentinel_for<S, I>)
 class subrange : public view_interface<subrange<I, S, K>> {
 private:
 static constexpr bool StoreSize = // exposition only
 K == subrange_kind::sized && !sized_sentinel_for<S, I>;
 I begin_ = I(); // exposition only
 S end_ = S(); // exposition only
 make-unsigned-like-t<iter_difference_t<I>> size_ = 0; // exposition only; present only
 // if StoreSize is true
 public:
 subrange() requires default_initializable<I> = default;

 constexpr subrange(convertible-to-non-slicing<I> auto i, S s) requires (!StoreSize);

 constexpr subrange(convertible-to-non-slicing<I> auto i, S s,
 make-unsigned-like-t<iter_difference_t<I>> n)
 requires (K == subrange_kind::sized);
```

```

template<different-from<subrange> R>
 requires borrowed_range<R> &&
 convertible_to<non-slicing<iterator_t<R>, I> &&
 convertible_to<sentinel_t<R>, S>
constexpr subrange(R&& r) requires (!StoreSize || sized_range<R>);

template<borrowed_range R>
 requires convertible_to<non-slicing<iterator_t<R>, I> &&
 convertible_to<sentinel_t<R>, S>
constexpr subrange(R&& r, make-unsigned-like-t<iter_difference_t<I>> n)
 requires (K == subrange_kind::sized)
 : subrange{ranges::begin(r), ranges::end(r), n} {}

template<different-from<subrange> PairLike>
 requires pair-like-convertible-from<PairLike, const I&, const S&>
constexpr operator PairLike() const;

constexpr I begin() const requires copyable<I>;
[[nodiscard]] constexpr I begin() requires (!copyable<I>);
constexpr S end() const;

constexpr bool empty() const;
constexpr make-unsigned-like-t<iter_difference_t<I>> size() const
 requires (K == subrange_kind::sized);

[[nodiscard]] constexpr subrange next(iter_difference_t<I> n = 1) const &
 requires forward_iterator<I>;
[[nodiscard]] constexpr subrange next(iter_difference_t<I> n = 1) &&;
[[nodiscard]] constexpr subrange prev(iter_difference_t<I> n = 1) const
 requires bidirectional_iterator<I>;
constexpr subrange& advance(iter_difference_t<I> n);
};

template<input_or_output_iterator I, sentinel_for<I> S>
 subrange(I, S) -> subrange<I, S>;

template<input_or_output_iterator I, sentinel_for<I> S>
 subrange(I, S, make-unsigned-like-t<iter_difference_t<I>>) ->
 subrange<I, S, subrange_kind::sized>;

template<borrowed_range R>
 subrange(R&&) ->
 subrange<iterator_t<R>, sentinel_t<R>,
 (sized_range<R> || sized_sentinel_for<sentinel_t<R>, iterator_t<R>>)
 ? subrange_kind::sized : subrange_kind::unsized>;

template<borrowed_range R>
 subrange(R&&, make-unsigned-like-t<range_difference_t<R>>) ->
 subrange<iterator_t<R>, sentinel_t<R>, subrange_kind::sized>;
}

```

## 26.5.4.2 Constructors and conversions

[range.subrange.ctor]

constexpr subrange(convertible-to-non-slicing<I> auto i, S s) requires (!StoreSize);

1    *Preconditions:* [i,s) is a valid range.

2    *Effects:* Initializes *begin\_* with std::move(i) and *end\_* with s.

constexpr subrange(convertible-to-non-slicing<I> auto i, S s,
 make-unsigned-like-t<iter\_difference\_t<I>> n)
 requires (K == subrange\_kind::sized);

3    *Preconditions:* [i,s) is a valid range, and n == to-unsigned-like(ranges::distance(i, s)) is true.

4     *Effects:* Initializes `begin_` with `std::move(i)` and `end_` with `s`. If `StoreSize` is `true`, initializes `size_` with `n`.

5     NOTE: Accepting the length of the range and storing it to later return from `size()` enables `subrange` to model `sized_range` even when it stores an iterator and sentinel that do not model `sized_sentinel_for`.

```
template<different-from<subrange> R>
 requires borrowed_range<R> &&
 convertible-to-non-slicing<iterator_t<R>, I> &&
 convertible_to<sentinel_t<R>, S>
 constexpr subrange(R&& r) requires (!StoreSize || sized_range<R>);
```

6     *Effects:* Equivalent to:

- (6.1)     — If `StoreSize` is `true`, `subrange(r, static_cast<decltype(size_)>(ranges::size(r)))`.
- (6.2)     — Otherwise, `subrange(ranges::begin(r), ranges::end(r))`.

```
template<different-from<subrange> PairLike>
 requires pair-like-convertible-from<PairLike, const I&, const S&>
 constexpr operator PairLike() const;
```

7     *Effects:* Equivalent to: `return PairLike(begin_, end_);`

#### 26.5.4.3 Accessors

[range.subrange.access]

```
constexpr I begin() const requires copyable<I>;
```

1     *Effects:* Equivalent to: `return begin_;`

[[nodiscard]] constexpr I begin() requires (!copyable<I>);

2     *Effects:* Equivalent to: `return std::move(begin_);`

```
constexpr S end() const;
```

3     *Effects:* Equivalent to: `return end_;`

```
constexpr bool empty() const;
```

4     *Effects:* Equivalent to: `return begin_ == end_;`

```
constexpr make-unsigned-like-t<iter_difference_t<I>> size() const
 requires (K == subrange_kind::sized);
```

5     *Effects:*

- (5.1)     — If `StoreSize` is `true`, equivalent to: `return size_;`

- (5.2)     — Otherwise, equivalent to: `return to-unsigned-like(end_ - begin_);`

[[nodiscard]] constexpr subrange next(iter\_difference\_t<I> n = 1) const &
 requires forward\_iterator<I>;

6     *Effects:* Equivalent to:

```
auto tmp = *this;
tmp.advance(n);
return tmp;
```

[[nodiscard]] constexpr subrange next(iter\_difference\_t<I> n = 1) &&

7     *Effects:* Equivalent to:

```
advance(n);
return std::move(*this);
```

[[nodiscard]] constexpr subrange prev(iter\_difference\_t<I> n = 1) const
 requires bidirectional\_iterator<I>;

8     *Effects:* Equivalent to:

```
auto tmp = *this;
tmp.advance(-n);
return tmp;
```

```

constexpr subrange& advance(iterator_difference_t<I> n);

9 Effects: Equivalent to:

 if constexpr (bidirectional_iterator<I>) {
 if (n < 0) {
 ranges::advance(begin_, n);
 if constexpr (StoreSize)
 size_ += to-unsigned-like(-n);
 return *this;
 }
 }

 auto d = n - ranges::advance(begin_, n, end_);
 if constexpr (StoreSize)
 size_ -= to-unsigned-like(d);
 return *this;

template<size_t N, class I, class S, subrange_kind K>
requires ((N == 0 && copyable<I>) || N == 1)
constexpr auto get(const subrange<I, S, K>& r);
template<size_t N, class I, class S, subrange_kind K>
requires (N < 2)
constexpr auto get(subrange<I, S, K>&& r);

```

10 Effects: Equivalent to:

```

if constexpr (N == 0)
 return r.begin();
else
 return r.end();

```

## 26.5.5 Dangling iterator handling

[range.dangling]

- <sup>1</sup> The type **dangling** is used together with the template aliases **borrowed\_iterator\_t** and **borrowed\_subrange\_t**. When an algorithm that typically returns an iterator into, or a subrange of, a range argument is called with an rvalue range argument that does not model **borrowed\_range** (26.4.2), the return value possibly refers to a range whose lifetime has ended. In such cases, the type **dangling** is returned instead of an iterator or subrange.

```

namespace std::ranges {
 struct dangling {
 constexpr dangling() noexcept = default;
 constexpr dangling(auto&&...) noexcept {}
 };
}

```

- <sup>2</sup> EXAMPLE:

```

vector<int> f();
auto result1 = ranges::find(f(), 42); // #1
static_assert(same_as<decltype(result1), ranges::dangling>);
auto vec = f();
auto result2 = ranges::find(vec, 42); // #2
static_assert(same_as<decltype(result2), vector<int>::iterator>);
auto result3 = ranges::find(ranges::subrange{vec}, 42); // #3
static_assert(same_as<decltype(result3), vector<int>::iterator>);

```

The call to **ranges::find** at #1 returns **ranges::dangling** since **f()** is an rvalue **vector**; it is possible for the **vector** to be destroyed before a returned iterator is dereferenced. However, the calls at #2 and #3 both return iterators since the lvalue **vec** and specializations of **subrange** model **borrowed\_range**.

- <sup>3</sup> For a type **R** that models **range**:

- (3.1) — if **R** models **borrowed\_range**, then **borrowed\_iterator\_t<R>** denotes **iterator\_t<R>**, and **borrowed\_subrange\_t<R>** denotes **subrange<iterator\_t<R>>**;
- (3.2) — otherwise, both **borrowed\_iterator\_t<R>** and **borrowed\_subrange\_t<R>** denote **dangling**.

## 26.5.6 Class template `elements_of`

[range.elements.of]

Specializations of `elements_of` encapsulate a range and act as a tag in overload sets to disambiguate when a range should be treated as a sequence rather than a single value.

EXAMPLE:

```
template<bool YieldElements>
generator<any> f(ranges::input_range auto&& r) {
 if constexpr (YieldElements)
 co_yield ranges::elements_of(r); // yield each element of r
 else
 co_yield r; // yield r as a single value
}

namespace std::ranges {
 template<range R, class Allocator = allocator<byte>>
 struct elements_of {
 [[no_unique_address]] R range;
 [[no_unique_address]] Allocator allocator = Allocator();
 };
}

template<class R, class Allocator = allocator<byte>>
elements_of(R&&, Allocator = Allocator()) -> elements_of<R&&, Allocator>;
}
```

## 26.5.7 Range conversions

[range.utility.conv]

### 26.5.7.1 General

[range.utility.conv.general]

- <sup>1</sup> The range conversion functions construct an object (usually a container) from a range, by using a constructor taking a range, a `from_range_t` tagged constructor, or a constructor taking a pair of iterators, or by inserting each element of the range into the default-constructed object.
- <sup>2</sup> `ranges::to` is applied recursively, allowing the conversion of a range of ranges.

EXAMPLE:

```
string_view str = "the quick brown fox";
auto words = views::split(str, ' ') | to<vector<string>>();
// words is vector<string>{"the", "quick", "brown", "fox"}
```

- <sup>3</sup> Let `reservable-container` be defined as follows:

```
template<class Container>
constexpr bool reservable-container = // exposition only
 sized_range<Container> &&
 requires(Container& c, range_size_t<Container> n) {
 c.reserve(n);
 { c.capacity() } -> same_as<decltype(n)>;
 { c.max_size() } -> same_as<decltype(n)>;
 };

```

- <sup>4</sup> Let `container-insertable` be defined as follows:

```
template<class Container, class Ref>
constexpr bool container-insertable = // exposition only
 requires(Container& c, Ref&& ref) {
 requires (requires { c.push_back(std::forward<Ref>(ref)); } ||
 requires { c.insert(c.end(), std::forward<Ref>(ref)); });
 };

```

- <sup>5</sup> Let `container-inserter` be defined as follows:

```
template<class Ref, class Container>
constexpr auto container-inserter(Container& c) { // exposition only
 if constexpr (requires { c.push_back(declval<Ref>()); })
 return back_inserter(c);
 else
 return inserter(c, c.end());
}
```

26.5.7.2 `ranges::to`

[range.utility.conv.to]

```
template<class C, input_range R, class... Args> requires (!view<C>)
constexpr C to(R&& r, Args&&... args);
```

1 *Mandates:* C is a cv-unqualified class type.

2 *Returns:* An object of type C constructed from the elements of r in the following manner:

- (2.1) — If C does not satisfy `input_range` or `convertible_to<range_reference_t<R>, range_value_t<C>>` is true:
  - (2.1.1) — If `constructible_from<C, R, Args...>` is true:
 

```
C(std::forward<R>(r), std::forward<Args>(args)...)
```
  - (2.1.2) — Otherwise, if `constructible_from<C, from_range_t, R, Args...>` is true:
 

```
C(from_range, std::forward<R>(r), std::forward<Args>(args)...)
```
  - (2.1.3) — Otherwise, if
    - (2.1.3.1) — `common_range<R>` is true,
    - (2.1.3.2) — the *qualified-id* `iterator_traits<iterator_t<R>>::iterator_category` is valid and denotes a type that models `derived_from<input_iterator_tag>`, and
    - (2.1.3.3) — `constructible_from<C, iterator_t<R>, sentinel_t<R>, Args...>` is true:
 

```
C(ranges::begin(r), ranges::end(r), std::forward<Args>(args)...)
```
  - (2.1.4) — Otherwise, if
    - (2.1.4.1) — `constructible_from<C, Args...>` is true, and
    - (2.1.4.2) — `container-insertable<C, range_reference_t<R>>` is true:
 

```
C c(std::forward<Args>(args)...);
if constexpr (sized_range<R> && reservable_container<C>)
 c.reserve(static_cast<range_size_t<C>>(ranges::size(r)));
ranges::copy(r, container inserter<range_reference_t<R>>(c));
```
- (2.2) — Otherwise, if `input_range<range_reference_t<R>>` is true:
 

```
to<C>(r | views::transform([](auto&& elem) {
 return to<range_value_t<C>>(std::forward<decltype(elem)>(elem));
}), std::forward<Args>(args)...);
```
- (2.3) — Otherwise, the program is ill-formed.

```
template<template<class...> class C, input_range R, class... Args>
constexpr auto to(R&& r, Args&&... args);
```

3 Let *input-iterator* be an exposition-only type:

```
struct input_iterator { // exposition only
 using iterator_category = input_iterator_tag;
 using value_type = range_value_t<R>;
 using difference_type = ptrdiff_t;
 using pointer = add_pointer_t<range_reference_t<R>>;
 using reference = range_reference_t<R>;
 reference operator*() const;
 pointer operator->() const;
 input_iterator& operator++();
 input_iterator operator++(int);
 bool operator==(const input_iterator&) const;
};
```

NOTE: *input-iterator* meets the syntactic requirements of *Cpp17InputIterator*.

4 Let *DEDUCE\_EXPR* be defined as follows:

- (4.1) — `C(declval<R>(), declval<Args>()...)` if that is a valid expression,
- (4.2) — otherwise, `C(from_range, declval<R>(), declval<Args>()...)` if that is a valid expression,
- (4.3) — otherwise,
 

```
C(declval<input_iterator>(), declval<input_iterator>(), declval<Args>()...)
```

- if that is a valid expression,  
 (4.4) — otherwise, the program is ill-formed.
- 5     >Returns: `to<decltype(DEDUCE_EXPR)>(std::forward<R>(r), std::forward<Args>(args) ...)`.

### 26.5.7.3 `ranges::to` adaptors

[range.utility.conv.adaptors]

```
template<class C, class... Args> requires (!view<C>)
 constexpr auto to(Args&&... args);
template<template<class...> class C, class... Args>
 constexpr auto to(Args&&... args);
```

- 1     >Mandates: For the first overload, C is a cv-unqualified class type.  
 2     >Returns: A range adaptor closure object (26.7.2) f that is a perfect forwarding call wrapper (22.10.4) with the following properties:

- (2.1) — It has no target object.
- (2.2) — Its bound argument entities `bound_args` consist of objects of types `decay_t<Args>...` direct-non-list-initialized with `std::forward<Args>(args)...`, respectively.
- (2.3) — Its call pattern is `to<C>(r, bound_args...)`, where r is the argument used in a function call expression of f.

## 26.6 Range factories

[range.factories]

### 26.6.1 General

[range.factories.general]

- 1 Subclause 26.6 defines *range factories*, which are utilities to create a view.  
 2 Range factories are declared in namespace `std::ranges::views`.

### 26.6.2 Empty view

[range.empty]

#### 26.6.2.1 Overview

[range.empty.overview]

- 1 `empty_view` produces a view of no elements of a particular type.  
 2 EXAMPLE:

```
auto e = views::empty<int>;
static_assert(ranges::empty(e));
static_assert(0 == e.size());
```

#### 26.6.2.2 Class template `empty_view`

[range.empty.view]

```
namespace std::ranges {
 template<class T>
 requires is_object_v<T>
 class empty_view : public view_interface<empty_view<T>> {
 public:
 static constexpr T* begin() noexcept { return nullptr; }
 static constexpr T* end() noexcept { return nullptr; }
 static constexpr T* data() noexcept { return nullptr; }
 static constexpr size_t size() noexcept { return 0; }
 static constexpr bool empty() noexcept { return true; }
 };
}
```

### 26.6.3 Single view

[range.single]

#### 26.6.3.1 Overview

[range.single.overview]

- 1 `single_view` produces a view that contains exactly one element of a specified value.  
 2 The name `views::single` denotes a customization point object (16.3.3.3.5). Given a subexpression E, the expression `views::single(E)` is expression-equivalent to `single_view<decay_t<decltype((E))>>(E)`.  
 3 EXAMPLE:

```
for (int i : views::single(4))
 cout << i; // prints 4
```

26.6.3.2 Class template `single_view`

[range.single.view]

```

namespace std::ranges {
 template<move_constructible T>
 requires is_object_v<T>
 class single_view : public view_interface<single_view<T>> {
 private:
 movable_box<T> value_; // exposition only (see 26.7.3)

 public:
 single_view() requires default_initializable<T> = default;
 constexpr explicit single_view(const T& t) requires copy_constructible<T>;
 constexpr explicit single_view(T&& t);
 template<class... Args>
 requires constructible_from<T, Args...>
 constexpr explicit single_view(in_place_t, Args&&... args);

 constexpr T* begin() noexcept;
 constexpr const T* begin() const noexcept;
 constexpr T* end() noexcept;
 constexpr const T* end() const noexcept;

```

constexpr T* data() noexcept;
constexpr const T* data() const noexcept;

```

7      *Effects:* Equivalent to: `return value_.operator->();`

## 26.6.4 Iota view

[range.iota]

## 26.6.4.1 Overview

[range.iota.overview]

<sup>1</sup> `iota_view` generates a sequence of elements by repeatedly incrementing an initial value.

- <sup>2</sup> The name `views::iota` denotes a customization point object (16.3.3.5). Given subexpressions `E` and `F`, the expressions `views::iota(E)` and `views::iota(E, F)` are expression-equivalent to `iota_view(E)` and `iota_view(E, F)`, respectively.

- <sup>3</sup> EXAMPLE:

```
for (int i : views::iota(1, 10))
 cout << i << ' '; // prints 1 2 3 4 5 6 7 8 9
```

#### 26.6.4.2 Class template iota\_view

[range.iota.view]

```
namespace std::ranges {
 template<class I>
 concept decrementable = see below; // exposition only

 template<class I>
 concept advanceable = see below; // exposition only

 template<weakly_incrementable W, semiregular Bound = unreachable_sentinel_t>
 requires weakly-equality-comparable-with<W, Bound> && copyable<W>
 class iota_view : public view_interface<iota_view<W, Bound>> {
 private:
 // 26.6.4.3, class iota_view::iterator
 struct iterator; // exposition only

 // 26.6.4.4, class iota_view::sentinel
 struct sentinel; // exposition only

 W value_ = W(); // exposition only
 Bound bound_ = Bound(); // exposition only

 public:
 iota_view() requires default_initializable<W> = default;
 constexpr explicit iota_view(W value);
 constexpr explicit iota_view(type_identity_t<W> value, type_identity_t<Bound> bound);
 constexpr explicit iota_view(iterator first, see below last);

 constexpr iterator begin() const;
 constexpr auto end() const;
 constexpr iterator end() const requires same_as<W, Bound>;

 constexpr auto size() const requires see below;
 };

 template<class W, class Bound>
 requires (!is-integer-like<W> || !is-integer-like<Bound> ||
 (is-signed-integer-like<W> == is-signed-integer-like<Bound>))
 iota_view(W, Bound) -> iota_view<W, Bound>;
 }
}
```

- <sup>1</sup> Let  $IOTA\text{-}DIFF\text{-}T(W)$  be defined as follows:

- (1.1) — If `W` is not an integral type, or if it is an integral type and `sizeof(iter_difference_t<W>)` is greater than `sizeof(W)`, then  $IOTA\text{-}DIFF\text{-}T(W)$  denotes `iter_difference_t<W>`.
- (1.2) — Otherwise,  $IOTA\text{-}DIFF\text{-}T(W)$  is a signed integer type of width greater than the width of `W` if such a type exists.
- (1.3) — Otherwise,  $IOTA\text{-}DIFF\text{-}T(W)$  is an unspecified signed-integer-like type (25.3.4.4) of width not less than the width of `W`.

NOTE: It is unspecified whether this type satisfies `weakly_incrementable`.

- <sup>2</sup> The exposition-only `decrementable` concept is equivalent to:

```
template<class I>
concept decrementable = // exposition only
 incrementable<I> && requires(I i) {
 { --i } -> same_as<I&>;
```

```
{ i-- } -> same_as<I>;
};
```

3 When an object is in the domain of both pre- and post-decrement, the object is said to be *decrementable*.

4 Let **a** and **b** be equal objects of type **I**. **I** models *decrementable* only if

(4.1) — If **a** and **b** are decrementable, then the following are all true:

(4.1.1) — addressof(--**a**) == addressof(**a**)

(4.1.2) — bool(a-- == **b**)

(4.1.3) — bool(((void)a--, **a**) == --**b**)

(4.1.4) — bool(++(--**a**) == **b**).

(4.2) — If **a** and **b** are incrementable, then bool(--(++**a**) == **b**).

5 The exposition-only *advanceable* concept is equivalent to:

```
template<class I>
concept advanceable = // exposition only
 decrementable<I> && totally_ordered<I> &&
 requires(I i, const I j, const IOTA-DIFF-T(I) n) {
 { i += n } -> same_as<I&>;
 { i -= n } -> same_as<I&>;
 I(j + n);
 I(n + j);
 I(j - n);
 { j - j } -> convertible_to<IOTA-DIFF-T(I)>;
 };
```

Let **D** be *IOTA-DIFF-T(I)*. Let **a** and **b** be objects of type **I** such that **b** is reachable from **a** after **n** applications of **++a**, for some value **n** of type **D**. **I** models *advanceable* only if

- (5.1) — (**a** += **n**) is equal to **b**.
- (5.2) — addressof(**a** += **n**) is equal to addressof(**a**).
- (5.3) — **I(a + n)** is equal to (**a** += **n**).
- (5.4) — For any two positive values **x** and **y** of type **D**, if **I(a + D(x + y))** is well-defined, then **I(a + D(x + y))** is equal to **I(I(a + x) + y)**.
- (5.5) — **I(a + D(0))** is equal to **a**.
- (5.6) — If **I(a + D(n - 1))** is well-defined, then **I(a + n)** is equal to [] (I c) { return ++c; }(I(a + D(n - 1))).
- (5.7) — (**b** += -**n**) is equal to **a**.
- (5.8) — (**b** -= **n**) is equal to **a**.
- (5.9) — addressof(**b** -= **n**) is equal to addressof(**b**).
- (5.10) — **I(b - n)** is equal to (**b** -= **n**).
- (5.11) — **D(b - a)** is equal to **n**.
- (5.12) — **D(a - b)** is equal to **D(-n)**.
- (5.13) — bool(**a** <= **b**) is true.

```
constexpr explicit iota_view(W value);
```

6 *Preconditions*: Bound denotes *unreachable\_sentinel\_t* or **Bound()** is reachable from **value**. When **W** and **Bound** model *totally\_ordered\_with*, then **bool(value <= Bound())** is true.

7 *Effects*: Initializes **value\_** with **value**.

```
constexpr explicit iota_view(type_identity_t<W> value, type_identity_t<Bound> bound);
```

8 *Preconditions*: Bound denotes *unreachable\_sentinel\_t* or **bound** is reachable from **value**. When **W** and **Bound** model *totally\_ordered\_with*, then **bool(value <= bound)** is true.

9 *Effects*: Initializes **value\_** with **value** and **bound\_** with **bound**.

```

 constexpr explicit iota_view(iterator first, see below last);
10 Effects: Equivalent to:
 — If same_as<W, Bound> is true, iota_view(first.value_, last.value_).
(10.1) — Otherwise, if Bound denotes unreachable_sentinel_t, iota_view(first.value_, last).
(10.2) — Otherwise, iota_view(first.value_, last.bound_).

11 Remarks: The type of last is:
(11.1) — If same_as<W, Bound> is true, iterator.
(11.2) — Otherwise, if Bound denotes unreachable_sentinel_t, Bound.
(11.3) — Otherwise, sentinel.

 constexpr iterator begin() const;
12 Effects: Equivalent to: return iterator{value_};

 constexpr auto end() const;
13 Effects: Equivalent to:
 if constexpr (same_as<Bound, unreachable_sentinel_t>)
 return unreachable_sentinel;
 else
 return sentinel{bound_};

 constexpr iterator end() const requires same_as<W, Bound>;
14 Effects: Equivalent to: return iterator{bound_};

 constexpr auto size() const requires see below;
15 Effects: Equivalent to:
 if constexpr (is-integer-like<W> && is-integer-like<Bound>)
 return (value_ < 0)
 ? ((bound_ < 0)
 ? to-unsigned-like(-value_) - to-unsigned-like(-bound_)
 : to-unsigned-like(bound_) + to-unsigned-like(-value_))
 : to-unsigned-like(bound_) - to-unsigned-like(value_);
 else
 return to-unsigned-like(bound_ - value_);

16 Remarks: The expression in the requires-clause is equivalent to:
 (same_as<W, Bound> && advanceable<W>) || (is-integer-like<W> && is-integer-like<Bound>) ||
 sized_sentinel_for<Bound, W>

```

#### 26.6.4.3 Class iota\_view::iterator

[range.iota.iterator]

```

namespace std::ranges {
 template<weakly_incrementable W, semiregular Bound>
 requires weakly-equality-comparable-with<W, Bound> && copyable<W>
 struct iota_view<W, Bound>::iterator {
 private:
 W value_ = W(); // exposition only

 public:
 using iterator_concept = see below;
 using iterator_category = input_iterator_tag; // present only if W models incrementable and
 // IOTA-DIFF-T(W) is an integral type
 using value_type = W;
 using difference_type = IOTA-DIFF-T(W);

 iterator() requires default_initializable<W> = default;
 constexpr explicit iterator(W value);

 constexpr W operator*() const noexcept(is_nothrow_copy_constructible_v<W>);

```

```

constexpr iterator& operator++();
constexpr void operator++(int);
constexpr iterator operator++(int) requires incrementable<W>;

constexpr iterator& operator--() requires decrementable<W>;
constexpr iterator operator--(int) requires decrementable<W>;

 }

```

#### 26.6.4.4 Class iota\_view::sentinel

[range.iota.sentinel]

```

namespace std::ranges {
 template<weakly_incrementable W, semiregular Bound>
 requires weakly-equality-comparable-with<W, Bound> && copyable<W>
 struct iota_view<W, Bound>::sentinel {
 private:
 Bound bound_ = Bound(); // exposition only

 public:
 sentinel() = default;
 constexpr explicit sentinel(Bound bound);

 friend constexpr bool operator==(const iterator& x, const sentinel& y);

```

```

friend constexpr iter_difference_t<W> operator-(const iterator& x, const sentinel& y)
 requires sized_sentinel_for<Bound, W>;
friend constexpr iter_difference_t<W> operator-(const sentinel& x, const iterator& y)
 requires sized_sentinel_for<Bound, W>;
};

};

constexpr explicit sentinel(Bound bound);

1 Effects: Initializes bound_ with bound.

friend constexpr bool operator==(const iterator& x, const sentinel& y);
2 Effects: Equivalent to: return x.value_ == y.bound_;

friend constexpr iter_difference_t<W> operator-(const iterator& x, const sentinel& y)
 requires sized_sentinel_for<Bound, W>;
3 Effects: Equivalent to: return x.value_ - y.bound_;

friend constexpr iter_difference_t<W> operator-(const sentinel& x, const iterator& y)
 requires sized_sentinel_for<Bound, W>;
4 Effects: Equivalent to: return -(y - x);

```

## 26.6.5 Repeat view

[range.repeat]

### 26.6.5.1 Overview

[range.repeat.overview]

- 1 `repeat_view` generates a sequence of elements by repeatedly producing the same value.
- 2 The name `views::repeat` denotes a customization point object (16.3.3.3.5). Given subexpressions *E* and *F*, the expressions `views::repeat(E)` and `views::repeat(E, F)` are expression-equivalent to `repeat_view(E)` and `repeat_view(E, F)`, respectively.
- 3 EXAMPLE:

```

for (int i : views::repeat(17, 4))
 cout << i << ' ';
// prints 17 17 17 17

```

### 26.6.5.2 Class template repeat\_view

[range.repeat.view]

```

namespace std::ranges {
 template<class T>
 concept integer-like-with-usable-difference-type = // exposition only
 is-signed-integer-like<T> || (is-integer-like<T> && weakly_incrementable<T>);

 template<move_constructible T, semiregular Bound = unreachable_sentinel_t>
 requires (is_object_v<T> && same_as<T, remove_cv_t<T>> &&
 (integer-like-with-usable-difference-type<Bound> || same_as<Bound, unreachable_sentinel_t>))

 class repeat_view : public view_interface<repeat_view<T, Bound>> {
 private:
 // 26.6.5.3, class repeat_view::iterator
 struct iterator; // exposition only

 movable_box<T> value_; // exposition only, see 26.7.3
 Bound bound_ = Bound(); // exposition only

 public:
 repeat_view() requires default_initializable<T> = default;

 constexpr explicit repeat_view(const T& value, Bound bound = Bound())
 requires copy_constructible<T>;
 constexpr explicit repeat_view(T&& value, Bound bound = Bound());
 template<class... TArgs, class... BoundArgs>
 requires constructible_from<T, TArgs...> &&
 constructible_from<Bound, BoundArgs...>
 constexpr explicit repeat_view(piecewise_construct_t,

```

```

tuple<TArgs...> value_args, tuple<BoundArgs...> bound_args = tuple<>{};

constexpr iterator begin() const;
constexpr iterator end() const requires (!same_as<Bound, unreachable_sentinel_t>);
constexpr unreachable_sentinel_t end() const noexcept;

constexpr auto size() const requires (!same_as<Bound, unreachable_sentinel_t>);
};

template<class T, class Bound>
repeat_view(T, Bound) -> repeat_view<T, Bound>;
}

constexpr explicit repeat_view(const T& value, Bound bound = Bound())
requires copy_constructible<T>;
1 Preconditions: If Bound is not unreachable_sentinel_t, bound ≥ 0 .
2 Effects: Initializes value_ with value and bound_ with bound.

constexpr explicit repeat_view(T&& value, Bound bound = Bound());
3 Preconditions: If Bound is not unreachable_sentinel_t, bound ≥ 0 .
4 Effects: Initializes value_ with std::move(value) and bound_ with bound.

template<class... TArgs, class... BoundArgs>
requires constructible_from<T, TArgs...> &&
constructible_from<Bound, BoundArgs...>
constexpr explicit repeat_view(piecewise_construct_t,
tuple<TArgs...> value_args, tuple<BoundArgs...> bound_args = tuple<>{});
5 Effects: Initializes value_ with make_from_tuple<T>(std::move(value_args)) and initializes
bound_ with make_from_tuple<Bound>(std::move(bound_args)). The behavior is undefined if Bound
is not unreachable_sentinel_t and bound_ is negative.

constexpr iterator begin() const;
6 Effects: Equivalent to: return iterator(addressof(*value_));
constexpr iterator end() const requires (!same_as<Bound, unreachable_sentinel_t>);
7 Effects: Equivalent to: return iterator(addressof(*value_), bound_);
constexpr unreachable_sentinel_t end() const noexcept;
8 Effects: Equivalent to: return unreachable_sentinel;
constexpr auto size() const requires (!same_as<Bound, unreachable_sentinel_t>);
9 Effects: Equivalent to: return to-unsigned-like(bound_);

```

**26.6.5.3 Class `repeat_view::iterator`** [range.repeat.iterator]

```

namespace std::ranges {
 template<move_constructible T, semiregular Bound>
 requires (is_object_v<T> && same_as<T, remove_cv_t<T>> &&
 (integer-like-with-usable-difference-type<Bound> ||
 same_as<Bound, unreachable_sentinel_t>))
 class repeat_view<T, Bound>::iterator {
 private:

 return i;

friend constexpr iterator operator-(iterator i, difference_type n);
18 Effects: Equivalent to:
 i -= n;
 return i;

friend constexpr difference_type operator-(const iterator& x, const iterator& y);
19 Effects: Equivalent to:
 return static_cast<difference_type>(x.current_) - static_cast<difference_type>(y.current_);

```

## 26.6.6 Istream view

[range.istream]

### 26.6.6.1 Overview

[range.istream.overview]

- basic\_istream\_view* models *input\_range* and reads (using *operator>>*) successive elements from its corresponding input stream.
- The name *views::istream<T>* denotes a customization point object (16.3.3.3.5). Given a type *T* and a subexpression *E* of type *U*, if *U* models *derived\_from<basic\_istream<typename U::char\_type, typename U::traits\_type>>*, then the expression *views::istream<T>(E)* is expression-equivalent to *basic\_istream\_view<T, typename U::char\_type, typename U::traits\_type>(E)*; otherwise, *views::istream<T>(E)* is ill-formed.

3 EXAMPLE:

```

auto ints = istringstream{"0 1 2 3 4"};
ranges::copy(views::istream<int>(ints), ostream_iterator<int>(cout, "-"));
// prints 0-1-2-3-4-

```

### 26.6.6.2 Class template *basic\_istream\_view*

[range.istream.view]

```

namespace std::ranges {
 template<class Val, class CharT, class Traits>
 concept stream-extractable =
 requires(basic_istream<CharT, Traits>& is, Val& t) {
 is >> t;
 }
}

```

```

};

template<movable Val, class CharT, class Traits = char_traits<CharT>>
 requires default_initializable<Val> &&
 stream-extractable<Val, CharT, Traits>
class basic_istream_view : public view_interface<basic_istream_view<Val, CharT, Traits>> {
public:
 constexpr explicit basic_istream_view(basic_istream<CharT, Traits>& stream);

 constexpr auto begin() {
 *stream_ >> value_;
 return iterator{*this};
 }

 constexpr default_sentinel_t end() const noexcept;

private:
 // 26.6.3, class basic_istream_view::iterator
 struct iterator; // exposition only
 basic_istream<CharT, Traits>* stream_; // exposition only
 Val value_ = Val(); // exposition only
};

constexpr explicit basic_istream_view(basic_istream<CharT, Traits>& stream);
1 Effects: Initializes stream_ with addressof(stream).

constexpr default_sentinel_t end() const noexcept;
2 Effects: Equivalent to: return default_sentinel;

```

### 26.6.6.3 Class basic\_istream\_view::iterator

[range.istream.iterator]

```

namespace std::ranges {
 template<movable Val, class CharT, class Traits>
 requires default_initializable<Val> &&
 stream-extractable<Val, CharT, Traits>
 class basic_istream_view<Val, CharT, Traits>::iterator {
public:
 using iterator_concept = input_iterator_tag;
 using difference_type = ptrdiff_t;
 using value_type = Val;

 constexpr explicit iterator(basic_istream_view& parent) noexcept;

 iterator(const iterator&) = delete;
 iterator(iterator&&) = default;

 iterator& operator=(const iterator&) = delete;
 iterator& operator=(iterator&&) = default;

 iterator& operator++();
 void operator++(int);

 Val& operator*() const;

 friend bool operator==(const iterator& x, default_sentinel_t);

private:
 basic_istream_view* parent_; // exposition only
 };
}

constexpr explicit iterator(basic_istream_view& parent) noexcept;
1 Effects: Initializes parent_ with addressof(parent).

```

```

iterator& operator++();
2 Effects: Equivalent to:
 *parent_->stream_ >> parent_->value_;
 return *this;

void operator++(int);
3 Effects: Equivalent to +++this.

Val& operator*() const;
4 Effects: Equivalent to: return parent_->value_;

friend bool operator==(const iterator& x, default_sentinel_t);
5 Effects: Equivalent to: return !*x.parent_->stream_;

```

## 26.7 Range adaptors

[range.adaptors]

### 26.7.1 General

[range.adaptors.general]

- 1 Subclause 26.7 defines *range adaptors*, which are utilities that transform a range into a view with custom behaviors. These adaptors can be chained to create pipelines of range transformations that evaluate lazily as the resulting view is iterated.
- 2 Range adaptors are declared in namespace `std::ranges::views`.
- 3 The bitwise OR operator is overloaded for the purpose of creating adaptor chain pipelines. The adaptors also support function call syntax with equivalent semantics.
- 4 EXAMPLE:

```

vector<int> ints{0,1,2,3,4,5};
auto even = [] (int i) { return 0 == i % 2; };
auto square = [] (int i) { return i * i; };
for (int i : ints | views::filter(even) | views::transform(square)) {
 cout << i << ' '; // prints 0 4 16
}
assert(ranges::equal(ints | views::filter(even), views::filter(ints, even)));

```

### 26.7.2 Range adaptor objects

[range.adaptor.object]

- 1 A *range adaptor closure object* is a unary function object that accepts a range argument. For a range adaptor closure object `C` and an expression `R` such that `decltype((R))` models `range`, the following expressions are equivalent:

```

C(R)
R | C

```

Given an additional range adaptor closure object `D`, the expression `C | D` produces another range adaptor closure object `E`. `E` is a perfect forwarding call wrapper (22.10.4) with the following properties:

- (1.1) — Its target object is an object `d` of type `decay_t<decltype((D))>` direct-non-list-initialized with `D`.
- (1.2) — It has one bound argument entity, an object `c` of type `decay_t<decltype((C))>` direct-non-list-initialized with `C`.
- (1.3) — Its call pattern is `d(c(arg))`, where `arg` is the argument used in a function call expression of `E`.

The expression `C | D` is well-formed if and only if the initializations of the state entities of `E` are all well-formed.

- 2 Given an object `t` of type `T`, where
  - (2.1) — `t` is a unary function object that accepts a range argument,
  - (2.2) — `T` models `derived_from<range_adaptor_closure<T>>`,
  - (2.3) — `T` has no other base classes of type `range_adaptor_closure<U>` for any other type `U`, and
  - (2.4) — `T` does not model `range`

then the implementation ensures that `t` is a range adaptor closure object.

- 3 The template parameter `D` for `range_adaptor_closure` may be an incomplete type. If an expression of type `cv D` is used as an operand to the `|` operator, `D` shall be complete and model `derived_from<range_-`

`adaptor_closure<D>`. The behavior of an expression involving an object of type *cv D* as an operand to the `|` operator is undefined if overload resolution selects a program-defined operator `|` function.

- 4 If an expression of type *cv U* is used as an operand to the `|` operator, where *U* has a base class of type `range_adaptor_closure<T>` for some type *T* other than *U*, the behavior is undefined.
- 5 The behavior of a program that adds a specialization for `range_adaptor_closure` is undefined.
- 6 A *range adaptor object* is a customization point object (16.3.3.5) that accepts a `viewable_range` as its first argument and returns a view.
- 7 If a range adaptor object accepts only one argument, then it is a range adaptor closure object.
- 8 If a range adaptor object `adaptor` accepts more than one argument, then let `range` be an expression such that `decltype((range))` models `viewable_range`, let `args...` be arguments such that `adaptor(range, args...)` is a well-formed expression as specified in the rest of subclause 26.7, and let `BoundArgs` be a pack that denotes `decay_t<decltype((args))>...`. The expression `adaptor(args...)` produces a range adaptor closure object *f* that is a perfect forwarding call wrapper (22.10.4) with the following properties:
  - (8.1) — Its target object is a copy of `adaptor`.
  - (8.2) — Its bound argument entities `bound_args` consist of objects of types `BoundArgs...` direct-non-list-initialized with `std::forward<decltype((args))>(args)...`, respectively.
  - (8.3) — Its call pattern is `adaptor(r, bound_args...)`, where *r* is the argument used in a function call expression of *f*.

The expression `adaptor(args...)` is well-formed if and only if the initialization of the bound argument entities of the result, as specified above, are all well-formed.

### 26.7.3 Movable wrapper

### [range.move.wrap]

- 1 Many types in this subclause are specified in terms of an exposition-only class template `movable_box`. `movable_box<T>` behaves exactly like `optional<T>` with the following differences:

- (1.1) — `movable_box<T>` constrains its type parameter *T* with `move_constructible<T> && is_object_v<T>`.
- (1.2) — The default constructor of `movable_box<T>` is equivalent to:

```
constexpr movable_box() noexcept(is_nothrow_default_constructible_v<T>)
 requires default_initializable<T>
 : movable_box{in_place} {}
```

- (1.3) — If `copyable<T>` is not modeled, the copy assignment operator is equivalent to:

```
constexpr movable_box& operator=(const movable_box& that)
 noexcept(is_nothrow_copy_constructible_v<T>)
 requires copy_constructible<T> {
 if (this != addressof(that)) {
 if (that) emplace(*that);
 else reset();
 }
 return *this;
}
```

- (1.4) — If `movable<T>` is not modeled, the move assignment operator is equivalent to:

```
constexpr movable_box& operator=(movable_box&& that)
 noexcept(is_nothrow_move_constructible_v<T>)
 if (this != addressof(that)) {
 if (that) emplace(std::move(*that));
 else reset();
 }
 return *this;
}
```

- 2 Recommended practice:

- (2.1) — If `copy_constructible<T>` is true, `movable_box<T>` should store only a *T* if either *T* models `copyable`, or `is_nothrow_move_constructible_v<T> && is_nothrow_copy_constructible_v<T>` is true.
- (2.2) — Otherwise, `movable_box<T>` should store only a *T* if either *T* models `movable` or `is_nothrow_move_constructible_v<T>` is true.

#### 26.7.4 Non-propagating cache

[range.nonprop.cache]

- <sup>1</sup> Some types in subclause 26.7 are specified in terms of an exposition-only class template *non-propagating-cache*. *non-propagating-cache*<T> behaves exactly like *optional*<T> with the following differences:

(1.1) — *non-propagating-cache*<T> constrains its type parameter T with *is\_object\_v*<T>.

(1.2) — The copy constructor is equivalent to:

```
constexpr non-propagating-cache(const non-propagating-cache&) noexcept {}
```

(1.3) — The move constructor is equivalent to:

```
constexpr non-propagating-cache(non-propagating-cache&& other) noexcept {
 other.reset();
}
```

(1.4) — The copy assignment operator is equivalent to:

```
constexpr non-propagating-cache& operator=(const non-propagating-cache& other) noexcept {
 if (addressof(other) != this)
 reset();
 return *this;
}
```

(1.5) — The move assignment operator is equivalent to:

```
constexpr non-propagating-cache& operator=(non-propagating-cache&& other) noexcept {
 reset();
 other.reset();
 return *this;
}
```

(1.6) — *non-propagating-cache*<T> has an additional member function template specified as follows:

```
template<class I>
constexpr T& emplace-deref(const I& i); // exposition only
```

*Mandates*: The declaration T t(\*i); is well-formed for some invented variable t.

*NOTE 1*: If \*i is a prvalue of type cv T, there is no requirement that it is movable (9.4.1).

*Effects*: Calls *reset()*. Then direct-non-list-initializes the contained value with \*i.

*Postconditions*: \*this contains a value.

*Returns*: A reference to the new contained value.

*Throws*: Any exception thrown by the initialization of the contained value.

*Remarks*: If an exception is thrown during the initialization of T, \*this does not contain a value, and the previous value (if any) has been destroyed.

- <sup>2</sup> NOTE 2: *non-propagating-cache* enables an input view to temporarily cache values as it is iterated over.

#### 26.7.5 Range adaptor helpers

[range.adaptor.helpers]

```
namespace std::ranges {
 template<class F, class Tuple>
 constexpr auto tuple-transform(F&& f, Tuple&& t) { // exposition only
 return apply([&]<class... Ts>(Ts&&... elements) {
 return tuple<invoke_result_t<F&, Ts>...>(invoke(f, std::forward<Ts>(elements))...);
 }, std::forward<Tuple>(t));
 }

 template<class F, class Tuple>
 constexpr void tuple-for-each(F&& f, Tuple&& t) { // exposition only
 apply([&]<class... Ts>(Ts&&... elements) {
 (static_cast<void>(invoke(f, std::forward<Ts>(elements))), ...);
 }, std::forward<Tuple>(t));
 }

 template<class T>
 constexpr T& as-lvalue(T&& t) { // exposition only
 return static_cast<T&>(t);
 }
}
```

```

 }
}
```

## 26.7.6 All view

### 26.7.6.1 General

[range.all]

[range.all.general]

- 1 `views::all` returns a view that includes all elements of its range argument.
- 2 The name `views::all` denotes a range adaptor object (26.7.2). Given a subexpression `E`, the expression `views::all(E)` is expression-equivalent to:
  - (2.1) — `decay-copy(E)` if the decayed type of `E` models `view`.
  - (2.2) — Otherwise, `ref_view{E}` if that expression is well-formed.
  - (2.3) — Otherwise, `owning_view{E}`.

### 26.7.6.2 Class template `ref_view`

[range.ref.view]

- 1 `ref_view` is a view of the elements of some other range.

```

namespace std::ranges {
 template<range R>
 requires is_object_v<R>
 class ref_view : public view_interface<ref_view<R>> {
 private:
 R* r_; // exposition only

 public:
 template<different-from<ref_view> T>
 requires see below
 constexpr ref_view(T&& t);

 constexpr R& base() const { return *r_; }

 constexpr iterator_t<R> begin() const { return ranges::begin(*r_); }
 constexpr sentinel_t<R> end() const { return ranges::end(*r_); }

 constexpr bool empty() const
 requires requires { ranges::empty(*r_); }
 { return ranges::empty(*r_); }

 constexpr auto size() const requires sized_range<R>
 { return ranges::size(*r_); }

 constexpr auto data() const requires contiguous_range<R>
 { return ranges::data(*r_); }
 };

 template<class R>
 ref_view(R&) -> ref_view<R>;
}
```

```

template<different-from<ref_view> T>
 requires see below
constexpr ref_view(T&& t);
```

2 *Effects*: Initializes `r_` with `addressof(static_cast<R&>(std::forward<T>(t)))`.

3 *Remarks*: Let `FUN` denote the exposition-only functions

```

void FUN(R&);
void FUN(R&&) = delete;
```

The expression in the *requires-clause* is equivalent to:

```
convertible_to<T, R&> && requires { FUN(declval<T>()); }
```

**26.7.6.3 Class template `owning_view`**

[range.owning.view]

- <sup>1</sup> `owning_view` is a move-only view of the elements of some other range.

```
namespace std::ranges {
 template<range R>
 requires movable<R> && (!is-initializer-list<R>) // see 26.4.5
 class owning_view : public view_interface<owning_view<R>> {
 private:
 R r_ = R(); // exposition only

 public:
 owning_view() requires default_initializable<R> = default;
 constexpr owning_view(R&& t);

 owning_view(owning_view&&) = default;
 owning_view& operator=(owning_view&&) = default;

 constexpr R& base() & noexcept { return r_; }
 constexpr const R& base() const & noexcept { return r_; }
 constexpr R&& base() && noexcept { return std::move(r_); }
 constexpr const R&& base() const && noexcept { return std::move(r_); }

 constexpr iterator_t<R> begin() { return ranges::begin(r_); }
 constexpr sentinel_t<R> end() { return ranges::end(r_); }

 constexpr auto begin() const requires range<const R>
 { return ranges::begin(r_); }
 constexpr auto end() const requires range<const R>
 { return ranges::end(r_); }

 constexpr bool empty() requires requires { ranges::empty(r_); }
 { return ranges::empty(r_); }
 constexpr bool empty() const requires requires { ranges::empty(r_); }
 { return ranges::empty(r_); }

 constexpr auto size() requires sized_range<R>
 { return ranges::size(r_); }
 constexpr auto size() const requires sized_range<const R>
 { return ranges::size(r_); }

 constexpr auto data() requires contiguous_range<R>
 { return ranges::data(r_); }
 constexpr auto data() const requires contiguous_range<const R>
 { return ranges::data(r_); }
 };
 }

 constexpr owning_view(R&& t);
}
```

- <sup>2</sup> *Effects:* Initializes `r_` with `std::move(t)`.

**26.7.7 As rvalue view**

[range.as.rvalue]

**26.7.7.1 Overview**

[range.as.rvalue.overview]

- <sup>1</sup> `as_rvalue_view` presents a view of an underlying sequence with the same behavior as the underlying sequence except that its elements are rvalues. Some generic algorithms can be called with an `as_rvalue_view` to replace copying with moving.
- <sup>2</sup> The name `views::as_rvalue` denotes a range adaptor object (26.7.2). Let `E` be an expression and let `T` be `decltype((E))`. The expression `views::as_rvalue(E)` is expression-equivalent to:
- (2.1) — `views::all(E)` if `same_as<range_rvalue_reference_t<T>, range_reference_t<T>>` is true.
  - (2.2) — Otherwise, `as_rvalue_view(E)`.
- <sup>3</sup> EXAMPLE:

```
vector<string> words = {"the", "quick", "brown", "fox", "ate", "a", "pterodactyl"};
vector<string> new_words;
ranges::copy(words | views::as_rvalue, back_inserter(new_words));
// moves each string from words into new_words
```

### 26.7.7.2 Class template as\_rvalue\_view

[range.as.rvalue.view]

```
namespace std::ranges {
 template<view V>
 requires input_range<V>
 class as_rvalue_view : public view_interface<as_rvalue_view<V>> {
 V base_ = V(); // exposition only

 public:
 as_rvalue_view() requires default_initializable<V> = default;
 constexpr explicit as_rvalue_view(V base);

 constexpr V base() const & requires copy_constructible<V> { return base_; }
 constexpr V base() && { return std::move(base_); }

 constexpr auto begin() requires (!simple_view<V>)
 { return move_iterator(ranges::begin(base_)); }
 constexpr auto begin() const requires range<const V>
 { return move_iterator(ranges::begin(base_)); }

 constexpr auto end() requires (!simple_view<V>)
 { if constexpr (common_range<V>)
 return move_iterator(ranges::end(base_));
 } else {
 return move_sentinel(ranges::end(base_));
 }
 }
 constexpr auto end() const requires range<const V>
 { if constexpr (common_range<const V>)
 return move_iterator(ranges::end(base_));
 } else {
 return move_sentinel(ranges::end(base_));
 }
}

constexpr auto size() requires sized_range<V> { return ranges::size(base_); }
constexpr auto size() const requires sized_range<const V> { return ranges::size(base_); }
};

template<class R>
 as_rvalue_view(R&&) -> as_rvalue_view<views::all_t<R>>;
}
```

constexpr explicit as\_rvalue\_view(V base);

<sup>1</sup> Effects: Initializes *base\_* with `std::move(base)`.

