(2.3) — Stage 3: Determine where padding is required.

(2.4) — Stage 4: Insert the sequence into the `out`.

3 Detailed descriptions of each stage follow.

4 *Returns*: `out`.

**Stage 1:** The first action of stage 1 is to determine a conversion specifier. The tables that describe this determination use the following local variables

```
fmtflags flags = str.flags();
fmtflags basefield = (flags & (ios_base::basefield));
fmtflags uppercase = (flags & (ios_base::uppercase));
fmtflags floatfield = (flags & (ios_base::floatfield));
fmtflags showpos = (flags & (ios_base::showpos));
fmtflags showbase = (flags & (ios_base::showbase));
fmtflags showpoint = (flags & (ios_base::showpoint));
```

All tables used in describing stage 1 are ordered. That is, the first line whose condition is true applies. A line without a condition is the default behavior when none of the earlier lines apply.

For conversion from an integral type other than a character type, the function determines the integral conversion specifier as indicated in [Table 108](#).

Table 108: Integer conversions [tab:facet.num.put.int]

| State                                                           | stdio equivalent |
|-----------------------------------------------------------------|------------------|
| <code>basefield == ios_base::oct</code>                         | <code>%o</code>  |
| <code>(basefield == ios_base::hex) &amp;&amp; !uppercase</code> | <code>%x</code>  |
| <code>(basefield == ios_base::hex)</code>                       | <code>%X</code>  |
| for a <code>signed</code> integral type                         | <code>%d</code>  |
| for an <code>unsigned</code> integral type                      | <code>%u</code>  |

For conversion from a floating-point type, the function determines