### 26.7.8 Filter view

[range.filter]

#### 26.7.8.1 Overview

[range.filter.overview]

- <sup>1</sup> `filter_view` presents a view of the elements of an underlying sequence that satisfy a predicate.
- <sup>2</sup> The name `views::filter` denotes a range adaptor object (26.7.2). Given subexpressions *E* and *P*, the expression `views::filter(E, P)` is expression-equivalent to `filter_view(E, P)`.
- <sup>3</sup> EXAMPLE:

```
vector<int> is{ 0, 1, 2, 3, 4, 5, 6 };
auto evens = views::filter(is, [](int i) { return 0 == i % 2; });
for (int i : evens)
 cout << i << ' '; // prints 0 2 4 6
```

## 26.7.8.2 Class template filter\_view

[range.filter.view]

```

namespace std::ranges {
 template<input_range V, indirect_unary_predicate<iterator_t<V>> Pred>
 requires view<V> && is_object_v<Pred>
 class filter_view : public view_interface<filter_view<V, Pred>> {
 private:
 V base_ = V(); // exposition only
 movable_box<Pred> pred_; // exposition only

 // 26.7.8.3, class filter_view::iterator
 class iterator; // exposition only

 // 26.7.8.4, class filter_view::sentinel
 class sentinel; // exposition only

 public:
 filter_view() requires default_initializable<V> && default_initializable<Pred> = default;
 constexpr explicit filter_view(V base, Pred pred);

 constexpr V base() const & requires copy_constructible<V> { return base_; }
 constexpr V base() && { return std::move(base_); }

 constexpr const Pred& pred() const;

 constexpr iterator begin();
 constexpr auto end() {
 if constexpr (common_range<V>)
 return iterator{*this, ranges::end(base_)};
 else
 return sentinel{*this};
 }
 };

 template<class R, class Pred>
 filter_view(R&&, Pred) -> filter_view<views::all_t<R>, Pred>;
 }
}

```

1      *Effects:* Initializes *base\_* with `std::move(base)` and initializes *pred\_* with `std::move(pred)`.

2      *Effects:* Equivalent to: `return *pred_;`

3      *Preconditions:* *pred\_.has\_value()* is true.

4      *Returns:* `{*this, ranges::find_if(base_, ref(*pred_))}`.

5      *Remarks:* In order to provide the amortized constant time complexity required by the `range` concept when `filter_view` models `forward_range`, this function caches the result within the `filter_view` for use on subsequent calls.

## 26.7.8.3 Class filter\_view::iterator

[range.filter.iterator]

```

namespace std::ranges {
 template<input_range V, indirect_unary_predicate<iterator_t<V>> Pred>
 requires view<V> && is_object_v<Pred>
 class filter_view<V, Pred>::iterator {
 private:
 iterator_t<V> current_ = iterator_t<V>(); // exposition only
 filter_view* parent_ = nullptr; // exposition only

 public:
 using iterator_concept = see below;

```

```

using iterator_category = see below; // not always present
using value_type = range_value_t<V>;
using difference_type = range_difference_t<V>;

iterator() requires default_initializable<iterator_t<V>> = default;
constexpr iterator(filter_view& parent, iterator_t<V> current);

constexpr const iterator_t<V>& base() const & noexcept;
constexpr iterator_t<V> base() &&;
constexpr range_reference_t<V> operator*() const;
constexpr iterator_t<V> operator->() const
 requires has-arrow<iterator_t<V>> && copyable<iterator_t<V>>;

constexpr iterator& operator++();
constexpr void operator++(int);
constexpr iterator operator++(int) requires forward_range<V>;

constexpr iterator& operator--() requires bidirectional_range<V>;
constexpr iterator operator--(int) requires bidirectional_range<V>;

friend constexpr bool operator==(const iterator& x, const iterator& y)
 requires equality_comparable<iterator_t<V>>;

friend constexpr range_rvalue_reference_t<V> iter_move(const iterator& i)
 noexcept(noexcept(ranges::iter_move(i.current_)));
}

friend constexpr void iter_swap(const iterator& x, const iterator& y)
 noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
 requires indirectly_swappable<iterator_t<V>>;
}

```

- 1 Modification of the element a `filter_view::iterator` denotes is permitted, but results in undefined behavior if the resulting value does not satisfy the filter predicate.
  - 2 `iterator::iterator_concept` is defined as follows:
    - 1) — If V models `bidirectional_range`, then `iterator_concept` denotes `bidirectional_iterator_tag`.
    - 2) — Otherwise, if V models `forward_range`, then `iterator_concept` denotes `forward_iterator_tag`.
    - 3) — Otherwise, `iterator_concept` denotes `input_iterator_tag`.
  - 3 The member `typedef-name iterator_category` is defined if and only if V models `forward_range`. In that case, `iterator::iterator_category` is defined as follows:
    - 1) — Let C denote the type `iterator_traits<iterator_t<V>>::iterator_category`.
    - 2) — If C models `derived_from<bidirectional_iterator_tag>`, then `iterator_category` denotes `bidirectional_iterator_tag`.
    - 3) — Otherwise, if C models `derived_from<forward_iterator_tag>`, then `iterator_category` denotes `forward_iterator_tag`.
    - 4) — Otherwise, `iterator category` denotes C.

```
constexpr iterator(filter view& parent, iterator t<V> current)
```

- Effects:* Initializes `current` with `std::move(current)` and `parent` with `addressof(parent)`.

```
constexpr const iterator t<V>& base() const & noexcept
```

- Effects: Equivalent to: return *current*

```
constexpr iterator t<v> base() &&
```

- Effects: Equivalent to: `return std::move(current);`

`constexpr range reference t<V> operator*() const;`

- Effects: Equivalent to: `return *current;`

```

constexpr iterator_t<V> operator->() const
 requires has-arrow<iterator_t<V>> && copyable<iterator_t<V>>;
8 Effects: Equivalent to: return current_;

constexpr iterator& operator++();
9 Effects: Equivalent to:
 current_ = ranges::find_if(std::move(++current_), ranges::end(parent_->base_),
 ref(*parent_->pred_));
 return *this;

constexpr void operator++(int);
10 Effects: Equivalent to +++this.

constexpr iterator operator++(int) requires forward_range<V>;
11 Effects: Equivalent to:
 auto tmp = *this;
 +++this;
 return tmp;

constexpr iterator& operator--() requires bidirectional_range<V>;
12 Effects: Equivalent to:
 do
 --current_;
 while (!invoke(*parent_->pred_, *current_));
 return *this;

constexpr iterator operator--(int) requires bidirectional_range<V>;
13 Effects: Equivalent to:
 auto tmp = *this;
 --*this;
 return tmp;

friend constexpr bool operator==(const iterator& x, const iterator& y)
 requires equality_comparable<iterator_t<V>>;
14 Effects: Equivalent to: return x.current_ == y.current_;

friend constexpr range_rvalue_reference_t<V> iter_move(const iterator& i)
 noexcept(noexcept(ranges::iter_move(i.current_)));
15 Effects: Equivalent to: return ranges::iter_move(i.current_);

friend constexpr void iter_swap(const iterator& x, const iterator& y)
 noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
 requires indirectly_swappable<iterator_t<V>>;
16 Effects: Equivalent to ranges::iter_swap(x.current_, y.current_).

```

#### 26.7.8.4 Class filter\_view::sentinel

[range.filter.sentinel]

```

namespace std::ranges {
 template<input_range V, indirect_unary_predicate<iterator_t<V>> Pred>
 requires view<V> && is_object_v<Pred>
 class filter_view<V, Pred>::sentinel {
 private:
 sentinel_t<V> end_ = sentinel_t<V>(); // exposition only

 public:
 sentinel() = default;
 constexpr explicit sentinel(filter_view& parent);

 constexpr sentinel_t<V> base() const;

```

```

 friend constexpr bool operator==(const iterator& x, const sentinel& y);
 };
}

constexpr explicit sentinel(filter_view& parent);

1 Effects: Initializes end_ with ranges::end(parent.base_);

constexpr sentinel_t<V> base() const;
2 Effects: Equivalent to: return end_;

friend constexpr bool operator==(const iterator& x, const sentinel& y);
3 Effects: Equivalent to: return x.current_ == y.end_;

```

## 26.7.9 Transform view

[range.transform]

### 26.7.9.1 Overview

[range.transform.overview]

- 1 *transform\_view* presents a view of an underlying sequence after applying a transformation function to each element.
- 2 The name `views::transform` denotes a range adaptor object (26.7.2). Given subexpressions *E* and *F*, the expression `views::transform(E, F)` is expression-equivalent to `transform_view(E, F)`.
- 3 EXAMPLE:

```

vector<int> is{ 0, 1, 2, 3, 4 };
auto squares = views::transform(is, [](int i) { return i * i; });
for (int i : squares)
 cout << i << ' '; // prints 0 1 4 9 16

```

### 26.7.9.2 Class template transform\_view

[range.transform.view]

```

namespace std::ranges {
 template<input_range V, move_constructible F>
 requires view<V> && is_object_v<F> &&
 regular_invocable<F&, range_reference_t<V>> &&
 can_reference<invoke_result_t<F&, range_reference_t<V>>>
 class transform_view : public view_interface<transform_view<V, F>> {
 private:
 // 26.7.9.3, class template transform_view::iterator
 template<bool> struct iterator; // exposition only

 // 26.7.9.4, class template transform_view::sentinel
 template<bool> struct sentinel; // exposition only

 V base_ = V(); // exposition only
 movable_box<F> fun_; // exposition only

 public:

}

```

<sup>1</sup> *iterator::iterator\_concept* is defined as follows:

- (1.1) — If *Base* models `random_access_range`, then `iterator_concept` denotes `random_access_iterator_tag`.
- (1.2) — Otherwise, if *Base* models `bidirectional_range`, then `iterator_concept` denotes `bidirectional_iterator_tag`.
- (1.3) — Otherwise, if *Base* models `forward_range`, then `iterator_concept` denotes `forward_iterator_tag`.
- (1.4) — Otherwise, `iterator_concept` denotes `input_iterator_tag`.

<sup>2</sup> The member `typedef-name iterator_category` is defined if and only if *Base* models `forward_range`. In that case, `iterator::iterator_category` is defined as follows: Let C denote the type `iterator_traits<iterator_t<Base>>::iterator_category`.

- (2.1) — If `is_reference_v<invoke_result_t<maybe-const<Const, F>&, range_reference_t<Base>>>` is `true`, then
  - (2.1.1) — if C models `derived_from<contiguous_iterator_tag>`, `iterator_category` denotes `random_access_iterator_tag`;
  - (2.1.2) — otherwise, `iterator_category` denotes C.
- (2.2) — Otherwise, `iterator_category` denotes `input_iterator_tag`.

```
constexpr iterator(Parent& parent, iterator_t<Base> current);
```

3     *Effects:* Initializes `current_` with `std::move(current)` and `parent_` with `addressof(parent)`.

```
constexpr iterator(iterator<!Const> i)

operator-(const sentinel& y, const iterator<OtherConst>& x);

6 Effects: Equivalent to: return y.end_ - x.current_;

```

## 26.7.10 Take view

[range.take]

### 26.7.10.1 Overview

[range.take.overview]

- 1 `take_view` produces a view of the first  $N$  elements from another view, or all the elements if the adapted view contains fewer than  $N$ .
- 2 The name `views::take` denotes a range adaptor object (26.7.2). Let  $E$  and  $F$  be expressions, let  $T$  be `remove_cvref_t<decltype((E))>, and let  $D$  be range_difference_t<decltype((E))>. If decltype((F)) does not`

model `convertible_to<D>`, `views::take(E, F)` is ill-formed. Otherwise, the expression `views::take(E, F)` is expression-equivalent to:

- (2.1) — If T is a specialization of `empty_view` (26.6.2.2), then `((void)F, decay-copy(E))`, except that the evaluations of E and F are indeterminately sequenced.
- (2.2) — Otherwise, if T models `random_access_range` and `sized_range` and is a specialization of `span` (24.7.2.2), `basic_string_view` (23.3), or `subrange` (26.5.4), then `U(ranges::begin(E), ranges::begin(E) + std::min<D>(ranges::distance(E), F))`, except that E is evaluated only once, where U is a type determined as follows:
  - (2.2.1) — if T is a specialization of `span`, then U is `span<typename T::element_type>`;
  - (2.2.2) — otherwise, if T is a specialization of `basic_string_view`, then U is T;
  - (2.2.3) — otherwise, T is a specialization of `subrange`, and U is `subrange<iterator_t<T>>`;
  - (2.3) — otherwise, if T is a specialization of `iota_view` (26.6.4.2) that models `random_access_range` and `sized_range`, then `iota_view(*ranges::begin(E), *(ranges::begin(E) + std::min<D>(ranges::distance(E), F)))`, except that E is evaluated only once.
  - (2.4) — Otherwise, if T is a specialization of `repeat_view` (26.6.5.2):
    - (2.4.1) — if T models `sized_range`, then
 

```
views::repeat(*E.value_, std::min<D>(ranges::distance(E), F))
```

 except that E is evaluated only once;
    - (2.4.2) — otherwise, `views::repeat(*E.value_, static_cast<D>(F))`.
  - (2.5) — Otherwise, `take_view(E, F)`.

<sup>3</sup> EXAMPLE:

```
vector<int> is{0,1,2,3,4,5,6,7,8,9};
for (int i : is | views::take(5))
 cout << i << ' '; // prints 0 1 2 3 4
```

### 26.7.10.2 Class template `take_view`

[range.take.view]

```
namespace std::ranges {
 template<view V>
 class take_view : public view_interface<take_view<V>> {
 private:
 V base_ = V(); // exposition only
 range_difference_t<V> count_ = 0; // exposition only

 // 26.7.10.3, class template take_view::sentinel
 template<bool> class sentinel; // exposition only

 public:
 take_view() requires default_initializable<V> = default;
 constexpr explicit take_view(V base, range_difference_t<V> count);

 constexpr V base() const & requires copy_constructible<V> { return base_; }
 constexpr V base() && { return std::move(base_); }

 constexpr auto begin() requires (!simple_view<V>) {
 if constexpr (sized_range<V>) {
 if constexpr (random_access_range<V>) {
 return ranges::begin(base_);
 } else {
 auto sz = range_difference_t<V>(size());
 return counted_iterator(ranges::begin(base_), sz);
 }
 } else if constexpr (sized_sentinel_for<sentinel_t<V>, iterator_t<V>>) {
 auto it = ranges::begin(base_);
 auto sz = std::min(count_, ranges::end(base_) - it);
 return counted_iterator(std::move(it), sz);
 } else {
 return counted_iterator(ranges::begin(base_), count_);
 }
 }
 };
}
```

```

 }

 constexpr auto begin() const requires range<const V> {
 if constexpr (sized_range<const V>) {
 if constexpr (random_access_range<const V>) {
 return ranges::begin(base_);
 } else {
 auto sz = range_difference_t<const V>(size());
 return counted_iterator(ranges::begin(base_), sz);
 }
 } else if constexpr (sized_sentinel_for<sentinel_t<const V>, iterator_t<const V>>) {
 auto it = ranges::begin(base_);
 auto sz = std::min(count_, ranges::end(base_) - it);
 return counted_iterator(std::move(it), sz);
 } else {
 return counted_iterator(ranges::begin(base_), count_);
 }
 }

 constexpr auto end() requires (!simple_view<V>) {
 if constexpr (sized_range<V>) {
 if constexpr (random_access_range<V>)
 return ranges::begin(base_) + range_difference_t<V>(size());
 else
 return default_sentinel;
 } else if constexpr (sized_sentinel_for<sentinel_t<V>, iterator_t<V>>) {
 return default_sentinel;
 } else {
 return sentinel<false>{ranges::end(base_)};
 }
 }

 constexpr auto end() const requires range<const V> {
 if constexpr (sized_range<const V>) {
 if constexpr (random_access_range<const V>)
 return ranges::begin(base_) + range_difference_t<const V>(size());
 else
 return default_sentinel;
 } else if constexpr (sized_sentinel_for<sentinel_t<const V>, iterator_t<const V>>) {
 return default_sentinel;
 } else {
 return sentinel<true>{ranges::end(base_)};
 }
 }

 constexpr auto size() requires sized_range<V> {
 auto n = ranges::size(base_);
 return ranges::min(n, static_cast<decltype(n)>(count_));
 }

 constexpr auto size() const requires sized_range<const V> {
 auto n = ranges::size(base_);
 return ranges::min(n, static_cast<decltype(n)>(count_));
 }
};

template<class R>
take_view(R&&, range_difference_t<R>)
-> take_view<views::all_t<R>>;
}

constexpr explicit take_view(V base, range_difference_t<V> count);

```

<sup>1</sup> *Preconditions:* `count >= 0` is true.

2     *Effects:* Initializes `base_` with `std::move(base)` and `count_` with `count`.

### 26.7.10.3 Class template `take_view::sentinel`

[range.take.sentinel]

```
namespace std::ranges {
 template<view V>
 template<bool Const>
 class take_view<V>::sentinel {
 private:
 using Base = maybe_const<Const, V>; // exposition only
 template<bool OtherConst>
 using CI = counted_iterator<iterator_t<maybe_const<OtherConst, V>>>; // exposition only
 sentinel_t<Base> end_ = sentinel_t<Base>(); // exposition only

 public:
 sentinel() = default;
 constexpr explicit sentinel(sentinel_t<Base> end);
 constexpr sentinel(sentinel<!Const> s)
 requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
 constexpr sentinel_t<Base> base() const;

 friend constexpr bool operator==(const CI<Const>& y, const sentinel& x);

 template<bool OtherConst = !Const>
 requires sentinel_for<sentinel_t<Base>, iterator_t<maybe_const<OtherConst, V>>>
 friend constexpr bool operator==(const CI<OtherConst>& y, const sentinel& x);
 };
 }

 constexpr explicit sentinel(sentinel_t<Base> end);
}
```

1     *Effects:* Initializes `end_` with `end`.

```
constexpr sentinel(sentinel<!Const> s)
 requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
```

2     *Effects:* Initializes `end_` with `std::move(s.end_)`.

```
constexpr sentinel_t<Base> base() const;
```

3     *Effects:* Equivalent to: `return end_;`

```
friend constexpr bool operator==(const CI<Const>& y, const sentinel& x);
```

```
template<bool OtherConst = !Const>
 requires sentinel_for<sentinel_t<Base>, iterator_t<maybe_const<OtherConst, V>>>
friend constexpr bool operator==(const CI<OtherConst>& y, const sentinel& x);
```

4     *Effects:* Equivalent to: `return y.count() == 0 || y.base() == x.end_;`

## 26.7.11 Take while view

[range.take.while]

### 26.7.11.1 Overview

[range.take.while.overview]

- 1 Given a unary predicate `pred` and a view `r`, `take_while_view` produces a view of the range [ranges::begin(r), ranges::find\_if\_not(r, pred)).
- 2 The name `views::take_while` denotes a range adaptor object (26.7.2). Given subexpressions `E` and `F`, the expression `views::take_while(E, F)` is expression-equivalent to `take_while_view(E, F)`.
- 3 EXAMPLE:

```
auto input = istringstream{"0 1 2 3 4 5 6 7 8 9"};
auto small = [] (const auto x) noexcept { return x < 5; };
auto small_ints = views::istream<int>(input) | views::take_while(small);
for (const auto i : small_ints) {
 cout << i << ' ';
} // prints 0 1 2 3 4
auto i = 0;
```

```
input >> i;
cout << i; // prints 6
```

26.7.11.2 Class template `take_while_view`

[range.take.while.view]

```
namespace std::ranges {
 template<view V, class Pred>
 requires input_range<V> && is_object_v<Pred> &&
 indirect_unary_predicate<const Pred, iterator_t<V>>
 class take_while_view : public view_interface<take_while_view<V, Pred>> {
 // 26.7.11.3, class template take_while_view::sentinel
 template<bool> class sentinel; // exposition only

 V base_ = V(); // exposition only
 movable_box<Pred> pred_; // exposition only

 public:
 take_while_view() requires default_initializable<V> && default_initializable<Pred> = default;
 constexpr explicit take_while_view(V base, Pred pred);

 constexpr V base() const & requires copy_constructible<V> { return base_; }
 constexpr V base() && { return std::move(base_); }

 constexpr const Pred& pred() const;

 constexpr auto begin() requires (!simple_view<V>)
 { return ranges::begin(base_); }

 constexpr auto begin() const
 requires range<const V> &&
 indirect_unary_predicate<const Pred, iterator_t<const V>>
 { return ranges::begin(base_); }

 constexpr auto end() requires (!simple_view<V>)
 { return sentinel<false>(ranges::end(base_), addressof(*pred_)); }

 constexpr auto end() const
 requires range<const V> &&
 indirect_unary_predicate<const Pred, iterator_t<const V>>
 { return sentinel<true>(ranges::end(base_), addressof(*pred_)); }
 };

 template<class R, class Pred>
 take_while_view(R&&, Pred) -> take_while_view<views::all_t<R>, Pred>;
}
}
```

constexpr explicit `take_while_view`(V base, Pred pred);

1      *Effects:* Initializes `base_` with `std::move(base)` and `pred_` with `std::move(pred)`.

constexpr const Pred& pred() const;

2      *Effects:* Equivalent to: `return *pred_;`

26.7.11.3 Class template `take_while_view::sentinel`

[range.take.while.sentinel]

```
namespace std::ranges {
 template<view V, class Pred>
 requires input_range<V> && is_object_v<Pred> &&
 indirect_unary_predicate<const Pred, iterator_t<V>>
 template<bool Const>
 class take_while_view<V, Pred>::sentinel {
 using Base = maybe_const<Const, V>; // exposition only

 sentinel_t<Base> end_ = sentinel_t<Base>(); // exposition only
 const Pred* pred_ = nullptr; // exposition only
```

```

public:
 sentinel() = default;
 constexpr explicit sentinel(sentinel_t<Base> end, const Pred* pred);
 constexpr sentinel(sentinel_t<!Const> s)
 requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
 constexpr sentinel_t<Base> base() const { return end_; }

 friend constexpr bool operator==(const iterator_t<Base>& x, const sentinel& y);

 template<bool OtherConst = !Const>
 requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
 friend constexpr bool operator==(const iterator_t<maybe-const<OtherConst, V>>& x,
 const sentinel& y);
};

constexpr explicit sentinel(sentinel_t<Base> end, const Pred* pred);

1 Effects: Initializes end_ with end and pred_ with pred.

constexpr sentinel(sentinel_t<!Const> s)
 requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
2 Effects: Initializes end_ with std::move(s.end_) and pred_ with s.pred_.

friend constexpr bool operator==(const iterator_t<Base>& x, const sentinel& y);

template<bool OtherConst = !Const>
 requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr bool operator==(const iterator_t<maybe-const<OtherConst, V>>& x,
 const sentinel& y);

3 Effects: Equivalent to: return y.end_ == x || !invoke(*y.pred_, *x);

```

## 26.7.12 Drop view

[range.drop]

### 26.7.12.1 Overview

[range.drop.overview]

- 1 *drop\_view* produces a view excluding the first *N* elements from another view, or an empty range if the adapted view contains fewer than *N* elements.
- 2 The name `views::drop` denotes a range adaptor object (26.7.2). Let *E* and *F* be expressions, let *T* be `remove_cvref_t<decltype((E))>, and let D be range_difference_t<decltype((E))>. If decltype((F)) does not model convertible_to<D>, views::drop(E, F) is ill-formed. Otherwise, the expression views::drop(E, F) is expression-equivalent to:
 
  - (2.1) — If T is a specialization of empty_view (26.6.2.2), then ((void)F, decay-copy(E)), except that the evaluations of E and F are indeterminately sequenced.
  - (2.2) — Otherwise, if T models random_access_range and sized_range and is
    - (2.2.1) — a specialization of span (24.7.2.2),
    - (2.2.2) — a specialization of basic_string_view (23.3),
    - (2.2.3) — a specialization of iota_view (26.6.4.2), or
    - (2.2.4) — a specialization of subrange (26.5.4) where T::StoreSize is false,
 then U(ranges::begin(E) + std::min<D>(ranges::distance(E), F), ranges::end(E)), except that E is evaluated only once, where U is span<typename T::element_type> if T is a specialization of span and T otherwise.
  - (2.3) — Otherwise, if T is a specialization of subrange (26.5.4) that models random_access_range and sized_range, then T(ranges::begin(E) + std::min<D>(ranges::distance(E), F), ranges::end(E), to-unsigned-like(ranges::distance(E) - std::min<D>(ranges::distance(E), F))), except that E and F are each evaluated only once.
  - (2.4) — Otherwise, if T is a specialization of repeat_view (26.6.5.2):
    - (2.4.1) — if T models sized_range, then`

- views::repeat(\*E.value\_, ranges::distance(E) - std::min<D>(ranges::distance(E), F))  
except that E is evaluated only once;
- (2.4.2) — otherwise, ((void)F, *decay-copy*(E)), except that the evaluations of E and F are indeterminately sequenced.
- (2.5) — Otherwise, drop\_view(E, F).

<sup>3</sup> EXAMPLE:

```
auto ints = views::iota(0) | views::take(10);
for (auto i : ints | views::drop(5)) {
 cout << i << ' ';
} // prints 5 6 7 8 9
```

### 26.7.12.2 Class template drop\_view

[range.drop.view]

```
namespace std::ranges {
 template<view V>
 class drop_view : public view_interface<drop_view<V>> {
 public:
 drop_view() requires default_initializable<V> = default;
 constexpr explicit drop_view(V base, range_difference_t<V> count);

 constexpr V base() const & requires copy_constructible<V> { return base_; }
 constexpr V base() && { return std::move(base_); }

 constexpr auto begin()
 requires (!simple_view<V> &&
 random_access_range<const V> && sized_range<const V>);

 constexpr auto begin() const
 requires random_access_range<const V> && sized_range<const V>;

 constexpr auto end() requires (!simple_view<V>)
 { return ranges::end(base_); }

 constexpr auto end() const requires range<const V>
 { return ranges::end(base_); }

 constexpr auto size() requires sized_range<V> {
 const auto s = ranges::size(base_);
 const auto c = static_cast<decltype(s)>(count_);
 return s < c ? 0 : s - c;
 }

 constexpr auto size() const requires sized_range<const V> {
 const auto s = ranges::size(base_);
 const auto c = static_cast<decltype(s)>(count_);
 return s < c ? 0 : s - c;
 }

 private:
 V base_ = V(); // exposition only
 range_difference_t<V> count_ = 0; // exposition only
 };
}

template<class R>
drop_view(R&&, range_difference_t<R>) -> drop_view<views::all_t<R>>;
```

constexpr explicit drop\_view(V base, range\_difference\_t<V> count);

<sup>1</sup> *Preconditions*: count  $\geq 0$  is true.

<sup>2</sup> *Effects*: Initializes *base\_* with std::move(base) and *count\_* with count.

```

constexpr auto begin()
 requires (!simple_view<V> &&
 random_access_range<const V> && sized_range<const V>));
constexpr auto begin() const
 requires random_access_range<const V> && sized_range<const V>;
3 Returns: ranges::next(ranges::begin(base_), count_, ranges::end(base_)).
```

4    *Remarks:* In order to provide the amortized constant-time complexity required by the `range` concept when `drop_view` models `forward_range`, the first overload caches the result within the `drop_view` for use on subsequent calls.

NOTE: Without this, applying a `reverse_view` over a `drop_view` would have quadratic iteration complexity.

### 26.7.13 Drop while view

[range.drop.while]

#### 26.7.13.1 Overview

[range.drop.while.overview]

- 1 Given a unary predicate `pred` and a view `r`, `drop_while_view` produces a view of the range [ranges::find\_if\_not(r, pred), ranges::end(r)].
- 2 The name `views::drop_while` denotes a range adaptor object (26.7.2). Given subexpressions `E` and `F`, the expression `views::drop_while(E, F)` is expression-equivalent to `drop_while_view(E, F)`.
- 3 EXAMPLE:

```

constexpr auto source = " \t \t \t hello there"sv;
auto is_invisible = [](const auto x) { return x == ' ' || x == '\t'; };
auto skip_ws = views::drop_while(source, is_invisible);
for (auto c : skip_ws) {
 cout << c; // prints hello there with no leading space
}
```

#### 26.7.13.2 Class template drop\_while\_view

[range.drop.while.view]

```

namespace std::ranges {
 template<view V, class Pred>
 requires input_range<V> && is_object_v<Pred> &&
 indirect_unary_predicate<const Pred, iterator_t<V>>
 class drop_while_view : public view_interface<drop_while_view<V, Pred>> {
 public:
 drop_while_view() requires default_initializable<V> && default_initializable<Pred> = default;
 constexpr explicit drop_while_view(V base, Pred pred);

 constexpr V base() const & requires copy_constructible<V> { return base_; }
 constexpr V base() && { return std::move(base_); }

 constexpr const Pred& pred() const;

 constexpr auto begin();

 constexpr auto end() { return ranges::end(base_); }

 private:
 V base_ = V(); // exposition only
 movable_box<Pred> pred_; // exposition only
 };

 template<class R, class Pred>
 drop_while_view(R&&, Pred) -> drop_while_view<views::all_t<R>, Pred>;
 }
```

- 1    *Effects:* Initializes `base_` with `std::move(base)` and `pred_` with `std::move(pred)`.

`constexpr const Pred& pred() const;`

- 2    *Effects:* Equivalent to: `return *pred_;`

```
constexpr auto begin();
3 Preconditions: pred_.has_value() is true.
4 Returns: ranges::find_if(base_, cref(*pred_)).
5 Remarks: In order to provide the amortized constant-time complexity required by the range concept when drop_while_view models forward_range, the first call caches the result within the drop_while_view for use on subsequent calls.
NOTE: Without this, applying a reverse_view over a drop_while_view would have quadratic iteration complexity.
```

## 26.7.14 Join view

[range.join]

### 26.7.14.1 Overview

[range.join.overview]

- 1 `join_view` flattens a view of ranges into a view.
- 2 The name `views::join` denotes a range adaptor object (26.7.2). Given a subexpression *E*, the expression `views::join(E)` is expression-equivalent to `join_view<views::all_t<decltype((E))>>{E}`.
- 3 EXAMPLE:

```
vector<string> ss{"hello", " ", "world", "!"};
for (char ch : ss | views::join)
 cout << ch; // prints hello world!
```

### 26.7.14.2 Class template `join_view`

[range.join.view]

```
namespace std::ranges {
 template<input_range V>
 requires view<V> && input_range<range_reference_t<V>>
 class join_view : public view_interface<join_view<V>> {
 private:
 using InnerRng = range_reference_t<V>; // exposition only

 // 26.7.14.3, class template join_view::iterator
 template<bool Const>
 struct iterator; // exposition only

 // 26.7.14.4, class template join_view::sentinel
 template<bool Const>
 struct sentinel; // exposition only

 V base_ = V(); // exposition only

 non-propagating-cache<iterator_t<V>> outer_; // exposition only, present only
 non-propagating-cache<remove_cv_t<InnerRng>> inner_; // when !forward_range<V>
 // exposition only, present only
 // if is_reference_v<InnerRng> is false

 public:
 join_view() requires default_initializable<V> = default;
 constexpr explicit join_view(V base);

 constexpr V base() const & requires copy_constructible<V> { return base_; }
 constexpr V base() && { return std::move(base_); }

 constexpr auto begin() {
 if constexpr (forward_range<V>) {
 constexpr bool use_const = simple_view<V> &&
 is_reference_v<InnerRng>;
 return iterator<use_const>{*this, ranges::begin(base_)};
 } else {
 outer_ = ranges::begin(base_);
 return iterator<false>{*this};
 }
 }
 }
}
```

```

constexpr auto begin() const
 requires forward_range<const V> &&
 is_reference_v<range_reference_t<const V>> &&
 input_range<range_reference_t<const V>>
{ return iterator<true>{*this, ranges::begin(base_)}; }

constexpr auto end() {
 if constexpr (forward_range<V> &&
 is_reference_v<InnerRng> && forward_range<InnerRng> &&
 common_range<V> && common_range<InnerRng>)
 return iterator<simple_view<V>>{*this, ranges::end(base_)};
 else
 return sentinel<simple_view<V>>{*this};
}

constexpr auto end() const
 requires forward_range<const V> &&
 is_reference_v<range_reference_t<const V>> &&
 input_range<range_reference_t<const V>> {
 if constexpr (forward_range<range_reference_t<const V>> &&
 common_range<const V> &&
 common_range<range_reference_t<const V>>)
 return iterator<true>{*this, ranges::end(base_)};
 else
 return sentinel<true>{*this};
}
};

template<class R>
explicit join_view(R&&) -> join_view<views::all_t<R>>;
}

constexpr explicit join_view(V base);

```

1      *Effects:* Initializes *base\_* with std::move(*base*).

#### 26.7.14.3 Class template join\_view::iterator

[range.join.iterator]

```

namespace std::ranges {
 template<input_range V>
 requires view<V> && input_range<range_reference_t<V>>
 template<bool Const>
 struct join_view<V>::iterator {
 private:
 using Parent = maybe_const<Const, join_view>; // exposition only
 using Base = maybe_const<Const, V>; // exposition only
 using OuterIter = iterator_t<Base>; // exposition only
 using InnerIter = iterator_t<range_reference_t<Base>>; // exposition only

 static constexpr bool ref_is_gvalue = // exposition only
 is_reference_v<range_reference_t<Base>>;

 OuterIter outer_ = OuterIter(); // exposition only, present only
 // if Base models forward_range
 optional<InnerIter> inner_; // exposition only
 Parent* parent_ = nullptr; // exposition only

 constexpr void satisfy(); // exposition only

 constexpr OuterIter& outer(); // exposition only
 constexpr const OuterIter& outer() const; // exposition only

 constexpr iterator(Parent& parent, OuterIter outer) // exposition only
 requires forward_range<Base>;

```

```

constexpr explicit iterator(Parent& parent)
 requires (!forward_range<Base>);
 // exposition only

public:
 using iterator_concept = see below;
 using iterator_category = see below; // not always present
 using value_type = range_value_t<range_reference_t<Base>>;
 using difference_type = see below;

 iterator() = default;
 constexpr iterator(iterator<!Const> i)
 requires Const &&
 convertible_to<iterator_t<V>, OuterIter> &&
 convertible_to<iterator_t<InnerRng>, InnerIter>;

 constexpr decltype(auto) operator*() const { return **inner_; }

 constexpr InnerIter operator->() const
 requires has-arrow<InnerIter> && copyable<InnerIter>;

 constexpr iterator& operator++();
 constexpr void operator++(int);
 constexpr iterator operator++(int)
 requires ref-is-glvalue && forward_range<Base> &&
 forward_range<range_reference_t<Base>>;

 constexpr iterator& operator--()
 requires ref-is-glvalue && bidirectional_range<Base> &&
 bidirectional_range<range_reference_t<Base>> &&
 common_range<range_reference_t<Base>>;

 constexpr iterator operator--(int)
 requires ref-is-glvalue && bidirectional_range<Base> &&
 bidirectional_range<range_reference_t<Base>> &&
 common_range<range_reference_t<Base>>;

 friend constexpr bool operator==(const iterator& x, const iterator& y)
 requires ref-is-glvalue && forward_range<Base> &&
 equality_comparable<iterator_t<range_reference_t<Base>>>;

 friend constexpr decltype(auto) iter_move(const iterator& i)
 noexcept(noexcept(ranges::iter_move(*i.inner_))) {
 return ranges::iter_move(*i.inner_);
 }

 friend constexpr void iter_swap(const iterator& x, const iterator& y)
 noexcept(noexcept(ranges::iter_swap(*x.inner_, *y.inner_)))
 requires indirectly_swappable<InnerIter>;
 };
}

```

<sup>1</sup> *iterator::iterator\_concept* is defined as follows:

- (1.1) — If *ref-is-glvalue* is true, *Base* models *bidirectional\_range*, and *range\_reference\_t<Base>* models both *bidirectional\_range* and *common\_range*, then *iterator\_concept* denotes *bidirectional\_iterator\_tag*.
- (1.2) — Otherwise, if *ref-is-glvalue* is true and *Base* and *range\_reference\_t<Base>* each model *forward\_range*, then *iterator\_concept* denotes *forward\_iterator\_tag*.
- (1.3) — Otherwise, *iterator\_concept* denotes *input\_iterator\_tag*.

<sup>2</sup> The member *typedef-name iterator\_category* is defined if and only if *ref-is-glvalue* is true, *Base* models *forward\_range*, and *range\_reference\_t<Base>* models *forward\_range*. In that case, *iterator::iterator\_category* is defined as follows:

- (2.1) — Let  $OUTERC$  denote `iterator_traits<iterator_t<Base>>::iterator_category`, and let  $INNERC$  denote `iterator_traits<iterator_t<range_reference_t<Base>>>::iterator_category`.
- (2.2) — If  $OUTERC$  and  $INNERC$  each model `derived_from<bidirectional_iterator_tag>` and `range_reference_t<Base>` models `common_range`, `iterator_category` denotes `bidirectional_iterator_tag`.
- (2.3) — Otherwise, if  $OUTERC$  and  $INNERC$  each model `derived_from<forward_iterator_tag>`, `iterator_category` denotes `forward_iterator_tag`.
- (2.4) — Otherwise, `iterator_category` denotes `input_iterator_tag`.

3 `iterator::difference_type` denotes the type:

```
common_type_t<
 range_difference_t<Base>,
 range_difference_t<range_reference_t<Base>>>
```

4 `join_view` iterators use the `satisfy` function to skip over empty inner ranges.

```
constexpr OuterIter& outer();
constexpr const OuterIter& outer() const;
```

5 *Returns*: `outer_` if `Base` models `forward_range`; otherwise, `*parent_->outer_`.

```
constexpr void satisfy();
```

6 *Effects*: Equivalent to:

```
auto update_inner = [this](const iterator_t<Base>& x) -> auto&& {
 if constexpr (ref-is-glvalue) // *x is a reference
 return *x;
 else
 return parent_->inner_.emplace_deref(x);
};

for (; outer() != ranges::end(parent_->base_); ++outer()) {
 auto&& inner = update_inner(outer());
 inner_ = ranges::begin(inner);
 if (*inner_ != ranges::end(inner))
 return;
}
if constexpr (ref-is-glvalue)
 inner_.reset();
```

```
constexpr iterator(Parent& parent, OuterIter outer)
 requires forward_range<Base>;
```

7 *Effects*: Initializes `outer_` with `std::move(outer)` and `parent_` with `addressof(parent)`; then calls `satisfy()`.

```
constexpr explicit iterator(Parent& parent)
 requires (!forward_range<Base>);
```

8 *Effects*: Initializes `parent_` with `addressof(parent)`; then calls `satisfy()`.

```
constexpr iterator(iterator<!Const> i)
 requires Const &&
 convertible_to<iterator_t<V>, OuterIter> &&
 convertible_to<iterator_t<InnerRng>, InnerIter>;
```

9 *Effects*: Initializes `outer_` with `std::move(i.outer_)`, `inner_` with `std::move(i.inner_)`, and `parent_` with `i.parent_`.

10 NOTE: `Const` can only be `true` when `Base` models `forward_range`.

```
constexpr InnerIter operator->() const
 requires has-arrow<InnerIter> && copyable<InnerIter>;
```

11 *Effects*: Equivalent to: `return *inner_;`

```

constexpr iterator& operator++();

12 Let inner-range be:
(12.1) — If ref-is-glvalue is true, *outer().
(12.2) — Otherwise, *parent_->inner_.

13 Effects: Equivalent to:
 if (++*inner_ == ranges::end(as-lvalue(inner-range))) {
 ++outer();
 satisfy();
 }
 return *this;

constexpr void operator++(int);

14 Effects: Equivalent to: +++this.

constexpr iterator operator++(int)
 requires ref-is-glvalue && forward_range<Base> &&
 forward_range<range_reference_t<Base>>;

15 Effects: Equivalent to:
 auto tmp = *this;
 +++this;
 return tmp;

constexpr iterator& operator--()
 requires ref-is-glvalue && bidirectional_range<Base> &&
 bidirectional_range<range_reference_t<Base>> &&
 common_range<range_reference_t<Base>>;

16 Effects: Equivalent to:
 if (outer_ == ranges::end(parent_->base_))
 inner_ = ranges::end(as-lvalue(*--outer_));
 while (*inner_ == ranges::begin(as-lvalue(*outer_)))
 inner_ = ranges::end(as-lvalue(--outer_));
 --*inner_;
 return *this;

constexpr iterator operator--(int)
 requires ref-is-glvalue && bidirectional_range<Base> &&
 bidirectional_range<range_reference_t<Base>> &&
 common_range<range_reference_t<Base>>;

17 Effects: Equivalent to:
 auto tmp = *this;
 --*this;
 return tmp;

friend constexpr bool operator==(const iterator& x, const iterator& y)
 requires ref-is-glvalue && forward_range<Base> &&
 equality_comparable<iterator_t<range_reference_t<Base>>>;

```

18 Effects: Equivalent to: return *x.outer\_* == *y.outer\_* && *x.inner\_* == *y.inner\_*;

```

friend constexpr void iter_swap(const iterator& x, const iterator& y)
 noexcept(noexcept(ranges::iter_swap(*x.inner_, *y.inner_)))
 requires indirectly_swappable<InnerIter>;

```

19 Effects: Equivalent to: return ranges::iter\_swap(\**x.inner\_*, \**y.inner\_*);

#### 26.7.14.4 Class template join\_view::sentinel

[range.join.sentinel]

```

namespace std::ranges {
 template<input_range V>
 requires view<V> && input_range<range_reference_t<V>>
 template<bool Const>
 struct join_view<V>::sentinel {

```

```

private:
 using Parent = maybe-const<Const, join_view>; // exposition only
 using Base = maybe-const<Const, V>; // exposition only
 sentinel_t<Base> end_ = sentinel_t<Base>(); // exposition only

public:
 sentinel() = default;

 constexpr explicit sentinel(Parent& parent);
 constexpr sentinel(sentinel<!Const> s)
 requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
}

template<bool OtherConst>
 requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
};

constexpr explicit sentinel(Parent& parent);

1 Effects: Initializes end_ with ranges::end(parent.base_).

constexpr sentinel(sentinel<!Const> s)
 requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
2 Effects: Initializes end_ with std::move(s.end_).

template<bool OtherConst>
 requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
3 Effects: Equivalent to: return x.outer() == y.end_;

```

## 26.7.15 Join with view

[range.join.with]

### 26.7.15.1 Overview

[range.join.with.overview]

- 1 join\_with\_view takes a view and a delimiter, and flattens the view, inserting every element of the delimiter in between elements of the view. The delimiter can be a single element or a view of elements.
- 2 The name `views::join_with` denotes a range adaptor object (26.7.2). Given subexpressions E and F, the expression `views::join_with(E, F)` is expression-equivalent to `join_with_view(E, F)`.
- 3 EXAMPLE:

```

vector<string> vs = {"the", "quick", "brown", "fox"};
for (char c : vs | views::join_with('-')) {
 cout << c;
}
// The above prints the-quick-brown-fox

```

### 26.7.15.2 Class template join\_with\_view

[range.join.with.view]

```

namespace std::ranges {
 template<class R, class P>
 concept compatible-joinable-ranges = // exposition only
 common_with<range_value_t<R>, range_value_t<P>> &&
 common_reference_with<range_reference_t<R>, range_reference_t<P>> &&
 common_reference_with<range_rvalue_reference_t<R>, range_rvalue_reference_t<P>>;
}

template<class R>
concept bidirectional-common = bidirectional_range<R> && common_range<R>; // exposition only

template<input_range V, forward_range Pattern>
 requires view<V> && input_range<range_reference_t<V>>
 && view<Pattern>
 && compatible-joinable-ranges<range_reference_t<V>, Pattern>
class join_with_view : public view_interface<join_with_view<V, Pattern>> {
 using InnerRng = range_reference_t<V>; // exposition only
}
```

```

V base_ = V();
non-propagating-cache<iterator_t<V>> outer_it_;
non-propagating-cache<remove_cv_t<InnerRng>> inner_;

Pattern pattern_ = Pattern();

// 26.7.15.3, class template join_with_view::iterator
template<bool Const> struct iterator;
// exposition only

// 26.7.15.4, class template join_with_view::sentinel
template<bool Const> struct sentinel;
// exposition only

public:
join_with_view()
 requires default_initializable<V> && default_initializable<Pattern> = default;

constexpr explicit join_with_view(V base, Pattern pattern);

template<input_range R>
 requires constructible_from<V, views::all_t<R>> &&
 constructible_from<Pattern, single_view<range_value_t<InnerRng>>>
constexpr explicit join_with_view(R&& r, range_value_t<InnerRng> e);

 iter_rvalue_reference_t<PatternIter>>;
 return visit<rvalue_reference>(ranges::iter_move, x.inner_it_);
}

friend constexpr void iter_swap(const iterator& x, const iterator& y)
 requires indirectly_swappable<InnerIter, PatternIter> {
 visit(ranges::iter_swap, x.inner_it_, y.inner_it_);
}
};

}

```

<sup>1</sup> *iterator*::*iterator\_concept* is defined as follows:

- (1.1) — If *ref-is-glvalue* is true, *Base* models *bidirectional\_range*, and *InnerBase* and *PatternBase* each model *bidirectional-common*, then *iterator\_concept* denotes *bidirectional\_iterator\_tag*.
- (1.2) — Otherwise, if *ref-is-glvalue* is true and *Base* and *InnerBase* each model *forward\_range*, then *iterator\_concept* denotes *forward\_iterator\_tag*.
- (1.3) — Otherwise, *iterator\_concept* denotes *input\_iterator\_tag*.

<sup>2</sup> The member *typedef-name* *iterator\_category* is defined if and only if *ref-is-glvalue* is true, and *Base* and *InnerBase* each model *forward\_range*. In that case, *iterator*::*iterator\_category* is defined as follows:

- (2.1) — Let *OUTERC* denote *iterator\_traits<OuterIter>*::*iterator\_category*, let *INNERC* denote *iterator\_traits<InnerIter>*::*iterator\_category*, and let *PATTERNC* denote *iterator\_traits<PatternIter>*::*iterator\_category*.
- (2.2) — If
 

```
is_reference_v<common_reference_t<iter_reference_t<InnerIter>,
 iter_reference_t<PatternIter>>>
```

 is false, *iterator\_category* denotes *input\_iterator\_tag*.
- (2.3) — Otherwise, if *OUTERC*, *INNERC*, and *PATTERNC* each model *derived\_from<bidirectional\_iterator\_category>* and *InnerBase* and *PatternBase* each model *common\_range*, *iterator\_category* denotes *bidirectional\_iterator\_tag*.
- (2.4) — Otherwise, if *OUTERC*, *INNERC*, and *PATTERNC* each model *derived\_from<forward\_iterator\_tag>*, *iterator\_category* denotes *forward\_iterator\_tag*.

(2.5) — Otherwise, `iterator_category` denotes `input_iterator_tag`.

3 `iterator::value_type` denotes the type:

```
common_type_t<iter_value_t<InnerIter>, iter_value_t<PatternIter>>
```

4 `iterator::difference_type` denotes the type:

```
common_type_t<
 iter_difference_t<OuterIter>,
 iter_difference_t<InnerIter>,
 iter_difference_t<PatternIter>>
```

```
constexpr OuterIter& outer();
```

```
constexpr const OuterIter& outer() const;
```

5 *Returns*: `outer_it_` if `Base` models `forward_range`; otherwise, `*parent_->outer_it_`.

```
constexpr auto& update_inner();
```

6 *Effects*: Equivalent to:

```
if constexpr (ref-is-glvalue)
 return as-lvalue(*outer());
else
 return parent_->inner_.emplace-deref(outer());
```

```
constexpr auto& get_inner();
```

7 *Effects*: Equivalent to:

```
if constexpr (ref-is-glvalue)
 return as-lvalue(*outer());
else
 return *parent_->inner_;
```

```
constexpr void satisfy();
```

8 *Effects*: Equivalent to:

```
while (true) {
 if (inner_it_.index() == 0) {
 if (std::get<0>(inner_it_) != ranges::end(parent_->pattern_))
 break;
 inner_it_.emplace<1>(ranges::begin(update_inner()));
 } else {
 if (std::get<1>(inner_it_) != ranges::end(get_inner()))
 break;
 if (++outer() == ranges::end(parent_->base_)) {
 if constexpr (ref-is-glvalue)
 inner_it_.emplace<0>();
 break;
 }
 inner_it_.emplace<0>(ranges::begin(parent_->pattern_));
 }
}
```

NOTE 1: `join_with_view` iterators use the `satisfy` function to skip over empty inner ranges.

```
constexpr iterator(Parent& parent, OuterIter outer)
```

```
 requires forward_range<Base>;
```

```
constexpr explicit iterator(Parent& parent)
```

```
 requires (!forward_range<Base>);
```

9 *Effects*: Initializes `parent_` with `addressof(parent)`. For the first overload, also initializes `outer_it_` with `std::move(outer)`. Then, equivalent to:

```
if (outer() != ranges::end(parent_->base_)) {
 inner_it_.emplace<1>(ranges::begin(update_inner()));
 satisfy();
}
```

```

constexpr iterator(iterator<!Const> i)
 requires Const && convertible_to<iterator_t<V>, OuterIter> &&
 convertible_to<iterator_t<InnerRng>, InnerIter> &&
 convertible_to<iterator_t<Pattern>, PatternIter>;
10 Effects: Initializes outer_it_ with std::move(i.outer_it_) and parent_ with i.parent_. Then,
 equivalent to:
 if (i.inner_it_.index() == 0)
 inner_it_.emplace<0>(std::get<0>(std::move(i.inner_it_)));
 else
 inner_it_.emplace<1>(std::get<1>(std::move(i.inner_it_)));
11 NOTE 2: Const can only be true when Base models forward_range.

constexpr decltype(auto) operator*() const;
12 Effects: Equivalent to:
 using reference =
 common_reference_t<iter_reference_t<InnerIter>, iter_reference_t<PatternIter>>;
 return visit([](auto& it) -> reference { return *it; }, inner_it_);
 constexpr iterator& operator++();
13 Effects: Equivalent to:
 visit([](auto& it){ ++it; }, inner_it_);
 satisfy();
 return *this;

constexpr void operator++(int);
14 Effects: Equivalent to +++this.

 if (it == ranges::begin(inner)) {
 inner_it_.emplace<0>(ranges::end(parent_->pattern_));
 } else {
 break;
 }
 }
 }
}

```

```

 }
 }
 visit([](auto& it){ --it; }, inner_it_);
 return *this;
}

constexpr iterator operator--(int)
 requires ref_is_lvalue && bidirectional_range<Base> &&
 bidirectional_common<InnerBase> && bidirectional_common<PatternBase>;

```

17     *Effects:* Equivalent to:

```

 iterator tmp = *this;
 --*this;
 return tmp;

```

```

friend constexpr bool operator==(const iterator& x, const iterator& y)
 requires ref_is_lvalue && forward_range<Base> &&
 equality_comparable<InnerIter>;

```

18     *Effects:* Equivalent to:

```

 return x.outer_it_ == y.outer_it_ && x.inner_it_ == y.inner_it_;

```

#### 26.7.15.4 Class template join\_with\_view::sentinel

[range.join.with.sentinel]

```

namespace std::ranges {
 template<input_range V, forward_range Pattern>
 requires view<V> && input_range<range_reference_t<V>>
 && view<Pattern> && compatible_joinable_ranges<range_reference_t<V>, Pattern>
 template<bool Const>
 class join_with_view<V, Pattern>::sentinel {

 constexpr explicit sentinel(Parent& parent); // exposition only

 public:
 sentinel() = default;
 constexpr sentinel(sentinel<!Const> s)
 requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
 template<bool OtherConst>
 requires sentinel_for<sentinel_t<Base>, iterator_t<maybe_const<OtherConst, V>>>
 friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
 };
 }

 constexpr explicit sentinel(Parent& parent);
}
```

1     *Effects:* Initializes *end\_* with ranges::end(*parent.base\_*).

```

constexpr sentinel(sentinel<!Const> s)
 requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

```

2     *Effects:* Initializes *end\_* with std::move(*s.end\_*).

```

template<bool OtherConst>
 requires sentinel_for<sentinel_t<Base>, iterator_t<maybe_const<OtherConst, V>>>
 friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

```

3     *Effects:* Equivalent to: return *x.outer()* == *y.end\_*;

#### 26.7.16 Lazy split view

[range.lazy.split]

##### 26.7.16.1 Overview

[range.lazy.split.overview]

<sup>1</sup> *lazy\_split\_view* takes a view and a delimiter, and splits the view into subranges on the delimiter. The delimiter can be a single element or a view of elements.

- <sup>2</sup> The name `views::lazy_split` denotes a range adaptor object (26.7.2). Given subexpressions E and F, the expression `views::lazy_split(E, F)` is expression-equivalent to `lazy_split_view(E, F)`.
- <sup>3</sup> EXAMPLE:

```
string str{"the quick brown fox"};
for (auto word : str | views::lazy_split(' '))
 for (char ch : word)
 cout << ch;
 cout << '*';
}
// The above prints the*quick*brown*fox*
```

26.7.16.2 Class template `lazy_split_view`

[range.lazy.split.view]

```

 noexcept(noexcept(ranges::iter_swap(x.i_.current, y.i_.current)))
 requires indirectly_swappable<iterator_t<Base>>;
8 Effects: Equivalent to ranges::iter_swap(x.i_.current, y.i_.current).

```

### 26.7.17 Split view

[range.split]

#### 26.7.17.1 Overview

[range.split.overview]

- 1 `split_view` takes a view and a delimiter, and splits the view into `subranges` on the delimiter. The delimiter can be a single element or a view of elements.
- 2 The name `views::split` denotes a range adaptor object (26.7.2). Given subexpressions `E` and `F`, the expression `views::split(E, F)` is expression-equivalent to `split_view(E, F)`.
- 3 EXAMPLE:

```

string str{"the quick brown fox"};
for (auto word : views::split(str, ' ')) {
 cout << string_view(word) << '*';
}
// The above prints the*quick*brown*fox*

```

#### 26.7.17.2 Class template `split_view`

[range.split.view]

```

namespace std::ranges {
 template<forward_range V, forward_range Pattern>
 requires view<V> && view<Pattern> &&
 indirectly_comparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to>
 class split_view : public view_interface<split_view<V, Pattern>> {

```

```

private:
 V base_ = V(); // exposition only
 Pattern pattern_ = Pattern(); // exposition only

 // 26.7.17.3, class split_view::iterator
 struct iterator; // exposition only

 // 26.7.17.4, class split_view::sentinel
 struct sentinel; // exposition only

public:
 split_view()
 requires default_initializable<V> && default_initializable<Pattern> = default;
 constexpr explicit split_view(V base, Pattern pattern);

 template<forward_range R>
 requires constructible_from<V, views::all_t<R>> &&
 constructible_from<Pattern, single_view<range_value_t<R>>>
 constexpr explicit split_view(R&& r, range_value_t<R> e);

 constexpr V base() const & requires copy_constructible<V> { return base_; }
 constexpr V base() && { return std::move(base_); }

 constexpr iterator begin();

 constexpr auto end() {
 if constexpr (common_range<V>) {
 return iterator{*this, ranges::end(base_), {}};
 } else {
 return sentinel{*this};
 }
 }

 constexpr subrange<iterator_t<V>> find-next(iterator_t<V>); // exposition only
};

template<class R, class P>
split_view(R&&, P&&) -> split_view<views::all_t<R>, views::all_t<P>>;

template<forward_range R>
split_view(R&&, range_value_t<R>)
 -> split_view<views::all_t<R>, single_view<range_value_t<R>>>;
}

```

1      *Effects:* Initializes *base\_* with `std::move(base)`, and *pattern\_* with `std::move(pattern)`.

```

template<forward_range R>
 requires constructible_from<V, views::all_t<R>> &&
 constructible_from<Pattern, single_view<range_value_t<R>>>
constexpr explicit split_view(R&& r, range_value_t<R> e);

```

2      *Effects:* Initializes *base\_* with `views::all(std::forward<R>(r))`, and *pattern\_* with `views::single(std::move(e))`.

constexpr iterator begin();

3      *Returns:* `{*this, ranges::begin(base_), find-next(ranges::begin(base_))}`.

4      *Remarks:* In order to provide the amortized constant time complexity required by the `range` concept, this function caches the result within the `split_view` for use on subsequent calls.

constexpr subrange<iterator\_t<V>> find-next(iterator\_t<V> it);

5      *Effects:* Equivalent to:

```
auto [b, e] = ranges::search(subrange(it, ranges::end(base_)), pattern_);
```

```

 if (b != ranges::end(base_) && ranges::empty(pattern_)) {
 ++b;
 ++e;
 }
 return {b, e};
}

```

26.7.17.3 Class `split_view::iterator`

[range.split.iterator]

```

namespace std::ranges {
 template<forward_range V, forward_range Pattern>
 requires view<V> && view<Pattern> &&
 indirectly_comparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to>
 class split_view<V, Pattern>::iterator {
 private:
 split_view* parent_ = nullptr; // exposition only
 iterator_t<V> cur_ = iterator_t<V>(); // exposition only
 subrange<iterator_t<V>> next_ = subrange<iterator_t<V>>(); // exposition only
 bool trailing_empty_ = false; // exposition only

 public:
 using iterator_concept = forward_iterator_tag;
 using iterator_category = input_iterator_tag;
 using value_type = subrange<iterator_t<V>>;
 using difference_type = range_difference_t<V>;

 iterator() = default;
 constexpr iterator(split_view& parent, iterator_t<V> current, subrange<iterator_t<V>> next);

 constexpr iterator_t<V> base() const;
 constexpr value_type operator*() const;

 constexpr iterator& operator++();
 constexpr iterator operator++(int);

 friend constexpr bool operator==(const iterator& x, const iterator& y);
 };
 }

 constexpr iterator(split_view& parent, iterator_t<V> current, subrange<iterator_t<V>> next);
}

```

<sup>1</sup> *Effects:* Initializes `parent_` with `addressof(parent)`, `cur_` with `std::move(current)`, and `next_-` with `std::move(next)`.

`constexpr iterator_t<V> base() const;`

<sup>2</sup> *Effects:* Equivalent to `return cur_;`

`constexpr value_type operator*() const;`

<sup>3</sup> *Effects:* Equivalent to `return {cur_, next_.begin()};`

`constexpr iterator& operator++();`

<sup>4</sup> *Effects:* Equivalent to:

```

 cur_ = next_.begin();
 if (cur_ != ranges::end(parent_->base_)) {
 cur_ = next_.end();
 if (cur_ == ranges::end(parent_->base_)) {
 trailing_empty_ = true;
 next_ = {cur_, cur_};
 } else {
 next_ = parent_->find-next(cur_);
 }
 } else {
 trailing_empty_ = false;
 }
 return *this;
 }
}

```

```

constexpr iterator operator++(int);
5 Effects: Equivalent to:
 auto tmp = *this;
 ***this;
 return tmp;

friend constexpr bool operator==(const iterator& x, const iterator& y);
6 Effects: Equivalent to:
 return x.cur_ == y.cur_ && x.trailing_empty_ == y.trailing_empty_;

```

#### 26.7.17.4 Class `split_view::sentinel`

[range.split.sentinel]

```

namespace std::ranges {
 template<forward_range V, forward_range Pattern>
 requires view<V> && view<Pattern> &&
 indirectly_comparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to>
 struct split_view<V, Pattern>::sentinel {
 private:
 sentinel_t<V> end_ = sentinel_t<V>(); // exposition only

 public:
 sentinel() = default;
 constexpr explicit sentinel(split_view& parent);

 friend constexpr bool operator==(const iterator& x, const sentinel& y);
 };
}

```

1     Effects: Initializes `end_` with `ranges::end(parent.base_)`.

friend constexpr bool operator==(const iterator& x, const sentinel& y);

2     Effects: Equivalent to: `return x.cur_ == y.end_ && !x.trailing_empty_;`

#### 26.7.18 Counted view

[range.counted]

- 1 A counted view presents a view of the elements of the counted range (25.3.1)  $i + [0, n)$  for an iterator  $i$  and non-negative integer  $n$ .
- 2 The name `views::counted` denotes a customization point object (16.3.3.3.5). Let  $E$  and  $F$  be expressions, let  $T$  be `decay_t<decltype((E))>, and let  $D$  be iter_difference_t<T>. If decltype((F)) does not model convertible_to<D>, views::counted(E, F) is ill-formed.`

NOTE: This case can result in substitution failure when `views::counted(E, F)` appears in the immediate context of a template instantiation.

Otherwise, `views::counted(E, F)` is expression-equivalent to:

- (2.1) — If  $T$  models `contiguous_iterator`, then `span(to_address(E), static_cast<size_t>(static_cast<D>(F)))`.
- (2.2) — Otherwise, if  $T$  models `random_access_iterator`, then `subrange(E, E + static_cast<D>(F))`, except that  $E$  is evaluated only once.
- (2.3) — Otherwise, `subrange(counted_iterator(E, F), default_sentinel)`.

#### 26.7.19 Common view

[range.common]

##### 26.7.19.1 Overview

[range.common.overview]

- 1 `common_view` takes a view which has different types for its iterator and sentinel and turns it into a view of the same elements with an iterator and sentinel of the same type.
- 2 NOTE: `common_view` is useful for calling legacy algorithms that expect a range's iterator and sentinel types to be the same.

<sup>3</sup> The name `views::common` denotes a range adaptor object (26.7.2). Given a subexpression `E`, the expression `views::common(E)` is expression-equivalent to:

- (3.1) — `views::all(E)`, if `decltype((E))` models `common_range` and `views::all(E)` is a well-formed expression.
- (3.2) — Otherwise, `common_view{E}`.

<sup>4</sup> EXAMPLE:

```
// Legacy algorithm:
template<class ForwardIterator>
size_t count(ForwardIterator first, ForwardIterator last);

template<forward_range R>
void my_algo(R&& r) {
 auto&& common = views::common(r);
 auto cnt = count(common.begin(), common.end());
 // ...
}
```

#### 26.7.19.2 Class template `common_view`

[range.common.view]

```
namespace std::ranges {
 template<view V>
 requires (!common_range<V> && copyable<iterator_t<V>>)
 class common_view : public view_interface<common_view<V>> {
 private:
 V base_ = V(); // exposition only

 public:
 common_view() requires default_initializable<V> = default;

 constexpr explicit common_view(V r);

 constexpr V base() const & requires copy_constructible<V> { return base_; }
 constexpr V base() && { return std::move(base_); }

 constexpr auto begin() {
 if constexpr (random_access_range<V> && sized_range<V>)
 return ranges::begin(base_);
 else
 return common_iterator<iterator_t<V>, sentinel_t<V>>(ranges::begin(base_));
 }

 constexpr auto begin() const requires range<const V> {
 if constexpr (random_access_range<const V> && sized_range<const V>)
 return ranges::begin(base_);
 else
 return common_iterator<iterator_t<const V>, sentinel_t<const V>>(ranges::begin(base_));
 }

 constexpr auto end() {
 if constexpr (random_access_range<V> && sized_range<V>)
 return ranges::begin(base_) + ranges::distance(base_);
 else
 return common_iterator<iterator_t<V>, sentinel_t<V>>(ranges::end(base_));
 }

 constexpr auto end() const requires range<const V> {
 if constexpr (random_access_range<const V> && sized_range<const V>)
 return ranges::begin(base_) + ranges::distance(base_);
 else
 return common_iterator<iterator_t<const V>, sentinel_t<const V>>(ranges::end(base_));
 }
 };
}
```

```

 constexpr auto size() requires sized_range<V> {
 return ranges::size(base_);
 }
 constexpr auto size() const requires sized_range<const V> {
 return ranges::size(base_);
 }
};

template<class R>
common_view(R&&) -> common_view<views::all_t<R>>;
}

constexpr explicit common_view(V base);

```

1      *Effects:* Initializes *base\_* with `std::move(base)`.

## 26.7.20 Reverse view

[range.reverse]

### 26.7.20.1 Overview

[range.reverse.overview]

- 1 `reverse_view` takes a bidirectional view and produces another view that iterates the same elements in reverse order.
  - 2 The name `views::reverse` denotes a range adaptor object (26.7.2). Given a subexpression *E*, the expression `views::reverse(E)` is expression-equivalent to:
    - (2.1) — If the type of *E* is a (possibly cv-qualified) specialization of `reverse_view`, equivalent to `E.base()`.
    - (2.2) — Otherwise, if the type of *E* is *cv subrange<reverse\_iterator<I>, reverse\_iterator<I>, K>* for some iterator type *I* and value *K* of type `subrange_kind`,
      - (2.2.1) — if *K* is `subrange_kind::sized`, equivalent to:
 
$$\text{subrange<}I, I, K\text{>}(E.\text{end}().\text{base}(), E.\text{begin}().\text{base}(), E.\text{size}())$$
      - (2.2.2) — otherwise, equivalent to:
 
$$\text{subrange<}I, I, K\text{>}(E.\text{end}().\text{base}(), E.\text{begin}().\text{base}())$$
- However, in either case *E* is evaluated only once.
- (2.3) — Otherwise, equivalent to `reverse_view{E}`.

3 EXAMPLE:

```

vector<int> is {0,1,2,3,4};
for (int i : is | views::reverse)
 cout << i << ' '; // prints 4 3 2 1 0

```

### 26.7.20.2 Class template reverse\_view

[range.reverse.view]

```

namespace std::ranges {
 template<view V>
 requires bidirectional_range<V>
 class reverse_view : public view_interface<reverse_view<V>> {
 private:
 V base_ = V(); // exposition only

 public:
 reverse_view() requires default_initializable<V> = default;

 constexpr explicit reverse_view(V r);

 constexpr V base() const & requires copy_constructible<V> { return base_; }
 constexpr V base() && { return std::move(base_); }

 constexpr reverse_iterator<iterator_t<V>> begin();
 constexpr reverse_iterator<iterator_t<V>> begin() requires common_range<V>;
 constexpr auto begin() const requires common_range<const V>;

 constexpr reverse_iterator<iterator_t<V>> end();
 constexpr auto end() const requires common_range<const V>;
 };
}

```

```

constexpr auto size() requires sized_range<V> {
 return ranges::size(base_);
}

constexpr auto size() const requires sized_range<const V> {
 return ranges::size(base_);
}

template<class R>
reverse_view(R&&) -> reverse_view<views::all_t<R>>;
};

constexpr explicit reverse_view(V base);

1 Effects: Initializes base_ with std::move(base).

constexpr reverse_iterator<iterator_t<V>> begin();

2 Returns:
 make_reverse_iterator(ranges::next(ranges::begin(base_), ranges::end(base_)))

3 Remarks: In order to provide the amortized constant time complexity required by the range concept,
this function caches the result within the reverse_view for use on subsequent calls.

constexpr reverse_iterator<iterator_t<V>> begin() requires common_range<V>;
constexpr auto begin() const requires common_range<const V>;
4 Effects: Equivalent to: return make_reverse_iterator(ranges::end(base_));

constexpr reverse_iterator<iterator_t<V>> end();
constexpr auto end() const requires common_range<const V>;
5 Effects: Equivalent to: return make_reverse_iterator(ranges::begin(base_));

```

## 26.7.21 As const view

[range.as.const]

### 26.7.21.1 Overview

[range.as.const.overview]

- 1 *as\_const\_view* presents a view of an underlying sequence as constant. That is, the elements of an *as\_const\_view* cannot be modified.
- 2 The name *views::as\_const* denotes a range adaptor object (26.7.2). Let *E* be an expression, let *T* be *decltype((E))*, and let *U* be *remove\_cvref\_t<T>*. The expression *views::as\_const(E)* is expression-equivalent to:
  - (2.1) — If *views::all\_t<T>* models *constant\_range*, then *views::all(E)*.
  - (2.2) — Otherwise, if *U* denotes *empty\_view<X>* for some type *X*, then *auto(views::empty<const X>)*.
  - (2.3) — Otherwise, if *U* denotes *span<X, Extent>* for some type *X* and some extent *Extent*, then *span<const X, Extent>(E)*.
  - (2.4) — Otherwise, if *U* denotes *ref\_view<X>* for some type *X* and *const X* models *constant\_range*, then *ref\_view(static\_cast<const X&>(E.base()))*.
  - (2.5) — Otherwise, if *E* is an lvalue, *const U* models *constant\_range*, and *U* does not model *view*, then *ref\_view(static\_cast<const U&>(E))*.
  - (2.6) — Otherwise, *as\_const\_view(E)*.

#### 3 EXAMPLE:

```

template<constant_range R>
void cant_touch_this(R&&);

vector<char> hammer = {'m', 'c'};
span<char> beat = hammer;
cant_touch_this(views::as_const(beat)); // will not modify the elements of hammer

```

### 26.7.21.2 Class template `as_const_view`

[range.as.const.view]

```
namespace std::ranges {
 template<view V>
 requires input_range<V>
 class as_const_view : public view_interface<as_const_view<V>> {
 V base_ = V(); // exposition only

 public:
 as_const_view() requires default_initializable<V> = default;
 constexpr explicit as_const_view(V base);

 constexpr V base() const & requires copy_constructible<V> { return base_; }
 constexpr V base() && { return std::move(base_); }

 constexpr auto begin() requires (!simple_view<V>) { return ranges::cbegin(base_); }
 constexpr auto begin() const requires range<const V> { return ranges::cbegin(base_); }

 constexpr auto end() requires (!simple_view<V>) { return ranges::cend(base_); }
 constexpr auto end() const requires range<const V> { return ranges::cend(base_); }

 constexpr auto size() requires sized_range<V> { return ranges::size(base_); }
 constexpr auto size() const requires sized_range<const V> { return ranges::size(base_); }
 };

 template<class R>
 as_const_view(R&&) -> as_const_view<views::all_t<R>>;
}

constexpr explicit as_const_view(V base);
```

<sup>1</sup> Effects: Initializes `base_` with `std::move(base)`.

### 26.7.22 Elements view

[range.elements]

#### 26.7.22.1 Overview

[range.elements.overview]

- <sup>1</sup> `elements_view` takes a view of tuple-like values and a `size_t`, and produces a view with a value-type of the  $N^{\text{th}}$  element of the adapted view's value-type.
- 2 The name `views::elements<N>` denotes a range adaptor object (26.7.2). Given a subexpression `E` and constant expression `N`, the expression `views::elements<N>(E)` is expression-equivalent to `elements_view<views::all_t<decltype((E))>, N>{E}`.

EXAMPLE 1:

```
auto historical_figures = map{
 pair{"Lovelace"sv, 1815},
 {"Turing"sv, 1912},
 {"Babbage"sv, 1791},
 {"Hamilton"sv, 1936}
};

auto names = historical_figures | views::elements<0>;
for (auto&& name : names) {
 cout << name << ' '; // prints Babbage Hamilton Lovelace Turing
}

auto birth_years = historical_figures | views::elements<1>;
for (auto&& born : birth_years) {
 cout << born << ' '; // prints 1791 1936 1815 1912
}
```

- 3 `keys_view` is an alias for `elements_view<R, 0>`, and is useful for extracting keys from associative containers.

EXAMPLE 2:

```
auto names = historical_figures | views::keys;
```

```
for (auto&& name : names) {
 cout << name << ' '; // prints Babbage Hamilton Lovelace Turing
}
```

- <sup>4</sup> values\_view is an alias for elements\_view<R, 1>, and is useful for extracting values from associative containers.

EXAMPLE 3:

```
auto is_even = [](const auto x) { return x % 2 == 0; };
cout << ranges::count_if(historical_figures | views::values, is_even); // prints 2
```

### 26.7.22.2 Class template elements\_view

[range.elements.view]

```
namespace std::ranges {
 template<class T, size_t N>
 concept has-tuple-element =
 tuple-like<T> && N < tuple_size_v<T>; // exposition only

 template<class T, size_t N>
 concept returnable-element =
 is_reference_v<T> || move_constructible<tuple_element_t<N, T>>; // exposition only

 template<input_range V, size_t N>
 requires view<V> && has-tuple-element<range_value_t<V>, N> &&
 has-tuple-element<remove_reference_t<range_reference_t<V>>, N> &&
 returnable-element<range_reference_t<V>, N>
 class elements_view : public view_interface<elements_view<V, N>> {
 public:
 elements_view() requires default_initializable<V> = default;
 constexpr explicit elements_view(V base);

 constexpr V base() const & requires copy_constructible<V> { return base_; }
 constexpr V base() && { return std::move(base_); }

 constexpr auto begin() requires (!simple_view<V>)
 { return iterator<false>(ranges::begin(base_)); }

 constexpr auto begin() const requires range<const V>
 { return iterator<true>(ranges::begin(base_)); }

 constexpr auto end() requires (!simple_view<V> && !common_range<V>)
 { return sentinel<false>(ranges::end(base_)); }

 constexpr auto end() const requires (!simple_view<V> && common_range<V>)
 { return iterator<false>(ranges::end(base_)); }

 constexpr auto end() const requires range<const V>
 { return sentinel<true>(ranges::end(base_)); }

 constexpr auto end() const requires common_range<const V>
 { return iterator<true>(ranges::end(base_)); }

 constexpr auto size() requires sized_range<V>
 { return ranges::size(base_); }

 constexpr auto size() const requires sized_range<const V>
 { return ranges::size(base_); }

 private:
 // 26.7.22.3, class template elements_view::iterator
 template<bool> class iterator; // exposition only

 // 26.7.22.4, class template elements_view::sentinel
 template<bool> class sentinel; // exposition only

```

```

 V base_ = V(); // exposition only
 };
}

constexpr explicit elements_view(V base);

1 Effects: Initializes base_ with std::move(base).

```

**26.7.22.3 Class template elements\_view::iterator** [range.elements.iterator]

```

namespace std::ranges {
 template<input_range V, size_t N>
 requires view<V> && has-tuple-element<range_value_t<V>, N> &&
 has-tuple-element<remove_reference_t<range_reference_t<V>>, N> &&
 returnable-element<range_reference_t<V>, N>
 template<bool Const>
 class elements_view<V, N>::iterator {
 using Base = maybe-const<Const, V>; // exposition only
 iterator_t<Base> current_ = iterator_t<Base>(); // exposition only
 static constexpr decltype(auto) get-element(const iterator_t<Base>& i); // exposition only

public:
 using iterator_concept = see below;
 using iterator_category = see below; // not always present
 using value_type = remove_cvref_t<tuple_element_t<N, range_value_t<Base>>>;
 using difference_type = range_difference_t<Base>;
 iterator() requires default_initializable<iterator_t<Base>> = default;
 constexpr explicit iterator(iterator_t<Base> current);
 constexpr iterator(iterator<!Const> i)
 requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;
 constexpr const iterator_t<Base>& base() const & noexcept;
 constexpr iterator_t<Base> base() &&;
 constexpr decltype(auto) operator*() const
 { return get-element(current_); }

 constexpr iterator& operator++();
 constexpr void operator++(int);
 constexpr iterator operator++(int) requires forward_range<Base>;
 constexpr iterator& operator--() requires bidirectional_range<Base>;
 constexpr iterator operator--(int) requires bidirectional_range<Base>;
 constexpr iterator& operator+=(difference_type x)
 requires random_access_range<Base>;
 constexpr iterator& operator-=(difference_type x)
 requires random_access_range<Base>;
 constexpr decltype(auto) operator[](difference_type n) const
 requires random_access_range<Base>
 { return get-element(current_ + n); }

 friend constexpr bool operator==(const iterator& x, const iterator& y)
 requires equality_comparable<iterator_t<Base>>;
 friend constexpr bool operator<(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
 friend constexpr bool operator>(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
 friend constexpr bool operator<=(const iterator& x, const iterator& y)
 requires random_access_range<Base>;

```

```

friend constexpr bool operator>=(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
 requires random_access_range<Base> && three_way_comparable<iterator_t<Base>>;
friend constexpr iterator operator+(const iterator& x, difference_type y)
 requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type x, const iterator& y)
 requires random_access_range<Base>;
friend constexpr iterator operator-(const iterator& x, difference_type y)
 requires random_access_range<Base>;
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
 requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;
};

}

```

<sup>1</sup> The member *typedef-name iterator\_concept* is defined as follows:

- (1.1) — If *Base* models *random\_access\_range*, then *iterator\_concept* denotes *random\_access\_iterator\_tag*.
  - (1.2) — Otherwise, if *Base* models *bidirectional\_range*, then *iterator\_concept* denotes *bidirectional\_iterator\_tag*.
  - (1.3) — Otherwise, if *Base* models *forward\_range*, then *iterator\_concept* denotes *forward\_iterator\_tag*.
  - (1.4) — Otherwise, *iterator\_concept* denotes *input\_iterator\_tag*.
- <sup>2</sup> The member *typedef-name iterator\_category* is defined if and only if *Base* models *forward\_range*. In that case, *iterator\_category* is defined as follows: Let C denote the type *iterator\_traits<iterator\_t<Base>>::iterator\_category*.
- (2.1) — If *std::get<N>(\*current\_)* is an rvalue, *iterator\_category* denotes *input\_iterator\_tag*.
  - (2.2) — Otherwise, if C models *derived\_from<random\_access\_iterator\_tag>*, *iterator\_category* denotes *random\_access\_iterator\_tag*.
  - (2.3) — Otherwise, *iterator\_category* denotes C.

```
static constexpr decltype(auto) get-element(const iterator_t<Base>& i);
```

<sup>3</sup> *Effects*: Equivalent to:

```

if constexpr (is_reference_v<range_reference_t<Base>>) {
 return std::get<N>(*i);
} else {
 using E = remove_cv_t<tuple_element_t<N, range_reference_t<Base>>>;
 return static_cast<E>(std::get<N>(*i));
}

```

```

24 Effects: Equivalent to: return x.current_ - y.current_;

```

#### 26.7.22.4 Class template elements\_view::sentinel [range.elements.sentinel]

```

namespace std::ranges {
 template<input_range V, size_t N>
 requires view<V> && has-tuple-element<range_value_t<V>, N> &&
 has-tuple-element<remove_reference_t<range_reference_t<V>>, N> &&
 returnable-element<range_reference_t<V>, N>
 template<bool Const>
 class elements_view<V, N>::sentinel {
 private:
 using Base = maybe_const<Const, V>; // exposition only
 sentinel_t<Base> end_ = sentinel_t<Base>(); // exposition only

 public:
 sentinel() = default;
 constexpr explicit sentinel(sentinel_t<Base> end);
 constexpr sentinel(sentinel<!Const> other)
 requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
 constexpr sentinel_t<Base> base() const;

 template<bool OtherConst>
 requires sentinel_for<sentinel_t<Base>, iterator_t<maybe_const<OtherConst, V>>>
 friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

 template<bool OtherConst>
 requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe_const<OtherConst, V>>>
 friend constexpr range_difference_t<maybe_const<OtherConst, V>>
 operator-(const iterator<OtherConst>& x, const sentinel& y);
 };
}

```

constexpr explicit sentinel(sentinel\_t<Base> end);

1 Effects: Initializes `end_` with `end`.

constexpr sentinel(sentinel<!Const> other)
 requires Const && convertible\_to<sentinel\_t<V>, sentinel\_t<Base>>;

2 Effects: Initializes `end_` with `std::move(other.end_)`.

constexpr sentinel\_t<Base> base() const;

3 Effects: Equivalent to: return `end_`;

```

template<bool OtherConst>
 requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

```

## 26.7.23 Enumerate view

[range.enumerate]

### 26.7.23.1 Overview

[range.enumerate.overview]

- 1 `enumerate_view` is a view whose elements represent both the position and value from a sequence of elements.
- 2 The name `views::enumerate` denotes a range adaptor object. Given a subexpression `E`, the expression `views::enumerate(E)` is expression-equivalent to `enumerate_view<views::all_t<decltype((E))>>(E)`.

EXAMPLE:

```

vector<int> vec{ 1, 2, 3 };
for (auto [index, value] : views::enumerate(vec))
 cout << index << ":" << value << ' '; // prints 0:1 1:2 2:3

```

### 26.7.23.2 Class template `enumerate_view`

[range.enumerate.view]

```

namespace std::ranges {
 template<view V>
 requires range-with-movable-references<V>
 class enumerate_view : public view_interface<enumerate_view<V>> {
 V base_ = V(); // exposition only

 // 26.7.23.3, class template enumerate_view::iterator
 template<bool Const>
 class iterator; // exposition only

 // 26.7.23.4, class template enumerate_view::sentinel
 template<bool Const>
 class sentinel; // exposition only

 public:
 constexpr enumerate_view() requires default_initializable<V> = default;
 constexpr explicit enumerate_view(V base);

 constexpr auto begin() requires (!simple-view<V>)
 { return iterator<false>(ranges::begin(base_), 0); }
 constexpr auto begin() const requires range-with-movable-references<const V>
 { return iterator<true>(ranges::begin(base_), 0); }

 constexpr auto end() requires (!simple-view<V>) {
 if constexpr (common_range<V> && sized_range<V>)
 return iterator<false>(ranges::end(base_), ranges::distance(base_));
 else
 return sentinel<false>(ranges::end(base_));
 }
 constexpr auto end() const requires range-with-movable-references<const V> {
 if constexpr (common_range<const V> && sized_range<const V>)
 return iterator<true>(ranges::end(base_), ranges::distance(base_));
 }
 };
}

```

```

 else
 return sentinel<true>(ranges::end(base_));
 }

constexpr auto size() requires sized_range<V>
{ return ranges::size(base_); }
constexpr auto size() const requires sized_range<const V>
{ return ranges::size(base_); }

constexpr V base() const & requires copy_constructible<V> { return base_; }
constexpr V base() && { return std::move(base_); }
};

template<class R>
enumerate_view(R&&) -> enumerate_view<views::all_t<R>>;
}

constexpr explicit enumerate_view(V base);

```

<sup>1</sup> Effects: Initializes *base\_* with `std::move(base)`.

#### 26.7.23.3 Class template `enumerate_view::iterator`

[range.enumerate.iterator]

```

namespace std::ranges {
 template<view V>
 requires range_with_movable_references<V>
 template<bool Const>
 class enumerate_view<V>::iterator {
 using Base = maybe_const<Const, V>; // exposition only

 public:
 using iterator_category = input_iterator_tag;
 using iterator_concept = see below;
 using difference_type = range_difference_t<Base>;
 using value_type = tuple<difference_type, range_value_t<Base>>;

 private:
 using reference_type = tuple<difference_type, range_reference_t<Base>>; // exposition only
 iterator_t<Base> current_ = iterator_t<Base>(); // exposition only
 difference_type pos_ = 0; // exposition only

 constexpr explicit
 iterator(iterator_t<Base> current, difference_type pos); // exposition only

 public:
 iterator() requires default_initializable<iterator_t<Base>> = default;
 constexpr iterator(iterator<!Const> i)
 requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;

 constexpr const iterator_t<Base>& base() const & noexcept;
 constexpr iterator_t<Base> base() &&;

 constexpr difference_type index() const noexcept;

 constexpr auto operator*() const {
 return reference_type(pos_, *current_);
 }

 constexpr iterator& operator++();
 constexpr void operator++(int);
 constexpr iterator operator++(int) requires forward_range<Base>;

 constexpr iterator& operator--() requires bidirectional_range<Base>;
 constexpr iterator operator--(int) requires bidirectional_range<Base>;

```

```

constexpr iterator& operator+=(difference_type x)
 requires random_access_range<Base>;
constexpr iterator& operator-=(difference_type x)
 requires random_access_range<Base>;

constexpr auto operator[](difference_type n) const
 requires random_access_range<Base>
{ return reference_type(pos_ + n, current_[n]); }

friend constexpr bool operator==(const iterator& x, const iterator& y) noexcept;
friend constexpr strong_ordering operator<=>(const iterator& x, const iterator& y) noexcept;

friend constexpr iterator operator+(const iterator& x, difference_type y)
 requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type x, const iterator& y)
 requires random_access_range<Base>;
friend constexpr iterator operator-(const iterator& x, difference_type y)
 requires random_access_range<Base>;
friend constexpr difference_type operator-(const iterator& x, const iterator& y);

friend constexpr auto iter_move(const iterator& i)
 noexcept(noexcept(ranges::iter_move(i.current_)) &&
 is_nothrow_move_constructible_v<range_rvalue_reference_t<Base>>) {
 return tuple<difference_type,
 range_rvalue_reference_t<Base>>(i.pos_, ranges::iter_move(i.current_));
}
};

}

1 The member typedef-name iterator::iterator_concept is defined as follows:
(1.1) — If Base models random_access_range, then iterator_concept denotes random_access_iterator_tag.
(1.2) — Otherwise, if Base models bidirectional_range, then iterator_concept denotes bidirectional_iterator_tag.
(1.3) — Otherwise, if Base models forward_range, then iterator_concept denotes forward_iterator_tag.
(1.4) — Otherwise, iterator_concept denotes input_iterator_tag.

```

2 The member *explicit iterator(iterator\_t<Base> current, difference\_type pos)*

*Effects:* Initializes *current\_* with *std::move(current)* and *pos\_* with *pos*.

3 The member *iterator(iterator\_t<Base> i)*  
*requires Const && convertible\_to<iterator\_t<V>, iterator\_t<Base>>;*

*Effects:* Initializes *current\_* with *std::move(i.current\_)* and *pos\_* with *i.pos\_*.

4 The member *const iterator\_t<Base>& base()* *const & noexcept;*

*Effects:* Equivalent to: *return current\_*;

5 The member *const iterator\_t<Base> base() &&;*

*Effects:* Equivalent to: *return std::move(current\_)*;

6 The member *difference\_type index() const noexcept;*

*Effects:* Equivalent to: *return pos\_*;

7 The member *constexpr iterator& operator++()*;

*Effects:* Equivalent to:

```

 ++current_;
 ++pos_;
 return *this;
}
```

```

constexpr void operator++(int);
8 Effects: Equivalent to $+++this$.
constexpr iterator operator++(int) requires forward_range<Base>;
9 Effects: Equivalent to:
 auto temp = *this;
 $+++this$;
 return temp;

constexpr iterator& operator--() requires bidirectional_range<Base>;
10 Effects: Equivalent to:
 $--current_{}$;
 $--pos_{}$;
 return *this;

constexpr iterator operator--(int) requires bidirectional_range<Base>;
11 Effects: Equivalent to:
 auto temp = *this;
 $--*this$;
 return temp;

constexpr iterator& operator+=(difference_type n)
 requires random_access_range<Base>;
12 Effects: Equivalent to:
 current_ += n;
 pos_ += n;
 return *this;

constexpr iterator& operator-=(difference_type n)
 requires random_access_range<Base>;
13 Effects: Equivalent to:
 current_ -= n;
 pos_ -= n;
 return *this;

friend constexpr bool operator==(const iterator& x, const iterator& y) noexcept;
14 Effects: Equivalent to: return x.pos_ == y.pos_;

friend constexpr strong_ordering operator<=>(const iterator& x, const iterator& y) noexcept;
15 Effects: Equivalent to: return x.pos_ <=> y.pos_;

friend constexpr iterator operator+(const iterator& x, difference_type y)
 requires random_access_range<Base>;
16 Effects: Equivalent to:
 auto temp = x;
 temp += y;
 return temp;

friend constexpr iterator operator+(difference_type x, const iterator& y)
 requires random_access_range<Base>;
17 Effects: Equivalent to: return y + x;

friend constexpr iterator operator-(const iterator& x, difference_type y)
 requires random_access_range<Base>;
18 Effects: Equivalent to:
 auto temp = x;
 temp -= y;
 return temp;

```

```
friend constexpr difference_type operator-(const iterator& x, const iterator& y);
19 Effects: Equivalent to: return x.pos_ - y.pos_;
```

#### 26.7.23.4 Class template `enumerate_view::sentinel`

[range.enumerate.sentinel]

```
namespace std::ranges {
 template<view V>
 requires range-with-movable-references<V>
 template<bool Const>
 class enumerate_view<V>::sentinel {
 using Base = maybe-const<Const, V>;
 sentinel_t<Base> end_ = sentinel_t<Base>(); // exposition only
 constexpr explicit sentinel(sentinel_t<Base> end); // exposition only
 constexpr explicit sentinel(sentinel_t<Base> end); // exposition only

 public:
 sentinel() = default;
 constexpr sentinel(sentinel<!Const> other)
 requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
 constexpr sentinel_t<Base> base() const;

 template<bool OtherConst>
 requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
 friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

 template<bool OtherConst>
 requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
 friend constexpr range_difference_t<maybe-const<OtherConst, V>>
 operator-(const iterator<OtherConst>& x, const sentinel& y);

 template<bool OtherConst>
 requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
 friend constexpr range_difference_t<maybe-const<OtherConst, V>>
 operator-(const sentinel& x, const iterator<OtherConst>& y);
 };
 };
}

constexpr explicit sentinel(sentinel_t<Base> end);
1 Effects: Initializes end_ with std::move(end).
```

```
constexpr sentinel(sentinel<!Const> other)
 requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
```

2 Effects: Initializes `end_` with `std::move(other.end_)`.

```
constexpr sentinel_t<Base> base() const;
```

3 Effects: Equivalent to: return `end_`;

```
template<bool OtherConst>
 requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
```

4 Effects: Equivalent to: return `x.current_ == y.end_`;

```
template<bool OtherConst>
 requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr range_difference_t<maybe-const<OtherConst, V>>
 operator-(const iterator<OtherConst>& x, const sentinel& y);
```

5 Effects: Equivalent to: return `x.current_ - y.end_`;

```
template<bool OtherConst>
 requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr range_difference_t<maybe-const<OtherConst, V>>
 operator-(const sentinel& x, const iterator<OtherConst>& y);
```

6 Effects: Equivalent to: return `x.end_ - y.current_`;

## 26.7.24 Zip view

[range.zip]

### 26.7.24.1 Overview

[range.zip.overview]

- <sup>1</sup> `zip_view` takes any number of views and produces a view of tuples of references to the corresponding elements of the constituent views.
- The name `views::zip` denotes a customization point object (16.3.3.5). Given a pack of subexpressions `Es...`, the expression `views::zip(Es...)` is expression-equivalent to
  - (2.1) — `auto(views::empty<tuple<>>)` if `Es` is an empty pack,
  - (2.2) — otherwise, `zip_view<views::all_t<decltype((Es))>...>(Es...)`.

EXAMPLE:

```
vector v = {1, 2};
list l = {'a', 'b', 'c'};

auto z = views::zip(v, l);
range_reference_t<decltype(z)> f = z.front(); // f is a tuple<int&, char&>
 // that refers to the first element of v and l

for (auto&& [x, y] : z) {
 cout << '(' << x << ", " << y << ") "; // prints (1, a) (2, b)
}
```

### 26.7.24.2 Class template `zip_view`

[range.zip.view]

```
namespace std::ranges {
 template<class... Rs>
 concept zip-is-common =
 (sizeof...(Rs) == 1 && (common_range<Rs> && ...)) ||
 (!(bidirectional_range<Rs> && ...) && (common_range<Rs> && ...)) ||
 ((random_access_range<Rs> && ...) && (sized_range<Rs> && ...));

 template<input_range... Views>
 requires (view<Views> && ...) && (sizeof...(Views) > 0)
 class zip_view : public view_interface<zip_view<Views...>> {
 tuple<Views...> views_; // exposition only

 // 26.7.24.3, class template zip_view::iterator
 template<bool> class iterator; // exposition only

 // 26.7.24.4, class template zip_view::sentinel
 template<bool> class sentinel; // exposition only

 public:
 zip_view() = default;
 constexpr explicit zip_view(Views... views);

 constexpr auto begin() requires (!(simple_view<Views> && ...)) {
 return iterator<false>(tuple_transform(ranges::begin, views_));
 }
 constexpr auto begin() const requires (range<const Views> && ...) {
 return iterator<true>(tuple_transform(ranges::begin, views_));
 }

 constexpr auto end() requires (!(simple_view<Views> && ...)) {
 if constexpr (!zip-is-common<Views...>) {
 return sentinel<false>(tuple_transform(ranges::end, views_));
 } else if constexpr ((random_access_range<Views> && ...)) {
 return begin() + iter_difference_t<iterator<false>>(size());
 } else {
 return iterator<false>(tuple_transform(ranges::end, views_));
 }
 }
 };
}
```

```

constexpr auto end() const requires (range<const Views> && ...) {
 if constexpr (!zip-is-common<const Views...>) {
 return sentinel<true>(tuple-transform(ranges::end, views_));
 } else if constexpr ((random_access_range<const Views> && ...)) {
 return begin() + iter_difference_t<iterator<true>>(size());
 } else {
 return iterator<true>(tuple-transform(ranges::end, views_));
 }
}

constexpr auto size() requires (sized_range<Views> && ...);
constexpr auto size() const requires (sized_range<const Views> && ...);
};

template<class... Rs>
zip_view(Rs&&...) -> zip_view<views::all_t<Rs>...>;
}

```

- <sup>1</sup> Two `zip_view` objects have the same underlying sequence if and only if the corresponding elements of `views_` are equal (18.2) and have the same underlying sequence.

NOTE: In particular, comparison of iterators obtained from `zip_view` objects that do not have the same underlying sequence is not required to produce meaningful results (25.3.4.11).

- ```

constexpr explicit zip_view(Views... views);
2   Effects: Initializes views_ with std::move(views).....
constexpr auto size() requires (sized_range<Views> && ...);
constexpr auto size() const requires (sized_range<const Views> && ...);
3   Effects: Equivalent to:
        return apply([](auto... sizes) {
            using CT = make-unsigned-like-t<common_type_t<decltype(sizes)...>>;
            return ranges::min({CT(sizes)...});
        }, tuple-transform(ranges::size, views_));

```

26.7.24.3 Class template `zip_view::iterator`

[range.zip.iterator]

```

namespace std::ranges {
    template<bool Const, class... Views>
    concept all-random-access =                               // exposition only
        (random_access_range<maybe-const<Const, Views>> && ...);
    template<bool Const, class... Views>
    concept all-bidirectional =                            // exposition only
        (bidirectional_range<maybe-const<Const, Views>> && ...);
    template<bool Const, class... Views>
    concept all-forward =                                // exposition only
        (forward_range<maybe-const<Const, Views>> && ...);

    template<input_range... Views>
        requires (view<Views> && ...) && (sizeof...(Views) > 0)
    template<bool Const>
    class zip_view<Views...>::iterator {
        tuple<iterator_t<maybe-const<Const, Views>>...> current_;           // exposition only
        constexpr iterator(tuple<iterator_t<maybe-const<Const, Views>>...>);      // exposition only
    public:
        using iterator_category = input_iterator_tag;                                // not always present
        using iterator_concept = see below;
        using value_type = tuple<range_value_t<maybe-const<Const, Views>>...>;
        using difference_type = common_type_t<range_difference_t<maybe-const<Const, Views>>...>;
        iterator() = default;
        constexpr iterator(iterator<!Const> i)
            requires Const && (convertible_to<iterator_t<Views>, iterator_t<const Views>> && ...);

```

```

constexpr auto operator*() const;
constexpr iterator& operator++();
constexpr void operator++(int);
constexpr iterator operator++(int) requires all-forward<Const, Views...>;

constexpr iterator& operator--() requires all-bidirectional<Const, Views...>;
constexpr iterator operator--(int) requires all-bidirectional<Const, Views...>;

constexpr iterator& operator+=(difference_type x)
    requires all-random-access<Const, Views...>;
constexpr iterator& operator-=(difference_type x)
    requires all-random-access<Const, Views...>;

constexpr auto operator[](difference_type n) const
    requires all-random-access<Const, Views...>;

friend constexpr bool operator==(const iterator& x, const iterator& y)
    requires (equality_comparable<iterator_t<maybe-const<Const, Views>>> && ...);

friend constexpr auto operator<=>(const iterator& x, const iterator& y)
    requires all-random-access<Const, Views...>;

friend constexpr iterator operator+(const iterator& i, difference_type n)
    requires all-random-access<Const, Views...>;
friend constexpr iterator operator+(difference_type n, const iterator& i)
    requires all-random-access<Const, Views...>;
friend constexpr iterator operator-(const iterator& i, difference_type n)
    requires all-random-access<Const, Views...>;
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
    requires (sized_sentinel_for<iterator_t<maybe-const<Const, Views>>,
              iterator_t<maybe-const<Const, Views>>> && ...);

friend constexpr auto iter_move(const iterator& i) noexcept(see below);

friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept(see below)
    requires (indirectly_swappable<iterator_t<maybe-const<Const, Views>>> && ...);
};

}

1 iterator::iterator_concept is defined as follows:
(1.1) — If all-random-access<Const, Views...> is modeled, then iterator_concept denotes random_access_iterator_tag.
(1.2) — Otherwise, if all-bidirectional<Const, Views...> is modeled, then iterator_concept denotes bidirectional_iterator_tag.
(1.3) — Otherwise, if all-forward<Const, Views...> is modeled, then iterator_concept denotes forward_iterator_tag.
(1.4) — Otherwise, iterator_concept denotes input_iterator_tag.

2 iterator::iterator_category is present if and only if all-forward<Const, Views...> is modeled.

3 If the invocation of any non-const member function of iterator exits via an exception, the iterator acquires a singular value.

constexpr explicit iterator(tuple<iterator_t<maybe-const<Const, Views>>...> current);

4 Effects: Initializes current_ with std::move(current).

constexpr iterator(iterator<!Const> i)
    requires Const && (convertible_to<iterator_t<Views>, iterator_t<const Views>> && ...);

5 Effects: Initializes current_ with std::move(i.current_).

constexpr auto operator*() const;

6 Effects: Equivalent to:
```

```

    return tuple-transform([](auto& i) -> decltype(auto) { return *i; }, current_);

constexpr iterator& operator++();

7   Effects: Equivalent to:
    tuple-for-each([](auto& i) { ++i; }, current_);
    return *this;

constexpr void operator++(int);

8   Effects: Equivalent to +++this.

constexpr iterator operator++(int) requires all-forward<Const, Views...>;
9   Effects: Equivalent to:
    auto tmp = *this;
    +++this;
    return tmp;

constexpr iterator& operator--() requires all-bidirectional<Const, Views...>;
10  Effects: Equivalent to:
    tuple-for-each([](auto& i) { --i; }, current_);
    return *this;

constexpr iterator operator--(int) requires all-bidirectional<Const, Views...>;
11  Effects: Equivalent to:
    auto tmp = *this;
    --*this;
    return tmp;

constexpr iterator& operator+=(difference_type x)
    requires all-random-access<Const, Views...>;
12  Effects: Equivalent to:
    tuple-for-each([&]<class I>(I& i) { i += iter_difference_t<I>(x); }, current_);
    return *this;

constexpr iterator& operator-=(difference_type x)
    requires all-random-access<Const, Views...>;
13  Effects: Equivalent to:
    tuple-for-each([&]<class I>(I& i) { i -= iter_difference_t<I>(x); }, current_);
    return *this;

constexpr auto operator[](difference_type n) const
    requires all-random-access<Const, Views...>;
14  Effects: Equivalent to:
    return tuple-transform([&]<class I>(I& i) -> decltype(auto) {
        return i[iter_difference_t<I>(n)];
    }, current_);

friend constexpr bool operator==(const iterator& x, const iterator& y)
    requires (equality_comparable<iterator_t<maybe-const<Const, Views>>> && ...);

15  Returns:
(15.1) — x.current_ == y.current_ if all-bidirectional<Const, Views...> is true.
(15.2) — Otherwise, true if there exists an integer  $0 \leq i < \text{sizeof...}(Views)$  such that bool(std::get<i>(x.current_) == std::get<i>(y.current_)) is true.
        NOTE: This allows zip_view to model common_range when all constituent views model common_range.
(15.3) — Otherwise, false.

```

friend constexpr auto operator<=>(const iterator& x, const iterator& y)
    requires all-random-access<Const, Views...>;
16   Returns: x.current_ <=> y.current_.

friend constexpr iterator operator+(const iterator& i, difference_type n)
    requires all-random-access<Const, Views...>;
friend constexpr iterator operator+(difference_type n, const iterator& i)
    requires all-random-access<Const, Views...>;
17   Effects: Equivalent to:
        auto r = i;
        r += n;
        return r;

friend constexpr iterator operator-(const iterator& i, difference_type n)
    requires all-random-access<Const, Views...>;
18   Effects: Equivalent to:
        auto r = i;
        r -= n;
        return r;

friend constexpr difference_type operator-(const iterator& x, const iterator& y)
    requires (sized_sentinel_for<iterator_t<maybe-const<Const, Views>>,
              iterator_t<maybe-const<Const, Views>>> && ...);
19   Let DIST(i) be difference_type(std::get<i>(x.current_) - std::get<i>(y.current_)).
20   Returns: The value with the smallest absolute value among DIST(n) for all integers  $0 \leq n < \text{sizeof...}(Views)$ .
friend constexpr auto iter_move(const iterator& i) noexcept(see below);
21   Effects: Equivalent to:
        return tuple-transform(ranges::iter_move, i.current_);
22   Remarks: The exception specification is equivalent to:
        (noexcept(ranges::iter_move(declval<const iterator_t<maybe-const<Const,
                                     Views>>&>()) && ...) &&
         (is_nothrow_move_constructible_v<range_rvalue_reference_t<maybe-const<Const,
                                     Views>>> && ...))

friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept(see below)
    requires (indirectly_swappable<iterator_t<maybe-const<Const, Views>>> && ...);
23   Effects: For every integer  $0 \leq i < \text{sizeof...}(Views)$ , performs:
        ranges::iter_swap(std::get<i>(l.current_), std::get<i>(r.current_))
24   Remarks: The exception specification is equivalent to the logical AND of the following expressions:
        noexcept(ranges::iter_swap(std::get<i>(l.current_), std::get<i>(r.current_)))
        for every integer  $0 \leq i < \text{sizeof...}(Views)$ .

```

26.7.24.4 Class template zip_view::sentinel

[range.zip.sentinel]

```

namespace std::ranges {

        sentinel() = default;
        constexpr sentinel(sentinel<!Const> i)
            requires Const && (convertible_to<sentinel_t<Views>, sentinel_t<const Views>> && ...);

```

```

template<bool OtherConst>
    requires (sentinel_for<sentinel_t<maybe-const<Const, Views>>,
              iterator_t<maybe-const<OtherConst, Views>>> && ...)
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

template<bool OtherConst>
    requires (sized_sentinel_for<sentinel_t<maybe-const<Const, Views>>,
              iterator_t<maybe-const<OtherConst, Views>>> && ...)
friend constexpr common_type_t<range_difference_t<maybe-const<OtherConst, Views>>...>
    operator-(const iterator<OtherConst>& x, const sentinel& y);

template<bool OtherConst>
    requires (sized_sentinel_for<sentinel_t<maybe-const<Const, Views>>,
              iterator_t<maybe-const<OtherConst, Views>>> && ...)
friend constexpr common_type_t<range_difference_t<maybe-const<OtherConst, Views>>...>
    operator-(const sentinel& y, const iterator<OtherConst>& x);
};

}

constexpr explicit sentinel(tuple<sentinel_t<maybe-const<Const, Views>>...> end);

1   Effects: Initializes end_ with end.

constexpr sentinel(sentinel<!Const> i)
    requires Const && (convertible_to<sentinel_t<Views>, sentinel_t<const Views>> && ...);

2   Effects: Initializes end_ with std::move(i.end_).

template<bool OtherConst>
    requires (sentinel_for<sentinel_t<maybe-const<Const, Views>>,
              iterator_t<maybe-const<OtherConst, Views>>> && ...)
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

3   Returns: true if there exists an integer  $0 \leq i < \text{sizeof...}(Views)$  such that bool(std::get<i>(x.current_) == std::get<i>(y.end_)) is true. Otherwise, false.

template<bool OtherConst>
    requires (sized_sentinel_for<sentinel_t<maybe-const<Const, Views>>,
              iterator_t<maybe-const<OtherConst, Views>>> && ...)
friend constexpr common_type_t<range_difference_t<maybe-const<OtherConst, Views>>...>
    operator-(const iterator<OtherConst>& x, const sentinel& y);

4   Let D be the return type. Let DIST(i) be  $D(\text{std::get<i>}(x.current_) - \text{std::get<i>}(y.end_))$ .

5   Returns: The value with the smallest absolute value among DIST(n) for all integers  $0 \leq n < \text{sizeof...}(Views)$ .

```

```

template<bool OtherConst>
    requires (sized_sentinel_for<sentinel_t<maybe-const<Const, Views>>,
              iterator_t<maybe-const<OtherConst, Views>>> && ...)
friend constexpr common_type_t<range_difference_t<maybe-const<OtherConst, Views>>...>
    operator-(const sentinel& y, const iterator<OtherConst>& x);

6   Effects: Equivalent to return -(x - y);

```

26.7.25 Zip transform view

[range.zip.transform]

26.7.25.1 Overview

[range.zip.transform.overview]

- 1 *zip_transform_view* takes an invocable object and any number of views and produces a view whose M^{th} element is the result of applying the invocable object to the M^{th} elements of all views.
- 2 The name `views::zip_transform` denotes a customization point object (16.3.3.3.5). Let F be a subexpression, and let Es... be a pack of subexpressions.
 - (2.1) — If Es is an empty pack, let FD be `decay_t<decltype((F))>`.
 - (2.1.1) — If `move_constructible<FD> && regular_invocable<FD&>` is false, or if `decay_t<invoke_result_t<FD&>>` is not an object type, `views::zip_transform(F, Es...)` is ill-formed.

- (2.1.2) — Otherwise, the expression `views::zip_transform(F, Es...)` is expression-equivalent to
`((void)F, auto(views::empty<decay_t<invoke_result_t<FD&>>>))`
- (2.2) — Otherwise, the expression `views::zip_transform(F, Es...)` is expression-equivalent to `zip_transform_view(F, Es...)`.

3 EXAMPLE:

```
vector v1 = {1, 2};
vector v2 = {4, 5, 6};

for (auto i : views::zip_transform(plus(), v1, v2)) {
    cout << i << ' ';      // prints 5 7
}
```

26.7.25.2 Class template `zip_transform_view`

[range.zip.transform.view]

```
namespace std::ranges {
    template<move_constructible F, input_range... Views>
        requires (view<Views> && ...) && (sizeof...(Views) > 0) && is_object_v<F> &&
            regular_invocable<F&, range_reference_t<Views>...> &&
            can_reference<invoke_result_t<F&, range_reference_t<Views>...>>
    class zip_transform_view : public view_interface<zip_transform_view<F, Views...>> {
        movable_box<F> fun_;                                // exposition only
        zip_view<Views...> zip_;                            // exposition only

        using InnerView = zip_view<Views...>;             // exposition only
        template<bool Const>
            using zip_iterator = iterator_t<maybe_const<Const, InnerView>>;           // exposition only
        template<bool Const>
            using sentinel = sentinel_t<maybe_const<Const, InnerView>>;           // exposition only

        // 26.7.25.3, class template zip_transform_view::iterator
        template<bool> class iterator;                      // exposition only

        // 26.7.25.4, class template zip_transform_view::sentinel
        template<bool> class sentinel;                     // exposition only

    public:
        zip_transform_view() = default;

        constexpr explicit zip_transform_view(F fun, Views... views);

        constexpr iterator(iterator<!Const> i)
            requires Const && convertible_to<zeparator<false>, zeparator<Const>>;

        constexpr decltype(auto) operator*() const noexcept(see below);
        constexpr iterator& operator++();
        constexpr void operator++(int);
        constexpr iterator operator++(int) requires forward_range<Base>;

        constexpr iterator& operator--() requires bidirectional_range<Base>;
        constexpr iterator operator--(int) requires bidirectional_range<Base>;

        constexpr iterator& operator+=(difference_type x) requires random_access_range<Base>;
        constexpr iterator& operator-=(difference_type x) requires random_access_range<Base>;

        constexpr decltype(auto) operator[](difference_type n) const
            requires random_access_range<Base>;

        friend constexpr bool operator==(const iterator& x, const iterator& y)
            requires equality_comparable<zeparator<Const>>;

```

```

friend constexpr auto operator<=(const iterator& x, const iterator& y)
    requires random_access_range<Base>;
friend constexpr iterator operator+(const iterator& i, difference_type n)
    requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type n, const iterator& i)
    requires random_access_range<Base>;
friend constexpr iterator operator-(const iterator& i, difference_type n)
    requires random_access_range<Base>;
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
    requires sized_sentinel_for<zip_iterator<Const>, zip_iterator<Const>>;
};

}

```

¹ The member *typedef-name iterator::iterator_category* is defined if and only if *Base* models *forward-range*. In that case, *iterator::iterator_category* is defined as follows:

(1.1) — If

invoke_result_t<maybe-const<Const, F>&, range_reference_t<maybe-const<Const, Views>>...>
is not a reference, *iterator_category* denotes *input_iterator_tag*.

(1.2) — Otherwise, let *Cs* denote the pack of types *iterator_traits<iterator_t<maybe-const<Const, Views>>>::iterator_category*....

(1.2.1) — If *(derived_from<Cs, random_access_iterator_tag> && ...)* is true, *iterator_category* denotes *random_access_iterator_tag*.

(1.2.2) — Otherwise, if *(derived_from<Cs, bidirectional_iterator_tag> && ...)* is true, *iterator_category* denotes *bidirectional_iterator_tag*.

(1.2.3) — Otherwise, if *(derived_from<Cs, forward_iterator_tag> && ...)* is true, *iterator_category* denotes *forward_iterator_tag*.

(1.2.4) — Otherwise, *iterator_category* denotes *input_iterator_tag*.

constexpr iterator(Parent& parent, zip_iterator<Const> inner);

² *Effects*: Initializes *parent_* with *addressof(parent)* and *inner_* with *std::move(inner)*.

constexpr iterator(iterator<!Const> i)
 requires Const && convertible_to<zip_iterator<false>, zip_iterator<Const>>;

³ *Effects*: Initializes *parent_* with *i.parent_* and *inner_* with *std::move(i.inner_)*.

constexpr decltype(auto) operator*() const noexcept(*see below*);

⁴ *Effects*: Equivalent to:

```

return apply([&](const auto&... iters) -> decltype(auto) {
    return invoke(*parent_->fun_, *iters...);
}, inner_.current_);

```

⁵ *Remarks*: Let *Is* be the pack *0, 1, ..., (sizeof...(Views)-1)*. The exception specification is equivalent to: *noexcept(invoker(*parent_->fun_, *std::get<Is>(inner_.current_))...)*.

constexpr iterator& operator++();

⁶ *Effects*: Equivalent to:

```

++inner_;
return *this;

```

constexpr void operator++(int);

⁷ *Effects*: Equivalent to: *++*this*.

constexpr iterator operator++(int) requires forward_range<Base>;

⁸ *Effects*: Equivalent to:

```

auto tmp = *this;
++*this;
return tmp;

```

```

constexpr iterator& operator--() requires bidirectional_range<Base>;
9   Effects: Equivalent to:
     --inner_;
     return *this;

constexpr iterator operator--(int) requires bidirectional_range<Base>;
10  Effects: Equivalent to:
      auto tmp = *this;
      --*this;
      return tmp;

constexpr iterator& operator+=(difference_type x)
    requires random_access_range<Base>;
11   Effects: Equivalent to:
      inner_ += x;
      return *this;

constexpr iterator& operator-=(difference_type x)
    requires random_access_range<Base>;
12   Effects: Equivalent to:
      inner_ -= x;
      return *this;

constexpr decltype(auto) operator[](difference_type n) const
    requires random_access_range<Base>;
13   Effects: Equivalent to:
      return apply([&]<class... Is>(const Is&... iters) -> decltype(auto) {
          return invoke(*parent_->fun_, iters[iter_difference_t<Is>(n)]...);
      }, inner_.current_);

friend constexpr bool operator==(const iterator& x, const iterator& y)
    requires equality_comparable<zip_iterator<Const>>;
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
    requires random_access_range<Base>;

```

14 Let *op* be the operator.

15 Effects: Equivalent to: `return x.inner_ op y.inner_;`

```

friend constexpr iterator operator+(const iterator& i, difference_type n)
    requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type n, const iterator& i)
    requires random_access_range<Base>;

```

16 Effects: Equivalent to: `return iterator(*i.parent_, i.inner_ + n);`

```

friend constexpr iterator operator-(const iterator& i, difference_type n)
    requires random_access_range<Base>;

```

17 Effects: Equivalent to: `return iterator(*i.parent_, i.inner_ - n);`

```

friend constexpr difference_type operator-(const iterator& x, const iterator& y)
    requires sized_sentinel_for<zip_iterator<Const>, zip_iterator<Const>>;

```

18 Effects: Equivalent to: `return x.inner_ - y.inner_;`

26.7.25.4 Class template `zip_transform_view::sentinel` [range.zip.transform.sentinel]

```

namespace std::ranges {
    template<move_constructible F, input_range... Views>
        requires (view<Views> && ...) && (sizeof...(Views) > 0) && is_object_v<F> &&
            regular_invocable<F&, range_reference_t<Views>...> &&
            can-reference<invoke_result_t<F&, range_reference_t<Views>...>>
    template<bool Const>
        class zip_transform_view<F, Views...>::sentinel {

```

```

    sentinel<Const> inner_;                                // exposition only
    constexpr explicit sentinel(z sentinel<Const> inner);  // exposition only

public:

}

template<bool OtherConst>
    requires sentinel_for<z sentinel<Const>, z operator<OtherConst>>
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

template<bool OtherConst>
    requires sized_sentinel_for<z sentinel<Const>, z operator<OtherConst>>
friend constexpr range_difference_t<maybe_const<OtherConst, InnerView>>
    operator-(const iterator<OtherConst>& x, const sentinel& y);

template<bool OtherConst>
    requires sized_sentinel_for<z sentinel<Const>, z operator<OtherConst>>
friend constexpr range_difference_t<maybe_const<OtherConst, InnerView>>
    operator-(const sentinel& x, const iterator<OtherConst>& y);
};

};

constexpr explicit sentinel(z sentinel<Const> inner);

1   Effects: Initializes inner_ with inner.

constexpr sentinel(sentinel<!Const> i)
    requires Const && convertible_to<z sentinel<false>, z sentinel<Const>>;
2   Effects: Initializes inner_ with std::move(i.inner_).

template<bool OtherConst>
    requires sentinel_for<z sentinel<Const>, z operator<OtherConst>>
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

3   Effects: Equivalent to: return x.inner_ == y.inner_;

template<bool OtherConst>
    requires sized_sentinel_for<z sentinel<Const>, z operator<OtherConst>>
friend constexpr range_difference_t<maybe_const<OtherConst, InnerView>>
    operator-(const iterator<OtherConst>& x, const sentinel& y);
template<bool OtherConst>
    requires sized_sentinel_for<z sentinel<Const>, z operator<OtherConst>>
friend constexpr range_difference_t<maybe_const<OtherConst, InnerView>>
    operator-(const sentinel& x, const iterator<OtherConst>& y);

4   Effects: Equivalent to: return x.inner_ - y.inner_;

```

26.7.26 Adjacent view

[range.adjacent]

26.7.26.1 Overview

[range.adjacent.overview]

- ¹ adjacent_view takes a view and produces a view whose M^{th} element is a tuple of references to the M^{th} through $(M + N - 1)^{\text{th}}$ elements of the original view. If the original view has fewer than N elements, the resulting view is empty.
- ² The name `views::adjacent<N>` denotes a range adaptor object (26.7.2). Given a subexpression E and a constant expression N, the expression `views::adjacent<N>(E)` is expression-equivalent to

- (2.1) — `((void)E, auto(views::empty<tuple<>>))` if N is equal to 0,
- (2.2) — otherwise, `adjacent_view<views::all_t<decltype((E))>, N>(E)`.

EXAMPLE:

```
vector v = {1, 2, 3, 4};
```

```
for (auto i : v | views::adjacent<2>) {
    cout << "(" << std::get<0>(i) << ", " << std::get<1>(i) << ") ";
} // prints (1, 2) (2, 3) (3, 4)
```

- 3 Define *REPEAT*(*T*, *N*) as a pack of *N* types, each of which denotes the same type as *T*.

26.7.26.2 Class template adjacent_view

[range.adjacent.view]

```
namespace std::ranges {
    template<forward_range V, size_t N>
        requires view<V> && (N > 0)
    class adjacent_view : public view_interface<adjacent_view<V, N>> {
        V base_ = V(); // exposition only

        // 26.7.26.3, class template adjacent_view::iterator
        template<bool> class iterator; // exposition only

        // 26.7.26.4, class template adjacent_view::sentinel
        template<bool> class sentinel; // exposition only

        struct as-sentinel{}; // exposition only

    public:
        adjacent_view() requires default_initializable<V> = default;
        constexpr explicit adjacent_view(V base);

        constexpr V base() const & requires copy_constructible<V> { return base_; }
        constexpr V base() && { return std::move(base_); }

        constexpr auto begin() requires (!simple_view<V>) {
            return iterator<false>(ranges::begin(base_), ranges::end(base_));
        }

        constexpr auto begin() const requires range<const V> {
            return iterator<true>(ranges::begin(base_), ranges::end(base_));
        }

        constexpr auto end() requires (!simple_view<V>) {
            if constexpr (common_range<V>) {
                return iterator<false>(as-sentinel{}, ranges::begin(base_), ranges::end(base_));
            } else {
                return sentinel<false>(ranges::end(base_));
            }
        }

        constexpr auto end() const requires range<const V> {
            if constexpr (common_range<const V>) {
                return iterator<true>(as-sentinel{}, ranges::begin(base_), ranges::end(base_));
            } else {
                return sentinel<true>(ranges::end(base_));
            }
        }

        constexpr auto size() requires sized_range<V>;
        constexpr auto size() const requires sized_range<const V>;
    };
}

constexpr explicit adjacent_view(V base);
```

- 1 *Effects:* Initializes *base_* with `std::move(base)`.

```
constexpr auto size() requires sized_range<V>;
constexpr auto size() const requires sized_range<const V>;
```

- 2 *Effects:* Equivalent to:

```

using ST = decltype(ranges::size(base_));
using CT = common_type_t<ST, size_t>;
auto sz = static_cast<CT>(ranges::size(base_));
sz -= std::min<CT>(sz, N - 1);
return static_cast<ST>(sz);

```

26.7.26.3 Class template adjacent_view::iterator [range.adjacent.iterator]

```

namespace std::ranges {
    template<forward_range V, size_t N>
        requires view<V> && (N > 0)
    template<bool Const>
    class adjacent_view<V, N>::iterator {
        using Base = maybe_const<Const, V>; // exposition only
        array<iterator_t<Base>, N> current_ = array<iterator_t<Base>, N>(); // exposition only
        constexpr iterator(iterator_t<Base> first, sentinel_t<Base> last); // exposition only
        constexpr iterator(as_sentinel, iterator_t<Base> first, iterator_t<Base> last); // exposition only
    public:
        using iterator_category = input_iterator_tag;
        using iterator_concept = see below;
        using value_type = tuple<REPEAT(range_value_t<Base>, N)...>;
        using difference_type = range_difference_t<Base>;

        iterator() = default;

            requires random_access_range<Base> &&
                three_way_comparable<iterator_t<Base>>;
        friend constexpr iterator operator+(const iterator& i, difference_type n)
            requires random_access_range<Base>;
        friend constexpr iterator operator+(difference_type n, const iterator& i)
            requires random_access_range<Base>;
        friend constexpr iterator operator-(const iterator& i, difference_type n)
            requires random_access_range<Base>;
        friend constexpr difference_type operator-(const iterator& x, const iterator& y)
            requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;

```

```

        friend constexpr auto iter_move(const iterator& i) noexcept(see below);
        friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept(see below)
            requires indirectly_swappable<iterator_t<Base>>;
    };
}

1 iterator::iterator_concept is defined as follows:
(1.1) — If Base models random_access_range, then iterator_concept denotes random_access_iterator_tag.
(1.2) — Otherwise, if Base models bidirectional_range, then iterator_concept denotes bidirectional_iterator_tag.
(1.3) — Otherwise, iterator_concept denotes forward_iterator_tag.

2 If the invocation of any non-const member function of iterator exits via an exception, the iterator acquires a singular value.

constexpr iterator(iterator_t<Base> first, sentinel_t<Base> last);

3 Postconditions: current_[0] == first is true, and for every integer  $1 \leq i < N$ , current_[i] == ranges::next(current_[i-1], 1, last) is true.

constexpr iterator(as-sentinel, iterator_t<Base> first, iterator_t<Base> last);

4 Postconditions: If Base does not model bidirectional_range, each element of current_ is equal to last. Otherwise, current_[N-1] == last is true, and for every integer  $0 \leq i < (N-1)$ , current_[i] == ranges::prev(current_[i+1], 1, first) is true.

constexpr iterator(iterator<!Const> i)
    requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;
5 Effects: Initializes each element of current_ with the corresponding element of i.current_ as an xvalue.

constexpr auto operator*() const;

6 Effects: Equivalent to:
    return tuple-transform([](auto& i) -> decltype(auto) { return *i; }, current_);

constexpr iterator& operator++();

7 Preconditions: current_.back() is incrementable.

8 Postconditions: Each element of current_ is equal to ranges::next(i), where i is the value of that element before the call.

9 Returns: *this.

constexpr iterator operator++(int);

10 Effects: Equivalent to:
    auto tmp = *this;
    ***this;
    return tmp;

constexpr iterator& operator--() requires bidirectional_range<Base>;
11 Preconditions: current_.front() is decrementable.

12 Postconditions: Each element of current_ is equal to ranges::prev(i), where i is the value of that element before the call.

13 Returns: *this.

constexpr iterator operator--(int) requires bidirectional_range<Base>;
14 Effects: Equivalent to:
    auto tmp = *this;
    --**this;
    return tmp;

```

```

constexpr iterator& operator+=(difference_type x)
    requires random_access_range<Base>;
15   Preconditions: current_.back() + x has well-defined behavior.
16   Postconditions: Each element of current_ is equal to i + x, where i is the value of that element
     before the call.
17   Returns: *this.

constexpr iterator& operator-=(difference_type x)
    requires random_access_range<Base>;
18   Preconditions: current_.front() - x has well-defined behavior.
19   Postconditions: Each element of current_ is equal to i - x, where i is the value of that element
     before the call.
20   Returns: *this.

constexpr auto operator[](difference_type n) const
    requires random_access_range<Base>;
21   Effects: Equivalent to:
        return tuple-transform([&](auto& i) -> decltype(auto) { return i[n]; }, current_);

friend constexpr bool operator==(const iterator& x, const iterator& y);
22   Returns: x.current_.back() == y.current_.back();

friend constexpr bool operator<(const iterator& x, const iterator& y)
    requires random_access_range<Base>;
23   Returns: x.current_.back() < y.current_.back();

friend constexpr bool operator>(const iterator& x, const iterator& y)
    requires random_access_range<Base>;
24   Effects: Equivalent to: return y < x;

friend constexpr bool operator<=(const iterator& x, const iterator& y)
    requires random_access_range<Base>;
25   Effects: Equivalent to: return !(y < x);

friend constexpr bool operator>=(const iterator& x, const iterator& y)
    requires random_access_range<Base>;
26   Effects: Equivalent to: return !(x < y);

friend constexpr auto operator<=>(const iterator& x, const iterator& y)
    requires random_access_range<Base> &&
        three_way_comparable<iterator_t<Base>>;
27   Returns: x.current_.back() <= y.current_.back();

friend constexpr iterator operator+(const iterator& i, difference_type n)
    requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type n, const iterator& i)
    requires random_access_range<Base>;
28   Effects: Equivalent to:
        auto r = i;
        r += n;
        return r;

friend constexpr iterator operator-(const iterator& i, difference_type n)
    requires random_access_range<Base>;
29   Effects: Equivalent to:
        auto r = i;
        r -= n;

```

```

    return r;

friend constexpr difference_type operator-(const iterator& x, const iterator& y)
    requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;
30   Effects: Equivalent to: return x.current_.back() - y.current_.back();

friend constexpr auto iter_move(const iterator& i) noexcept(see below);
31   Effects: Equivalent to: return tuple-transform(ranges::iter_move, i.current_);

32   Remarks: The exception specification is equivalent to:
        noexcept(ranges::iter_move(declval<const iterator_t<Base>&>()) &&
                  is_nothrow_move_constructible_v<range_rvalue_reference_t<Base>>

friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept(see below)
    requires indirectly_swappable<iterator_t<Base>>;
33   Preconditions: None of the iterators in l.current_ is equal to an iterator in r.current_.

34   Effects: For every integer  $0 \leq i < N$ , performs ranges::iter_swap(l.current_[i], r.current_[i]).

35   Remarks: The exception specification is equivalent to:
        noexcept(ranges::iter_swap(declval<iterator_t<Base>>(), declval<iterator_t<Base>>()))

26.7.26.4 Class template adjacent_view::sentinel [range.adjacent.sentinel]

friend constexpr range_difference_t<maybe-const<OtherConst, V>>
  operator-(const sentinel& y, const iterator<OtherConst>& x);

5   Effects: Equivalent to: return y.end_ - x.current_.back();

```

26.7.27 Adjacent transform view

[range.adjacent.transform]

26.7.27.1 Overview

[range.adjacent.transform.overview]

- 1 adjacent_transform_view takes an invocable object and a view and produces a view whose M^{th} element is the result of applying the invocable object to the M^{th} through $(M + N - 1)^{\text{th}}$ elements of the original view. If the original view has fewer than N elements, the resulting view is empty.
- 2 The name `views::adjacent_transform<N>` denotes a range adaptor object (26.7.2). Given subexpressions E and F and a constant expression N:
 - (2.1) — If N is equal to 0, `views::adjacent_transform<N>(E, F)` is expression-equivalent to `((void)E, views::zip_transform(F))`, except that the evaluations of E and F are indeterminately sequenced.
 - (2.2) — Otherwise, the expression `views::adjacent_transform<N>(E, F)` is expression-equivalent to `adjacent_transform_view<views::all_t<decaytype((E))>, decay_t<decaytype((F))>, N>(E, F)`.
- 3 EXAMPLE:

```

vector v = {1, 2, 3, 4};

for (auto i : v | views::adjacent_transform<2>(std::multiplies())) {
  cout << i << ' ';    // prints 2 6 12
}

```

26.7.27.2 Class template adjacent_transform_view

[range.adjacent.transform.view]

```

namespace std::ranges {
  template<forward_range V, move_constructible F, size_t N>
    requires view<V> && (N > 0) && is_object_v<F> &&
      regular_invocable<F&, REPEAT(range_reference_t<V>, N)...> &&
      can-reference<invoke_result_t<F&, REPEAT(range_reference_t<V>, N)...>>
    class adjacent_transform_view : public view_interface<adjacent_transform_view<V, F, N>> {
      movable_box<F> fun_;                                // exposition only
      adjacent_view<V, N> inner_;                          // exposition only

      using InnerView = adjacent_view<V, N>;             // exposition only
      template<bool Const>
        using inner_iterator = iterator_t<maybe-const<Const, InnerView>>;           // exposition only
      template<bool Const>
        using inner_sentinel = sentinel_t<maybe-const<Const, InnerView>>;           // exposition only

      // 26.7.27.3, class template adjacent_transform_view::iterator
      template<bool> class iterator;                      // exposition only

      // 26.7.27.4, class template adjacent_transform_view::sentinel
      template<bool> class sentinel;                     // exposition only

      public:
        adjacent_transform_view() = default;
        constexpr explicit adjacent_transform_view(V base, F fun);
    };
}

```

```

constexpr V base() const & requires copy_constructible<InnerView> { return inner_.base(); }
constexpr V base() && { return std::move(inner_).base(); }

constexpr auto begin() {
    return iterator<false>(*this, inner_.begin());
}

constexpr auto begin() const
    requires range<const InnerView> &&
        regular_invocable<const F&, REPEAT(range_reference_t<const V>, N)...> {
    return iterator<true>(*this, inner_.begin());
}

constexpr auto end() {
    if constexpr (common_range<InnerView>) {
        return iterator<false>(*this, inner_.end());
    } else {
        return sentinel<false>(inner_.end());
    }
}

constexpr auto end() const
    requires range<const InnerView> &&
        regular_invocable<const F&, REPEAT(range_reference_t<const V>, N)...> {
    if constexpr (common_range<const InnerView>) {
        return iterator<true>(*this, inner_.end());
    } else {
        return sentinel<true>(inner_.end());
    }
}

constexpr auto size() requires sized_range<InnerView> {
    return inner_.size();
}

constexpr auto size() const requires sized_range<const InnerView> {
    return inner_.size();
}
};

};

constexpr explicit adjacent_transform_view(V base, F fun);

```

¹ *Effects:* Initializes *fun_* with `std::move(fun)` and *inner_* with `std::move(base)`.

26.7.27.3 Class template adjacent_transform_view::iterator [range.adjacent.transform.iterator]

```

namespace std::ranges {
    template<forward_range V, move_constructible F, size_t N>
        requires view<V> && (N > 0) && is_object_v<F> &&
            regular_invocable<F&, REPEAT(range_reference_t<V>, N)...> &&
            can_reference<invoke_result_t<F&, REPEAT(range_reference_t<V>, N)...>>>
    template<bool Const>
        class adjacent_transform_view<V, F, N>::iterator {
            using Parent = maybe_const<Const, adjacent_transform_view>;           // exposition only
            using Base = maybe_const<Const, V>;                                     // exposition only
            Parent* parent_ = nullptr;                                                 // exposition only
            inner_iterator<Const> inner_;                                            // exposition only

26.7.28 Chunk view

[range.chunk]

26.7.28.1 Overview

[range.chunk.overview]

- ¹ `chunk_view` takes a view and a number N and produces a range of views that are N -sized non-overlapping successive chunks of the elements of the original view, in order. The last view in the range can have fewer than N elements.
- ² The name `views::chunk` denotes a range adaptor object (26.7.2). Given subexpressions E and N , the expression `views::chunk(E, N)` is expression-equivalent to `chunk_view(E, N)`.

EXAMPLE:

```

vector v = {1, 2, 3, 4, 5};

for (auto r : v | views::chunk(2)) {
    cout << '[';
    auto sep = "";
    for (auto i : r) {
        cout << sep << i;
        sep = ", ";
    }
    cout << "] ";
}
// The above prints [1, 2] [3, 4] [5]

```

26.7.28.2 Class template chunk_view for input ranges

[range.chunk.view.input]

```

namespace std::ranges {
    template<class I>
    constexpr I div.ceil(I num, I denom) {                                // exposition only
        I r = num / denom;
        if (num % denom)
            ++r;
        return r;
    }

    template<view V>
    requires input_range<V>
    class chunk_view : public view_interface<chunk_view<V>> {
        V base_;                                         // exposition only
        range_difference_t<V> n_;                      // exposition only
        range_difference_t<V> remainder_ = 0;           // exposition only
        non-propagating-cache<iterator_t<V>> current_; // exposition only
        // 26.7.28.3, class chunk_view::outer-iterator
        class outer-iterator;                           // exposition only
        // 26.7.28.5, class chunk_view::inner-iterator
        class inner-iterator;                          // exposition only
    };
}

```

```

26.7.29 Slide view

[range.slide]

26.7.29.1 Overview

[range.slide.overview]

- ¹ slide_view takes a view and a number N and produces a view whose M^{th} element is a view over the M^{th} through $(M + N - 1)^{\text{th}}$ elements of the original view. If the original view has fewer than N elements, the resulting view is empty.
- ² The name `views::slide` denotes a range adaptor object (26.7.2). Given subexpressions E and N , the expression `views::slide(E, N)` is expression-equivalent to `slide_view(E, N)`.

EXAMPLE:

```
vector v = {1, 2, 3, 4};

for (auto i : v | views::slide(2)) {
    cout << '[' << i[0] << ", " << i[1] << "] ";
} // prints [1, 2] [2, 3] [3, 4]
```

26.7.29.2 Class template slide_view

[range.slide.view]

```
namespace std::ranges {
    template<class V>
    concept slide-caches-nothing = random_access_range<V> && sized_range<V>;           // exposition only

    template<class V>
    concept slide-caches-last =                                                               // exposition only
        !slide-caches-nothing<V> && bidirectional_range<V> && common_range<V>;

    template<class V>
    concept slide-caches-first =                                                               // exposition only
        !slide-caches-nothing<V> && !slide-caches-last<V>;

    template<forward_range V>
    requires view<V>
    class slide_view : public view_interface<slide_view<V>> {
        V base_;                                         // exposition only
        range_difference_t<V> n_;                      // exposition only

        // 26.7.29.3, class template slide_view::iterator
        template<bool> class iterator;                 // exposition only

        // 26.7.29.4, class slide_view::sentinel
        class sentinel;                                // exposition only

        public:
            constexpr explicit slide_view(V base, range_difference_t<V> n);

            constexpr V base() const & requires copy_constructible<V> { return base_; }
            constexpr V base() && { return std::move(base_); }

            constexpr auto begin()
                requires (!(simple_view<V> && slide-caches-nothing<const V>));
            constexpr auto begin() const requires slide-caches-nothing<const V>;

            constexpr auto end()
                requires (!(simple_view<V> && slide-caches-nothing<const V>));
            constexpr auto end() const requires slide-caches-nothing<const V>;

            constexpr auto size() requires sized_range<V>;
            constexpr auto size() const requires sized_range<const V>;
    };
}
```

```

template<class R>
slide_view(R&&, range_difference_t<R>) -> slide_view<views::all_t<R>>;
}

constexpr explicit slide_view(V base, range_difference_t<V> n);
1   Preconditions: n > 0 is true.
2   Effects: Initializes base_ with std::move(base) and n_ with n.

constexpr auto begin()
    requires (!(simple_view<V> && slide-caches-nothing<const V>));
3   Returns:
(3.1)   — If V models slide-caches-first,
        iterator<false>(ranges::begin(base_),
                           ranges::next(ranges::begin(base_), n_ - 1, ranges::end(base_)), n_)
(3.2)   — Otherwise, iterator<false>(ranges::begin(base_), n_).

4   Remarks: In order to provide the amortized constant-time complexity required by the range concept,
this function caches the result within the slide_view for use on subsequent calls when V models
slide-caches-first.
      constexpr auto begin() const requires slide-caches-nothing<const V>;
5     Returns: iterator<true>(ranges::begin(base_), n_).

constexpr auto end()
    requires !(simple_view<V> && slide-caches-nothing<const V>);
6     Returns:
(6.1)   — If V models slide-caches-nothing,
        iterator<false>(ranges::begin(base_) + range_difference_t<V>(size()), n_)
(6.2)   — Otherwise, if V models slide-caches-last,
        iterator<false>(ranges::prev(ranges::end(base_), n_ - 1, ranges::begin(base_)), n_)
(6.3)   — Otherwise, if V models common_range,
        iterator<false>(ranges::end(base_), ranges::end(base_), n_)
(6.4)   — Otherwise, sentinel(ranges::end(base_)).

7   Remarks: In order to provide the amortized constant-time complexity required by the range concept,
this function caches the result within the slide_view for use on subsequent calls when V models
slide-caches-last.
      constexpr auto end() const requires slide-caches-nothing<const V>;
8     Returns: begin() + range_difference_t<const V>(size()).

constexpr auto size() requires sized_range<V>;
constexpr auto size() const requires sized_range<const V>;
9   Effects: Equivalent to:
      auto sz = ranges::distance(base_) - n_ + 1;
      if (sz < 0) sz = 0;
      return to-unsigned-like(sz);

```

26.7.29.3 Class template slide_view::iterator

[range.slide.iterator]

```

namespace std::ranges {
    template<forward_range V>
        requires view<V>
    template<bool Const>
        class slide_view<V>::iterator {
            using Base = maybe-const<Const, V>;           // exposition only
            iterator_t<Base> current_ = iterator_t<Base>(); // exposition only
            iterator_t<Base> last_ele_ = iterator_t<Base>(); // exposition only,

```

```

    // present only if Base models slide-caches-first
range_difference_t<Base> n_ = 0;           // exposition only

constexpr iterator(iterator_t<Base> current, range_difference_t<Base> n) // exposition only
    requires (!slide-caches-first<Base>);

constexpr iterator(iterator_t<Base> current, iterator_t<Base> last_ele, // exposition only
    range_difference_t<Base> n)
    requires slide-caches-first<Base>;

public:
    using iterator_category = input_iterator_tag;
    using iterator_concept = see below;
    using value_type = decltype(views::counted(current_, n_));
    using difference_type = range_difference_t<Base>;

    iterator() = default;
    constexpr iterator(iterator<!Const> i)
        requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;
}

constexpr auto operator*() const;
constexpr iterator& operator++();
constexpr iterator operator++(int);

constexpr iterator& operator--() requires bidirectional_range<Base>;
constexpr iterator operator--(int) requires bidirectional_range<Base>;

constexpr iterator& operator+=(difference_type x)
    requires random_access_range<Base>;
constexpr iterator& operator-=(difference_type x)
    requires random_access_range<Base>;

constexpr auto operator[](difference_type n) const
    requires random_access_range<Base>;
```

friend constexpr bool operator==(const iterator& x, const iterator& y);

friend constexpr bool operator<(const iterator& x, const iterator& y)
 requires random_access_range<Base>;

friend constexpr bool operator>(const iterator& x, const iterator& y)
 requires random_access_range<Base>;

friend constexpr bool operator<=(const iterator& x, const iterator& y)
 requires random_access_range<Base>;

friend constexpr bool operator>=(const iterator& x, const iterator& y)
 requires random_access_range<Base>;

friend constexpr auto operator<=>(const iterator& x, const iterator& y)
 requires random_access_range<Base> &&
 three_way_comparable<iterator_t<Base>>;

friend constexpr iterator operator+(const iterator& i, difference_type n)
 requires random_access_range<Base>;

friend constexpr iterator operator+(difference_type n, const iterator& i)
 requires random_access_range<Base>;

friend constexpr iterator operator-(const iterator& i, difference_type n)
 requires random_access_range<Base>;

friend constexpr difference_type operator-(const iterator& x, const iterator& y)
 requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;

};

}

¹ *iterator::iterator_concept* is defined as follows:

(1.1) — If *Base* models *random_access_range*, then *iterator_concept* denotes *random_access_iterator_tag*.

- (1.2) — Otherwise, if *Base* models `bidirectional_range`, then `iterator_concept` denotes `bidirectional_iterator_tag`.
- (1.3) — Otherwise, `iterator_concept` denotes `forward_iterator_tag`.

2 If the invocation of any non-const member function of *iterator* exits via an exception, the *iterator* acquires a singular value.

```
constexpr iterator(iterator_t<Base> current, range_difference_t<Base> n)
    requires (!slide-caches-first<Base>);
```

3 *Effects*: Initializes *current_* with *current* and *n_* with *n*.

```
constexpr iterator(iterator_t<Base> current, iterator_t<Base> last_ele,
    range_difference_t<Base> n)
    requires slide-caches-first<Base>;
```

4 *Effects*: Initializes *current_* with *current*, *last_ele_* with *last_ele*, and *n_* with *n*.

```
constexpr iterator(iterator<!Const> i)
    requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;
```

5 *Effects*: Initializes *current_* with `std::move(i.current_)` and *n_* with *i.n_*.

NOTE: `iterator<true>` can only be formed when *Base* models `slide-caches-nothing`, in which case *last_ele_* is not present.

```
constexpr auto operator*() const;
```

6 *Returns*: `views::counted(current_, n_)`.

```
constexpr iterator& operator++();
```

7 *Preconditions*: *current_* and *last_ele_* (if present) are incrementable.

8 *Postconditions*: *current_* and *last_ele_* (if present) are each equal to `ranges::next(i)`, where *i* is the value of that data member before the call.

9 *Returns*: `*this`.

```
constexpr iterator operator++(int);
```

10 *Effects*: Equivalent to:

```
    auto tmp = *this;
    ***this;
    return tmp;
```

```
constexpr iterator& operator--() requires bidirectional_range<Base>;
```

11 *Preconditions*: *current_* and *last_ele_* (if present) are decrementable.

12 *Postconditions*: *current_* and *last_ele_* (if present) are each equal to `ranges::prev(i)`, where *i* is the value of that data member before the call.

13 *Returns*: `*this`.

```
constexpr iterator operator--(int) requires bidirectional_range<Base>;
```

14 *Effects*: Equivalent to:

```
    auto tmp = *this;
    --*this;
    return tmp;
```

```
constexpr iterator& operator+=(difference_type x)
    requires random_access_range<Base>;
```

15 *Preconditions*: *current_ + x* and *last_ele_ + x* (if *last_ele_* is present) have well-defined behavior.

16 *Postconditions*: *current_* and *last_ele_* (if present) are each equal to *i + x*, where *i* is the value of that data member before the call.

17 *Returns*: `*this`.

```

constexpr iterator& operator=(difference_type x)
    requires random_access_range<Base>;
18   Preconditions: current_ - x and last_ele_ - x (if last_ele_ is present) have well-defined behavior.
19   Postconditions: current_ and last_ele_ (if present) are each equal to i - x, where i is the value of
     that data member before the call.
20   Returns: *this.

constexpr auto operator[](difference_type n) const
    requires random_access_range<Base>;
21   Effects: Equivalent to: return views::counted(current_ + n, n_);

friend constexpr bool operator==(const iterator& x, const iterator& y);
22   Returns: If last_ele_ is present, x.last_ele_ == y.last_ele_; otherwise, x.current_ == y.current_.

friend constexpr bool operator<(const iterator& x, const iterator& y)
    requires random_access_range<Base>;
23   Returns: x.current_ < y.current_.

friend constexpr bool operator>(const iterator& x, const iterator& y)
    requires random_access_range<Base>;
24   Effects: Equivalent to: return y < x;

friend constexpr bool operator<=(const iterator& x, const iterator& y)
    requires random_access_range<Base>;
25   Effects: Equivalent to: return !(y < x);

friend constexpr bool operator>=(const iterator& x, const iterator& y)
    requires random_access_range<Base>;
26   Effects: Equivalent to: return !(x < y);

friend constexpr auto operator<=>(const iterator& x, const iterator& y)
    requires random_access_range<Base> &&
        three_way_comparable<iterator_t<Base>>;
27   Returns: x.current_ <= y.current_.

friend constexpr iterator operator+(const iterator& i, difference_type n)
    requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type n, const iterator& i)
    requires random_access_range<Base>;
28   Effects: Equivalent to:
        auto r = i;
        r += n;
        return r;

friend constexpr iterator operator-(const iterator& i, difference_type n)
    requires random_access_range<Base>;
29   Effects: Equivalent to:
        auto r = i;
        r -= n;
        return r;

friend constexpr difference_type operator-(const iterator& x, const iterator& y)
    requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;
30   Returns: If last_ele_ is present, x.last_ele_ - y.last_ele_; otherwise, x.current_ - y.current_.

```

26.7.29.4 Class `slide_view::sentinel`

[range.slide.sentinel]

```

namespace std::ranges {
    template<forward_range V>
    requires view<V>
    class slide_view<V>::sentinel {
        sentinel_t<V> end_ = sentinel_t<V>();           // exposition only
        constexpr explicit sentinel(sentinel_t<V> end);   // exposition only

    public:
        sentinel() = default;

        friend constexpr bool operator==(const iterator<false>& x, const sentinel& y);

        friend constexpr range_difference_t<V>
        operator-(const iterator<false>& x, const sentinel& y)
        requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;

        friend constexpr range_difference_t<V>
        operator-(const sentinel& y, const iterator<false>& x)
        requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
    };
}

```

¹ NOTE: `sentinel` is used only when `slide-caches-first`<V> is true.

```
constexpr explicit sentinel(sentinel_t<V> end);
```

² Effects: Initializes `end_` with `end`.

```
friend constexpr bool operator==(const iterator<false>& x, const sentinel& y);
```

³ Returns: `x.last_ele_ == y.end_`.

```
friend constexpr range_difference_t<V>
operator-(const iterator<false>& x, const sentinel& y)
requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
```

⁴ Returns: `x.last_ele_ - y.end_`.

```
friend constexpr range_difference_t<V>
operator-(const sentinel& y, const iterator<false>& x)
requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
```

⁵ Returns: `y.end_ - x.last_ele_`.

26.7.30 Chunk by view

[range.chunk.by]

26.7.30.1 Overview

[range.chunk.by.overview]

- ¹ `chunk_by_view` takes a view and a predicate, and splits the view into `subranges` between each pair of adjacent elements for which the predicate returns `false`.
- ² The name `views::chunk_by` denotes a range adaptor object (26.7.2). Given subexpressions `E` and `F`, the expression `views::chunk_by(E, F)` is expression-equivalent to `chunk_by_view(E, F)`.

EXAMPLE:

```

vector v = {1, 2, 2, 3, 0, 4, 5, 2};

for (auto r : v | views::chunk_by(ranges::less_equal{})) {
    cout << '[';
    auto sep = "";
    for (auto i : r) {
        cout << sep << i;
        sep = ", ";
    }
    cout << "] ";
}
// The above prints [1, 2, 2, 3] [0, 4, 5] [2]

```

26.7.30.2 Class template `chunk_by_view`

[range.chunk.by.view]

```

namespace std::ranges {
    template<forward_range V, indirect_binary_predicate<iterator_t<V>, iterator_t<V>> Pred>
        requires view<V> && is_object_v<Pred>
    class chunk_by_view : public view_interface<chunk_by_view<V, Pred>> {
        V base_ = V();                                     // exposition only
        movable_box<Pred> pred_;                         // exposition only

        // 26.7.30.3, class chunk_by_view::iterator
        class iterator;                                  // exposition only

        public:
            chunk_by_view() requires default_initializable<V> && default_initializable<Pred> = default;
            constexpr explicit chunk_by_view(V base, Pred pred);

            constexpr V base() const & requires copy_constructible<V> { return base_; }
            constexpr V base() && { return std::move(base_); }

            constexpr const Pred& pred() const;

            constexpr iterator begin();
            constexpr auto end();

            constexpr iterator_t<V> find-next(iterator_t<V>);           // exposition only
            constexpr iterator_t<V> find-prev(iterator_t<V>)           // exposition only
                requires bidirectional_range<V>;
    };
}

template<class R, class Pred>
    chunk_by_view(R&&, Pred) -> chunk_by_view<views::all_t<R>, Pred>;
}

```

`constexpr explicit chunk_by_view(V base, Pred pred);`

1 *Effects:* Initializes `base_` with `std::move(base)` and `pred_` with `std::move(pred)`.

`constexpr const Pred& pred() const;`

2 *Effects:* Equivalent to: `return *pred_;`

`constexpr iterator begin();`

3 *Preconditions:* `pred_.has_value()` is true.

4 *Returns:* `iterator(*this, ranges::begin(base_), find-next(ranges::begin(base_)))`.

5 *Remarks:* In order to provide the amortized constant-time complexity required by the `range` concept, this function caches the result within the `chunk_by_view` for use on subsequent calls.

`constexpr auto end();`

6 *Effects:* Equivalent to:

```

        if constexpr (common_range<V>) {
            return iterator(*this, ranges::end(base_), ranges::end(base_));
        } else {
            return default_sentinel;
        }
    
```

`constexpr iterator_t<V> find-next(iterator_t<V> current);`

7 *Preconditions:* `pred_.has_value()` is true.

8 *Returns:*

```

        ranges::next(ranges::adjacent_find(current, ranges::end(base_), not_fn(ref(*pred_))),
                     1, ranges::end(base_))
    
```

`constexpr iterator_t<V> find-prev(iterator_t<V> current) requires bidirectional_range<V>;`

9 *Preconditions:*

- (9.1) — *current* is not equal to `ranges::begin(base_)`.
 (9.2) — `pred_.has_value()` is true.
- 10 *Returns:* An iterator *i* in the range `[ranges::begin(base_), current]` such that:
 (10.1) — `ranges::adjacent_find(i, current, not_fn(ref(*pred_)))` is equal to *current*; and
 (10.2) — if *i* is not equal to `ranges::begin(base_)`, then `bool(invoker(*pred_, *ranges::prev(i), *i))` is false.

26.7.30.3 Class `chunk_by_view::iterator`

[range.chunk.by.iter]

```
namespace std::ranges {
    template<forward_range V, indirect_binary_predicate<iterator_t<V>, iterator_t<V>> Pred>
        requires view<V> && is_object_v<Pred>
    class chunk_by_view<V, Pred>::iterator {
        chunk_by_view* parent_ = nullptr; // exposition only
        iterator_t<V> current_ = iterator_t<V>(); // exposition only
        iterator_t<V> next_ = iterator_t<V>(); // exposition only

        constexpr iterator(chunk_by_view& parent, iterator_t<V> current, // exposition only
                           iterator_t<V> next); // exposition only

    public:
        using value_type = subrange<iterator_t<V>>;
        using difference_type = range_difference_t<V>;
        using iterator_category = input_iterator_tag;
        using iterator_concept = see below;

        iterator() = default;

        constexpr value_type operator*() const;
        constexpr iterator& operator++();
        constexpr iterator operator++(int);

        constexpr iterator& operator--() requires bidirectional_range<V>;
        constexpr iterator operator--(int) requires bidirectional_range<V>;

        friend constexpr bool operator==(const iterator& x, const iterator& y);
        friend constexpr bool operator==(const iterator& x, default_sentinel_t);
    };
}
```

¹ *iterator::iterator_concept* is defined as follows:

- (1.1) — If *V* models `bidirectional_range`, then *iterator_concept* denotes `bidirectional_iterator_tag`.
 (1.2) — Otherwise, *iterator_concept* denotes `forward_iterator_tag`.

constexpr iterator(chunk_by_view& parent, iterator_t<V> current, iterator_t<V> next);

2 *Effects:* Initializes *parent_* with `addressof(parent)`, *current_* with *current*, and *next_* with *next*.

constexpr value_type operator*() const;

3 *Preconditions:* *current_* is not equal to *next_*.

4 *Returns:* `subrange(current_, next_)`.

constexpr iterator& operator++();

5 *Preconditions:* *current_* is not equal to *next_*.

6 *Effects:* Equivalent to:

```
    current_ = next_;
    next_ = parent_->find-next(current_);
    return *this;
```

```

constexpr iterator operator++(int);
7   Effects: Equivalent to:
    auto tmp = *this;
    +++this;
    return tmp;

constexpr iterator& operator--() requires bidirectional_range<V>;
8   Effects: Equivalent to:
    next_ = current_;
    current_ = parent_->find-prev(next_);
    return *this;

constexpr iterator operator--(int) requires bidirectional_range<V>;
9   Effects: Equivalent to:
    auto tmp = *this;
    --*this;
    return tmp;

friend constexpr bool operator==(const iterator& x, const iterator& y);
10  Returns: x.current_ == y.current_.

friend constexpr bool operator==(const iterator& x, default_sentinel_t);
11  Returns: x.current_ == x.next_.

```

26.7.31 Stride view

[range.stride]

26.7.31.1 Overview

[range.stride.overview]

- 1 `stride_view` presents a view of an underlying sequence, advancing over n elements at a time, as opposed to the usual single-step succession.
- 2 The name `views::stride` denotes a range adaptor object (26.7.2). Given subexpressions E and N , the expression `views::stride(E, N)` is expression-equivalent to `stride_view(E, N)`.
- 3 EXAMPLE:

```

auto input = views::iota(0, 12) | views::stride(3);
ranges::copy(input, ostream_iterator<int>(cout, " ")); // prints 0 3 6 9
ranges::copy(input | views::reverse, ostream_iterator<int>(cout, " ")); // prints 9 6 3 0

```

26.7.31.2 Class template `stride_view`

[range.stride.view]

```

namespace std::ranges {
    template<input_range V>
    requires view<V>
    class stride_view : public view_interface<stride_view<V>> {
        V base_; // exposition only
        range_difference_t<V> stride_; // exposition only
        // 26.7.31.3, class template stride_view::iterator
        template<bool> class iterator; // exposition only
    public:
        constexpr explicit stride_view(V base, range_difference_t<V> stride);

        constexpr V base() const & requires copy_constructible<V> { return base_; }

```

26.7.32 Cartesian product view

[range.cartesian]

26.7.32.1 Overview

[range.cartesian.overview]

- cartesian_product_view** takes any non-zero number of ranges n and produces a view of tuples calculated by the n -ary cartesian product of the provided ranges.
- The name `views::cartesian_product` denotes a customization point object (16.3.3.3.5). Given a pack of subexpressions E_s , the expression `views::cartesian_product(Es...)` is expression-equivalent to
 - `views::single(tuple())` if E_s is an empty pack,
 - otherwise, `cartesian_product_view<views::all_t<decltype((Es))>...>(Es...)`.

3 EXAMPLE:

```

vector<int> v { 0, 1, 2 };
for (auto&& [a, b, c] : views::cartesian_product(v, v, v)) {
    cout << a << ' ' << b << ' ' << c << '\n';
}
// The above prints
// 0 0 0
// 0 0 1
// 0 0 2
// 0 1 0
// 0 1 1
// ...

```

26.7.32.2 Class template cartesian_product_view

[range.cartesian.view]

```

namespace std::ranges {
    template<bool Const, class First, class... Vs>
    concept cartesian-product-is-random-access =           // exposition only
        (random_access_range<maybe-const<Const, First>> && ... &&
         (random_access_range<maybe-const<Const, Vs>>
          && sized_range<maybe-const<Const, Vs>>));

    template<class R>
    concept cartesian-product-common-arg =                  // exposition only
        common_range<R> || (sized_range<R> && random_access_range<R>);

    template<bool Const, class First, class... Vs>
    concept cartesian-product-is-bidirectional =           // exposition only
        (bidirectional_range<maybe-const<Const, First>> && ... &&
         (bidirectional_range<maybe-const<Const, Vs>>
          && cartesian-product-common-arg<maybe-const<Const, Vs>>));

    template<class First, class... Vs>
    concept cartesian-product-is-common =                   // exposition only
        cartesian-product-common-arg<First>;

    template<class... Vs>
    concept cartesian-product-is-sized =                   // exposition only
        (sized_range<Vs> && ...);

    template<bool Const, template<class> class FirstSent, class First, class... Vs>
    concept cartesian-is-sized-sentinel =                 // exposition only
        (sized_sentinel_for<FirstSent<maybe-const<Const, First>>,
         iterator_t<maybe-const<Const, First>>> && ...
          && (sized_range<maybe-const<Const, Vs>>
               && sized_sentinel_for<iterator_t<maybe-const<Const, Vs>>,
               iterator_t<maybe-const<Const, Vs>>>));

    template<cartesian-product-common-arg R>
    constexpr auto cartesian-common-arg-end(R& r) {           // exposition only
        if constexpr (common_range<R>) {
            return ranges::end(r);
        } else {
            return ranges::begin(r) + ranges::distance(r);
        }
    }

    template<input_range First, forward_range... Vs>
    requires (view<First> && ... && view<Vs>)
    class cartesian_product_view : public view_interface<cartesian_product_view<First, Vs...>> {
        private:
            tuple<First, Vs...> bases_;                      // exposition only
            // 26.7.32.3, class template cartesian_product_view::iterator
            template<bool Const> class iterator;             // exposition only

        public:
            constexpr cartesian_product_view() = default;
            constexpr explicit cartesian_product_view(First first_base, Vs... bases);

            constexpr iterator<false> begin()
                requires (!simple-view<First> || ... || !simple-view<Vs>);
            constexpr iterator<true> begin() const
                requires (range<const First> && ... && range<const Vs>);

            constexpr iterator<false> end()
                requires ((!simple-view<First> || ... || !simple-view<Vs>) &&
                          cartesian-product-is-common<First, Vs...>);
    }
}

```

```

constexpr iterator<true> end() const
    requires cartesian-product-is-common<const First, const Vs...>;
constexpr default_sentinel_t end() const noexcept;

constexpr see below size()
    requires cartesian-product-is-sized<First, Vs...>;
constexpr see below size() const
    requires cartesian-product-is-sized<const First, const Vs...>;
};

template<class... Vs>
cartesian_product_view(Vs&&...) -> cartesian_product_view<views::all_t<Vs>...>;
}

```

constexpr explicit cartesian_product_view(First first_base, Vs... bases);

1 *Effects:* Initializes *bases_* with `std::move(first_base)`, `std::move(bases)`....

```

constexpr iterator<false> begin()
    requires (!simple-view<First> || ... || !simple-view<Vs>);

```

2 *Effects:* Equivalent to:

```
    return iterator<false>(*this, tuple-transform(ranges::begin, bases_));
```

```

constexpr iterator<true> begin() const
    requires (range<const First> && ... && range<const Vs>);

```

3 *Effects:* Equivalent to:

```
    return iterator<true>(*this, tuple-transform(ranges::begin, bases_));
```

```

constexpr iterator<false> end()
    requires ((!simple-view<First> || ... || !simple-view<Vs>)
        && cartesian-product-is-common<First, Vs...>);
constexpr iterator<true> end() const
    requires cartesian-product-is-common<const First, const Vs...>;

```

4 Let:

- (4.1) — *is-const* be **true** for the const-qualified overload, and **false** otherwise;
- (4.2) — *is-empty* be **true** if the expression `ranges::empty(rng)` is **true** for any *rng* among the underlying ranges except the first one and **false** otherwise; and
- (4.3) — *begin-or-first-end(rng)* be expression-equivalent to *is-empty* ? `ranges::begin(rng)` : `cartesian-common-arg-end(rng)` if *rng* is the first underlying range and `ranges::begin(rng)` otherwise.

5 *Effects:* Equivalent to:

```

iterator<is-const> it(*this, tuple-transform(
    [](auto& rng){ return begin-or-first-end(rng); }, bases_));
return it;

```

constexpr default_sentinel_t end() const noexcept;

6 *Returns:* `default_sentinel`.

```

constexpr see below size()
    requires cartesian-product-is-sized<First, Vs...>;
constexpr see below size() const
    requires cartesian-product-is-sized<const First, const Vs...>;

```

7 The return type is an implementation-defined unsigned-integer-like type.

8 *Recommended practice:* The return type should be the smallest unsigned-integer-like type that is sufficiently wide to store the product of the maximum sizes of all the underlying ranges, if such a type exists.

9 Let *p* be the product of the sizes of all the ranges in *bases_*.

10 *Preconditions:* *p* can be represented by the return type.

11 >Returns: *p*.

26.7.32.3 Class template cartesian_product_view::iterator [range.cartesian.iterator]

```

namespace std::ranges {

}

}

```

¹ *iterator::iterator_concept* is defined as follows:

- (1.1) — If *cartesian-product-is-random-access*<Const, First, Vs...> is modeled, then *iterator_concept* denotes *random_access_iterator_tag*.
- (1.2) — Otherwise, if *cartesian-product-is-bidirectional*<Const, First, Vs...> is modeled, then *iterator_concept* denotes *bidirectional_iterator_tag*.
- (1.3) — Otherwise, if *maybe-const*<Const, First> models *forward_range*, then *iterator_concept* denotes *forward_iterator_tag*.
- (1.4) — Otherwise, *iterator_concept* denotes *input_iterator_tag*.

² *iterator::difference_type* is an implementation-defined signed-integer-like type.

³ *Recommended practice*: *iterator::difference_type* should be the smallest signed-integer-like type that is sufficiently wide to store the product of the maximum sizes of all underlying ranges if such a type exists.

⁴ template<size_t N = sizeof...(Vs)>
 constexpr void next();

⁵ *Effects*: Equivalent to:

```

auto& it = std::get<N>(current_);
++it;
if constexpr (N > 0) {
    if (it == ranges::end(std::get<N>(parent_->bases_))) {
        it = ranges::begin(std::get<N>(parent_->bases_));
        next<N - 1>();
    }
}

```

```

template<size_t N = sizeof...(Vs)>
    constexpr void prev();
```

⁶ *Effects*: Equivalent to:

```

auto& it = std::get<N>(current_);
if constexpr (N > 0) {
    if (it == ranges::begin(std::get<N>(parent_->bases_))) {
        it = cartesian-common-arg-end(std::get<N>(parent_->bases_));
        prev<N - 1>();
    }
}
--it;
```

```

template<class Tuple>
constexpr difference_type distance_from(const Tuple& t) const;

7 Let:
(7.1) — scaled-size( $N$ ) be the product of static_cast<difference_type>(ranges::size(std::get<N>(parent_>bases_))) and scaled-size( $N + 1$ ) if  $N \leq \text{sizeof...}(Vs)$ , otherwise static_cast<difference_type>(1);
(7.2) — scaled-distance( $N$ ) be the product of static_cast<difference_type>(std::get<N>(current_) - std::get<N>(t)) and scaled-size( $N + 1$ ); and
(7.3) — scaled-sum be the sum of scaled-distance( $N$ ) for every integer  $0 \leq N \leq \text{sizeof...}(Vs)$ .
8 Preconditions: scaled-sum can be represented by difference_type.
9 Returns: scaled-sum.

constexpr iterator(Parent& parent, tuple<iterator_t<maybe-const<Const, First>>, iterator_t<maybe-const<Const, Vs>>...> current);
10 Effects: Initializes parent_ with addressof(parent) and current_ with std::move(current).
constexpr iterator(iterator<!Const> i) requires Const &&
(convertible_to<iterator_t<First>, iterator_t<const First>> &&
... && convertible_to<iterator_t<Vs>, iterator_t<const Vs>>);
11 Effects: Initializes parent_ with i.parent_ and current_ with std::move(i.current_).
constexpr auto operator*() const;
12 Effects: Equivalent to:
    return tuple-transform([](auto& i) -> decltype(auto) { return *i; }, current_);
constexpr iterator& operator++();
13 Effects: Equivalent to:
    next();
    return *this;
constexpr void operator++(int);
14 Effects: Equivalent to ***this.
constexpr iterator operator++(int) requires forward_range<maybe-const<Const, First>>;
15 Effects: Equivalent to:
    auto tmp = *this;
    ***this;
    return tmp;
constexpr iterator& operator--()
    requires cartesian_product_is_bidirectional<Const, First, Vs...>;
16 Effects: Equivalent to:
    prev();
    return *this;
constexpr iterator operator--(int)
    requires cartesian_product_is_bidirectional<Const, First, Vs...>;
17 Effects: Equivalent to:
    auto tmp = *this;
    --*this;
    return tmp;
constexpr iterator& operator+=(difference_type x)
    requires cartesian_product_is_random_access<Const, First, Vs...>;
18 Let orig be the value of *this before the call.
    Let ret be:

```

(18.1) — If $x > 0$, the value of `*this` had `next` been called x times.
 (18.2) — Otherwise, if $x < 0$, the value of `*this` had `prev` been called $-x$ times.
 (18.3) — Otherwise, `orig`.

19 *Preconditions:* x is in the range `[ranges::distance(*this, ranges::begin(*parent_)), ranges::distance(*this, ranges::end(*parent_))]`.
 20 *Effects:* Sets the value of `*this` to `ret`.
 21 *Returns:* `*this`.
 22 *Complexity:* Constant.

```
constexpr iterator& operator=(difference_type x)
    requires cartesian-product-is-random-access<Const, First, Vs...>;
```

23 *Effects:* Equivalent to:

$$\begin{aligned} *this &+= -x; \\ &\text{return } *this; \end{aligned}$$

```
constexpr reference operator[](difference_type n) const
    requires cartesian-product-is-random-access<Const, First, Vs...>;
```

24 *Effects:* Equivalent to: `return *((*this) + n);`

```
friend constexpr bool operator==(const iterator& x, const iterator& y)
    requires equality_comparable<iterator_t<maybe-const<Const, First>>>;
```

25 *Effects:* Equivalent to: `return x.current_ == y.current_;`

```
friend constexpr bool operator==(const iterator& x, default_sentinel_t);
```

26 *Returns:* true if `std::get<i>(x.current_) == ranges::end(std::get<i>(x.parent_->bases_))`
 is true for any integer $0 \leq i \leq \text{sizeof...}(Vs)$; otherwise, false.

```
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
    requires all-random-access<Const, First, Vs...>;
```

27 *Effects:* Equivalent to: `return x.current_ <= y.current_;`

```
friend constexpr iterator operator+(const iterator& x, difference_type y)
    requires cartesian-product-is-random-access<Const, First, Vs...>;
```

28 *Effects:* Equivalent to: `return iterator(x) += y;`

```
friend constexpr iterator operator+(difference_type x, const iterator& y)
    requires cartesian-product-is-random-access<Const, First, Vs...>;
```

29 *Effects:* Equivalent to: `return y + x;`

```
friend constexpr iterator operator-(const iterator& x, difference_type y)
    requires cartesian-product-is-random-access<Const, First, Vs...>;
```

30 *Effects:* Equivalent to: `return iterator(x) -= y;`

```
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
    requires cartesian-is-sized-sentinel<Const, iterator_t, First, Vs...>;
```

31 *Effects:* Equivalent to: `return x.distance-from(y.current_);`

```
friend constexpr difference_type operator-(const iterator& i, default_sentinel_t)
    requires cartesian-is-sized-sentinel<Const, sentinel_t, First, Vs...>;
```

32 Let `end-tuple` be an object of a type that is a specialization of `tuple`, such that:
 (32.1) — `std::get<0>(end-tuple)` has the same value as `ranges::end(std::get<0>(i.parent_->bases_))`;
 (32.2) — `std::get<N>(end-tuple)` has the same value as `ranges::begin(std::get<N>(i.parent_->bases_))` for every integer $1 \leq N \leq \text{sizeof...}(Vs)$.

33 *Effects:* Equivalent to: `return i.distance-from(end-tuple);`

```

friend constexpr difference_type operator-(default_sentinel_t s, const iterator& i)
    requires cartesian_is_sized_sentinel<Const, sentinel_t, First, Vs...>;
34   Effects: Equivalent to: return -(i - s);

friend constexpr auto iter_move(const iterator& i) noexcept(see below);
35   Effects: Equivalent to: return tuple-transform(ranges::iter_move, i.current_);
36   Remarks: The exception specification is equivalent to the logical AND of the following expressions:
(36.1)   — noexcept(ranges::iter_move(std::get<N>(i.current_))) for every integer
        0 ≤ N ≤ sizeof...(Vs),
(36.2)   — is_nothrow_move_constructible_v<range_rvalue_reference_t<maybe_const<Const, T>>>
        for every type T in First, Vs...
friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept(see below)
    requires (indirectly_swappable<iterator_t<maybe_const<Const, First>>> && ... &&
              indirectly_swappable<iterator_t<maybe_const<Const, Vs>>>);
37   Effects: For every integer 0 ≤ i ≤ sizeof...(Vs), performs:
            ranges::iter_swap(std::get<i>(l.current_), std::get<i>(r.current_))
38   Remarks: The exception specification is equivalent to the logical AND of the following expressions:
(38.1)   — noexcept(ranges::iter_swap(std::get<i>(l.current_), std::get<i>(r.current_))) for
        every integer 0 ≤ i ≤ sizeof...(Vs).

```

26.8 Range generators

[coro.generator]

26.8.1 Overview

[coroutine.generator.overview]

- 1 Class template **generator** presents a view of the elements yielded by the evaluation of a coroutine.
- 2 A **generator** generates a sequence of elements by repeatedly resuming the coroutine from which it was returned. Elements of the sequence are produced by the coroutine each time a **co_yield** statement is evaluated. When the **co_yield** statement is of the form **co_yield elements_of(r)**, each element of the range **r** is successively produced as an element of the sequence.

EXAMPLE:

```

generator<int> ints(int start = 0) {
    while (true)
        co_yield start++;
}

void f() {
    for (auto i : ints() | views::take(3))
        cout << i << ' ';           // prints 0 1 2
}

```

26.8.2 Header generator synopsis

[generator.syn]

```

namespace std {
    // 26.8.3, class template generator
    template<class Ref, class V = void, class Allocator = void>
        class generator;

    namespace pmr {
        template<class R, class V = void>
            using generator = std::generator<R, V, polymorphic_allocator>;
    }
}

```

26.8.3 Class template generator

[coro.generator.class]

```

namespace std {
    template<class Ref, class V = void, class Allocator = void>
        class generator : public ranges::view_interface<generator<Ref, V, Allocator>> {
    private:
        using value = conditional_t<is_void_v<V>, remove_cvref_t<Ref>, V>; // exposition only
}

```

```

using reference = conditional_t<is_void_v<V>, Ref&&, Ref>;           // exposition only

// 26.8.6, class generator::iterator
class iterator;                           // exposition only

public:
    using yielded =
        conditional_t<is_reference_v<reference>, reference, const reference&>;

// 26.8.5, class generator::promise_type
class promise_type;

generator(const generator&) = delete;
generator(generator&& other) noexcept;

~generator();

generator& operator=(generator other) noexcept;

iterator begin();
default_sentinel_t end() const noexcept;

private:
    coroutine_handle<promise_type> coroutine_ = nullptr; // exposition only
    unique_ptr<stack<coroutine_handle<>>> active_;          // exposition only
};

}

```

1 *Mandates:*

- (1.1) — If **Allocator** is not **void**, **allocator_traits<Allocator>::pointer** is a pointer type.
- (1.2) — **value** is a cv-unqualified object type.
- (1.3) — **reference** is either a reference type, or a cv-unqualified object type that models **copy_constructible**.
- (1.4) — Let **RRef** denote **remove_reference_t<reference>&&** if **reference** is a reference type, and **reference** otherwise. Each of:
 - (1.4.1) — **common_reference_with<reference&&, value&>**,
 - (1.4.2) — **common_reference_with<reference&&, RRef&&>**, and
 - (1.4.3) — **common_reference_with<RRef&&, const value&>**

is modeled.

NOTE: These requirements ensure the exposition-only **iterator** type can model **indirectly_readable** and thus **input_iterator**.

2 If **Allocator** is not **void**, it shall meet the *Cpp17Allocator* requirements.

3 Specializations of **generator** model **view** and **input_range**.

4 The behavior of a program that adds a specialization for **generator** is undefined.

26.8.4 Members

[coro.generator.members]

```
generator(generator&& other) noexcept;
```

1 *Effects:* Initializes **coroutine_** with **exchange(other.coroutine_, {})** and **active_** with **exchange(other.active_, nullptr)**.

2 NOTE 1: Iterators previously obtained from **other** are not invalidated; they become iterators into ***this**.

```
~generator();
```

3 *Effects:* Equivalent to:

```

if (coroutine_) {
    coroutine_.destroy();
}
```

4 NOTE 2: Ownership of recursively yielded generators is held in awaitable objects in the coroutine frame of the
yielding generator, so destroying the root generator effectively destroys the entire stack of yielded generators.

generator& operator=(generator other) noexcept;

5 *Effects*: Equivalent to:

```
swap(coroutine_, other.coroutine_);
swap(active_, other.active_);
```

6 *Returns*: **this*.

7 NOTE 3: Iterators previously obtained from *other* are not invalidated; they become iterators into **this*.

iterator begin();

8 *Preconditions*: *coroutine_* refers to a coroutine suspended at its initial suspend point (9.5.4).

9 *Effects*: Pushes *coroutine_* into **active_*, then evaluates *coroutine_.resume()*.

10 *Returns*: An *iterator* object whose member *coroutine_* refers to the same coroutine as does *coroutine_*.

11 NOTE 4: A program that calls *begin* more than once on the same generator has undefined behavior.

default_sentinel_t end() const noexcept;

12 *Returns*: *default_sentinel*.

26.8.5 Class *generator::promise_type*

[*coro.generator.promise*]

```
namespace std {
    template<class Ref, class V, class Allocator>
    class generator<Ref, V, Allocator>::promise_type {
        public:
            generator get_return_object() noexcept;

            suspend_always initial_suspend() const noexcept { return {}; }
            auto final_suspend() noexcept;

            suspend_always yield_value(yielded val) noexcept;

            auto yield_value(const remove_reference_t<yielded>& lval)
                requires is_rvalue_reference_v<yielded> &&
                constructible_from<remove_cvref_t<yielded>, const remove_reference_t<yielded>>;
            template<class R2, class V2, class Alloc2, class Unused>
            requires same_as<typename generator<R2, V2, Alloc2>::yielded, yielded>
            auto yield_value(ranges::elements_of<generator<R2, V2, Alloc2>&&, Unused> g) noexcept;

            template<ranges::input_range R, class Alloc>
            requires convertible_to<ranges::range_reference_t<R>, yielded>
            auto yield_value(ranges::elements_of<R, Alloc> r) noexcept;

            void await_transform() = delete;

            void return_void() const noexcept {}
            void unhandled_exception();

            void* operator new(size_t size)
                requires same_as<Allocator, void> || default_initializable<Allocator>;

            template<class Alloc, class... Args>
            requires same_as<Allocator, void> || convertible_to<const Alloc&, Allocator>
            void* operator new(size_t size, allocator_arg_t, const Alloc& alloc, const Args&...);

            template<class This, class Alloc, class... Args>
            requires same_as<Allocator, void> || convertible_to<const Alloc&, Allocator>
            void* operator new(size_t size, const This&, allocator_arg_t, const Alloc& alloc,
                               const Args&...);
    };
}
```

```

    void operator delete(void* pointer, size_t size) noexcept;

private:
    add_pointer_t<yielded> value_ = nullptr;           // exposition only
    exception_ptr except_;                            // exposition only
};

}

generator get_return_object() noexcept;
1   Returns: A generator object whose member coroutine_ is coroutine_handle<promise_type>::from_promise(*this), and whose member active_ points to an empty stack.

auto final_suspend() noexcept;
2   Preconditions: A handle referring to the coroutine whose promise object is *this is at the top of *active_ of some generator object x. This function is called by that coroutine upon reaching its final suspend point (9.5.4).
3   Returns: An awaitable object of unspecified type (7.6.2.4) whose member functions arrange for the calling coroutine to be suspended, pop the coroutine handle from the top of *x.active_, and resume execution of the coroutine referred to by x.active_->top() if *x.active_ is not empty. If it is empty, control flow returns to the current coroutine caller or resumer (9.5.4).

suspend_always yield_value(yielded val) noexcept;
4   Effects: Equivalent to value_ = addressof(val).
5   Returns: {}.

auto yield_value(const remove_reference_t<yielded>& lval)
    requires is_rvalue_reference_v<yielded> &&
    constructible_from<remove_cvref_t<yielded>, const remove_reference_t<yielded>&>;
6   Preconditions: A handle referring to the coroutine whose promise object is *this is at the top of *active_ of some generator object.
7   Returns: An awaitable object of an unspecified type (7.6.2.4) that stores an object of type remove_cvref_t<yielded> direct-non-list-initialized with lval, whose member functions arrange for value_ to point to that stored object and then suspend the coroutine.
8   Throws: Any exception thrown by the initialization of the stored object.
9   Remarks: A yield-expression that calls this function has type void (7.6.17).

template<class R2, class V2, class Alloc2, class Unused>
    requires same_as<typename generator<R2, V2, Alloc2>::yielded, yielded>
    auto yield_value(ranges::elements_of<generator<R2, V2, Alloc2>&&, Unused> g) noexcept;
10  Preconditions: A handle referring to the coroutine whose promise object is *this is at the top of *active_ of some generator object x. The coroutine referred to by g.range.coroutine_ is suspended at its initial suspend point.
11  Returns: An awaitable object of an unspecified type (7.6.2.4) into which g.range is moved, whose member await_ready returns false, whose member await_suspend pushes g.range.coroutine_ into *x.active_ and resumes execution of the coroutine referred to by g.range.coroutine_, and whose member await_resume evaluates rethrow_exception(except_) if bool(except_) is true. If bool(except_) is false, the await_resume member has no effects.
12  Remarks: A yield-expression that calls this function has type void (7.6.17).

template<ranges::input_range R, class Alloc>
    requires convertible_to<ranges::range_reference_t<R>, yielded>
    auto yield_value(ranges::elements_of<R, Alloc> r) noexcept;
13  Effects: Equivalent to:

        auto nested = [](allocator_arg_t, Alloc, ranges::iterator_t<R> i, ranges::sentinel_t<R> s)
            -> generator<yielded, ranges::range_value_t<R>, Alloc> {
            for (; i != s; ++i) {
                co_yield static_cast<yielded>(*i);

```

```

        }
    };
    return yield_value(ranges::elements_of(nested(
        allocator_arg, r.allocator, ranges::begin(r.range), ranges::end(r.range))));

14   NOTE: A yield-expression that calls this function has type void (7.6.17).
```

`void unhandled_exception();`

15 *Preconditions*: A handle referring to the coroutine whose promise object is `*this` is at the top of `*active_` of some `generator` object `x`.

16 *Effects*: If the handle referring to the coroutine whose promise object is `*this` is the sole element of `*x.active_`, equivalent to `throw`, otherwise, assigns `current_exception()` to `except_`.

```

void* operator new(size_t size)
    requires same_as<Allocator, void> || default_initializable<Allocator>;

template<class Alloc, class... Args>
    requires same_as<Allocator, void> || convertible_to<const Alloc&, Allocator>
    void* operator new(size_t size, allocator_arg_t, const Alloc& alloc, const Args&...);

template<class This, class Alloc, class... Args>
    requires same_as<Allocator, void> || convertible_to<const Alloc&, Allocator>
    void* operator new(size_t size, const This&, allocator_arg_t, const Alloc& alloc,
                      const Args&...);
```

17 Let `A` be

- (17.1) — `Allocator`, if it is not `void`,
- (17.2) — `Alloc` for the overloads with a template parameter `Alloc`, or
- (17.3) — `allocator<void>` otherwise.

Let `B` be `allocator_traits<A>::template rebind_alloc<U>` where `U` is an unspecified type whose size and alignment are both `_STDCPP_DEFAULT_NEW_ALIGNMENT_`.

18 *Mandates*: `allocator_traits::pointer` is a pointer type.

19 *Effects*: Initializes an allocator `b` of type `B` with `A(aloc)`, for the overloads with a function parameter `alloc`, and with `A()` otherwise. Uses `b` to allocate storage for the smallest array of `U` sufficient to provide storage for a coroutine state of size `size`, and unspecified additional state necessary to ensure that `operator delete` can later deallocate this memory block with an allocator equal to `b`.

20 *Returns*: A pointer to the allocated storage.

```

void operator delete(void* pointer, size_t size) noexcept;
```

21 *Preconditions*: `pointer` was returned from an invocation of one of the above overloads of `operator new` with a `size` argument equal to `size`.

22 *Effects*: Deallocates the storage pointed to by `pointer` using an allocator equivalent to that used to allocate it.

26.8.6 Class `generator::iterator`

[`coro.generator.iterator`]

```

namespace std {
    template<class Ref, class V, class Allocator>
    class generator<Ref, V, Allocator>::iterator {
    public:
        using value_type = value;
        using difference_type = ptrdiff_t;

        iterator(iterator&& other) noexcept;
        iterator& operator=(iterator&& other) noexcept;

        reference operator*() const noexcept(is_nothrow_copy_constructible_v<reference>);
        iterator& operator++();
        void operator++(int);
```

```

    friend bool operator==(const iterator& i, default_sentinel_t);

private:
    coroutine_handle<promise_type> coroutine_; // exposition only
};

iterator(iterator&& other) noexcept;
1   Effects: Initializes coroutine_ with exchange(other.coroutine_, {}).

iterator& operator=(iterator&& other) noexcept;
2   Effects: Equivalent to coroutine_ = exchange(other.coroutine_, {}).
3   Returns: *this.

reference operator*() const noexcept(is_nothrow_copy_constructible_v<reference>);

4   Preconditions: For some generator object x, coroutine_ is in *x.active_ and x.active_->top()
refers to a suspended coroutine with promise object p.
5   Effects: Equivalent to: return static_cast<reference>(*p.value_);

iterator& operator++();
6   Preconditions: For some generator object x, coroutine_ is in *x.active_.
7   Effects: Equivalent to x.active_->top().resume().
8   Returns: *this.

void operator++(int);
9   Effects: Equivalent to +++this.

friend bool operator==(const iterator& i, default_sentinel_t);
10  Effects: Equivalent to: return i.coroutine_.done();

```

27 Algorithms library [algorithms]

27.1 General [algorithms.general]

- ¹ This Clause describes components that C++ programs may use to perform algorithmic operations on containers (Clause 24) and other sequences.
- ² The following subclauses describe components for non-modifying sequence operations, mutating sequence operations, sorting and related operations, and algorithms from the ISO C library, as summarized in Table 93.

Table 93: Algorithms library summary [tab:algorithms.summary]

Subclause	Header
27.2	Algorithms requirements
27.3	Parallel algorithms
27.5	Algorithm result types <algorithm>
27.6	Non-modifying sequence operations
27.7	Mutating sequence operations
27.8	Sorting and related operations
27.10	Generalized numeric operations <numeric>
27.11	Specialized <memory> algorithms <memory>
27.12	C library algorithms <cstdlib>

27.2 Algorithms requirements [algorithms.requirements]

- ¹ All of the algorithms are separated from the particular implementations of data structures and are parameterized by iterator types. Because of this, they can work with program-defined data structures, as long as these data structures have iterator types satisfying the assumptions on the algorithms.
- ² The entities defined in the `std::ranges` namespace in this Clause are not found by argument-dependent name lookup (6.5.4). When found by unqualified (6.5.3) name lookup for the *postfix-expression* in a function call (7.6.1.3), they inhibit argument-dependent name lookup.

EXAMPLE:

```
void foo() {
    using namespace std::ranges;
    std::vector<int> vec{1,2,3};
    find(begin(vec), end(vec), 2);      // #1
}
```

The function call expression at #1 invokes `std::ranges::find`, not `std::find`, despite that (a) the iterator type returned from `begin(vec)` and `end(vec)` may be associated with namespace `std` and (b) `std::find` is more specialized (13.7.7.3) than `std::ranges::find` since the former requires its first two parameters to have the same type.

- ³ For purposes of determining the existence of data races, algorithms shall not modify objects referenced through an iterator argument unless the specification requires such modification.
- ⁴ Throughout this Clause, where the template parameters are not constrained, the names of template parameters are used to express type requirements.

- (4.1) — If an algorithm's *Effects* element specifies that a value pointed to by any iterator passed as an argument is modified, then the type of that argument shall meet the requirements of a mutable iterator (25.3).
- (4.2) — If an algorithm's template parameter is named `InputIterator`, `InputIterator1`, or `InputIterator2`, the template argument shall meet the *Cpp17InputIterator* requirements (25.3.5.3).
- (4.3) — If an algorithm's template parameter is named `OutputIterator`, `OutputIterator1`, or `OutputIterator2`, the template argument shall meet the *Cpp17OutputIterator* requirements (25.3.5.4).
- (4.4) — If an algorithm's template parameter is named `ForwardIterator`, `ForwardIterator1`, `ForwardIterator2`, or `NoThrowForwardIterator`, the template argument shall meet the *Cpp17ForwardIterator*

- requirements (25.3.5.5) if it is required to be a mutable iterator, or model `forward_iterator` (25.3.4.11) otherwise.
- (4.5) — If an algorithm's template parameter is named `NoThrowForwardIterator`, the template argument is also required to have the property that no exceptions are thrown from increment, assignment, or comparison of, or indirection through, valid iterators.
 - (4.6) — If an algorithm's template parameter is named `BidirectionalIterator`, `BidirectionalIterator1`, or `BidirectionalIterator2`, the template argument shall meet the `Cpp17BidirectionalIterator` requirements (25.3.5.6) if it is required to be a mutable iterator, or model `bidirectional_iterator` (25.3.4.12) otherwise.
 - (4.7) — If an algorithm's template parameter is named `RandomAccessIterator`, `RandomAccessIterator1`, or `RandomAccessIterator2`, the template argument shall meet the `Cpp17RandomAccessIterator` requirements (25.3.5.7) if it is required to be a mutable iterator, or model `random_access_iterator` (25.3.4.13) otherwise.

NOTE 1: These requirements do not affect iterator arguments that are constrained, for which iterator category and mutability requirements are expressed explicitly.

- 5 Both in-place and copying versions are provided for certain algorithms.²¹⁵ When such a version is provided for *algorithm* it is called *algorithm_copy*. Algorithms that take predicates end with the suffix `_if` (which follows the suffix `_copy`).
- 6 When not otherwise constrained, the `Predicate` parameter is used whenever an algorithm expects a function object (22.10) that, when applied to the result of dereferencing the corresponding iterator, returns a value testable as `true`. If an algorithm takes `Predicate pred` as its argument and `first` as its iterator argument with value type `T`, the expression `pred(*first)` shall be well-formed and the type `decltype(pred(*first))` shall model `boolean-testable` (18.5.2). The function object `pred` shall not apply any non-constant function through its argument. Given a glvalue `u` of type (possibly const) `T` that designates the same object as `*first`, `pred(u)` shall be a valid expression that is equal to `pred(*first)`.
- 7 When not otherwise constrained, the `BinaryPredicate` parameter is used whenever an algorithm expects a function object that, when applied to the result of dereferencing two corresponding iterators or to dereferencing an iterator and type `T` when `T` is part of the signature, returns a value testable as `true`. If an algorithm takes `BinaryPredicate binary_pred` as its argument and `first1` and `first2` as its iterator arguments with respective value types `T1` and `T2`, the expression `binary_pred(*first1, *first2)` shall be well-formed and the type `decltype(binary_pred(*first1, *first2))` shall model `boolean-testable`. Unless otherwise specified, `BinaryPredicate` always takes the first iterator's `value_type` as its first argument, that is, in those cases when `T` value is part of the signature, the expression `binary_pred(*first1, value)` shall be well-formed and the type `decltype(binary_pred(*first1, value))` shall model `boolean-testable`. `binary_pred` shall not apply any non-constant function through any of its arguments. Given a glvalue `u` of type (possibly const) `T1` that designates the same object as `*first1`, and a glvalue `v` of type (possibly const) `T2` that designates the same object as `*first2`, `binary_pred(u, *first2)`, `binary_pred(*first1, v)`, and `binary_pred(u, v)` shall each be a valid expression that is equal to `binary_pred(*first1, *first2)`, and `binary_pred(u, value)` shall be a valid expression that is equal to `binary_pred(*first1, value)`.
- 8 The parameters `UnaryOperation`, `BinaryOperation`, `BinaryOperation1`, and `BinaryOperation2` are used whenever an algorithm expects a function object (22.10).
- 9 NOTE 2: Unless otherwise specified, algorithms that take function objects as arguments can copy those function objects freely. If object identity is important, a wrapper class that points to a non-copied implementation object such as `reference_wrapper<T>` (22.10.6), or some equivalent solution, can be used.
- 10 When the description of an algorithm gives an expression such as `*first == value` for a condition, the expression shall evaluate to either `true` or `false` in boolean contexts.
- 11 In the description of the algorithms, operator `+` is used for some of the iterator categories for which it does not have to be defined. In these cases the semantics of `a + n` are the same as those of

```
auto tmp = a;
for (; n < 0; ++n) --tmp;
for (; n > 0; --n) ++tmp;
return tmp;
```

²¹⁵) The decision whether to include a copying version was usually based on complexity considerations. When the cost of doing the operation dominates the cost of copy, the copying version is not included. For example, `sort_copy` is not included because the cost of sorting is much more significant, and users can invoke `copy` followed by `sort`.

Similarly, operator `-` is used for some combinations of iterators and sentinel types for which it does not have to be defined. If `[a, b)` denotes a range, the semantics of `b - a` in these cases are the same as those of

```
iter_difference_t<decltype(a)> n = 0;
for (auto tmp = a; tmp != b; ++tmp) ++n;
return n;
```

and if `[b, a)` denotes a range, the same as those of

```
iter_difference_t<decltype(b)> n = 0;
for (auto tmp = b; tmp != a; ++tmp) --n;
return n;
```

- 12 In the description of the algorithms, given an iterator `a` whose difference type is `D`, and an expression `n` of integer-like type other than *cv D*, the semantics of `a + n` and `a - n` are, respectively, those of `a + D(n)` and `a - D(n)`.
- 13 In the description of algorithm return values, a sentinel value `s` denoting the end of a range `[i, s)` is sometimes returned where an iterator is expected. In these cases, the semantics are as if the sentinel is converted into an iterator using `ranges::next(i, s)`.
- 14 Overloads of algorithms that take `range` arguments (26.4.2) behave as if they are implemented by calling `ranges::begin` and `ranges::end` on the `range(s)` and dispatching to the overload in namespace `ranges` that takes separate iterator and sentinel arguments.
- 15 The well-formedness and behavior of a call to an algorithm with an explicitly-specified template argument list is unspecified, except where explicitly stated otherwise.

NOTE 3: Consequently, an implementation can declare an algorithm with different template parameters than those presented.

27.3 Parallel algorithms

[algorithms.parallel]

27.3.1 Preamble

[algorithms.parallel.defns]

- ¹ Subclause 27.3 describes components that C++ programs may use to perform operations on containers and other sequences in parallel.
- ² A *parallel algorithm* is a function template listed in this document with a template parameter named `ExecutionPolicy`.
- ³ Parallel algorithms access objects indirectly accessible via their arguments by invoking the following functions:
 - (3.1) — All operations of the categories of the iterators that the algorithm is instantiated with.
 - (3.2) — Operations on those sequence elements that are required by its specification.
 - (3.3) — User-provided function objects to be applied during the execution of the algorithm, if required by the specification.
 - (3.4) — Operations on those function objects required by the specification.

NOTE 1: See 27.2.

These functions are herein called *element access functions*.

EXAMPLE 1: The `sort` function may invoke the following element access functions:

- (3.5) — Operations of the random-access iterator of the actual template argument (as per 25.3.5.7), as implied by the name of the template parameter `RandomAccessIterator`.
- (3.6) — The `swap` function on the elements of the sequence (as per the preconditions specified in 27.8.2.1).
- (3.7) — The user-provided `Compare` function object.

- ⁴ A standard library function is *vectorization-unsafe* if it is specified to synchronize with another function invocation, or another function invocation is specified to synchronize with it, and if it is not a memory allocation or deallocation function.

NOTE 2: Implementations must ensure that internal synchronization inside standard library functions does not prevent forward progress when those functions are executed by threads of execution with weakly parallel forward progress guarantees.

EXAMPLE 2:

```
int x = 0;
std::mutex m;
```

```

void f() {
    int a[] = {1,2};
    std::for_each(std::execution::par_unseq, std::begin(a), std::end(a), [&](int) {
        std::lock_guard<mutex> guard(m);           // incorrect: lock_guard constructor calls m.lock()
        ++x;
    });
}

```

The above program may result in two consecutive calls to `m.lock()` on the same thread of execution (which may deadlock), because the applications of the function object are not guaranteed to run on different threads of execution.

27.3.2 Requirements on user-provided function objects [algorithms.parallel.user]

- ¹ Unless otherwise specified, function objects passed into parallel algorithms as objects of type `Predicate`, `BinaryPredicate`, `Compare`, `UnaryOperation`, `BinaryOperation`, `BinaryOperation1`, `BinaryOperation2`, and the operators used by the analogous overloads to these parallel algorithms that are formed by an invocation with the specified default predicate or operation (where applicable) shall not directly or indirectly modify objects via their arguments, nor shall they rely on the identity of the provided objects.

27.3.3 Effect of execution policies on algorithm execution [algorithms.parallel.exec]

- ¹ Parallel algorithms have template parameters named `ExecutionPolicy` (22.12) which describe the manner in which the execution of these algorithms may be parallelized and the manner in which they apply the element access functions.
- ² If an object is modified by an element access function, the algorithm will perform no other unsynchronized accesses to that object. The modifying element access functions are those which are specified as modifying the object.

NOTE 1: For example, `swap`, `++`, `--`, `=`, and assignments modify the object. For the assignment and `=` operators, only the left argument is modified.

- ³ Unless otherwise stated, implementations may make arbitrary copies of elements (with type `T`) from sequences where `is_trivially_copy_constructible_v<T>` and `is_trivially_destructible_v<T>` are `true`.

NOTE 2: This implies that user-supplied function objects cannot rely on object identity of arguments for such input sequences. If object identity of the arguments to these function objects is important, a wrapping iterator that returns a non-copied implementation object such as `reference_wrapper<T>` (22.10.6), or some equivalent solution, can be used.

- ⁴ The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::sequenced_policy` all occur in the calling thread of execution.

NOTE 3: The invocations are not interleaved; see 6.9.1.

- ⁵ The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::unsequenced_policy` are permitted to execute in an unordered fashion in the calling thread of execution, unsequenced with respect to one another in the calling thread of execution.

NOTE 4: This means that multiple function object invocations can be interleaved on a single thread of execution, which overrides the usual guarantee from 6.9.1 that function executions do not overlap with one another.

The behavior of a program is undefined if it invokes a vectorization-unsafe standard library function from user code called from an `execution::unsequenced_policy` algorithm.

NOTE 5: Because `execution::unsequenced_policy` allows the execution of element access functions to be interleaved on a single thread of execution, blocking synchronization, including the use of mutexes, risks deadlock.

- ⁶ The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::parallel_policy` are permitted to execute either in the invoking thread of execution or in a thread of execution implicitly created by the library to support parallel algorithm execution. If the threads of execution created by `thread` (33.4.3) or `jthread` (33.4.4) provide concurrent forward progress guarantees (6.9.2.3), then a thread of execution implicitly created by the library will provide parallel forward progress guarantees; otherwise, the provided forward progress guarantee is implementation-defined. Any such invocations executing in the same thread of execution are indeterminately sequenced with respect to each other.

NOTE 6: It is the caller's responsibility to ensure that the invocation does not introduce data races or deadlocks.

EXAMPLE 1:

```
int a[] = {0,1};
std::vector<int> v;
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int i) {
    v.push_back(i*2+1); // incorrect: data race
});
```

The program above has a data race because of the unsynchronized access to the container `v`.

EXAMPLE 2:

```
std::atomic<int> x{0};
int a[] = {1,2};
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int) {
    x.fetch_add(1, std::memory_order::relaxed);
    // spin wait for another iteration to change the value of x
    while (x.load(std::memory_order::relaxed) == 1) {} // incorrect: assumes execution order
});
```

The above example depends on the order of execution of the iterations, and will not terminate if both iterations are executed sequentially on the same thread of execution.

EXAMPLE 3:

```
int x = 0;
std::mutex m;
int a[] = {1,2};
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int) {
    std::lock_guard<mutex> guard(m);
    ++x;
});
```

The above example synchronizes access to object `x` ensuring that it is incremented correctly.

- ⁷ The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::parallel_unsequenced_policy` are permitted to execute in an unordered fashion in unspecified threads of execution, and unsequenced with respect to one another within each thread of execution. These threads of execution are either the invoking thread of execution or threads of execution implicitly created by the library; the latter will provide weakly parallel forward progress guarantees.

NOTE 7: This means that multiple function object invocations can be interleaved on a single thread of execution, which overrides the usual guarantee from 6.9.1 that function executions do not overlap with one another.

The behavior of a program is undefined if it invokes a vectorization-unsafe standard library function from user code called from an `execution::parallel_unsequenced_policy` algorithm.

NOTE 8: Because `execution::parallel_unsequenced_policy` allows the execution of element access functions to be interleaved on a single thread of execution, blocking synchronization, including the use of mutexes, risks deadlock.

- ⁸ NOTE 9: The semantics of invocation with `execution::unsequenced_policy`, `execution::parallel_policy`, or `execution::parallel_unsequenced_policy` allow the implementation to fall back to sequential execution if the system cannot parallelize an algorithm invocation, e.g., due to lack of resources.

- ⁹ If an invocation of a parallel algorithm uses threads of execution implicitly created by the library, then the invoking thread of execution will either

- (9.1) — temporarily block with forward progress guarantee delegation (6.9.2.3) on the completion of these library-managed threads of execution, or
- (9.2) — eventually execute an element access function;

the thread of execution will continue to do so until the algorithm is finished.

NOTE 10: In blocking with forward progress guarantee delegation in this context, a thread of execution created by the library is considered to have finished execution as soon as it has finished the execution of the particular element access function that the invoking thread of execution logically depends on.

- ¹⁰ The semantics of parallel algorithms invoked with an execution policy object of implementation-defined type are implementation-defined.

27.3.4 Parallel algorithm exceptions

[algorithms.parallel.exceptions]

- ¹ During the execution of a parallel algorithm, if temporary memory resources are required for parallelization and none are available, the algorithm throws a `bad_alloc` exception.

- ² During the execution of a parallel algorithm, if the invocation of an element access function exits via an uncaught exception, the behavior is determined by the `ExecutionPolicy`.

27.3.5 `ExecutionPolicy` algorithm overloads [algorithms.parallel.overloads]

- ¹ Parallel algorithms are algorithm overloads. Each parallel algorithm overload has an additional template type parameter named `ExecutionPolicy`, which is the first template parameter. Additionally, each parallel algorithm overload has an additional function parameter of type `ExecutionPolicy&&`, which is the first function parameter.

NOTE: Not all algorithms have parallel algorithm overloads.

- ² Unless otherwise specified, the semantics of `ExecutionPolicy` algorithm overloads are identical to their overloads without.
- ³ Unless otherwise specified, the complexity requirements of `ExecutionPolicy` algorithm overloads are relaxed from the complexity requirements of the overloads without as follows: when the guarantee says “at most *expr*” or “exactly *expr*” and does not specify the number of assignments or swaps, and *expr* is not already expressed with $\mathcal{O}()$ notation, the complexity of the algorithm shall be $\mathcal{O}(\text{expr})$.
- ⁴ Parallel algorithms shall not participate in overload resolution unless `is_execution_policy_v<remove_cvref_t<ExecutionPolicy>>` is true.

27.4 Header <algorithm> synopsis

[algorithm.syn]

```

27.6 Non-modifying sequence operations

[alg.nonmodifying]

27.6.1 All of

[alg.all.of]

```

template<class InputIterator, class Predicate>
constexpr bool all_of(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
bool all_of(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
            Predicate pred);

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr bool ranges::all_of(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr bool ranges::all_of(R&& r, Pred pred, Proj proj = {});

```

1 Let E be:

- (1.1) — $\text{pred}(*i)$ for the overloads in namespace `std`;
- (1.2) — $\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, *i))$ for the overloads in namespace `ranges`.

2 *Returns*: `false` if E is `false` for some iterator i in the range $[first, last)$, and `true` otherwise.

3 *Complexity*: At most $last - first$ applications of the predicate and any projection.

27.6.2 Any of

[alg.any.of]

```

template<class InputIterator, class Predicate>
constexpr bool any_of(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
bool any_of(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
            Predicate pred);

```

```
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr bool ranges::any_of(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr bool ranges::any_of(R&& r, Pred pred, Proj proj = {});
```

1 Let E be:

- (1.1) — `pred(*i)` for the overloads in namespace `std`;
- (1.2) — `invoke(pred, invoke(proj, *i))` for the overloads in namespace `ranges`.

2 *Returns*: true if E is true for some iterator i in the range $[first, last]$, and false otherwise.

3 *Complexity*: At most $last - first$ applications of the predicate and any projection.

27.6.3 None of

`[alg.none.of]`

```
template<class InputIterator, class Predicate>
constexpr bool none_of(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
bool none_of(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
             Predicate pred);

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr bool ranges::none_of(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr bool ranges::none_of(R&& r, Pred pred, Proj proj = {});
```

1 Let E be:

- (1.1) — `pred(*i)` for the overloads in namespace `std`;
- (1.2) — `invoke(pred, invoke(proj, *i))` for the overloads in namespace `ranges`.

2 *Returns*: false if E is true for some iterator i in the range $[first, last]$, and true otherwise.

3 *Complexity*: At most $last - first$ applications of the predicate and any projection.

27.6.4 Contains

`[alg.contains]`

```
template<input_iterator I, sentinel_for<I> S, class T, class Proj = identity>
requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
constexpr bool ranges::contains(I first, S last, const T& value, Proj proj = {});
template<input_range R, class T, class Proj = identity>
requires indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
constexpr bool ranges::contains(R&& r, const T& value, Proj proj = {});
```

1 *Returns*: `ranges::find(std::move(first), last, value, proj) != last`.

```
template<forward_iterator I1, sentinel_for<I1> S1,
        forward_iterator I2, sentinel_for<I2> S2,
        class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr bool ranges::contains_subrange(I1 first1, S1 last1, I2 first2, S2 last2,
                                         Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<forward_range R1, forward_range R2,
        class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
constexpr bool ranges::contains_subrange(R1&& r1, R2&& r2, Pred pred = {},
                                         Proj1 proj1 = {}, Proj2 proj2 = {});
```

2 *Returns*: $first2 == last2 \ || \ !ranges::search(first1, last1, first2, last2, pred, proj1, proj2).empty()$.

27.6.5 For each

[alg.foreach]

```
template<class InputIterator, class Function>
constexpr Function for_each(InputIterator first, InputIterator last, Function f);
```

1 *Preconditions:* Function meets the *Cpp17MoveConstructible* requirements ([Table 31](#)).

NOTE1: Function need not meet the requirements of *Cpp17CopyConstructible* ([Table 32](#)).

2 *Effects:* Applies f to the result of dereferencing every iterator in the range [first, last), starting from first and proceeding to last - 1.

NOTE1: If the type of first meets the requirements of a mutable iterator, f can apply non-constant functions through the dereferenced iterator.

3 *Returns:* f.

4 *Complexity:* Applies f exactly last - first times.

5 *Remarks:* If f returns a result, the result is ignored.

```
template<class ExecutionPolicy, class ForwardIterator, class Function>
void for_each(ExecutionPolicy&& exec,
              ForwardIterator first, ForwardIterator last,
              Function f);
```

6 *Preconditions:* Function meets the *Cpp17CopyConstructible* requirements.

7 *Effects:* Applies f to the result of dereferencing every iterator in the range [first, last).

NOTE1: If the type of first meets the requirements of a mutable iterator, f can apply non-constant functions through the dereferenced iterator.

8 *Complexity:* Applies f exactly last - first times.

9 *Remarks:* If f returns a result, the result is ignored. Implementations do not have the freedom granted under [27.3.3](#) to make arbitrary copies of elements from the input sequence.

10 NOTE1: Does not return a copy of its Function parameter, since parallelization often does not permit efficient state accumulation.

```
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
        indirectly_unary_invocable<projected<I, Proj>> Fun>
constexpr ranges::for_each_result<I, Fun>
ranges::for_each(I first, S last, Fun f, Proj proj = {});
```

```
template<input_range R, class Proj = identity,
        indirectly_unary_invocable<projected<iterator_t<R>, Proj>> Fun>
constexpr ranges::for_each_result<borrowed_iterator_t<R>, Fun>
ranges::for_each(R&& r, Fun f, Proj proj = {});
```

11 *Effects:* Calls invoke(f, invoke(proj, *i)) for every iterator i in the range [first, last), starting from first and proceeding to last - 1.

NOTE1: If the result of invoke(proj, *i) is a mutable reference, f can apply non-constant functions.

12 *Returns:* {last, std::move(f)}.

13 *Complexity:* Applies f and proj exactly last - first times.

14 *Remarks:* If f returns a result, the result is ignored.

15 NOTE1: The overloads in namespace ranges require Fun to model *copy_constructible*.

```
template<class InputIterator, class Size, class Function>
constexpr InputIterator for_each_n(InputIterator first, Size n, Function f);
```

16 *Mandates:* The type Size is convertible to an integral type ([7.3.9](#), [11.4.8](#)).

17 *Preconditions:* n >= 0 is true. Function meets the *Cpp17MoveConstructible* requirements.

NOTE1: Function need not meet the requirements of *Cpp17CopyConstructible*.

18 *Effects:* Applies f to the result of dereferencing every iterator in the range [first, first + n) in order.

NOTE1: If the type of first meets the requirements of a mutable iterator, f can apply non-constant functions through the dereferenced iterator.

19 >Returns: `first + n`.

20 >*Remarks:* If `f` returns a result, the result is ignored.

```
template<class ExecutionPolicy, class ForwardIterator, class Size, class Function>
    ForwardIterator for_each_n(ExecutionPolicy&& exec, ForwardIterator first, Size n,
                               Function f);
```

21 *Mandates:* The type `Size` is convertible to an integral type (7.3.9, 11.4.8).

22 *Preconditions:* `n >= 0` is true. `Function` meets the *Cpp17CopyConstructible* requirements.

23 *Effects:* Applies `f` to the result of dereferencing every iterator in the range [`first, first + n`].

NOTE1: If the type of `first` meets the requirements of a mutable iterator, `f` can apply non-constant functions through the dereferenced iterator.

24 >Returns: `first + n`.

25 >*Remarks:* If `f` returns a result, the result is ignored. Implementations do not have the freedom granted under 27.3.3 to make arbitrary copies of elements from the input sequence.

```
template<input_iterator I, class Proj = identity,
         indirectly_unary_invocable<projected<I, Proj>> Fun>
constexpr ranges::for_each_n_result<I, Fun>
ranges::for_each_n(I first, iter_difference_t<I> n, Fun f, Proj proj = {});
```

26 *Preconditions:* `n >= 0` is true.

27 *Effects:* Calls `invoke(f, invoke(proj, *i))` for every iterator `i` in the range [`first, first + n`] in order.

NOTE1: If the result of `invoke(proj, *i)` is a mutable reference, `f` can apply non-constant functions.

28 >Returns: `{first + n, std::move(f)}`.

29 >*Remarks:* If `f` returns a result, the result is ignored.

30 NOTE1: The overload in namespace `ranges` requires `Fun` to model *copy_constructible*.

27.6.6 Find

[alg.find]

```
template<class InputIterator, class T>
constexpr InputIterator find(InputIterator first, InputIterator last,
                           const T& value);
template<class ExecutionPolicy, class ForwardIterator, class T>
ForwardIterator find(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
                     const T& value);

template<class InputIterator, class Predicate>
constexpr InputIterator find_if(InputIterator first, InputIterator last,
                               Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
ForwardIterator find_if(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
                       Predicate pred);

template<class InputIterator, class Predicate>
constexpr InputIterator find_if_not(InputIterator first, InputIterator last,
                                    Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
ForwardIterator find_if_not(ExecutionPolicy&& exec,
                           ForwardIterator first, ForwardIterator last,
                           Predicate pred);

template<input_iterator I, sentinel_for<I> S, class T, class Proj = identity>
requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
constexpr I ranges::find(I first, S last, const T& value, Proj proj = {});
template<input_range R, class T, class Proj = identity>
requires indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
constexpr borrowed_iterator_t<R>
ranges::find(R&& r, const T& value, Proj proj = {});
```

```

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr I ranges::find_if(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
        indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr borrowed_iterator_t<R>
ranges::find_if(R&& r, Pred pred, Proj proj = {});
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr borrowed_iterator_t<R>
ranges::find_if_not(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
        indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr borrowed_iterator_t<R>
ranges::find_if_not(R&& r, Pred pred, Proj proj = {});

```

1 Let E be:

- (1.1) — $*i == \text{value}$ for `find`;
- (1.2) — $\text{pred}(*i) != \text{false}$ for `find_if`;
- (1.3) — $\text{pred}(*i) == \text{false}$ for `find_if_not`;
- (1.4) — $\text{bool}(\text{invoke}(\text{proj}, *i) == \text{value})$ for `ranges::find`;
- (1.5) — $\text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, *i)))$ for `ranges::find_if`;
- (1.6) — $\text{bool}(!\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, *i)))$ for `ranges::find_if_not`.

2 *Returns*: The first iterator i in the range $[\text{first}, \text{last})$ for which E is `true`. Returns last if no such iterator is found.

3 *Complexity*: At most $\text{last} - \text{first}$ applications of the corresponding predicate and any projection.

27.6.7 Find last

[alg.find.last]

```

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity>
    requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
constexpr subrange<I> ranges::find_last(I first, S last, const T& value, Proj proj = {});
template<forward_range R, class T, class Proj = identity>
    requires indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
constexpr borrowed_subrange_t<R> ranges::find_last(R&& r, const T& value, Proj proj = {});
template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr subrange<I> ranges::find_last_if(I first, S last, Pred pred, Proj proj = {});
template<forward_range R, class Proj = identity,
        indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr borrowed_subrange_t<R> ranges::find_last_if(R&& r, Pred pred, Proj proj = {});
template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr subrange<I> ranges::find_last_if_not(I first, S last, Pred pred, Proj proj = {});
template<forward_range R, class Proj = identity,
        indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr borrowed_subrange_t<R> ranges::find_last_if_not(R&& r, Pred pred, Proj proj = {});

```

1 Let E be:

- (1.1) — $\text{bool}(\text{invoke}(\text{proj}, *i) == \text{value})$ for `ranges::find_last`;
- (1.2) — $\text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, *i)))$ for `ranges::find_last_if`;
- (1.3) — $\text{bool}(!\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, *i)))$ for `ranges::find_last_if_not`.

2 *Returns*: Let i be the last iterator in the range $[\text{first}, \text{last})$ for which E is `true`. Returns $\{i, \text{last}\}$, or $\{\text{last}, \text{last}\}$ if no such iterator is found.

3 *Complexity*: At most $\text{last} - \text{first}$ applications of the corresponding predicate and projection.

27.6.8 Find end

[alg.find.end]

```

template<class ForwardIterator1, class ForwardIterator2>
constexpr ForwardIterator1

```

```

find_end(ForwardIterator1 first1, ForwardIterator1 last1,
         ForwardIterator2 first2, ForwardIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator1
    find_end(ExecutionPolicy&& exec,
             ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2, ForwardIterator2 last2);

template<class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
constexpr ForwardIterator1
    find_end(ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2, ForwardIterator2 last2,
             BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
ForwardIterator1
    find_end(ExecutionPolicy&& exec,
             ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2, ForwardIterator2 last2,
             BinaryPredicate pred);

template<forward_iterator I1, sentinel_for<I1> S1, forward_iterator I2, sentinel_for<I2> S2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr subrange<I1>
    ranges::find_end(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {}, 
                     Proj1 proj1 = {}, Proj2 proj2 = {});
template<forward_range R1, forward_range R2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
constexpr borrowed_subrange_t<R1>
    ranges::find_end(R1&& r1, R2&& r2, Pred pred = {}, 
                     Proj1 proj1 = {}, Proj2 proj2 = {});

```

1 Let:

- (1.1) — *pred* be `equal_to{}` for the overloads with no parameter *pred*;
- (1.2) — *E* be:
 - (1.2.1) — *pred(*(*i* + *n*), *(*first2* + *n*))* for the overloads in namespace `std`;
 - (1.2.2) — `invoke(pred, invoke(proj1, *(i + n)), invoke(proj2, *(first2 + n)))` for the overloads in namespace `ranges`;
- (1.3) — *i* be *last1* if [*first2*,*last2*] is empty, or if (*last2* - *first2*) > (*last1* - *first1*) is true, or if there is no iterator in the range [*first1*,*last1* - (*last2* - *first2*)] such that for every non-negative integer *n* < (*last2* - *first2*), *E* is true. Otherwise *i* is the last such iterator in [*first1*,*last1* - (*last2* - *first2*)].

2 Returns:

- (2.1) — *i* for the overloads in namespace `std`.
- (2.2) — `{i, i + (i == last1 ? 0 : last2 - first2)}` for the overloads in namespace `ranges`.

3 Complexity: At most (*last2* - *first2*) * (*last1* - *first1* - (*last2* - *first2*) + 1) applications of the corresponding predicate and any projections.

27.6.9 Find first

[alg.find.first.of]

```

template<class InputIterator, class ForwardIterator>
constexpr InputIterator
    find_first_of(InputIterator first1, InputIterator last1,
                  ForwardIterator first2, ForwardIterator last2);

```

```

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator1
    find_first_of(ExecutionPolicy&& exec,
                  ForwardIterator1 first1, ForwardIterator1 last1,
                  ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator, class ForwardIterator,
         class BinaryPredicate>
constexpr InputIterator
    find_first_of(InputIterator first1, InputIterator last1,
                  ForwardIterator first2, ForwardIterator last2,
                  BinaryPredicate pred);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
ForwardIterator1
    find_first_of(ExecutionPolicy&& exec,
                  ForwardIterator1 first1, ForwardIterator1 last1,
                  ForwardIterator2 first2, ForwardIterator2 last2,
                  BinaryPredicate pred);

template<input_iterator I1, sentinel_for<I1> S1, forward_iterator I2, sentinel_for<I2> S2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr I1 ranges::find_first_of(I1 first1, S1 last1, I2 first2, S2 last2,
                                   Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, forward_range R2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
constexpr borrowed_iterator_t<R1>
    ranges::find_first_of(R1&& r1, R2&& r2,
                          Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

```

1 Let E be:

- (1.1) — $*i == *j$ for the overloads with no parameter `pred`;
- (1.2) — $\text{pred}(*i, *j) != \text{false}$ for the overloads with a parameter `pred` and no parameter `proj1`;
- (1.3) — $\text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj1}, *i), \text{invoke}(\text{proj2}, *j)))$ for the overloads with parameters `pred` and `proj1`.

2 *Effects*: Finds an element that matches one of a set of values.

3 *Returns*: The first iterator i in the range $[first1, last1]$ such that for some iterator j in the range $[first2, last2]$ E holds. Returns $last1$ if $[first2, last2]$ is empty or if no such iterator is found.

4 *Complexity*: At most $(last1-first1) * (last2-first2)$ applications of the corresponding predicate and any projections.

27.6.10 Adjacent find

[alg.adjacent.find]

```

template<class ForwardIterator>
constexpr ForwardIterator
    adjacent_find(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
    adjacent_find(ExecutionPolicy&& exec,
                  ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class BinaryPredicate>
constexpr ForwardIterator
    adjacent_find(ForwardIterator first, ForwardIterator last,
                  BinaryPredicate pred);

```

```

template<class ExecutionPolicy, class ForwardIterator, class BinaryPredicate>
ForwardIterator
adjacent_find(ExecutionPolicy&& exec,
             ForwardIterator first, ForwardIterator last,
             BinaryPredicate pred);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_binary_predicate<projected<I, Proj>,
         projected<I, Proj>> Pred = ranges::equal_to>
constexpr I ranges::adjacent_find(I first, S last, Pred pred = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_binary_predicate<projected<iterator_t<R>, Proj>,
         projected<iterator_t<R>, Proj>> Pred = ranges::equal_to>
constexpr borrowed_iterator_t<R> ranges::adjacent_find(R&& r, Pred pred = {}, Proj proj = {});

```

1 Let E be:

- (1.1) — $*i == *(i + 1)$ for the overloads with no parameter `pred`;
- (1.2) — $\text{pred}(*i, *(i + 1)) != \text{false}$ for the overloads with a parameter `pred` and no parameter `proj`;
- (1.3) — $\text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, *i), \text{invoke}(\text{proj}, *(i + 1))))$ for the overloads with both parameters `pred` and `proj`.

2 *Returns*: The first iterator i such that both i and $i + 1$ are in the range $[\text{first}, \text{last})$ for which E holds. Returns `last` if no such iterator is found.

3 *Complexity*: For the overloads with no `ExecutionPolicy`, exactly

$$\min((i - \text{first}) + 1, (\text{last} - \text{first}) - 1)$$

applications of the corresponding predicate, where i is `adjacent_find`'s return value. For the overloads with an `ExecutionPolicy`, $\mathcal{O}(\text{last} - \text{first})$ applications of the corresponding predicate, and no more than twice as many applications of any projection.

27.6.11 Count

[alg.count]

```

template<class InputIterator, class T>
constexpr typename iterator_traits<InputIterator>::difference_type
count(InputIterator first, InputIterator last, const T& value);
template<class ExecutionPolicy, class ForwardIterator, class T>
typename iterator_traits<ForwardIterator>::difference_type
count(ExecutionPolicy&& exec,
      ForwardIterator first, ForwardIterator last, const T& value);

template<class InputIterator, class Predicate>
constexpr typename iterator_traits<InputIterator>::difference_type
count_if(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
typename iterator_traits<ForwardIterator>::difference_type
count_if(ExecutionPolicy&& exec,
         ForwardIterator first, ForwardIterator last, Predicate pred);

template<input_iterator I, sentinel_for<I> S, class T, class Proj = identity>
requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
constexpr iter_difference_t<I>
ranges::count(I first, S last, const T& value, Proj proj = {});
template<input_range R, class T, class Proj = identity>
requires indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
constexpr range_difference_t<R>
ranges::count(R&& r, const T& value, Proj proj = {});
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr iter_difference_t<I>
ranges::count_if(I first, S last, Pred pred, Proj proj = {});

```

```

template<input_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr range_difference_t<R>
ranges::count_if(R&& r, Pred pred, Proj proj = {});

1 Let E be:
(1.1) — *i == value for the overloads with no parameter pred or proj;
(1.2) — pred(*i) != false for the overloads with a parameter pred but no parameter proj;
(1.3) — invoke(proj, *i) == value for the overloads with a parameter proj but no parameter pred;
(1.4) — bool(invoker(pred, invoke(proj, *i))) for the overloads with both parameters proj and pred.

2 Effects: Returns the number of iterators i in the range [first, last) for which E holds.

3 Complexity: Exactly last - first applications of the corresponding predicate and any projection.

```

27.6.12 Mismatch

[mismatch]

```

template<class InputIterator1, class InputIterator2>
constexpr pair<InputIterator1, InputIterator2>
mismatch(InputIterator1 first1, InputIterator1 last1,
          InputIterator2 first2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
pair<ForwardIterator1, ForwardIterator2>
mismatch(ExecutionPolicy&& exec,
          ForwardIterator1 first1, ForwardIterator1 last1,
          ForwardIterator2 first2);

template<class InputIterator1, class InputIterator2,
         class BinaryPredicate>
constexpr pair<InputIterator1, InputIterator2>
mismatch(InputIterator1 first1, InputIterator1 last1,
          InputIterator2 first2, BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
pair<ForwardIterator1, ForwardIterator2>
mismatch(ExecutionPolicy&& exec,
          ForwardIterator1 first1, ForwardIterator1 last1,
          ForwardIterator2 first2, BinaryPredicate pred);

template<class InputIterator1, class InputIterator2>
constexpr pair<InputIterator1, InputIterator2>
mismatch(InputIterator1 first1, InputIterator1 last1,
          InputIterator2 first2, InputIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
pair<ForwardIterator1, ForwardIterator2>
mismatch(ExecutionPolicy&& exec,
          ForwardIterator1 first1, ForwardIterator1 last1,
          ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2,
         class BinaryPredicate>
constexpr pair<InputIterator1, InputIterator2>
mismatch(InputIterator1 first1, InputIterator1 last1,
          InputIterator2 first2, InputIterator2 last2,
          BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
pair<ForwardIterator1, ForwardIterator2>
mismatch(ExecutionPolicy&& exec,
          ForwardIterator1 first1, ForwardIterator1 last1,
          ForwardIterator2 first2, ForwardIterator2 last2,
          BinaryPredicate pred);

```

```

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr ranges::mismatch_result<I1, I2>
    ranges::mismatch(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},  

                      Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
constexpr ranges::mismatch_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>>
    ranges::mismatch(R1&& r1, R2&& r2, Pred pred = {},  

                      Proj1 proj1 = {}, Proj2 proj2 = {});

1   Let last2 be first2 + (last1 - first1) for the overloads with no parameter last2 or r2.
2   Let E be:
(2.1) — !(*(first1 + n) == *(first2 + n)) for the overloads with no parameter pred;
(2.2) — pred(*(first1 + n), *(first2 + n)) == false for the overloads with a parameter pred and  
no parameter proj1;
(2.3) — !invoke(pred, invoke(proj1, *(first1 + n)), invoke(proj2, *(first2 + n))) for the  
overloads with both parameters pred and proj1.
3   Let N be min(last1 - first1, last2 - first2).
4   Returns: { first1 + n, first2 + n }, where n is the smallest integer in [0, N] such that E holds,  
or N if no such integer exists.
5   Complexity: At most N applications of the corresponding predicate and any projections.

```

27.6.13 Equal

[alg.equal]

```

template<class InputIterator1, class InputIterator2>
constexpr bool equal(InputIterator1 first1, InputIterator1 last1,
                     InputIterator2 first2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
bool equal(ExecutionPolicy&& exec,
           ForwardIterator1 first1, ForwardIterator1 last1,
           ForwardIterator2 first2);

template<class InputIterator1, class InputIterator2,
         class BinaryPredicate>
constexpr bool equal(InputIterator1 first1, InputIterator1 last1,
                     InputIterator2 first2, BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
bool equal(ExecutionPolicy&& exec,
           ForwardIterator1 first1, ForwardIterator1 last1,
           ForwardIterator2 first2, BinaryPredicate pred);

template<class InputIterator1, class InputIterator2>
constexpr bool equal(InputIterator1 first1, InputIterator1 last1,
                     InputIterator2 first2, InputIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
bool equal(ExecutionPolicy&& exec,
           ForwardIterator1 first1, ForwardIterator1 last1,
           ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2,
         class BinaryPredicate>
constexpr bool equal(InputIterator1 first1, InputIterator1 last1,
                     InputIterator2 first2, InputIterator2 last2,
                     BinaryPredicate pred);

```

```

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
bool equal(ExecutionPolicy&& exec,
           ForwardIterator1 first1, ForwardIterator1 last1,
           ForwardIterator2 first2, ForwardIterator2 last2,
           BinaryPredicate pred);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr bool ranges::equal(I1 first1, S1 last1, I2 first2, S2 last2,
                           Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, input_range R2, class Pred = ranges::equal_to,
         class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
constexpr bool ranges::equal(R1&& r1, R2&& r2, Pred pred = {},
                           Proj1 proj1 = {}, Proj2 proj2 = {});

```

1 Let:

- (1.1) — last2 be first2 + (last1 - first1) for the overloads with no parameter last2 or r2;
- (1.2) — pred be equal_to{} for the overloads with no parameter pred;
- (1.3) — E be:
 - (1.3.1) — pred(*i, *(first2 + (i - first1))) for the overloads with no parameter proj1;
 - (1.3.2) — invoke(pred, invoke(proj1, *i), invoke(proj2, *(first2 + (i - first1)))) for the overloads with parameter proj1.

2 Returns: If last1 - first1 != last2 - first2, return false. Otherwise return true if E holds for every iterator i in the range [first1, last1). Otherwise, returns false.

3 Complexity: If

- (3.1) — the types of first1, last1, first2, and last2 meet the *Cpp17RandomAccessIterator* requirements ([25.3.5.7](#)) and last1 - first1 != last2 - first2 for the overloads in namespace std;
 - (3.2) — the types of first1, last1, first2, and last2 pairwise model *sized_sentinel_for* ([25.3.4.8](#)) and last1 - first1 != last2 - first2 for the first overload in namespace ranges,
 - (3.3) — R1 and R2 each model *sized_range* and ranges::distance(r1) != ranges::distance(r2) for the second overload in namespace ranges,
- then no applications of the corresponding predicate and each projection; otherwise,
- (3.4) — For the overloads with no ExecutionPolicy, at most min(last1 - first1, last2 - first2) applications of the corresponding predicate and any projections.
 - (3.5) — For the overloads with an ExecutionPolicy, $\mathcal{O}(\min(\text{last1} - \text{first1}, \text{last2} - \text{first2}))$ applications of the corresponding predicate.

27.6.14 Is permutation

[alg.is.permutation]

```

template<class ForwardIterator1, class ForwardIterator2>
constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
                             ForwardIterator2 first2);
template<class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
                             ForwardIterator2 first2, BinaryPredicate pred);
template<class ForwardIterator1, class ForwardIterator2>
constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
                             ForwardIterator2 first2, ForwardIterator2 last2);
template<class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
                             ForwardIterator2 first2, ForwardIterator2 last2,

```

BinaryPredicate pred);

1 Let `last2` be `first2 + (last1 - first1)` for the overloads with no parameter named `last2`, and let `pred` be `equal_to{}` for the overloads with no parameter `pred`.

2 *Mandates*: `ForwardIterator1` and `ForwardIterator2` have the same value type.

3 *Preconditions*: The comparison function is an equivalence relation.

4 *Returns*: If `last1 - first1 != last2 - first2`, return `false`. Otherwise return `true` if there exists a permutation of the elements in the range `[first2, last2]`, beginning with `ForwardIterator2 begin`, such that `equal(first1, last1, begin, pred)` returns `true`; otherwise, returns `false`.

5 *Complexity*: No applications of the corresponding predicate if `ForwardIterator1` and `ForwardIterator2` meet the requirements of random access iterators and `last1 - first1 != last2 - first2`. Otherwise, exactly `last1 - first1` applications of the corresponding predicate if `equal(first1, last1, first2, last2, pred)` would return `true`; otherwise, at worst $\mathcal{O}(N^2)$, where N has the value `last1 - first1`.

```
template<forward_iterator I1, sentinel_for<I1> S1, forward_iterator I2,
        sentinel_for<I2> S2, class Proj1 = identity, class Proj2 = identity,
        indirect_equivalence_relation<projected<I1, Proj1>,
                                    projected<I2, Proj2>> Pred = ranges::equal_to>
constexpr bool ranges::is_permutation(I1 first1, S1 last1, I2 first2, S2 last2,
                                      Pred pred = {},
                                      Proj1 proj1 = {}, Proj2 proj2 = {});
```

```
template<forward_range R1, forward_range R2,
        class Proj1 = identity, class Proj2 = identity,
        indirect_equivalence_relation<projected<iterator_t<R1>, Proj1>,
                                    projected<iterator_t<R2>, Proj2>> Pred = ranges::equal_to>
constexpr bool ranges::is_permutation(R1&& r1, R2&& r2, Pred pred = {},
                                      Proj1 proj1 = {}, Proj2 proj2 = {});
```

6 *Returns*: If `last1 - first1 != last2 - first2`, return `false`. Otherwise return `true` if there exists a permutation of the elements in the range `[first2, last2]`, bounded by `[pfirst, plast]`, such that `ranges::equal(first1, last1, pfirst, plast, pred, proj1, proj2)` returns `true`; otherwise, returns `false`.

7 *Complexity*: No applications of the corresponding predicate and projections if:

- (7.1) — for the first overload,
- (7.1.1) — `S1` and `I1` model `sized_sentinel_for<S1, I1>`,
- (7.1.2) — `S2` and `I2` model `sized_sentinel_for<S2, I2>`, and
- (7.1.3) — `last1 - first1 != last2 - first2`;
- (7.2) — for the second overload, `R1` and `R2` each model `sized_range`, and `ranges::distance(r1) != ranges::distance(r2)`.

Otherwise, exactly `last1 - first1` applications of the corresponding predicate and projections if `ranges::equal(first1, last1, first2, last2, pred, proj1, proj2)` would return `true`; otherwise, at worst $\mathcal{O}(N^2)$, where N has the value `last1 - first1`.

27.6.15 Search

[alg.search]

```
template<class ForwardIterator1, class ForwardIterator2>
constexpr ForwardIterator1
    search(ForwardIterator1 first1, ForwardIterator1 last1,
           ForwardIterator2 first2, ForwardIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator1
    search(ExecutionPolicy&& exec,
           ForwardIterator1 first1, ForwardIterator1 last1,
           ForwardIterator2 first2, ForwardIterator2 last2);
```

```

template<class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
constexpr ForwardIterator1
search(ForwardIterator1 first1, ForwardIterator1 last1,
       ForwardIterator2 first2, ForwardIterator2 last2,
       BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
ForwardIterator1
search(ExecutionPolicy&& exec,
      ForwardIterator1 first1, ForwardIterator1 last1,
      ForwardIterator2 first2, ForwardIterator2 last2,
      BinaryPredicate pred);

```

- 1 *Returns:* The first iterator *i* in the range $[first1, last1 - (last2 - first2)]$ such that for every non-negative integer *n* less than $last2 - first2$ the following corresponding conditions hold: $*(i + n) == *(first2 + n)$, $pred(*(i + n), *(first2 + n)) != \text{false}$. Returns *first1* if $[first2, last2]$ is empty, otherwise returns *last1* if no such iterator is found.
- 2 *Complexity:* At most $(last1 - first1) * (last2 - first2)$ applications of the corresponding predicate.

```

template<forward_iterator I1, sentinel_for<I1> S1, forward_iterator I2,
         sentinel_for<I2> S2, class Pred = ranges::equal_to,
         class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr subrange<I1>
ranges::search(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {}, 
               Proj1 proj1 = {}, Proj2 proj2 = {});
template<forward_range R1, forward_range R2, class Pred = ranges::equal_to,
         class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
constexpr borrowed_subrange_t<R1>
ranges::search(R1&& r1, R2&& r2, Pred pred = {}, 
               Proj1 proj1 = {}, Proj2 proj2 = {});

```

- 3 *Returns:*
- (3.1) — $\{i, i + (last2 - first2)\}$, where *i* is the first iterator in the range $[first1, last1 - (last2 - first2)]$ such that for every non-negative integer *n* less than $last2 - first2$ the condition $\text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj1}, *(i + n)), \text{invoke}(\text{proj2}, *(first2 + n))))$ is true.
- (3.2) — Returns $\{last1, last1\}$ if no such iterator exists.
- 4 *Complexity:* At most $(last1 - first1) * (last2 - first2)$ applications of the corresponding predicate and projections.

```

template<class ForwardIterator, class Size, class T>
constexpr ForwardIterator
search_n(ForwardIterator first, ForwardIterator last,
          Size count, const T& value);
template<class ExecutionPolicy, class ForwardIterator, class Size, class T>
ForwardIterator
search_n(ExecutionPolicy&& exec,
          ForwardIterator first, ForwardIterator last,
          Size count, const T& value);

template<class ForwardIterator, class Size, class T,
         class BinaryPredicate>
constexpr ForwardIterator
search_n(ForwardIterator first, ForwardIterator last,
          Size count, const T& value,
          BinaryPredicate pred);

```

```

template<class ExecutionPolicy, class ForwardIterator, class Size, class T,
         class BinaryPredicate>
ForwardIterator
search_n(ExecutionPolicy&& exec,
         ForwardIterator first, ForwardIterator last,
         Size count, const T& value,
         BinaryPredicate pred);

```

5 *Mandates*: The type `Size` is convertible to an integral type (7.3.9, 11.4.8).

6 *Returns*: The first iterator `i` in the range `[first, last - count]` such that for every non-negative integer `n` less than `count` the following corresponding conditions hold: `*(i + n) == value`, `pred(*(i + n), value) != false`. Returns `last` if no such iterator is found.

7 *Complexity*: At most `last - first` applications of the corresponding predicate.

```

template<forward_iterator I, sentinel_for<I> S, class T,
         class Pred = ranges::equal_to, class Proj = identity>
requires indirectly_comparable<I, const T*, Pred, Proj>
constexpr subrange<I>
ranges::search_n(I first, S last, iter_difference_t<I> count,
                 const T& value, Pred pred = {}, Proj proj = {});
template<forward_range R, class T, class Pred = ranges::equal_to,
         class Proj = identity>
requires indirectly_comparable<iterator_t<R>, const T*, Pred, Proj>
constexpr borrowed_subrange_t<R>
ranges::search_n(R&& r, range_difference_t<R> count,
                 const T& value, Pred pred = {}, Proj proj = {});

```

8 *Returns*: `{i, i + count}` where `i` is the first iterator in the range `[first, last - count]` such that for every non-negative integer `n` less than `count`, the following condition holds: `invoke(pred, invoke(proj, *(i + n)), value)`. Returns `{last, last}` if no such iterator is found.

9 *Complexity*: At most `last - first` applications of the corresponding predicate and projection.

```

template<class ForwardIterator, class Searcher>
constexpr ForwardIterator
search(ForwardIterator first, ForwardIterator last, const Searcher& searcher);

```

10 *Effects*: Equivalent to: `return searcher(first, last).first;`

11 *Remarks*: `Searcher` need not meet the *Cpp17CopyConstructible* requirements.

27.6.16 Starts with

[alg.starts.with]

```

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr bool ranges::starts_with(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
                                   Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, class Pred = ranges::equal_to, class Proj1 = identity,
         class Proj2 = identity>
requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
constexpr bool ranges::starts_with(R1&& r1, R2&& r2, Pred pred = {},
                                   Proj1 proj1 = {}, Proj2 proj2 = {});

```

1 *Returns*:

```

ranges::mismatch(std::move(first1), last1, std::move(first2), last2,
                  pred, proj1, proj2).in2 == last2

```

27.6.17 Ends with

[alg.ends.with]

```

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires (forward_iterator<I1> || sized_sentinel_for<S1, I1>) &&
         (forward_iterator<I2> || sized_sentinel_for<S2, I2>) &&
         indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr bool ranges::ends_with(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
                                 Proj1 proj1 = {}, Proj2 proj2 = {});

```

```

    Proj1 proj1 = {}, Proj2 proj2 = {}};

1   Let N1 be last1 - first1 and N2 be last2 - first2.

2   Returns: false if N1 < N2, otherwise

    ranges::equal(std::move(first1) + (N1 - N2), last1, std::move(first2), last2,
                  pred, proj1, proj2)

template<input_range R1, input_range R2, class Pred = ranges::equal_to, class Proj1 = identity,
         class Proj2 = identity>
requires (forward_range<R1> || sized_range<R1>) &&
          (forward_range<R2> || sized_range<R2>) &&
          indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
constexpr bool ranges::ends_with(R1&& r1, R2&& r2, Pred pred = {},
                                 Proj1 proj1 = {}, Proj2 proj2 = {});

3   Let N1 be ranges::distance(r1) and N2 be ranges::distance(r2).

4   Returns: false if N1 < N2, otherwise

    ranges::equal(ranges::drop_view(ranges::ref_view(r1), N1 - N2), r2, pred, proj1, proj2)

```

27.6.18 Fold

[alg.fold]

```

template<input_iterator I, sentinel_for<I> S, class T, indirectly-binary-left-foldable<T, I> F>
constexpr auto ranges::fold_left(I first, S last, T init, F f);

template<input_range R, class T, indirectly-binary-left-foldable<T, iterator_t<R>> F>
constexpr auto ranges::fold_left(R&& r, T init, F f);

1   Returns:

    ranges::fold_left_with_iter(std::move(first), last, std::move(init), f).value

template<input_iterator I, sentinel_for<I> S,
         indirectly-binary-left-foldable<iter_value_t<I>, I> F>
requires constructible_from<iter_value_t<I>, iter_reference_t<I>>
constexpr auto ranges::fold_left_first(I first, S last, F f);

template<input_range R, indirectly-binary-left-foldable<range_value_t<R>, iterator_t<R>> F>
requires constructible_from<range_value_t<R>, range_reference_t<R>>
constexpr auto ranges::fold_left_first(R&& r, F f);

2   Returns:

    ranges::fold_left_first_with_iter(std::move(first), last, f).value

template<bidirectional_iterator I, sentinel_for<I> S, class T,
         indirectly-binary-right-foldable<T, I> F>
constexpr auto ranges::fold_right(I first, S last, T init, F f);

template<bidirectional_range R, class T,
         indirectly-binary-right-foldable<T, iterator_t<R>> F>
constexpr auto ranges::fold_right(R&& r, T init, F f);

3   Effects: Equivalent to:

    using U = decay_t<invoke_result_t<F&, iter_reference_t<I>, T>>;
    if (first == last)
        return U(std::move(init));
    I tail = ranges::next(first, last);
    U accum = invoke(f, *--tail, std::move(init));
    while (first != tail)
        accum = invoke(f, *--tail, std::move(accum));
    return accum;

template<bidirectional_iterator I, sentinel_for<I> S,
         indirectly-binary-right-foldable<iter_value_t<I>, I> F>
requires constructible_from<iter_value_t<I>, iter_reference_t<I>>
constexpr auto ranges::fold_right_last(I first, S last, F f);

template<bidirectional_range R,
         indirectly-binary-right-foldable<range_value_t<R>, iterator_t<R>> F>
requires constructible_from<range_value_t<R>, range_reference_t<R>>

```

4 **constexpr auto ranges::fold_right_last(R&& r, F f);**
 5 Let U be decltype(ranges::fold_right(first, last, iter_value_t<I>(*first), f)).
 6 *Effects:* Equivalent to:

```
if (first == last)
    return optional<U>();
I tail = ranges::prev(ranges::next(first, std::move(last)));
return optional<U>(in_place,
    ranges::fold_right(std::move(first), tail, iter_value_t<I>(*tail), std::move(f)));
```

7 **template<input_iterator I, sentinel_for<I> S, class T,**
 indirectly-binary-left-foldable<T, I> F>
 constexpr see below ranges::fold_left_with_iter(I first, S last, T init, F f);
 8 **template<input_range R, class T, indirectly-binary-left-foldable<T, iterator_t<R>> F>**
 constexpr see below ranges::fold_left_with_iter(R&& r, T init, F f);

9 Let U be decay_t<invoke_result_t<F&, T, iter_reference_t<I>>.

10 *Effects:* Equivalent to:

```
if (first == last)
    return {std::move(first), U(std::move(init))};
U accum = invoke(f, std::move(init), *first);
for (++first; first != last; ++first)
    accum = invoke(f, std::move(accum), *first);
return {std::move(first), std::move(accum)};
```

11 *Remarks:* The return type is fold_left_with_iter_result<I, U> for the first overload and fold_left_with_iter_result<borrowed_iterator_t<R>, U> for the second overload.

12 **template<input_iterator I, sentinel_for<I> S,**
 indirectly-binary-left-foldable<iter_value_t<I>, I> F>
 requires constructible_from<iter_value_t<I>, iter_reference_t<I>>
 constexpr see below ranges::fold_left_first_with_iter(I first, S last, F f);
 13 **template<input_range R, indirectly-binary-left-foldable<range_value_t<R>, iterator_t<R>> F>**
 requires constructible_from<range_value_t<R>, range_reference_t<R>>
 constexpr see below ranges::fold_left_first_with_iter(R&& r, F f);

14 Let U be

```
decltype(ranges::fold_left(std::move(first), last, iter_value_t<I>(*first), f))
```

15 *Effects:* Equivalent to:

```
if (first == last)
    return {std::move(first), optional<U>()};
optional<U> init(in_place, *first);
for (++first; first != last; ++first)
    *init = invoke(f, std::move(*init), *first);
return {std::move(first), std::move(init)};
```

16 *Remarks:* The return type is fold_left_first_with_iter_result<I, optional<U>> for the first overload and fold_left_first_with_iter_result<borrowed_iterator_t<R>, optional<U>> for the second overload.

27.7 Mutating sequence operations

[alg.modifying.operations]

27.7.1 Copy

[alg.copy]

```
template<class InputIterator, class OutputIterator>
constexpr OutputIterator copy(InputIterator first, InputIterator last,
                            OutputIterator result);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O>
requires indirectly_copyable<I, O>
constexpr ranges::copy_result<I, O> ranges::copy(I first, S last, O result);
```

```
template<input_range R, weakly_incrementable O>
    requires indirectly_copyable<iterator_t<R>, O>
    constexpr ranges::copy_result<borrowed_iterator_t<R>, O> ranges::copy(R&& r, O result);
1   Let N be last - first.
2   Preconditions: result is not in the range [first, last].
3   Effects: Copies elements in the range [first, last) into the range [result, result + N) starting from first and proceeding to last. For each non-negative integer n < N, performs *(result + n) = *(first + n).
4   Returns:
```

- (4.1) — result + N for the overload in namespace std.
 (4.2) — {last, result + N} for the overloads in namespace ranges.

5 *Complexity:* Exactly N assignments.

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
    ForwardIterator2 copy(ExecutionPolicy&& policy,
                        ForwardIterator1 first, ForwardIterator1 last,
                        ForwardIterator2 result);
6   Preconditions: The ranges [first, last) and [result, result + (last - first)) do not overlap.
7   Effects: Copies elements in the range [first, last) into the range [result, result + (last - first)). For each non-negative integer n < (last - first), performs *(result + n) = *(first + n).
8   Returns: result + (last - first).
9   Complexity: Exactly last - first assignments.
```

```
template<class InputIterator, class Size, class OutputIterator>
    constexpr OutputIterator copy_n(InputIterator first, Size n,
                                    OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class Size, class ForwardIterator2>
    ForwardIterator2 copy_n(ExecutionPolicy&& exec,
                           ForwardIterator1 first, Size n,
                           ForwardIterator2 result);
```

```
template<input_iterator I, weakly_incrementable O>
    requires indirectly_copyable<I, O>
    constexpr ranges::copy_n_result<I, O>
        ranges::copy_n(I first, iter_difference_t<I> n, O result);
10  Let N be max(0, n).
11  Mandates: The type Size is convertible to an integral type (7.3.9, 11.4.8).
12  Effects: For each non-negative integer i < N, performs *(result + i) = *(first + i).
13  Returns:
14  — result + N for the overloads in namespace std.
15  — {first + N, result + N} for the overload in namespace ranges.
```

14 *Complexity:* Exactly N assignments.

```
template<class InputIterator, class OutputIterator, class Predicate>
    constexpr OutputIterator copy_if(InputIterator first, InputIterator last,
                                    OutputIterator result, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class Predicate>
    ForwardIterator2 copy_if(ExecutionPolicy&& exec,
                           ForwardIterator1 first, ForwardIterator1 last,
                           ForwardIterator2 result, Predicate pred);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred
    requires indirectly_copyable<I, O>
```

```

constexpr ranges::copy_if_result<I, 0>
ranges::copy_if(I first, S last, 0 result, Pred pred, Proj proj = {});
template<input_range R, weakly_incrementable 0, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
requires indirectly_copyable<iterator_t<R>, 0>
constexpr ranges::copy_if_result<borrowed_iterator_t<R>, 0>
ranges::copy_if(R&& r, 0 result, Pred pred, Proj proj = {});

```

15 Let E be:

- (15.1) — `bool(pred(*i))` for the overloads in namespace `std`;
- (15.2) — `bool(invoker(pred, invoke(proj, *i)))` for the overloads in namespace `ranges`,

and N be the number of iterators i in the range $[first, last)$ for which the condition E holds.

16 *Preconditions*: The ranges $[first, last)$ and $[result, result + (last - first))$ do not overlap.

NOTE: For the overload with an `ExecutionPolicy`, a performance cost is possible if `iterator_traits<ForwardIterator1>::value_type` is not `Cpp17MoveConstructible` ([Table 31](#)).

17 *Effects*: Copies all of the elements referred to by the iterator i in the range $[first, last)$ for which E is `true`.

18 *Returns*:

- (18.1) — `result + N` for the overloads in namespace `std`.
- (18.2) — `{last, result + N}` for the overloads in namespace `ranges`.

19 *Complexity*: Exactly $last - first$ applications of the corresponding predicate and any projection.

20 *Remarks*: Stable ([16.4.6.8](#)).

```

template<class BidirectionalIterator1, class BidirectionalIterator2>
constexpr BidirectionalIterator2
copy_backward(BidirectionalIterator1 first,
              BidirectionalIterator1 last,
              BidirectionalIterator2 result);

template<bidirectional_iterator I1, sentinel_for<I1> S1, bidirectional_iterator I2>
requires indirectly_copyable<I1, I2>
constexpr ranges::copy_backward_result<I1, I2>
ranges::copy_backward(I1 first, S1 last, I2 result);
template<bidirectional_range R, bidirectional_iterator I>
requires indirectly_copyable<iterator_t<R>, I>
constexpr ranges::copy_backward_result<borrowed_iterator_t<R>, I>
ranges::copy_backward(R&& r, I result);

```

21 Let N be $last - first$.

22 *Preconditions*: `result` is not in the range $(first, last]$.

23 *Effects*: Copies elements in the range $[first, last)$ into the range $[result - N, result)$ starting from $last - 1$ and proceeding to $first$.²¹⁶ For each positive integer $n \leq N$, performs $*(result - n) = *(last - n)$.

24 *Returns*:

- (24.1) — `result - N` for the overload in namespace `std`.
- (24.2) — `{last, result - N}` for the overloads in namespace `ranges`.

25 *Complexity*: Exactly N assignments.

27.7.2 Move

[\[alg.move\]](#)

```

template<class InputIterator, class OutputIterator>
constexpr OutputIterator move(InputIterator first, InputIterator last,
                             OutputIterator result);

```

²¹⁶) `copy_backward` can be used instead of `copy` when `last` is in the range $[result - N, result)$.

```
template<input_iterator I, sentinel_for<I> S, weakly_incrementable O>
    requires indirectly_movable<I, O>
    constexpr ranges::move_result<I, O>
        ranges::move(I first, S last, O result);
template<input_range R, weakly_incrementable O>
    requires indirectly_movable<iterator_t<R>, O>
    constexpr ranges::move_result<borrowed_iterator_t<R>, O>
        ranges::move(R&& r, O result);
```

1 Let E be

- (1.1) — `std::move(*first + n)` for the overload in namespace `std`;
- (1.2) — `ranges::iter_move(first + n)` for the overloads in namespace `ranges`.

Let N be $last - first$.

2 *Preconditions:* `result` is not in the range $[first, last]$.

3 *Effects:* Moves elements in the range $[first, last]$ into the range $[result, result + N]$ starting from `first` and proceeding to `last`. For each non-negative integer $n < N$, performs $*(result + n) = E$.

4 *Returns:*

- (4.1) — `result + N` for the overload in namespace `std`.
- (4.2) — `{last, result + N}` for the overloads in namespace `ranges`.

5 *Complexity:* Exactly N assignments.

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
    ForwardIterator2 move(ExecutionPolicy&& policy,
                          ForwardIterator1 first, ForwardIterator1 last,
                          ForwardIterator2 result);
```

6 Let N be $last - first$.

7 *Preconditions:* The ranges $[first, last]$ and $[result, result + N]$ do not overlap.

8 *Effects:* Moves elements in the range $[first, last]$ into the range $[result, result + N]$. For each non-negative integer $n < N$, performs $*(result + n) = std::move(*(first + n))$.

9 *Returns:* `result + N`.

10 *Complexity:* Exactly N assignments.

```
template<class BidirectionalIterator1, class BidirectionalIterator2>
    constexpr BidirectionalIterator2
        move_backward(BidirectionalIterator1 first, BidirectionalIterator1 last,
                      BidirectionalIterator2 result);
```

```
template<bidirectional_iterator I1, sentinel_for<I1> S1, bidirectional_iterator I2>
    requires indirectly_movable<I1, I2>
    constexpr ranges::move_backward_result<I1, I2>
        ranges::move_backward(I1 first, S1 last, I2 result);
template<bidirectional_range R, bidirectional_iterator I>
    requires indirectly_movable<iterator_t<R>, I>
    constexpr ranges::move_backward_result<borrowed_iterator_t<R>, I>
        ranges::move_backward(R&& r, I result);
```

11 Let E be

- (11.1) — `std::move(*(last - n))` for the overload in namespace `std`;
- (11.2) — `ranges::iter_move(last - n)` for the overloads in namespace `ranges`.

Let N be $last - first$.

12 *Preconditions:* `result` is not in the range $(first, last]$.

13 *Effects:* Moves elements in the range $[first, last]$ into the range $[result - N, result]$ starting from `last - 1` and proceeding to `first`.²¹⁷ For each positive integer $n \leq N$, performs $*(result - n) = E$.

²¹⁷) `move_backward` can be used instead of `move` when `last` is in the range $[result - N, result]$.

14 *Returns:*
 (14.1) — `result` – N for the overload in namespace `std`.
 (14.2) — `{last, result – N}` for the overloads in namespace `ranges`.
 15 *Complexity:* Exactly N assignments.

27.7.3 Swap

[alg.swap]

```
template<class ForwardIterator1, class ForwardIterator2>
constexpr ForwardIterator2
    swap_ranges(ForwardIterator1 first1, ForwardIterator1 last1,
                ForwardIterator2 first2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
    swap_ranges(ExecutionPolicy&& exec,
                ForwardIterator1 first1, ForwardIterator1 last1,
                ForwardIterator2 first2);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2>
    requires indirectly_swappable<I1, I2>
constexpr ranges::swap_ranges_result<I1, I2>
    ranges::swap_ranges(I1 first1, S1 last1, I2 first2, S2 last2);
template<input_range R1, input_range R2>
    requires indirectly_swappable<iterator_t<R1>, iterator_t<R2>>
constexpr ranges::swap_ranges_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>>
    ranges::swap_ranges(R1&& r1, R2&& r2);
```

1 Let:

- (1.1) — `last2` be $\text{first2} + (\text{last1} - \text{first1})$ for the overloads with no parameter named `last2`;
 (1.2) — M be $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$.

2 *Preconditions:* The two ranges $[\text{first1}, \text{last1}]$ and $[\text{first2}, \text{last2}]$ do not overlap. For the overloads in namespace `std`, $\ast(\text{first1} + n)$ is swappable with (16.4.4.3) $\ast(\text{first2} + n)$.

3 *Effects:* For each non-negative integer $n < M$ performs:

- (3.1) — `swap(*(\text{first1} + n), *(\text{first2} + n))` for the overloads in namespace `std`;
 (3.2) — `ranges::iter_swap(first1 + n, first2 + n)` for the overloads in namespace `ranges`.

4 *Returns:*

- (4.1) — `last2` for the overloads in namespace `std`.
 (4.2) — `{first1 + M, first2 + M}` for the overloads in namespace `ranges`.

5 *Complexity:* Exactly M swaps.

```
template<class ForwardIterator1, class ForwardIterator2>
constexpr void iter_swap(ForwardIterator1 a, ForwardIterator2 b);

6        Preconditions: a and b are dereferenceable.  $\ast a$  is swappable with (16.4.4.3)  $\ast b$ .  

7        Effects: As if by swap(*a, *b).
```

27.7.4 Transform

[alg.transform]

```
template<class InputIterator, class OutputIterator,
        class UnaryOperation>
constexpr OutputIterator
    transform(InputIterator first1, InputIterator last1,
              OutputIterator result, UnaryOperation op);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
        class UnaryOperation>
ForwardIterator2
    transform(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 result, UnaryOperation op);
```

```

template<class InputIterator1, class InputIterator2,
         class OutputIterator, class BinaryOperation>
constexpr OutputIterator
    transform(InputIterator1 first1, InputIterator1 last1,
              InputIterator2 first2, OutputIterator result,
              BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class BinaryOperation>
ForwardIterator
    transform(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator result,
              BinaryOperation binary_op);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O,
         copy_constructible F, class Proj = identity>
requires indirectly_writable<O, indirect_result_t<F&, projected<I, Proj>>>
constexpr ranges::unary_transform_result<I, O>
ranges::transform(I first1, S last1, O result, F op, Proj proj = {});

template<input_range R, weakly_incrementable O, copy_constructible F,
         class Proj = identity>
requires indirectly_writable<O, indirect_result_t<F&, projected<iterator_t<R>, Proj>>>
constexpr ranges::unary_transform_result<borrowed_iterator_t<R>, O>
ranges::transform(R&& r, O result, F op, Proj proj = {});

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         weakly_incrementable O, copy_constructible F, class Proj1 = identity,
         class Proj2 = identity>
requires indirectly_writable<O, indirect_result_t<F&, projected<I1, Proj1>,
                  projected<I2, Proj2>>>
constexpr ranges::binary_transform_result<I1, I2, O>
ranges::transform(I1 first1, S1 last1, I2 first2, S2 last2, O result,
                 F binary_op, Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, input_range R2, weakly_incrementable O,
         copy_constructible F, class Proj1 = identity, class Proj2 = identity>
requires indirectly_writable<O, indirect_result_t<F&, projected<iterator_t<R1>, Proj1>,
                  projected<iterator_t<R2>, Proj2>>>
constexpr ranges::binary_transform_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
ranges::transform(R1&& r1, R2&& r2, O result,
                 F binary_op, Proj1 proj1 = {}, Proj2 proj2 = {});

```

1 Let:

- (1.1) — last2 be $\text{first2} + (\text{last1} - \text{first1})$ for the overloads with parameter first2 but no parameter last2 ;
- (1.2) — N be $\text{last1} - \text{first1}$ for unary transforms, or $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$ for binary transforms;
- (1.3) — E be
 - (1.3.1) — $\text{op}(*(\text{first1} + (\text{i} - \text{result})))$ for unary transforms defined in namespace `std`;
 - (1.3.2) — $\text{binary_op}(*(\text{first1} + (\text{i} - \text{result})), *(\text{first2} + (\text{i} - \text{result})))$ for binary transforms defined in namespace `std`;
 - (1.3.3) — $\text{invoke}(\text{op}, \text{invoke}(\text{proj}, *(\text{first1} + (\text{i} - \text{result}))))$ for unary transforms defined in namespace `ranges`;
 - (1.3.4) — $\text{invoke}(\text{binary_op}, \text{invoke}(\text{proj1}, *(\text{first1} + (\text{i} - \text{result}))), \text{invoke}(\text{proj2}, *(\text{first2} + (\text{i} - \text{result}))))$ for binary transforms defined in namespace `ranges`.

2 *Preconditions:* op and binary_op do not invalidate iterators or subranges, nor modify elements in the ranges

- (2.1) — $[\text{first1}, \text{first1} + N]$,
- (2.2) — $[\text{first2}, \text{first2} + N]$, and

- (2.3) — `[result, result + N]`.²¹⁸
- 3 *Effects:* Assigns through every iterator `i` in the range `[result, result + N)` a new corresponding value equal to `E`.
- 4 *Returns:*
- (4.1) — `result + N` for the overloads defined in namespace `std`.
- (4.2) — `{first1 + N, result + N}` for unary transforms defined in namespace `ranges`.
- (4.3) — `{first1 + N, first2 + N, result + N}` for binary transforms defined in namespace `ranges`.
- 5 *Complexity:* Exactly `N` applications of `op` or `binary_op`, and any projections. This requirement also applies to the overload with an `ExecutionPolicy`.
- 6 *Remarks:* `result` may be equal to `first1` or `first2`.

27.7.5 Replace

[alg.replace]

```
template<class ForwardIterator, class T>
constexpr void replace(ForwardIterator first, ForwardIterator last,
                      const T& old_value, const T& new_value);
template<class ExecutionPolicy, class ForwardIterator, class T>
void replace(ExecutionPolicy&& exec,
             ForwardIterator first, ForwardIterator last,
             const T& old_value, const T& new_value);

template<class ForwardIterator, class Predicate, class T>
constexpr void replace_if(ForwardIterator first, ForwardIterator last,
                        Predicate pred, const T& new_value);
template<class ExecutionPolicy, class ForwardIterator, class Predicate, class T>
void replace_if(ExecutionPolicy&& exec,
                ForwardIterator first, ForwardIterator last,
                Predicate pred, const T& new_value);

template<input_iterator I, sentinel_for<I> S, class T1, class T2, class Proj = identity>
requires indirectly_writable<I, const T2&> &&
        indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T1*>
constexpr I
    ranges::replace(I first, S last, const T1& old_value, const T2& new_value, Proj proj = {});
template<input_range R, class T1, class T2, class Proj = identity>
requires indirectly_writable<iterator_t<R>, const T2&> &&
        indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T1*>
constexpr borrowed_iterator_t<R>
    ranges::replace(R&& r, const T1& old_value, const T2& new_value, Proj proj = {});
template<input_iterator I, sentinel_for<I> S, class T, class Proj = identity,
        indirect_unary_predicate<projected<I, Proj>> Pred>
requires indirectly_writable<I, const T&>
constexpr I ranges::replace_if(I first, S last, Pred pred, const T& new_value, Proj proj = {});
template<input_range R, class T, class Proj = identity,
        indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
requires indirectly_writable<iterator_t<R>, const T&>
constexpr borrowed_iterator_t<R>
    ranges::replace_if(R&& r, Pred pred, const T& new_value, Proj proj = {});
```

1 Let `E` be

- (1.1) — `bool(*i == old_value)` for `replace`;
- (1.2) — `bool(pred(*i))` for `replace_if`;
- (1.3) — `bool(invoker(proj, *i) == old_value)` for `ranges::replace`;
- (1.4) — `bool(invoker(pred, invoker(proj, *i)))` for `ranges::replace_if`.

²¹⁸) The use of fully closed ranges is intentional.

- 2 *Mandates*: `new_value` is writable (25.3.1) to `first`.
 3 *Effects*: Substitutes elements referred by the iterator `i` in the range `[first, last)` with `new_value`, when `E` is true.
 4 *Returns*: `last` for the overloads in namespace `ranges`.
 5 *Complexity*: Exactly `last - first` applications of the corresponding predicate and any projection.

```
template<class InputIterator, class OutputIterator, class T>
constexpr OutputIterator
    replace_copy(InputIterator first, InputIterator last,
                OutputIterator result,
                const T& old_value, const T& new_value);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class T>
ForwardIterator2
    replace_copy(ExecutionPolicy&& exec,
                ForwardIterator1 first, ForwardIterator1 last,
                ForwardIterator2 result,
                const T& old_value, const T& new_value);

template<class InputIterator, class OutputIterator, class Predicate, class T>
constexpr OutputIterator
    replace_copy_if(InputIterator first, InputIterator last,
                   OutputIterator result,
                   Predicate pred, const T& new_value);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class Predicate, class T>
ForwardIterator2
    replace_copy_if(ExecutionPolicy&& exec,
                   ForwardIterator1 first, ForwardIterator1 last,
                   ForwardIterator2 result,
                   Predicate pred, const T& new_value);

template<input_iterator I, sentinel_for<I> S, class T1, class T2, output_iterator<const T2&> O,
         class Proj = identity>
requires indirectly_copyable<I, O> &&
    indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T1*>
constexpr ranges::replace_copy_result<I, O>
    ranges::replace_copy(I first, S last, O result, const T1& old_value, const T2& new_value,
                        Proj proj = {});
template<input_range R, class T1, class T2, output_iterator<const T2&> O,
         class Proj = identity>
requires indirectly_copyable<iterator_t<R>, O> &&
    indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T1*>
constexpr ranges::replace_copy_result<borrowed_iterator_t<R>, O>
    ranges::replace_copy(R&& r, O result, const T1& old_value, const T2& new_value,
                        Proj proj = {});

template<input_iterator I, sentinel_for<I> S, class T, output_iterator<const T&> O,
         class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
requires indirectly_copyable<I, O>
constexpr ranges::replace_copy_if_result<I, O>
    ranges::replace_copy_if(I first, S last, O result, Pred pred, const T& new_value,
                           Proj proj = {});
template<input_range R, class T, output_iterator<const T&> O, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
requires indirectly_copyable<iterator_t<R>, O>
constexpr ranges::replace_copy_if_result<borrowed_iterator_t<R>, O>
    ranges::replace_copy_if(R&& r, O result, Pred pred, const T& new_value,
                           Proj proj = {});
```

- 6 Let `E` be
 (6.1) — `bool(*(first + (i - result)) == old_value)` for `replace_copy`;
 (6.2) — `bool(pred(*(first + (i - result))))` for `replace_copy_if`;

(6.3) — `bool(invoker(proj, *(first + (i - result))) == old_value)` for `ranges::replace_copy`;

(6.4) — `bool(invoker(pred, invoke(proj, *(first + (i - result))))))` for `ranges::replace_copy_if`.

7 *Mandates*: The results of the expressions `*first` and `new_value` are writable (25.3.1) to `result`.

8 *Preconditions*: The ranges `[first, last)` and `[result, result + (last - first))` do not overlap.

9 *Effects*: Assigns through every iterator `i` in the range `[result, result + (last - first))` a new corresponding value

(9.1) — `new_value` if `E` is `true` or

(9.2) — `*(first + (i - result))` otherwise.

10 *Returns*:

(10.1) — `result + (last - first)` for the overloads in namespace `std`.

(10.2) — `{last, result + (last - first)}` for the overloads in namespace `ranges`.

11 *Complexity*: Exactly `last - first` applications of the corresponding predicate and any projection.

27.7.6 Fill

[alg.fill]

```
template<class ForwardIterator, class T>
constexpr void fill(ForwardIterator first, ForwardIterator last, const T& value);
template<class ExecutionPolicy, class ForwardIterator, class T>
void fill(ExecutionPolicy&& exec,
          ForwardIterator first, ForwardIterator last, const T& value);

template<class OutputIterator, class Size, class T>
constexpr OutputIterator fill_n(OutputIterator first, Size n, const T& value);
template<class ExecutionPolicy, class ForwardIterator, class Size, class T>
ForwardIterator fill_n(ExecutionPolicy&& exec,
                      ForwardIterator first, Size n, const T& value);

template<class T, output_iterator<const T&> O, sentinel_for<O> S>
constexpr O ranges::fill(O first, S last, const T& value);
template<class T, output_range<const T&> R>
constexpr borrowed_iterator_t<R> ranges::fill(R&& r, const T& value);
template<class T, output_iterator<const T&> O>
constexpr O ranges::fill_n(O first, iter_difference_t<O> n, const T& value);
```

1 Let N be $\max(0, n)$ for the `fill_n` algorithms, and `last - first` for the `fill` algorithms.

2 *Mandates*: The expression `value` is writable (25.3.1) to the output iterator. The type `Size` is convertible to an integral type (7.3.9, 11.4.8).

3 *Effects*: Assigns `value` through all the iterators in the range `[first, first + N)`.

4 *Returns*: `first + N`.

5 *Complexity*: Exactly N assignments.

27.7.7 Generate

[alg.generate]

```
template<class ForwardIterator, class Generator>
constexpr void generate(ForwardIterator first, ForwardIterator last,
                      Generator gen);
template<class ExecutionPolicy, class ForwardIterator, class Generator>
void generate(ExecutionPolicy&& exec,
              ForwardIterator first, ForwardIterator last,
              Generator gen);

template<class OutputIterator, class Size, class Generator>
constexpr OutputIterator generate_n(OutputIterator first, Size n, Generator gen);
template<class ExecutionPolicy, class ForwardIterator, class Size, class Generator>
ForwardIterator generate_n(ExecutionPolicy&& exec,
                           ForwardIterator first, Size n, Generator gen);
```

```

template<input_or_output_iterator O, sentinel_for<O> S, copy_constructible F>
    requires invocable<F&> && indirectly_writable<O, invoke_result_t<F&>>
    constexpr O ranges::generate(O first, S last, F gen);
template<class R, copy_constructible F>
    requires invocable<F&> && output_range<R, invoke_result_t<F&>>
    constexpr borrowed_iterator_t<R> ranges::generate(R&& r, F gen);
template<input_or_output_iterator O, copy_constructible F>
    requires invocable<F&> && indirectly_writable<O, invoke_result_t<F&>>
    constexpr O ranges::generate_n(O first, iter_difference_t<O> n, F gen);

1   Let  $N$  be  $\max(0, n)$  for the generate_n algorithms, and  $last - first$  for the generate algorithms.
2   Mandates: Size is convertible to an integral type (7.3.9, 11.4.8).
3   Effects: Assigns the result of successive evaluations of gen() through each iterator in the range [first, first + N].
4   Returns: first + N.
5   Complexity: Exactly  $N$  evaluations of gen() and assignments.

```

27.7.8 Remove

[alg.remove]

```

template<class ForwardIterator, class T>
    constexpr ForwardIterator remove(ForwardIterator first, ForwardIterator last,
                                    const T& value);
template<class ExecutionPolicy, class ForwardIterator, class T>
    ForwardIterator remove(ExecutionPolicy&& exec,
                          ForwardIterator first, ForwardIterator last,
                          const T& value);

template<class ForwardIterator, class Predicate>
    constexpr ForwardIterator remove_if(ForwardIterator first, ForwardIterator last,
                                       Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
    ForwardIterator remove_if(ExecutionPolicy&& exec,
                           ForwardIterator first, ForwardIterator last,
                           Predicate pred);

template<permutable I, sentinel_for<I> S, class T, class Proj = identity>
    requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
    constexpr subrange<I> ranges::remove(I first, S last, const T& value, Proj proj = {});
template<forward_range R, class T, class Proj = identity>
    requires permutable<iterator_t<R>> &&
    indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
    constexpr borrowed_subrange_t<R>
        ranges::remove(R&& r, const T& value, Proj proj = {});
template<permutable I, sentinel_for<I> S, class Proj = identity,
        indirect_unary_predicate<projected<I, Proj>> Pred>
    constexpr subrange<I> ranges::remove_if(I first, S last, Pred pred, Proj proj = {});
template<forward_range R, class Proj = identity,
        indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
    requires permutable<iterator_t<R>>
    constexpr borrowed_subrange_t<R>
        ranges::remove_if(R&& r, Pred pred, Proj proj = {});

```

- 1 Let E be
 - (1.1) — `bool(*i == value)` for `remove`;
 - (1.2) — `bool(pred(*i))` for `remove_if`;
 - (1.3) — `bool(invoker(proj, *i) == value)` for `ranges::remove`;
 - (1.4) — `bool(invoker(pred, invoker(proj, *i)))` for `ranges::remove_if`.
- 2 *Preconditions:* For the algorithms in namespace `std`, the type of `*first` meets the `Cpp17MoveAssignable` requirements (Table 33).

- 3 *Effects:* Eliminates all the elements referred to by iterator *i* in the range [*first*, *last*) for which *E* holds.
- 4 *Returns:* Let *j* be the end of the resulting range. Returns:
- (4.1) — *j* for the overloads in namespace **std**.
- (4.2) — *{j, last}* for the overloads in namespace **ranges**.
- 5 *Complexity:* Exactly *last - first* applications of the corresponding predicate and any projection.
- 6 *Remarks:* Stable ([16.4.6.8](#)).
- 7 NOTE 1: Each element in the range [*ret*, *last*), where *ret* is the returned value, has a valid but unspecified state, because the algorithms can eliminate elements by moving from elements that were originally in that range.

```
template<class InputIterator, class OutputIterator, class T>
constexpr OutputIterator
remove_copy(InputIterator first, InputIterator last,
           OutputIterator result, const T& value);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class T>
ForwardIterator2
remove_copy(ExecutionPolicy&& exec,
            ForwardIterator1 first, ForwardIterator1 last,
            ForwardIterator2 result, const T& value);

template<class InputIterator, class OutputIterator, class Predicate>
constexpr OutputIterator
remove_copy_if(InputIterator first, InputIterator last,
               OutputIterator result, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class Predicate>
ForwardIterator2
remove_copy_if(ExecutionPolicy&& exec,
               ForwardIterator1 first, ForwardIterator1 last,
               ForwardIterator2 result, Predicate pred);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class T,
         class Proj = identity>
requires indirectly_copyable<I, O> &&
indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
constexpr ranges::remove_copy_result<I, O>
ranges::remove_copy(I first, S last, O result, const T& value, Proj proj = {});
template<input_range R, weakly_incrementable O, class T, class Proj = identity>
requires indirectly_copyable<iterator_t<R>, O> &&
indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
constexpr ranges::remove_copy_result<borrowed_iterator_t<R>, O>
ranges::remove_copy(R&& r, O result, const T& value, Proj proj = {});
template<input_iterator I, sentinel_for<I> S, weakly_incrementable O,
         class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
requires indirectly_copyable<I, O>
constexpr ranges::remove_copy_if_result<I, O>
ranges::remove_copy_if(I first, S last, O result, Pred pred, Proj proj = {});
template<input_range R, weakly_incrementable O, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
requires indirectly_copyable<iterator_t<R>, O>
constexpr ranges::remove_copy_if_result<borrowed_iterator_t<R>, O>
ranges::remove_copy_if(R&& r, O result, Pred pred, Proj proj = {});
```

8 Let *E* be

- (8.1) — *bool(*i == value)* for *remove_copy*;
- (8.2) — *bool(pred(*i))* for *remove_copy_if*;
- (8.3) — *bool(invoker(proj, *i) == value)* for *ranges::remove_copy*;
- (8.4) — *bool(invoker(pred, invoker(proj, *i)))* for *ranges::remove_copy_if*.

9 Let N be the number of elements in $[first, last)$ for which E is false.
 10 *Mandates*: `*first` is writable (25.3.1) to `result`.
 11 *Preconditions*: The ranges $[first, last)$ and $[result, result + (last - first))$ do not overlap.
 NOTE 2: For the overloads with an `ExecutionPolicy`, a performance cost is possible if `iterator_traits<ForwardIterator1>::value_type` does not meet the *Cpp17MoveConstructible* (Table 31) requirements.
 12 *Effects*: Copies all the elements referred to by the iterator `i` in the range $[first, last)$ for which E is false.
 13 *Returns*:
 (13.1) — `result + N`, for the algorithms in namespace `std`.
 (13.2) — $\{last, result + N\}$, for the algorithms in namespace `ranges`.
 14 *Complexity*: Exactly $last - first$ applications of the corresponding predicate and any projection.
 15 *Remarks*: Stable (16.4.6.8).

27.7.9 Unique

[alg.unique]

```
template<class ForwardIterator>
constexpr ForwardIterator unique(ForwardIterator first, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator unique(ExecutionPolicy&& exec,
                      ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class BinaryPredicate>
constexpr ForwardIterator unique(ForwardIterator first, ForwardIterator last,
                                BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator, class BinaryPredicate>
ForwardIterator unique(ExecutionPolicy&& exec,
                      ForwardIterator first, ForwardIterator last,
                      BinaryPredicate pred);

template<permutable I, sentinel_for<I> S, class Proj = identity,
         indirect_equivalence_relation<projected<I, Proj>> C = ranges::equal_to>
constexpr subrange<I> ranges::unique(I first, S last, C comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_equivalence_relation<projected<iterator_t<R>, Proj>> C = ranges::equal_to>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R>
ranges::unique(R&& r, C comp = {}, Proj proj = {});
```

1 Let `pred` be `equal_to{}` for the overloads with no parameter `pred`, and let E be

- (1.1) — `bool(pred(*(i - 1), *i))` for the overloads in namespace `std`;
 (1.2) — `bool(invoker(comp, invoke(proj, *(i - 1)), invoke(proj, *i)))` for the overloads in namespace `ranges`.

2 *Preconditions*: For the overloads in namespace `std`, `pred` is an equivalence relation and the type of `*first` meets the *Cpp17MoveAssignable* requirements (Table 33).

3 *Effects*: For a nonempty range, eliminates all but the first element from every consecutive group of equivalent elements referred to by the iterator `i` in the range $[first + 1, last)$ for which E is true.

4 *Returns*: Let `j` be the end of the resulting range. Returns:

- (4.1) — `j` for the overloads in namespace `std`.
 (4.2) — $\{j, last\}$ for the overloads in namespace `ranges`.

5 *Complexity*: For nonempty ranges, exactly $(last - first) - 1$ applications of the corresponding predicate and no more than twice as many applications of any projection.

```
template<class InputIterator, class OutputIterator>
constexpr OutputIterator
unique_copy(InputIterator first, InputIterator last,
            OutputIterator result);
```

```

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
    unique_copy(ExecutionPolicy&& exec,
                ForwardIterator1 first, ForwardIterator1 last,
                ForwardIterator2 result);

template<class InputIterator, class OutputIterator,
         class BinaryPredicate>
constexpr OutputIterator
    unique_copy(InputIterator first, InputIterator last,
               OutputIterator result, BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
ForwardIterator2
    unique_copy(ExecutionPolicy&& exec,
                ForwardIterator1 first, ForwardIterator1 last,
                ForwardIterator2 result, BinaryPredicate pred);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class Proj = identity,
         indirect_equivalence_relation<projected<I, Proj>> C = ranges::equal_to>
requires indirectly_copyable<I, O> &&
    (forward_iterator<I> ||
     (input_iterator<O> && same_as<iter_value_t<I>, iter_value_t<O>>) ||
     indirectly_copyable_storable<I, O>)
constexpr ranges::unique_copy_result<I, O>
ranges::unique_copy(I first, S last, O result, C comp = {}, Proj proj = {});
template<input_range R, weakly_incrementable O, class Proj = identity,
         indirect_equivalence_relation<projected<iterator_t<R>, Proj>> C = ranges::equal_to>
requires indirectly_copyable<iterator_t<R>, O> &&
    (forward_iterator<iterator_t<R> ||
     (input_iterator<O> && same_as<range_value_t<R>, iter_value_t<O>>) ||
     indirectly_copyable_storable<iterator_t<R>, O>)
constexpr ranges::unique_copy_result<borrowed_iterator_t<R>, O>
ranges::unique_copy(R&& r, O result, C comp = {}, Proj proj = {});

```

6 Let `pred` be `equal_to{}` for the overloads in namespace `std` with no parameter `pred`, and let `E` be
 (6.1) — `bool(pred(*i, *(i - 1)))` for the overloads in namespace `std`;

(6.2) — `bool(invoker(comp, invoke(proj, *i), invoke(proj, *(i - 1))))` for the overloads in
 namespace `ranges`.

7 *Mandates:* `*first` is writable ([25.3.1](#)) to `result`.

8 *Preconditions:*

(8.1) — The ranges `[first, last)` and `[result, result + (last - first))` do not overlap.

(8.2) — For the overloads in namespace `std`:

(8.2.1) — The comparison function is an equivalence relation.

(8.2.2) — For the overloads with no `ExecutionPolicy`, let `T` be the value type of `InputIterator`. If `InputIterator` models `forward_iterator` ([25.3.4.11](#)), then there are no additional requirements for `T`. Otherwise, if `OutputIterator` meets the `Cpp17ForwardIterator` requirements and its value type is the same as `T`, then `T` meets the `Cpp17CopyAssignable` ([Table 34](#)) requirements. Otherwise, `T` meets both the `Cpp17CopyConstructible` ([Table 32](#)) and `Cpp17CopyAssignable` requirements.

NOTE: For the overloads with an `ExecutionPolicy`, a performance cost is possible if the value type of `ForwardIterator1` does not meet both the `Cpp17CopyConstructible` and `Cpp17CopyAssignable` requirements.

9 *Effects:* Copies only the first element from every consecutive group of equal elements referred to by the iterator `i` in the range `[first, last)` for which `E` holds.

10 *Returns:*

(10.1) — `result + N` for the overloads in namespace `std`.

(10.2) — `{last, result + N}` for the overloads in namespace `ranges`.

11 *Complexity:* Exactly `last - first - 1` applications of the corresponding predicate and no more than twice as many applications of any projection.

27.7.10 Reverse

[alg.reverse]

```
template<class BidirectionalIterator>
constexpr void reverse(BidirectionalIterator first, BidirectionalIterator last);
template<class ExecutionPolicy, class BidirectionalIterator>
void reverse(ExecutionPolicy&& exec,
            BidirectionalIterator first, BidirectionalIterator last);

template<bidirectional_iterator I, sentinel_for<I> S>
requires permutable<I>
constexpr I ranges::reverse(I first, S last);
template<bidirectional_range R>
requires permutable<iterator_t<R>>
constexpr borrowed_iterator_t<R> ranges::reverse(R&& r);
```

1 *Preconditions:* For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17Value-Swappable* requirements ([16.4.4.3](#)).

2 *Effects:* For each non-negative integer $i < (last - first) / 2$, applies `std::iter_swap`, or `ranges::iter_swap` for the overloads in namespace `ranges`, to all pairs of iterators `first + i`, `(last - i) - 1`.

3 *Returns:* `last` for the overloads in namespace `ranges`.

4 *Complexity:* Exactly $(last - first)/2$ swaps.

```
template<class BidirectionalIterator, class OutputIterator>
constexpr OutputIterator
reverse_copy(BidirectionalIterator first, BidirectionalIterator last,
            OutputIterator result);
template<class ExecutionPolicy, class BidirectionalIterator, class ForwardIterator>
ForwardIterator
reverse_copy(ExecutionPolicy&& exec,
            BidirectionalIterator first, BidirectionalIterator last,
            ForwardIterator result);

template<bidirectional_iterator I, sentinel_for<I> S, weakly_incrementable O>
requires indirectly_copyable<I, O>
constexpr ranges::reverse_copy_result<I, O>
ranges::reverse_copy(I first, S last, O result);
template<bidirectional_range R, weakly_incrementable O>
requires indirectly_copyable<iterator_t<R>, O>
constexpr ranges::reverse_copy_result<borrowed_iterator_t<R>, O>
ranges::reverse_copy(R&& r, O result);
```

5 Let N be $last - first$.

6 *Preconditions:* The ranges $[first, last)$ and $[result, result + N)$ do not overlap.

7 *Effects:* Copies the range $[first, last)$ to the range $[result, result + N)$ such that for every non-negative integer $i < N$ the following assignment takes place: $*(result + N - 1 - i) = *(first + i)$.

8 *Returns:*

(8.1) — `result + N` for the overloads in namespace `std`.

(8.2) — `{last, result + N}` for the overloads in namespace `ranges`.

9 *Complexity:* Exactly N assignments.

27.7.11 Rotate

[alg.rotate]

```
template<class ForwardIterator>
constexpr ForwardIterator
```

```

rotate(ForwardIterator first, ForwardIterator middle, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
rotate(ExecutionPolicy&& exec,
      ForwardIterator first, ForwardIterator middle, ForwardIterator last);

```

```

template<permutable I, sentinel_for<I> S>
constexpr subrange<I> ranges::rotate(I first, I middle, S last);

```

1 *Preconditions:* [first,middle) and [middle,last) are valid ranges. For the overloads in namespace std, ForwardIterator meets the Cpp17ValueSwappable requirements (16.4.4.3), and the type of *first meets the Cpp17MoveConstructible (Table 31) and Cpp17MoveAssignable (Table 33) requirements.

2 *Effects:* For each non-negative integer $i < (last - first)$, places the element from the position first + i into position first + (i + (last - middle)) % (last - first).

NOTE: This is a left rotate.

3 *Returns:*

(3.1) — first + (last - middle) for the overloads in namespace std.

(3.2) — {first + (last - middle), last} for the overload in namespace ranges.

4 *Complexity:* At most last - first swaps.

```

template<forward_range R>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R> ranges::rotate(R&& r, iterator_t<R> middle);

```

5 *Effects:* Equivalent to: return ranges::rotate(ranges::begin(r), middle, ranges::end(r));

```

template<class ForwardIterator, class OutputIterator>
constexpr OutputIterator
rotate_copy(ForwardIterator first, ForwardIterator middle, ForwardIterator last,
           OutputIterator result);

```

```

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
rotate_copy(ExecutionPolicy&& exec,
            ForwardIterator1 first, ForwardIterator1 middle, ForwardIterator1 last,
            ForwardIterator2 result);

```

```

template<forward_iterator I, sentinel_for<I> S, weakly_incrementable O>
requires indirectly_copyable<I, O>
constexpr ranges::rotate_copy_result<I, O>
ranges::rotate_copy(I first, I middle, S last, O result);

```

6 Let N be last - first.

7 *Preconditions:* [first,middle) and [middle,last) are valid ranges. The ranges [first,last) and [result,result + N) do not overlap.

8 *Effects:* Copies the range [first,last) to the range [result,result + N) such that for each non-negative integer $i < N$ the following assignment takes place: *(result + i) = *(first + (i + (middle - first)) % N).

9 *Returns:*

(9.1) — result + N for the overloads in namespace std.

(9.2) — {last, result + N} for the overload in namespace ranges.

10 *Complexity:* Exactly N assignments.

```

template<forward_range R, weakly_incrementable O>
requires indirectly_copyable<iterator_t<R>, O>
constexpr ranges::rotate_copy_result<borrowed_iterator_t<R>, O>
ranges::rotate_copy(R&& r, iterator_t<R> middle, O result);

```

11 *Effects:* Equivalent to:

```

return ranges::rotate_copy(ranges::begin(r), middle, ranges::end(r), std::move(result));

```

27.7.12 Sample

[alg.random.sample]

```
template<class PopulationIterator, class SampleIterator,
         class Distance, class UniformRandomBitGenerator>
SampleIterator sample(PopulationIterator first, PopulationIterator last,
                      SampleIterator out, Distance n,
                      UniformRandomBitGenerator&& g);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class Gen>
requires (forward_iterator<I> || random_access_iterator<O>) &&
         indirectly_copyable<I, O> &&
         uniform_random_bit_generator<remove_reference_t<Gen>>
O ranges::sample(I first, S last, O out, iter_difference_t<I> n, Gen&& g);
template<input_range R, weakly_incrementable O, class Gen>
requires (forward_range<R> || random_access_iterator<O>) &&
         indirectly_copyable<iterator_t<R>, O> &&
         uniform_random_bit_generator<remove_reference_t<Gen>>
O ranges::sample(R&& r, O out, range_difference_t<R> n, Gen&& g);
```

1 *Mandates*: For the overload in namespace `std`, `Distance` is an integer type and `*first` is writable (25.3.1) to `out`.

2 *Preconditions*: `out` is not in the range `[first, last)`. For the overload in namespace `std`:

- (2.1) — `PopulationIterator` meets the *Cpp17InputIterator* requirements (25.3.5.3).
- (2.2) — `SampleIterator` meets the *Cpp17OutputIterator* requirements (25.3.5.4).
- (2.3) — `SampleIterator` meets the *Cpp17RandomAccessIterator* requirements (25.3.5.7) unless `PopulationIterator` models `forward_iterator` (25.3.4.11).
- (2.4) — `remove_reference_t<UniformRandomBitGenerator>` meets the requirements of a uniform random bit generator type (28.5.3.3).

3 *Effects*: Copies `min(last - first, n)` elements (the *sample*) from `[first, last)` (the *population*) to `out` such that each possible sample has equal probability of appearance.

NOTE: Algorithms that obtain such effects include *selection sampling* and *reservoir sampling*.

4 *Returns*: The end of the resulting sample range.

5 *Complexity*: $\mathcal{O}(\text{last} - \text{first})$.

6 *Remarks*:

- (6.1) — For the overload in namespace `std`, stable if and only if `PopulationIterator` models `forward_iterator`. For the first overload in namespace `ranges`, stable if and only if `I` models `forward_iterator`.
- (6.2) — To the extent that the implementation of this function makes use of random numbers, the object `g` serves as the implementation's source of randomness.

27.7.13 Shuffle

[alg.random.shuffle]

```
template<class RandomAccessIterator, class UniformRandomBitGenerator>
void shuffle(RandomAccessIterator first,
             RandomAccessIterator last,
             UniformRandomBitGenerator&& g);

template<random_access_iterator I, sentinel_for<I> S, class Gen>
requires permutable<I> &&
        uniform_random_bit_generator<remove_reference_t<Gen>>
I ranges::shuffle(I first, S last, Gen&& g);
template<random_access_range R, class Gen>
requires permutable<iterator_t<R>> &&
        uniform_random_bit_generator<remove_reference_t<Gen>>
borrowed_iterator_t<R> ranges::shuffle(R&& r, Gen&& g);
```

1 *Preconditions*: For the overload in namespace `std`:

- (1.1) — `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3).

- (1.2) — The type `remove_reference_t<UniformRandomBitGenerator>` meets the uniform random bit generator (28.5.3.3) requirements.
- 2 *Effects:* Permutes the elements in the range `[first, last)` such that each possible permutation of those elements has equal probability of appearance.
- 3 *Returns:* `last` for the overloads in namespace `ranges`.
- 4 *Complexity:* Exactly $(last - first) - 1$ swaps.
- 5 *Remarks:* To the extent that the implementation of this function makes use of random numbers, the object referenced by `g` shall serve as the implementation's source of randomness.

27.7.14 Shift

[alg.shift]

```
template<class ForwardIterator>
constexpr ForwardIterator
shift_left(ForwardIterator first, ForwardIterator last,
           typename iterator_traits<ForwardIterator>::difference_type n);
template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
shift_left(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
           typename iterator_traits<ForwardIterator>::difference_type n);

template<permutable I, sentinel_for<I> S>
constexpr subrange<I> ranges::shift_left(I first, S last, iter_difference_t<I> n);
template<forward_range R>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R> ranges::shift_left(R&& r, range_difference_t<R> n)
```

- 1 *Preconditions:* $n \geq 0$ is true. For the overloads in namespace `std`, the type of `*first` meets the `Cpp17MoveAssignable` requirements.
- 2 *Effects:* If $n == 0$ or $n \geq last - first$, does nothing. Otherwise, moves the element from position `first + n + i` into position `first + i` for each non-negative integer $i < (last - first) - n$. For the overloads without an `ExecutionPolicy` template parameter, does so in order starting from $i = 0$ and proceeding to $i = (last - first) - n - 1$.
- 3 *Returns:* Let `NEW_LAST` be `first + (last - first - n)` if $n < last - first$, otherwise `first`.
- (3.1) — `NEW_LAST` for the overloads in namespace `std`.
- (3.2) — `{first, NEW_LAST}` for the overloads in namespace `ranges`.
- 4 *Complexity:* At most $(last - first) - n$ assignments.

```
template<class ForwardIterator>
constexpr ForwardIterator
shift_right(ForwardIterator first, ForwardIterator last,
            typename iterator_traits<ForwardIterator>::difference_type n);
template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
shift_right(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
            typename iterator_traits<ForwardIterator>::difference_type n);

template<permutable I, sentinel_for<I> S>
constexpr subrange<I> ranges::shift_right(I first, S last, iter_difference_t<I> n);
template<forward_range R>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R> ranges::shift_right(R&& r, range_difference_t<R> n);

5 Preconditions:  $n \geq 0$  is true. For the overloads in namespace std, the type of *first meets the Cpp17MoveAssignable requirements, and ForwardIterator meets the Cpp17BidirectionalIterator requirements (25.3.5.6) or the Cpp17ValueSwappable requirements.

6 Effects: If  $n == 0$  or  $n \geq last - first$ , does nothing. Otherwise, moves the element from position first + i into position first + n + i for each non-negative integer  $i < (last - first) - n$ . Does so in order starting from  $i = (last - first) - n - 1$  and proceeding to  $i = 0$  if:

```

- (6.1) — for the overload in namespace `std` without an `ExecutionPolicy` template parameter, `ForwardIterator` meets the *Cpp17BidirectionalIterator* requirements,
- (6.2) — for the overloads in namespace `ranges`, `I` models `bidirectional_iterator`.
- 7 *Returns:* Let `NEW_FIRST` be `first + n` if `n < last - first`, otherwise `last`.
- (7.1) — `NEW_FIRST` for the overloads in namespace `std`.
- (7.2) — `{NEW_FIRST, last}` for the overloads in namespace `ranges`.
- 8 *Complexity:* At most $(last - first) - n$ assignments or swaps.

27.8 Sorting and related operations

[alg.sorting]

27.8.1 General

[alg.sorting.general]

- 1 The operations in 27.8 defined directly in namespace `std` have two versions: one that takes a function object of type `Compare` and one that uses an `operator<`.
- 2 `Compare` is a function object type (22.10) that meets the requirements for a template parameter named `BinaryPredicate` (27.2). The return value of the function call operation applied to an object of type `Compare`, when converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. `Compare comp` is used throughout for algorithms assuming an ordering relation.
- 3 For all algorithms that take `Compare`, there is a version that uses `operator<` instead. That is, `comp(*i, *j) != false` defaults to `*i < *j != false`. For algorithms other than those described in 27.8.4, `comp` shall induce a strict weak ordering on the values.
- 4 The term *strict* refers to the requirement of an irreflexive relation (`!comp(x, x)` for all `x`), and the term *weak* to requirements that are not as strong as those for a total ordering, but stronger than those for a partial ordering. If we define `equiv(a, b)` as `!comp(a, b) && !comp(b, a)`, then the requirements are that `comp` and `equiv` both be transitive relations:

- (4.1) — `comp(a, b) && comp(b, c)` implies `comp(a, c)`
- (4.2) — `equiv(a, b) && equiv(b, c)` implies `equiv(a, c)`

NOTE: Under these conditions, it can be shown that

- (4.3) — `equiv` is an equivalence relation,
- (4.4) — `comp` induces a well-defined relation on the equivalence classes determined by `equiv`, and
- (4.5) — the induced relation is a strict total ordering.

- 5 A sequence is *sorted with respect to a comp and proj* for a comparator and projection `comp` and `proj` if for every iterator `i` pointing to the sequence and every non-negative integer `n` such that `i + n` is a valid iterator pointing to an element of the sequence,

```
bool(invoker(comp, invoker(proj, *(i + n)), invoker(proj, *i)))  
is false.
```

- 6 A sequence is *sorted with respect to a comparator comp* for a comparator `comp` if it is sorted with respect to `comp` and `identity{}` (the identity projection).

- 7 A sequence `[start, finish)` is *partitioned with respect to an expression f(e)* if there exists an integer `n` such that for all `0 <= i < (finish - start)`, `f(*(start + i))` is `true` if and only if `i < n`.

- 8 In the descriptions of the functions that deal with ordering relationships we frequently use a notion of equivalence to describe concepts such as stability. The equivalence to which we refer is not necessarily an `operator==`, but an equivalence relation induced by the strict weak ordering. That is, two elements `a` and `b` are considered equivalent if and only if `!(a < b) && !(b < a)`.

27.8.2 Sorting

[alg.sort]

27.8.2.1 sort

[sort]

```
template<class RandomAccessIterator>  
constexpr void sort(RandomAccessIterator first, RandomAccessIterator last);  
template<class ExecutionPolicy, class RandomAccessIterator>  
void sort(ExecutionPolicy&& exec,  
          RandomAccessIterator first, RandomAccessIterator last);
```

```

template<class RandomAccessIterator, class Compare>
constexpr void sort(RandomAccessIterator first, RandomAccessIterator last,
                    Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void sort(ExecutionPolicy&& exec,
          RandomAccessIterator first, RandomAccessIterator last,
          Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
    ranges::sort(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
    ranges::sort(R&& r, Comp comp = {}, Proj proj = {});

```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.
- 2 *Preconditions:* For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17Value-Swappable* requirements ([16.4.4.3](#)) and the type of `*first` meets the *Cpp17MoveConstructible* ([Table 31](#)) and *Cpp17MoveAssignable* ([Table 33](#)) requirements.
- 3 *Effects:* Sorts the elements in the range `[first, last)` with respect to `comp` and `proj`.
- 4 *Returns:* `last` for the overloads in namespace `ranges`.
- 5 *Complexity:* Let N be `last - first`. $\mathcal{O}(N \log N)$ comparisons and projections.

27.8.2.2 stable_sort

[stable.sort]

```

template<class RandomAccessIterator>
void stable_sort(RandomAccessIterator first, RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
void stable_sort(ExecutionPolicy&& exec,
                 RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
void stable_sort(RandomAccessIterator first, RandomAccessIterator last,
                 Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void stable_sort(ExecutionPolicy&& exec,
                 RandomAccessIterator first, RandomAccessIterator last,
                 Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
I ranges::stable_sort(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
borrowed_iterator_t<R>
    ranges::stable_sort(R&& r, Comp comp = {}, Proj proj = {});

```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.
- 2 *Preconditions:* For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17Value-Swappable* requirements ([16.4.4.3](#)) and the type of `*first` meets the *Cpp17MoveConstructible* ([Table 31](#)) and *Cpp17MoveAssignable* ([Table 33](#)) requirements.
- 3 *Effects:* Sorts the elements in the range `[first, last)` with respect to `comp` and `proj`.
- 4 *Returns:* `last` for the overloads in namespace `ranges`.
- 5 *Complexity:* Let N be `last - first`. If enough extra memory is available, $N \log(N)$ comparisons. Otherwise, at most $N \log^2(N)$ comparisons. In either case, twice as many projections as the number of comparisons.

6 *Remarks:* Stable (16.4.6.8).

27.8.2.3 partial_sort

[partial.sort]

```
template<class RandomAccessIterator>
constexpr void partial_sort(RandomAccessIterator first,
                           RandomAccessIterator middle,
                           RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
void partial_sort(ExecutionPolicy&& exec,
                  RandomAccessIterator first,
                  RandomAccessIterator middle,
                  RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void partial_sort(RandomAccessIterator first,
                           RandomAccessIterator middle,
                           RandomAccessIterator last,
                           Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void partial_sort(ExecutionPolicy&& exec,
                  RandomAccessIterator first,
                  RandomAccessIterator middle,
                  RandomAccessIterator last,
                  Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
ranges::partial_sort(I first, I middle, S last, Comp comp = {}, Proj proj = {});
```

1 Let *comp* be *less{}* and *proj* be *identity{}* for the overloads with no parameters by those names.

2 *Preconditions:* [*first*,*middle*) and [*middle*,*last*) are valid ranges. For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

3 *Effects:* Places the first *middle* - *first* elements from the range [*first*,*last*) as sorted with respect to *comp* and *proj* into the range [*first*,*middle*). The rest of the elements in the range [*middle*,*last*) are placed in an unspecified order.

4 *Returns:* *last* for the overload in namespace `ranges`.

5 *Complexity:* Approximately (*last* - *first*) * log(*middle* - *first*) comparisons, and twice as many projections.

```
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::partial_sort(R&& r, iterator_t<R> middle, Comp comp = {}, Proj proj = {});
```

6 *Effects:* Equivalent to:

```
return ranges::partial_sort(ranges::begin(r), middle, ranges::end(r), comp, proj);
```

27.8.2.4 partial_sort_copy

[partial.sort.copy]

```
template<class InputIterator, class RandomAccessIterator>
constexpr RandomAccessIterator
partial_sort_copy(InputIterator first, InputIterator last,
                  RandomAccessIterator result_first,
                  RandomAccessIterator result_last);
template<class ExecutionPolicy, class ForwardIterator, class RandomAccessIterator>
RandomAccessIterator
partial_sort_copy(ExecutionPolicy&& exec,
                  ForwardIterator first, ForwardIterator last,
                  RandomAccessIterator result_first,
```

```

        RandomAccessIterator result_last);

template<class InputIterator, class RandomAccessIterator,
         class Compare>
constexpr RandomAccessIterator
partial_sort_copy(InputIterator first, InputIterator last,
                  RandomAccessIterator result_first,
                  RandomAccessIterator result_last,
                  Compare comp);
template<class ExecutionPolicy, class ForwardIterator, class RandomAccessIterator,
         class Compare>
RandomAccessIterator
partial_sort_copy(ExecutionPolicy&& exec,
                  ForwardIterator first, ForwardIterator last,
                  RandomAccessIterator result_first,
                  RandomAccessIterator result_last,
                  Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, random_access_iterator I2, sentinel_for<I2> S2,
         class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires indirectly_copyable<I1, I2> && sortable<I2, Comp, Proj2> &&
indirect_strict_weak_order<Comp, projected<I1, Proj1>, projected<I2, Proj2>>
constexpr ranges::partial_sort_copy_result<I1, I2>
ranges::partial_sort_copy(I1 first, S1 last, I2 result_first, S2 result_last,
                        Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, random_access_range R2, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
requires indirectly_copyable<iterator_t<R1>, iterator_t<R2>> &&
sortable<iterator_t<R2>, Comp, Proj2> &&
indirect_strict_weak_order<Comp, projected<iterator_t<R1>, Proj1>,
                           projected<iterator_t<R2>, Proj2>>
constexpr ranges::partial_sort_copy_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>>
ranges::partial_sort_copy(R1&& r, R2&& result_r, Comp comp = {},
                        Proj1 proj1 = {}, Proj2 proj2 = {});

```

- 1 Let N be $\min(\text{last} - \text{first}, \text{result_last} - \text{result_first})$. Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.
- 2 *Mandates:* For the overloads in namespace `std`, the expression `*first` is writable ([25.3.1](#)) to `result_-first`.
- 3 *Preconditions:* For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17Value-Swappable* requirements ([16.4.4.3](#)), the type of `*result_first` meets the *Cpp17MoveConstructible* ([Table 31](#)) and *Cpp17MoveAssignable* ([Table 33](#)) requirements.
- 4 For iterators `a1` and `b1` in $[\text{first}, \text{last})$, and iterators `x2` and `y2` in $[\text{result_first}, \text{result_last})$, after evaluating the assignment `*y2 = *b1`, let E be the value of

```
bool(invoker(comp, invoke(proj1, *a1), invoke(proj2, *y2))).
```

 Then, after evaluating the assignment `*x2 = *a1`, E is equal to

```
bool(invoker(comp, invoke(proj2, *x2), invoke(proj2, *y2))).
```

 NOTE: Writing a value from the input range into the output range does not affect how it is ordered by `comp` and `proj1` or `proj2`.
- 5 *Effects:* Places the first N elements as sorted with respect to `comp` and `proj2` into the range $[\text{result_first}, \text{result_first} + N)$.
- 6 *Returns:*
 - (6.1) — `result_first + N` for the overloads in namespace `std`.
 - (6.2) — $\{\text{last}, \text{result_first} + N\}$ for the overloads in namespace `ranges`.
- 7 *Complexity:* Approximately $(\text{last} - \text{first}) * \log N$ comparisons, and twice as many projections.

27.8.2.5 `is_sorted`[`is.sorted`]

```

template<class ForwardIterator>
constexpr bool is_sorted(ForwardIterator first, ForwardIterator last);

1   Effects: Equivalent to: return is_sorted_until(first, last) == last;

template<class ExecutionPolicy, class ForwardIterator>
bool is_sorted(ExecutionPolicy&& exec,
               ForwardIterator first, ForwardIterator last);

2   Effects: Equivalent to:
        return is_sorted_until(std::forward<ExecutionPolicy>(exec), first, last) == last;

template<class ForwardIterator, class Compare>
constexpr bool is_sorted(ForwardIterator first, ForwardIterator last,
                        Compare comp);

3   Effects: Equivalent to: return is_sorted_until(first, last, comp) == last;

template<class ExecutionPolicy, class ForwardIterator, class Compare>
bool is_sorted(ExecutionPolicy&& exec,
               ForwardIterator first, ForwardIterator last,
               Compare comp);

4   Effects: Equivalent to:
        return is_sorted_until(std::forward<ExecutionPolicy>(exec), first, last, comp) == last;

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr bool ranges::is_sorted(I first, S last, Comp comp = {}, Proj proj = {});

template<forward_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr bool ranges::is_sorted(R&& r, Comp comp = {}, Proj proj = {});

5   Effects: Equivalent to: return ranges::is_sorted_until(first, last, comp, proj) == last;

template<class ForwardIterator>
constexpr ForwardIterator
    is_sorted_until(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
    is_sorted_until(ExecutionPolicy&& exec,
                   ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
constexpr ForwardIterator
    is_sorted_until(ForwardIterator first, ForwardIterator last,
                   Compare comp);

template<class ExecutionPolicy, class ForwardIterator, class Compare>
ForwardIterator
    is_sorted_until(ExecutionPolicy&& exec,
                   ForwardIterator first, ForwardIterator last,
                   Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::is_sorted_until(I first, S last, Comp comp = {}, Proj proj = {});

template<forward_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr borrowed_iterator_t<R>
    ranges::is_sorted_until(R&& r, Comp comp = {}, Proj proj = {});

6   Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.

7   Returns: The last iterator i in [first, last] for which the range [first, i) is sorted with respect to comp and proj.

```

8 *Complexity:* Linear.

27.8.3 Nth element

[alg.nth.element]

```
template<class RandomAccessIterator>
constexpr void nth_element(RandomAccessIterator first, RandomAccessIterator nth,
                           RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
void nth_element(ExecutionPolicy&& exec,
                 RandomAccessIterator first, RandomAccessIterator nth,
                 RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void nth_element(RandomAccessIterator first, RandomAccessIterator nth,
                           RandomAccessIterator last, Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void nth_element(ExecutionPolicy&& exec,
                 RandomAccessIterator first, RandomAccessIterator nth,
                 RandomAccessIterator last, Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
ranges::nth_element(I first, I nth, S last, Comp comp = {}, Proj proj = {});
```

1 Let *comp* be *less*{ } and *proj* be *identity*{ } for the overloads with no parameters by those names.

2 *Preconditions:* [*first*,*nth*] and [*nth*,*last*] are valid ranges. For the overloads in namespace **std**, **RandomAccessIterator** meets the *Cpp17ValueSwappable* requirements (16.4.4.3), and the type of **first* meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

3 *Effects:* After *nth_element* the element in the position pointed to by *nth* is the element that would be in that position if the whole range were sorted with respect to *comp* and *proj*, unless *nth* == *last*. Also for every iterator *i* in the range [*first*,*nth*] and every iterator *j* in the range [*nth*,*last*] it holds that: *bool(invoker(comp, invoke(proj, *j), invoke(proj, *i)))* is false.

4 *Returns:* *last* for the overload in namespace **ranges**.

5 *Complexity:* For the overloads with no **ExecutionPolicy**, linear on average. For the overloads with an **ExecutionPolicy**, $\mathcal{O}(N)$ applications of the predicate, and $\mathcal{O}(N \log N)$ swaps, where $N = \text{last} - \text{first}$.

```
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::nth_element(R&& r, iterator_t<R> nth, Comp comp = {}, Proj proj = {});
```

6 *Effects:* Equivalent to:
return ranges::nth_element(ranges::begin(r), nth, ranges::end(r), comp, proj);

27.8.4 Binary search

[alg.binary.search]

27.8.4.1 General

[alg.binary.search.general]

1 All of the algorithms in 27.8.4 are versions of binary search and assume that the sequence being searched is partitioned with respect to an expression formed by binding the search key to an argument of the comparison function. They work on non-random access iterators minimizing the number of comparisons, which will be logarithmic for all types of iterators. They are especially appropriate for random access iterators, because these algorithms do a logarithmic number of steps through the data structure. For non-random access iterators they execute a linear number of steps.

27.8.4.2 lower_bound

[lower_bound]

```
template<class ForwardIterator, class T>
constexpr ForwardIterator
```

```

lower_bound(ForwardIterator first, ForwardIterator last,
            const T& value);

template<class ForwardIterator, class T, class Compare>
constexpr ForwardIterator
lower_bound(ForwardIterator first, ForwardIterator last,
            const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity,
         indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::lower_bound(I first, S last, const T& value, Comp comp = {}, Proj proj = {});
template<forward_range R, class T, class Proj = identity,
         indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp =
         ranges::less>
constexpr borrowed_iterator_t<R>
ranges::lower_bound(R&& r, const T& value, Comp comp = {}, Proj proj = {});

1 Let comp be less{} and proj be identity{} for overloads with no parameters by those names.
2 Preconditions: The elements e of [first, last) are partitioned with respect to the expression
  bool(invoker(comp, invoke(proj, e), value)).
3 Returns: The furthermost iterator i in the range [first, last] such that for every iterator j in the
  range [first, i), bool(invoker(comp, invoke(proj, *j), value)) is true.
4 Complexity: At most  $\log_2(\text{last} - \text{first}) + \mathcal{O}(1)$  comparisons and projections.

```

27.8.4.3 upper_bound

[upper bound]

```

template<class ForwardIterator, class T>
constexpr ForwardIterator
upper_bound(ForwardIterator first, ForwardIterator last,
            const T& value);

template<class ForwardIterator, class T, class Compare>
constexpr ForwardIterator
upper_bound(ForwardIterator first, ForwardIterator last,
            const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity,
         indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::upper_bound(I first, S last, const T& value, Comp comp = {}, Proj proj = {});
template<forward_range R, class T, class Proj = identity,
         indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp =
         ranges::less>
constexpr borrowed_iterator_t<R>
ranges::upper_bound(R&& r, const T& value, Comp comp = {}, Proj proj = {});

1 Let comp be less{} and proj be identity{} for overloads with no parameters by those names.
2 Preconditions: The elements e of [first, last) are partitioned with respect to the expression
  !bool(invoker(comp, value, invoke(proj, e))).
3 Returns: The furthermost iterator i in the range [first, last] such that for every iterator j in the
  range [first, i), !bool(invoker(comp, value, invoke(proj, *j))) is true.
4 Complexity: At most  $\log_2(\text{last} - \text{first}) + \mathcal{O}(1)$  comparisons and projections.

```

27.8.4.4 equal_range

[equal range]

```

template<class ForwardIterator, class T>
constexpr pair<ForwardIterator, ForwardIterator>
equal_range(ForwardIterator first,
            ForwardIterator last, const T& value);

```

```

template<class ForwardIterator, class T, class Compare>
constexpr pair<ForwardIterator, ForwardIterator>
equal_range(ForwardIterator first,
            ForwardIterator last, const T& value,
            Compare comp);

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity,
         indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
constexpr subrange<I>
ranges::equal_range(I first, S last, const T& value, Comp comp = {}, Proj proj = {});
template<forward_range R, class T, class Proj = identity,
         indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp =
         ranges::less>
constexpr borrowed_subrange_t<R>
ranges::equal_range(R&& r, const T& value, Comp comp = {}, Proj proj = {});

1 Let comp be less{} and proj be identity{} for overloads with no parameters by those names.
2 Preconditions: The elements e of [first, last) are partitioned with respect to the expressions
  bool(invoker(comp, invoker(proj, e), value)) and !bool(invoker(comp, value, invoker(proj, e))). Also, for all elements e of [first, last), bool(comp(e, value)) implies !bool(comp(value, e)) for the overloads in namespace std.
3 Returns:
(3.1) — For the overloads in namespace std:
      {lower_bound(first, last, value, comp),
       upper_bound(first, last, value, comp)}
(3.2) — For the overloads in namespace ranges:
      {ranges::lower_bound(first, last, value, comp, proj),
       ranges::upper_bound(first, last, value, comp, proj)}
4 Complexity: At most  $2 * \log_2(\text{last} - \text{first}) + \mathcal{O}(1)$  comparisons and projections.

```

27.8.4.5 binary_search

[binary.search]

```

template<class ForwardIterator, class T>
constexpr bool
binary_search(ForwardIterator first, ForwardIterator last,
              const T& value);

template<class ForwardIterator, class T, class Compare>
constexpr bool
binary_search(ForwardIterator first, ForwardIterator last,
              const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity,
         indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
constexpr bool ranges::binary_search(I first, S last, const T& value, Comp comp = {},
                                      Proj proj = {});
template<forward_range R, class T, class Proj = identity,
         indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp =
         ranges::less>
constexpr bool ranges::binary_search(R&& r, const T& value, Comp comp = {},
                                      Proj proj = {});

```

- 1 Let comp be less{} and proj be identity{} for overloads with no parameters by those names.
- 2 *Preconditions:* The elements e of [first, last) are partitioned with respect to the expressions
 bool(invoker(comp, invoker(proj, e), value)) and !bool(invoker(comp, value, invoker(proj, e))). Also, for all elements e of [first, last), bool(comp(e, value)) implies !bool(comp(value, e)) for the overloads in namespace std.
- 3 *Returns:* true if and only if for some iterator i in the range [first, last), !bool(invoker(comp, invoker(proj, *i), value)) && !bool(invoker(comp, value, invoker(proj, *i))) is true.
- 4 *Complexity:* At most $\log_2(\text{last} - \text{first}) + \mathcal{O}(1)$ comparisons and projections.

27.8.5 Partitions

[alg.partitions]

```
template<class InputIterator, class Predicate>
constexpr bool is_partitioned(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
bool is_partitioned(ExecutionPolicy&& exec,
                    ForwardIterator first, ForwardIterator last, Predicate pred);

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr bool ranges::is_partitioned(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr bool ranges::is_partitioned(R&& r, Pred pred, Proj proj = {});
```

- 1 Let `proj` be `identity{}` for the overloads with no parameter named `proj`.
- 2 *Returns:* true if and only if the elements `e` of $[first, last)$ are partitioned with respect to the expression `bool(invoker(pred, invoke(proj, e)))`.
- 3 *Complexity:* Linear. At most $last - first$ applications of `pred` and `proj`.

```
template<class ForwardIterator, class Predicate>
constexpr ForwardIterator
partition(ForwardIterator first, ForwardIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
ForwardIterator
partition(ExecutionPolicy&& exec,
           ForwardIterator first, ForwardIterator last, Predicate pred);

template<permutable I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr subrange<I>
ranges::partition(I first, S last, Pred pred, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R>
ranges::partition(R&& r, Pred pred, Proj proj = {});
```

- 4 Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let $E(x)$ be `bool(invoker(pred, invoke(proj, x))).`
- 5 *Preconditions:* For the overloads in namespace `std`, `ForwardIterator` meets the *Cpp17ValueSwappable* requirements ([16.4.4.3](#)).
- 6 *Effects:* Places all the elements `e` in $[first, last)$ that satisfy $E(e)$ before all the elements that do not.
- 7 *Returns:* Let `i` be an iterator such that $E(*j)$ is `true` for every iterator `j` in $[first, i)$ and `false` for every iterator `j` in $[i, last)$. Returns:

- (7.1) — `i` for the overloads in namespace `std`.
- (7.2) — `{i, last}` for the overloads in namespace `ranges`.

8 *Complexity:* Let $N = last - first$:

- (8.1) — For the overload with no `ExecutionPolicy`, exactly N applications of the predicate and projection. At most $N/2$ swaps if the type of `first` meets the *Cpp17BidirectionalIterator* requirements for the overloads in namespace `std` or models `bidirectional_iterator` for the overloads in namespace `ranges`, and at most N swaps otherwise.
- (8.2) — For the overload with an `ExecutionPolicy`, $\mathcal{O}(N \log N)$ swaps and $\mathcal{O}(N)$ applications of the predicate.

```
template<class BidirectionalIterator, class Predicate>
BidirectionalIterator
stable_partition(BidirectionalIterator first, BidirectionalIterator last, Predicate pred);
```

```

template<class ExecutionPolicy, class BidirectionalIterator, class Predicate>
BidirectionalIterator
stable_partition(ExecutionPolicy&& exec,
                BidirectionalIterator first, BidirectionalIterator last, Predicate pred);

template<bidirectional_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
requires permutable<I>
subrange<I> ranges::stable_partition(I first, S last, Pred pred, Proj proj = {});
template<bidirectional_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
requires permutable<iterator_t<R>>
borrowed_subrange_t<R> ranges::stable_partition(R&& r, Pred pred, Proj proj = {});

9   Let proj be identity{} for the overloads with no parameter named proj and let E(x) be bool(invoker(
      pred, invoke(proj, x))).
```

10 *Preconditions:* For the overloads in namespace std, BidirectionalIterator meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of *first meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

11 *Effects:* Places all the elements e in [first, last) that satisfy E(e) before all the elements that do not. The relative order of the elements in both groups is preserved.

12 *Returns:* Let i be an iterator such that for every iterator j in [first, i), E(*j) is true, and for every iterator j in the range [i, last), E(*j) is false. Returns:

- (12.1) — i for the overloads in namespace std.
- (12.2) — {i, last} for the overloads in namespace ranges.

13 *Complexity:* Let N = last - first:

- (13.1) — For the overloads with no ExecutionPolicy, at most $N \log_2 N$ swaps, but only $\mathcal{O}(N)$ swaps if there is enough extra memory. Exactly N applications of the predicate and projection.
- (13.2) — For the overload with an ExecutionPolicy, $\mathcal{O}(N \log N)$ swaps and $\mathcal{O}(N)$ applications of the predicate.

```

template<class InputIterator, class OutputIterator1, class OutputIterator2, class Predicate>
constexpr pair<OutputIterator1, OutputIterator2>
partition_copy(InputIterator first, InputIterator last,
               OutputIterator1 out_true, OutputIterator2 out_false, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class ForwardIterator1,
         class ForwardIterator2, class Predicate>
pair<ForwardIterator1, ForwardIterator2>
partition_copy(ExecutionPolicy&& exec,
               ForwardIterator first, ForwardIterator last,
               ForwardIterator1 out_true, ForwardIterator2 out_false, Predicate pred);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O1, weakly_incrementable O2,
         class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
requires indirectly_copyable<I, O1> && indirectly_copyable<I, O2>
constexpr ranges::partition_copy_result<I, O1, O2>
ranges::partition_copy(I first, S last, O1 out_true, O2 out_false, Pred pred,
                      Proj proj = {});
template<input_range R, weakly_incrementable O1, weakly_incrementable O2,
         class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
requires indirectly_copyable<iterator_t<R>, O1 &&
       indirectly_copyable<iterator_t<R>, O2>
constexpr ranges::partition_copy_result<borrowed_iterator_t<R>, O1, O2>
ranges::partition_copy(R&& r, O1 out_true, O2 out_false, Pred pred, Proj proj = {});

14  Let proj be identity{} for the overloads with no parameter named proj and let E(x) be bool(invoker(
      pred, invoke(proj, x))).
```

15 *Mandates:* For the overloads in namespace std, the expression *first is writable (25.3.1) to out_true and out_false.

16 *Preconditions*: The input range and output ranges do not overlap.
 NOTE: For the overload with an `ExecutionPolicy`, a performance cost is possible if `first`'s value type does not meet the `Cpp17CopyConstructible` requirements.

17 *Effects*: For each iterator `i` in `[first, last)`, copies `*i` to the output range beginning with `out_true` if `E(*i)` is `true`, or to the output range beginning with `out_false` otherwise.

18 *Returns*: Let `o1` be the end of the output range beginning at `out_true`, and `o2` the end of the output range beginning at `out_false`. Returns
 (18.1) — `{o1, o2}` for the overloads in namespace `std`.
 (18.2) — `{last, o1, o2}` for the overloads in namespace `ranges`.

19 *Complexity*: Exactly `last - first` applications of `pred` and `proj`.

```
template<class ForwardIterator, class Predicate>
constexpr ForwardIterator
partition_point(ForwardIterator first, ForwardIterator last, Predicate pred);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr I ranges::partition_point(I first, S last, Pred pred, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr borrowed_iterator_t<R>
ranges::partition_point(R&& r, Pred pred, Proj proj = {});
```

20 Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let `E(x)` be `bool(invoker(pred, invoke(proj, x)))`.

21 *Preconditions*: The elements `e` of `[first, last)` are partitioned with respect to `E(e)`.

22 *Returns*: An iterator `mid` such that `E(*i)` is `true` for all iterators `i` in `[first, mid)`, and `false` for all iterators `i` in `[mid, last)`.

23 *Complexity*: $\mathcal{O}(\log(\text{last} - \text{first}))$ applications of `pred` and `proj`.

27.8.6 Merge

[alg.merge]

```
template<class InputIterator1, class InputIterator2,
         class OutputIterator>
constexpr OutputIterator
merge(InputIterator1 first1, InputIterator1 last1,
      InputIterator2 first2, InputIterator2 last2,
      OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
ForwardIterator
merge(ExecutionPolicy&& exec,
      ForwardIterator1 first1, ForwardIterator1 last1,
      ForwardIterator2 first2, ForwardIterator2 last2,
      ForwardIterator result);

template<class InputIterator1, class InputIterator2,
         class OutputIterator, class Compare>
constexpr OutputIterator
merge(InputIterator1 first1, InputIterator1 last1,
      InputIterator2 first2, InputIterator2 last2,
      OutputIterator result, Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class Compare>
ForwardIterator
merge(ExecutionPolicy&& exec,
      ForwardIterator1 first1, ForwardIterator1 last1,
      ForwardIterator2 first2, ForwardIterator2 last2,
      ForwardIterator result, Compare comp);
```

```

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
    weakly_incrementable O, class Comp = ranges::less, class Proj1 = identity,
    class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::merge_result<I1, I2, O>
    ranges::merge(I1 first1, S1 last1, I2 first2, S2 last2, O result,
        Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, weakly_incrementable O, class Comp = ranges::less,
    class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::merge_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
    ranges::merge(R1&& r1, R2&& r2, O result,
        Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
1   Let  $N$  be  $(last1 - first1) + (last2 - first2)$ . Let comp be less{}, proj1 be identity{}, and
    proj2 be identity{}, for the overloads with no parameters by those names.
2   Preconditions: The ranges  $[first1, last1]$  and  $[first2, last2]$  are sorted with respect to comp and
    proj1 or proj2, respectively. The resulting range does not overlap with either of the original ranges.
3   Effects: Copies all the elements of the two ranges  $[first1, last1]$  and  $[first2, last2]$  into the range
     $[result, result\_last]$ , where result\_last is result + N. If an element a precedes b in an input
    range, a is copied into the output range before b. If e1 is an element of  $[first1, last1]$  and e2 is
    of  $[first2, last2]$ , e2 is copied into the output range before e1 if and only if bool(invoker(comp,
    invoke(proj2, e2), invoke(proj1, e1))) is true.
4   Returns:
(4.1)   — result_last for the overloads in namespace std.
(4.2)   —  $\{last1, last2, result\_last\}$  for the overloads in namespace ranges.
5   Complexity:
(5.1)   — For the overloads with no ExecutionPolicy, at most  $N - 1$  comparisons and applications of each
        projection.
(5.2)   — For the overloads with an ExecutionPolicy,  $\mathcal{O}(N)$  comparisons.
6   Remarks: Stable (16.4.6.8).

```

```

template<class BidirectionalIterator>
void inplace_merge(BidirectionalIterator first,
                    BidirectionalIterator middle,
                    BidirectionalIterator last);
template<class ExecutionPolicy, class BidirectionalIterator>
void inplace_merge(ExecutionPolicy&& exec,
                    BidirectionalIterator first,
                    BidirectionalIterator middle,
                    BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
void inplace_merge(BidirectionalIterator first,
                    BidirectionalIterator middle,
                    BidirectionalIterator last, Compare comp);
template<class ExecutionPolicy, class BidirectionalIterator, class Compare>
void inplace_merge(ExecutionPolicy&& exec,
                    BidirectionalIterator first,
                    BidirectionalIterator middle,
                    BidirectionalIterator last, Compare comp);

template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
I ranges::inplace_merge(I first, I middle, S last, Comp comp = {}, Proj proj = {});
7   Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.

```

8 *Preconditions:* [first, middle) and [middle, last) are valid ranges sorted with respect to comp and proj. For the overloads in namespace std, BidirectionalIterator meets the Cpp17ValueSwappable requirements (16.4.4.3) and the type of *first meets the Cpp17MoveConstructible (Table 31) and Cpp17MoveAssignable (Table 33) requirements.

9 *Effects:* Merges two sorted consecutive ranges [first, middle) and [middle, last), putting the result of the merge into the range [first, last). The resulting range is sorted with respect to comp and proj.

10 *Returns:* last for the overload in namespace ranges.

11 *Complexity:* Let $N = \text{last} - \text{first}$:

(11.1) — For the overloads with no ExecutionPolicy, and if enough additional memory is available, exactly $N - 1$ comparisons.

(11.2) — Otherwise, $\mathcal{O}(N \log N)$ comparisons.

In either case, twice as many projections as comparisons.

12 *Remarks:* Stable (16.4.6.8).

```
template<bidirectional_range R, class Comp = ranges::less, class Proj = identity>
    requires sortable<iterator_t<R>, Comp, Proj>
borrowed_iterator_t<R>
    ranges::inplace_merge(R&& r, iterator_t<R> middle, Comp comp = {}, Proj proj = {});
```

13 *Effects:* Equivalent to:

```
return ranges::inplace_merge(ranges::begin(r), middle, ranges::end(r), comp, proj);
```

27.8.7 Set operations on sorted structures

[alg.set.operations]

27.8.7.1 General

[alg.set.operations.general]

1 Subclause 27.8.7 defines all the basic set operations on sorted structures. They also work with multisets (24.4.7) containing multiple copies of equivalent elements. The semantics of the set operations are generalized to multisets in a standard way by defining set_union to contain the maximum number of occurrences of every element, set_intersection to contain the minimum, and so on.

27.8.7.2 includes

[includes]

```
template<class InputIterator1, class InputIterator2>
    constexpr bool includes(InputIterator1 first1, InputIterator1 last1,
                           InputIterator2 first2, InputIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
    bool includes(ExecutionPolicy&& exec,
                  ForwardIterator1 first1, ForwardIterator1 last1,
                  ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2, class Compare>
    constexpr bool includes(InputIterator1 first1, InputIterator1 last1,
                           InputIterator2 first2, InputIterator2 last2,
                           Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class Compare>
    bool includes(ExecutionPolicy&& exec,
                  ForwardIterator1 first1, ForwardIterator1 last1,
                  ForwardIterator2 first2, ForwardIterator2 last2,
                  Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
        class Proj1 = identity, class Proj2 = identity,
        indirect_strict_weak_order<projected<I1, Proj1>,
                           projected<I2, Proj2>> Comp = ranges::less>
    constexpr bool ranges::includes(I1 first1, S1 last1, I2 first2, S2 last2, Comp comp = {},
                                    Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, class Proj1 = identity,
        class Proj2 = identity,
        indirect_strict_weak_order<projected<iterator_t<R1>, Proj1>,
                           projected<iterator_t<R2>, Proj2>> Comp = ranges::less>
    constexpr bool ranges::includes(R1&& r1, R2&& r2, Comp comp = {}>,
```

- 1 Proj1 proj1 = {}, Proj2 proj2 = {};
- 1 Let `comp` be `less{}`, `proj1` be `identity{}`, and `proj2` be `identity{}`, for the overloads with no parameters by those names.
- 2 *Preconditions:* The ranges `[first1, last1)` and `[first2, last2)` are sorted with respect to `comp` and `proj1` or `proj2`, respectively.
- 3 *Returns:* `true` if and only if `[first2, last2)` is a subsequence of `[first1, last1)`.
 NOTE: A sequence S is a subsequence of another sequence T if S can be obtained from T by removing some, all, or none of T 's elements and keeping the remaining elements in the same order.
- 4 *Complexity:* At most $2 * ((last1 - first1) + (last2 - first2)) - 1$ comparisons and applications of each projection.

27.8.7.3 `set_union`[`set.union`]

```
template<class InputIterator1, class InputIterator2, class OutputIterator>
constexpr OutputIterator
set_union(InputIterator1 first1, InputIterator1 last1,
          InputIterator2 first2, InputIterator2 last2,
          OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
ForwardIterator
set_union(ExecutionPolicy&& exec,
          ForwardIterator1 first1, ForwardIterator1 last1,
          ForwardIterator2 first2, ForwardIterator2 last2,
          ForwardIterator result);

template<class InputIterator1, class InputIterator2, class OutputIterator, class Compare>
constexpr OutputIterator
set_union(InputIterator1 first1, InputIterator1 last1,
          InputIterator2 first2, InputIterator2 last2,
          OutputIterator result, Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class Compare>
ForwardIterator
set_union(ExecutionPolicy&& exec,
          ForwardIterator1 first1, ForwardIterator1 last1,
          ForwardIterator2 first2, ForwardIterator2 last2,
          ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
        weakly_incrementable O, class Comp = ranges::less,
        class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::set_union_result<I1, I2, O>
ranges::set_union(I1 first1, S1 last1, I2 first2, S2 last2, O result, Comp comp = {},
                  Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, weakly_incrementable O,
        class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::set_union_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
ranges::set_union(R1&& r1, R2&& r2, O result, Comp comp = {},
                  Proj1 proj1 = {}, Proj2 proj2 = {});
```

- 1 Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.
- 2 *Preconditions:* The ranges `[first1, last1)` and `[first2, last2)` are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.
- 3 *Effects:* Constructs a sorted union of the elements from the two ranges; that is, the set of elements that are present in one or both of the ranges.
- 4 *Returns:* Let `result.last` be the end of the constructed range. Returns

- (4.1) — `result_last` for the overloads in namespace `std`.
 (4.2) — `{last1, last2, result_last}` for the overloads in namespace `ranges`.
- 5 *Complexity:* At most $2 * ((last1 - first1) + (last2 - first2)) - 1$ comparisons and applications of each projection.
- 6 *Remarks:* Stable (16.4.6.8). If `[first1, last1]` contains m elements that are equivalent to each other and `[first2, last2]` contains n elements that are equivalent to them, then all m elements from the first range are copied to the output range, in order, and then the final $\max(n - m, 0)$ elements from the second range are copied to the output range, in order.

27.8.7.4 `set_intersection`

[`set.intersection`]

```
template<class InputIterator1, class InputIterator2,
         class OutputIterator>
constexpr OutputIterator
set_intersection(InputIterator1 first1, InputIterator1 last1,
                InputIterator2 first2, InputIterator2 last2,
                OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
ForwardIterator
set_intersection(ExecutionPolicy&& exec,
                ForwardIterator1 first1, ForwardIterator1 last1,
                ForwardIterator2 first2, ForwardIterator2 last2,
                ForwardIterator result);

template<class InputIterator1, class InputIterator2,
         class OutputIterator, class Compare>
constexpr OutputIterator
set_intersection(InputIterator1 first1, InputIterator1 last1,
                InputIterator2 first2, InputIterator2 last2,
                OutputIterator result, Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class Compare>
ForwardIterator
set_intersection(ExecutionPolicy&& exec,
                ForwardIterator1 first1, ForwardIterator1 last1,
                ForwardIterator2 first2, ForwardIterator2 last2,
                ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         weakly_incrementable O, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::set_intersection_result<I1, I2, O>
ranges::set_intersection(I1 first1, S1 last1, I2 first2, S2 last2, O result,
                        Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, weakly_incrementable O,
         class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::set_intersection_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
ranges::set_intersection(R1&& r1, R2&& r2, O result,
                        Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

- 1 Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.
 2 *Preconditions:* The ranges `[first1, last1]` and `[first2, last2]` are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.
 3 *Effects:* Constructs a sorted intersection of the elements from the two ranges; that is, the set of elements that are present in both of the ranges.
 4 *Returns:* Let `result_last` be the end of the constructed range. Returns
 (4.1) — `result_last` for the overloads in namespace `std`.

- (4.2) — `{last1, last2, result_last}` for the overloads in namespace `ranges`.
- 5 *Complexity:* At most $2 * ((last1 - first1) + (last2 - first2)) - 1$ comparisons and applications of each projection.
- 6 *Remarks:* Stable (16.4.6.8). If $[first1, last1]$ contains m elements that are equivalent to each other and $[first2, last2]$ contains n elements that are equivalent to them, the first $\min(m, n)$ elements are copied from the first range to the output range, in order.

27.8.7.5 `set_difference`

[`set.difference`]

```
template<class InputIterator1, class InputIterator2,
         class OutputIterator>
constexpr OutputIterator
set_difference(InputIterator1 first1, InputIterator1 last1,
              InputIterator2 first2, InputIterator2 last2,
              OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
ForwardIterator
set_difference(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator2 last2,
              ForwardIterator result);

template<class InputIterator1, class InputIterator2,
         class OutputIterator, class Compare>
constexpr OutputIterator
set_difference(InputIterator1 first1, InputIterator1 last1,
              InputIterator2 first2, InputIterator2 last2,
              OutputIterator result, Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class Compare>
ForwardIterator
set_difference(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator2 last2,
              ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         weakly_incrementable O, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::set_difference_result<I1, O>
ranges::set_difference(I1 first1, S1 last1, I2 first2, S2 last2, O result,
                      Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, input_range R2, weakly_incrementable O,
         class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::set_difference_result<borrowed_iterator_t<R1>, O>
ranges::set_difference(R1&& r1, R2&& r2, O result,
                      Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

- 1 Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.
- 2 *Preconditions:* The ranges $[first1, last1]$ and $[first2, last2]$ are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.
- 3 *Effects:* Copies the elements of the range $[first1, last1]$ which are not present in the range $[first2, last2]$ to the range beginning at `result`. The elements in the constructed range are sorted.
- 4 *Returns:* Let `result_last` be the end of the constructed range. Returns
- (4.1) — `result_last` for the overloads in namespace `std`.
- (4.2) — `{last1, result_last}` for the overloads in namespace `ranges`.

- 5 *Complexity:* At most $2 * ((\text{last1} - \text{first1}) + (\text{last2} - \text{first2})) - 1$ comparisons and applications of each projection.
- 6 *Remarks:* If $[\text{first1}, \text{last1}]$ contains m elements that are equivalent to each other and $[\text{first2}, \text{last2}]$ contains n elements that are equivalent to them, the last $\max(m - n, 0)$ elements from $[\text{first1}, \text{last1}]$ are copied to the output range, in order.

27.8.7.6 set_symmetric_difference [set.symmetric.difference]

```
template<class InputIterator1, class InputIterator2,
         class OutputIterator>
constexpr OutputIterator
    set_symmetric_difference(InputIterator1 first1, InputIterator1 last1,
                           InputIterator2 first2, InputIterator2 last2,
                           OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
ForwardIterator
    set_symmetric_difference(ExecutionPolicy&& exec,
                           ForwardIterator1 first1, ForwardIterator1 last1,
                           ForwardIterator2 first2, ForwardIterator2 last2,
                           ForwardIterator result);

template<class InputIterator1, class InputIterator2,
         class OutputIterator, class Compare>
constexpr OutputIterator
    set_symmetric_difference(InputIterator1 first1, InputIterator1 last1,
                           InputIterator2 first2, InputIterator2 last2,
                           OutputIterator result, Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class Compare>
ForwardIterator
    set_symmetric_difference(ExecutionPolicy&& exec,
                           ForwardIterator1 first1, ForwardIterator1 last1,
                           ForwardIterator2 first2, ForwardIterator2 last2,
                           ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         weakly_incrementable O, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::set_symmetric_difference_result<I1, I2, O>
    ranges::set_symmetric_difference(I1 first1, S1 last1, I2 first2, S2 last2, O result,
                                    Comp comp = {}, Proj1 proj1 = {},
                                    Proj2 proj2 = {});

template<input_range R1, input_range R2, weakly_incrementable O,
         class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::set_symmetric_difference_result<borrowed_iterator_t<R1>,
                                                 borrowed_iterator_t<R2>, O>
    ranges::set_symmetric_difference(R1&& r1, R2&& r2, O result, Comp comp = {},
                                    Proj1 proj1 = {}, Proj2 proj2 = {});
```

- 1 Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.
- 2 *Preconditions:* The ranges $[\text{first1}, \text{last1}]$ and $[\text{first2}, \text{last2}]$ are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.
- 3 *Effects:* Copies the elements of the range $[\text{first1}, \text{last1}]$ that are not present in the range $[\text{first2}, \text{last2}]$, and the elements of the range $[\text{first2}, \text{last2}]$ that are not present in the range $[\text{first1}, \text{last1}]$ to the range beginning at `result`. The elements in the constructed range are sorted.
- 4 *Returns:* Let `result_last` be the end of the constructed range. Returns
 — `result_last` for the overloads in namespace `std`.

- (4.2) — `{last1, last2, result_last}` for the overloads in namespace `ranges`.
- 5 *Complexity:* At most $2 * ((last1 - first1) + (last2 - first2)) - 1$ comparisons and applications of each projection.
- 6 *Remarks:* Stable (16.4.6.8). If `[first1, last1]` contains m elements that are equivalent to each other and `[first2, last2]` contains n elements that are equivalent to them, then $|m - n|$ of those elements shall be copied to the output range: the last $m - n$ of these elements from `[first1, last1]` if $m > n$, and the last $n - m$ of these elements from `[first2, last2]` if $m < n$. In either case, the elements are copied in order.

27.8.8 Heap operations

[alg.heap.operations]

27.8.8.1 General

[alg.heap.operations.general]

- 1 A random access range `[a, b)` is a *heap with respect to comp and proj* for a comparator and projection `comp` and `proj` if its elements are organized such that:
- (1.1) — With $N = b - a$, for all i , $0 < i < N$, `bool(invoker(comp, invoke(proj, a[$\lfloor \frac{i-1}{2} \rfloor$]), invoke(proj, a[i])))` is `false`.
- (1.2) — `*a` may be removed by `pop_heap`, or a new element added by `push_heap`, in $\mathcal{O}(\log N)$ time.
- 2 These properties make heaps useful as priority queues.
- 3 `make_heap` converts a range into a heap and `sort_heap` turns a heap into a sorted sequence.

27.8.8.2 push_heap

[push.heap]

```
template<class RandomAccessIterator>
constexpr void push_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void push_heap(RandomAccessIterator first, RandomAccessIterator last,
                        Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
ranges::push_heap(I first, S last, Comp comp = {}, Proj proj = {});

template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::push_heap(R&& r, Comp comp = {}, Proj proj = {});
```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.
- 2 *Preconditions:* The range `[first, last - 1]` is a valid heap with respect to `comp` and `proj`. For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* requirements (Table 31) and the *Cpp17MoveAssignable* requirements (Table 33).
- 3 *Effects:* Places the value in the location `last - 1` into the resulting heap `[first, last)`.
- 4 *Returns:* `last` for the overloads in namespace `ranges`.
- 5 *Complexity:* At most $\log(last - first)$ comparisons and twice as many projections.

27.8.8.3 pop_heap

[pop.heap]

```
template<class RandomAccessIterator>
constexpr void pop_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void pop_heap(RandomAccessIterator first, RandomAccessIterator last,
                       Compare comp);
```

```

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
    ranges::pop_heap(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
    ranges::pop_heap(R&& r, Comp comp = {}, Proj proj = {});
1   Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.
2   Preconditions: The range [first, last) is a valid non-empty heap with respect to comp and proj.
For the overloads in namespace std, RandomAccessIterator meets the Cpp17ValueSwappable requirements (16.4.4.3) and the type of *first meets the Cpp17MoveConstructible (Table 31) and Cpp17MoveAssignable (Table 33) requirements.
3   Effects: Swaps the value in the location first with the value in the location last - 1 and makes [first, last - 1) into a heap with respect to comp and proj.
4   Returns: last for the overloads in namespace ranges.
5   Complexity: At most  $2 \log(last - first)$  comparisons and twice as many projections.

```

27.8.8.4 make_heap

[make.heap]

```

template<class RandomAccessIterator>
constexpr void make_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void make_heap(RandomAccessIterator first, RandomAccessIterator last,
                        Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
    ranges::make_heap(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
    ranges::make_heap(R&& r, Comp comp = {}, Proj proj = {});
1   Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.
2   Preconditions: For the overloads in namespace std, RandomAccessIterator meets the Cpp17ValueSwappable requirements (16.4.4.3) and the type of *first meets the Cpp17MoveConstructible (Table 31) and Cpp17MoveAssignable (Table 33) requirements.
3   Effects: Constructs a heap with respect to comp and proj out of the range [first, last).
4   Returns: last for the overloads in namespace ranges.
5   Complexity: At most  $3(last - first)$  comparisons and twice as many projections.

```

27.8.8.5 sort_heap

[sort.heap]

```

template<class RandomAccessIterator>
constexpr void sort_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void sort_heap(RandomAccessIterator first, RandomAccessIterator last,
                        Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
    ranges::sort_heap(I first, S last, Comp comp = {}, Proj proj = {});

```

```
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
    requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
    ranges::sort_heap(R&& r, Comp comp = {}, Proj proj = {});
```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.
- 2 *Preconditions:* The range `[first, last)` is a valid heap with respect to `comp` and `proj`. For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.
- 3 *Effects:* Sorts elements in the heap `[first, last)` with respect to `comp` and `proj`.
- 4 *Returns:* `last` for the overloads in namespace `ranges`.
- 5 *Complexity:* At most $2N \log N$ comparisons, where $N = \text{last} - \text{first}$, and twice as many projections.

27.8.8.6 `is_heap`

[is.heap]

```
template<class RandomAccessIterator>
constexpr bool is_heap(RandomAccessIterator first, RandomAccessIterator last);
```

- 1 *Effects:* Equivalent to: `return is_heap_until(first, last) == last;`

```
template<class ExecutionPolicy, class RandomAccessIterator>
bool is_heap(ExecutionPolicy&& exec,
             RandomAccessIterator first, RandomAccessIterator last);
```

- 2 *Effects:* Equivalent to:
`return is_heap_until(std::forward<ExecutionPolicy>(exec), first, last) == last;`

```
template<class RandomAccessIterator, class Compare>
constexpr bool is_heap(RandomAccessIterator first, RandomAccessIterator last,
                      Compare comp);
```

- 3 *Effects:* Equivalent to: `return is_heap_until(first, last, comp) == last;`

```
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
bool is_heap(ExecutionPolicy&& exec,
            RandomAccessIterator first, RandomAccessIterator last,
            Compare comp);
```

- 4 *Effects:* Equivalent to:
`return is_heap_until(std::forward<ExecutionPolicy>(exec), first, last, comp) == last;`

```
template<random_access_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr bool ranges::is_heap(I first, S last, Comp comp = {}, Proj proj = {});
```

```
template<random_access_range R, class Proj = identity,
        indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr bool ranges::is_heap(R&& r, Comp comp = {}, Proj proj = {});
```

- 5 *Effects:* Equivalent to: `return ranges::is_heap_until(first, last, comp, proj) == last;`

```
template<class RandomAccessIterator>
constexpr RandomAccessIterator
    is_heap_until(RandomAccessIterator first, RandomAccessIterator last);
```

```
template<class ExecutionPolicy, class RandomAccessIterator>
RandomAccessIterator
    is_heap_until(ExecutionPolicy&& exec,
                 RandomAccessIterator first, RandomAccessIterator last);
```

```
template<class RandomAccessIterator, class Compare>
constexpr RandomAccessIterator
    is_heap_until(RandomAccessIterator first, RandomAccessIterator last,
                  Compare comp);
```

```

template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
RandomAccessIterator
    is_heap_until(ExecutionPolicy&& exec,
                  RandomAccessIterator first, RandomAccessIterator last,
                  Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::is_heap_until(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr borrowed_iterator_t<R>
ranges::is_heap_until(R&& r, Comp comp = {}, Proj proj = {});

6   Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.
7   Returns: The last iterator i in [first, last] for which the range [first, i) is a heap with respect to
      comp and proj.
8   Complexity: Linear.

```

27.8.9 Minimum and maximum

[alg.min.max]

```

template<class T>
constexpr const T& min(const T& a, const T& b);
template<class T, class Compare>
constexpr const T& min(const T& a, const T& b, Compare comp);

template<class T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr const T& ranges::min(const T& a, const T& b, Comp comp = {}, Proj proj = {});

1   Preconditions: For the first form, T meets the Cpp17LessThanComparable requirements (Table 29).
2   Returns: The smaller value. Returns the first argument when the arguments are equivalent.
3   Complexity: Exactly one comparison and two applications of the projection, if any.
4   Remarks: An invocation may explicitly specify an argument for the template parameter T of the
      overloads in namespace std.

template<class T>
constexpr T min(initializer_list<T> r);
template<class T, class Compare>
constexpr T min(initializer_list<T> r, Compare comp);

template<copyable T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr T ranges::min(initializer_list<T> r, Comp comp = {}, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>>
constexpr range_value_t<R>
ranges::min(R&& r, Comp comp = {}, Proj proj = {});

5   Preconditions: ranges::distance(r) > 0. For the overloads in namespace std, T meets the Cpp17CopyConstructible requirements. For the first form, T meets the Cpp17LessThanComparable requirements
      (Table 29).
6   Returns: The smallest value in the input range. Returns a copy of the leftmost element when several
      elements are equivalent to the smallest.
7   Complexity: Exactly ranges::distance(r) - 1 comparisons and twice as many applications of the
      projection, if any.
8   Remarks: An invocation may explicitly specify an argument for the template parameter T of the
      overloads in namespace std.

```

```

template<class T>
constexpr const T& max(const T& a, const T& b);
template<class T, class Compare>
constexpr const T& max(const T& a, const T& b, Compare comp);

template<class T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr const T& ranges::max(const T& a, const T& b, Compare comp = {}, Proj proj = {});

9   Preconditions: For the first form, T meets the Cpp17LessThanComparable requirements (Table 29).
10  Returns: The larger value. Returns the first argument when the arguments are equivalent.
11  Complexity: Exactly one comparison and two applications of the projection, if any.
12  Remarks: An invocation may explicitly specify an argument for the template parameter T of the
    overloads in namespace std.

template<class T>
constexpr T max(initializer_list<T> r);
template<class T, class Compare>
constexpr T max(initializer_list<T> r, Compare comp);

template<copyable T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr T ranges::max(initializer_list<T> r, Compare comp = {}, Proj proj = {});
template<input_range R, class Proj = identity,

requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>*>
constexpr range_value_t<R>
ranges::max(R&& r, Compare comp = {}, Proj proj = {});

13  Preconditions: ranges::distance(r) > 0. For the overloads in namespace std, T meets the Cpp17-
    CopyConstructible requirements. For the first form, T meets the Cpp17LessThanComparable requirements
    (Table 29).
14  Returns: The largest value in the input range. Returns a copy of the leftmost element when several
    elements are equivalent to the largest.
15  Complexity: Exactly ranges::distance(r) - 1 comparisons and twice as many applications of the
    projection, if any.
16  Remarks: An invocation may explicitly specify an argument for the template parameter T of the
    overloads in namespace std.

template<class T>
constexpr pair<const T&, const T&> minmax(const T& a, const T& b);
template<class T, class Compare>
constexpr pair<const T&, const T&> minmax(const T& a, const T& b, Compare comp);

constexpr ranges::minmax_result<const T&>
ranges::minmax(const T& a, const T& b, Compare comp = {}, Proj proj = {});

17  Preconditions: For the first form, T meets the Cpp17LessThanComparable requirements (Table 29).
18  Returns: {b, a} if b is smaller than a, and {a, b} otherwise.
19  Complexity: Exactly one comparison and two applications of the projection, if any.
20  Remarks: An invocation may explicitly specify an argument for the template parameter T of the
    overloads in namespace std.

template<class T>
constexpr pair<T, T> minmax(initializer_list<T> t);
template<class T, class Compare>
constexpr pair<T, T> minmax(initializer_list<T> t, Compare comp);

```

```
template<copyable T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr ranges::minmax_result<T>
ranges::minmax(initializer_list<T> r, Comp comp = {}, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>>
constexpr ranges::minmax_result<range_value_t<R>>
ranges::minmax(R&& r, Comp comp = {}, Proj proj = {});
```

21 *Preconditions:* ranges::distance(r) > 0. For the overloads in namespace std, T meets the Cpp17-CopyConstructible requirements. For the first form, type T meets the Cpp17LessThanComparable requirements (Table 29).

22 *Returns:* Let X be the return type. Returns X{x, y}, where x is a copy of the leftmost element with the smallest value and y a copy of the rightmost element with the largest value in the input range.

23 *Complexity:* At most (3/2)ranges::distance(r) applications of the corresponding predicate and twice as many applications of the projection, if any.

24 *Remarks:* An invocation may explicitly specify an argument for the template parameter T of the overloads in namespace std.

```
template<class ForwardIterator>
constexpr ForwardIterator min_element(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator min_element(ExecutionPolicy&& exec,
                           ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
constexpr ForwardIterator min_element(ForwardIterator first, ForwardIterator last,
                                      Compare comp);
template<class ExecutionPolicy, class ForwardIterator, class Compare>
ForwardIterator min_element(ExecutionPolicy&& exec,
                           ForwardIterator first, ForwardIterator last, Compare comp);
```

```
template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>

constexpr borrowed_iterator_t<R>
ranges::max_element(R&& r, Comp comp = {}, Proj proj = {});

28   Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.

29   Returns: The first iterator i in the range [first, last) such that for every iterator j in the range
[first, last),
    bool(involve(comp, invoke(proj, *i), invoke(proj, *j)))
is false. Returns last if first == last.
30   Complexity: Exactly max(last - first - 1, 0) comparisons and twice as many projections.

template<class ForwardIterator>
constexpr pair<ForwardIterator, ForwardIterator>
minmax_element(ForwardIterator first, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
pair<ForwardIterator, ForwardIterator>
minmax_element(ExecutionPolicy&& exec,
               ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
constexpr pair<ForwardIterator, ForwardIterator>
minmax_element(ForwardIterator first, ForwardIterator last, Compare comp);
template<class ExecutionPolicy, class ForwardIterator, class Compare>
pair<ForwardIterator, ForwardIterator>
minmax_element(ExecutionPolicy&& exec,
               ForwardIterator first, ForwardIterator last, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr ranges::minmax_element_result<I>
ranges::minmax_element(I first, S last, Comp comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr ranges::minmax_element_result<borrowed_iterator_t<R>>
ranges::minmax_element(R&& r, Comp comp = {}, Proj proj = {});

31   Returns: {first, first} if [first, last) is empty, otherwise {m, M}, where m is the first iterator in
[first, last) such that no iterator in the range refers to a smaller element, and where M is the last
iterator219 in [first, last) such that no iterator in the range refers to a larger element.
32   Complexity: Let  $N$  be last - first. At most  $\max(\lfloor \frac{3}{2}(N - 1) \rfloor, 0)$  comparisons and twice as many
applications of the projection, if any.

```

27.8.10 Bounded value

[alg.clamp]

```

template<class T>
constexpr const T& clamp(const T& v, const T& lo, const T& hi);
template<class T, class Compare>
constexpr const T& clamp(const T& v, const T& lo, const T& hi, Compare comp);
template<class T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr const T&
ranges::clamp(const T& v, const T& lo, const T& hi, Comp comp = {}, Proj proj = {});

1   Let comp be less{} for the overloads with no parameter comp, and let proj be identity{} for the
overloads with no parameter proj.

```

²¹⁹ This behavior intentionally differs from `max_element`.

- 2 *Preconditions:* `bool(invoker(comp, invoke(proj, hi), invoke(proj, lo)))` is false. For the first form, type T meets the *Cpp17LessThanComparable* requirements ([Table 29](#)).
- 3 *Returns:* `lo` if `bool(invoker(comp, invoke(proj, v), invoke(proj, lo)))` is true, `hi` if `bool(invoker(comp, invoke(proj, hi), invoke(proj, v)))` is true, otherwise `v`.
- 4 *NOTE:* If NaN is avoided, T can be a floating-point type.
- 5 *Complexity:* At most two comparisons and three applications of the projection.

27.8.11 Lexicographical comparison

[[alg.lex.comparison](#)]

```
template<class InputIterator1, class InputIterator2>
constexpr bool
    lexicographical_compare(InputIterator1 first1, InputIterator1 last1,
                           InputIterator2 first2, InputIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
bool
    lexicographical_compare(ExecutionPolicy&& exec,
                           ForwardIterator1 first1, ForwardIterator1 last1,
                           ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2, class Compare>
constexpr bool
    lexicographical_compare(InputIterator1 first1, InputIterator1 last1,
                           InputIterator2 first2, InputIterator2 last2,
                           Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class Compare>
bool
    lexicographical_compare(ExecutionPolicy&& exec,
                           ForwardIterator1 first1, ForwardIterator1 last1,
                           ForwardIterator2 first2, ForwardIterator2 last2,
                           Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         class Proj1 = identity, class Proj2 = identity,
         indirect_strict_weak_order<projected<I1, Proj1>,
                               projected<I2, Proj2>> Comp = ranges::less>
constexpr bool
    ranges::lexicographical_compare(I1 first1, S1 last1, I2 first2, S2 last2,
                                    Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, class Proj1 = identity,
         class Proj2 = identity,
         indirect_strict_weak_order<projected<iterator_t<R1>, Proj1>,
                               projected<iterator_t<R2>, Proj2>> Comp = ranges::less>
constexpr bool
    ranges::lexicographical_compare(R1&& r1, R2&& r2, Comp comp = {},
                                    Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 *Returns:* true if and only if the sequence of elements defined by the range [first1, last1) is lexicographically less than the sequence of elements defined by the range [first2, last2).

2 *Complexity:* At most $2 \min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$ applications of the corresponding comparison and each projection, if any.

3 *Remarks:* If two sequences have the same number of elements and their corresponding elements (if any) are equivalent, then neither sequence is lexicographically less than the other. If one sequence is a proper prefix of the other, then the shorter sequence is lexicographically less than the longer sequence. Otherwise, the lexicographical comparison of the sequences yields the same result as the comparison of the first corresponding pair of elements that are not equivalent.

4 *EXAMPLE:* `ranges::lexicographical_compare(I1, S1, I2, S2, Comp, Proj1, Proj2)` can be implemented as:

```
for ( ; first1 != last1 && first2 != last2 ; ++first1, (void) ++first2) {
    if (invoke(comp, invoke(proj1, *first1), invoke(proj2, *first2))) return true;
```

```

        if (invoke(comp, invoke(proj2, *first2), invoke(proj1, *first1))) return false;
    }
    return first1 == last1 && first2 != last2;
5   NOTE: An empty sequence is lexicographically less than any non-empty sequence, but not less than any empty
         sequence.

```

27.8.12 Three-way comparison algorithms

[alg.three.way]

```

template<class InputIterator1, class InputIterator2, class Cmp>
constexpr auto
lexicographical_compare_three_way(InputIterator1 b1, InputIterator1 e1,
                                    InputIterator2 b2, InputIterator2 e2,
                                    Cmp comp)
    -> decltype(comp(*b1, *b2));
1   Let  $N$  be  $\min(e1 - b1, e2 - b2)$ . Let  $E(n)$  be  $\text{comp}(*(\mathbf{b1} + n), *(\mathbf{b2} + n))$ .
2   Mandates: decltype(comp(*b1, *b2)) is a comparison category type.
3   Returns:  $E(i)$ , where  $i$  is the smallest integer in  $[0, N]$  such that  $E(i) \neq 0$  is true, or  $(e1 - b1) \leq (e2 - b2)$  if no such integer exists.
4   Complexity: At most  $N$  applications of comp.

```

```

template<class InputIterator1, class InputIterator2>
constexpr auto
lexicographical_compare_three_way(InputIterator1 b1, InputIterator1 e1,
                                    InputIterator2 b2, InputIterator2 e2);
5   Effects: Equivalent to:
             return lexicographical_compare_three_way(b1, e1, b2, e2, compare_three_way());

```

27.8.13 Permutation generators

[alg.permutation.generators]

```

template<class BidirectionalIterator>
constexpr bool next_permutation(BidirectionalIterator first,
                                BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
constexpr bool next_permutation(BidirectionalIterator first,
                                BidirectionalIterator last, Compare comp);

template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr ranges::next_permutation_result<I>
ranges::next_permutation(I first, S last, Comp comp = {}, Proj proj = {});

template<bidirectional_range R, class Comp = ranges::less,
         class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr ranges::next_permutation_result<borrowed_iterator_t<R>>
ranges::next_permutation(R&& r, Comp comp = {}, Proj proj = {});

```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.
- 2 Preconditions: For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17Value-Swappable* requirements ([16.4.4.3](#)).
- 3 Effects: Takes a sequence defined by the range `[first, last)` and transforms it into the next permutation. The next permutation is found by assuming that the set of all permutations is lexicographically sorted with respect to `comp` and `proj`. If no such permutation exists, transforms the sequence into the first permutation; that is, the ascendingly-sorted one.
- 4 Returns: Let `B` be `true` if a next permutation was found and otherwise `false`. Returns:
 - (4.1) — `B` for the overloads in namespace `std`.
 - (4.2) — `{ last, B }` for the overloads in namespace `ranges`.
- 5 Complexity: At most $(\text{last} - \text{first}) / 2$ swaps.

```

template<class BidirectionalIterator>
constexpr bool prev_permutation(BidirectionalIterator first,
                                BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
constexpr bool prev_permutation(BidirectionalIterator first,
                                BidirectionalIterator last, Compare comp);

template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr ranges::prev_permutation_result<I>
ranges::prev_permutation(I first, S last, Comp comp = {}, Proj proj = {});

template<bidirectional_range R, class Comp = ranges::less,
         class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr ranges::prev_permutation_result<borrowed_iterator_t<R>>
ranges::prev_permutation(R&& r, Comp comp = {}, Proj proj = {});

6   Let comp be less{} and proj be identity{} for overloads with no parameters by those names.

7   Preconditions: For the overloads in namespace std, BidirectionalIterator meets the Cpp17ValueSwappable requirements (16.4.4.3).

8   Effects: Takes a sequence defined by the range [first, last) and transforms it into the previous permutation. The previous permutation is found by assuming that the set of all permutations is lexicographically sorted with respect to comp and proj. If no such permutation exists, transforms the sequence into the last permutation; that is, the descendingly-sorted one.

9   Returns: Let B be true if a previous permutation was found and otherwise false. Returns:
(9.1)   — B for the overloads in namespace std.
(9.2)   — { last, B } for the overloads in namespace ranges.

10  Complexity: At most  $(last - first) / 2$  swaps.

27.10 Generalized numeric operations

[numeric.ops]

27.10.1 General

[numeric.ops.general]

- 1 NOTE: The use of closed ranges as well as semi-open ranges to specify requirements throughout 27.10 is intentional.

27.10.2 Definitions

[numerics.defns]

- 1 Define *GENERALIZED_NONCOMMUTATIVE_SUM*(op, a₁, ..., a_N) as follows:
 - (1.1) — a₁ when N is 1, otherwise
 - (1.2) — op(*GENERALIZED_NONCOMMUTATIVE_SUM*(op, a₁, ..., a_K), *GENERALIZED_NONCOMMUTATIVE_SUM*(op, a_M, ..., a_N)) for any K where 1 < K + 1 = M ≤ N.
- 2 Define *GENERALIZED_SUM*(op, a₁, ..., a_N) as *GENERALIZED_NONCOMMUTATIVE_SUM*(op, b₁, ..., b_N), where b₁, ..., b_N may be any permutation of a₁, ..., a_N.

27.10.3 Accumulate

[accumulate]

```
template<class InputIterator, class T>
    constexpr T accumulate(InputIterator first, InputIterator last, T init);
template<class InputIterator, class T, class BinaryOperation>
    constexpr T accumulate(InputIterator first, InputIterator last, T init,
                           BinaryOperation binary_op);
```
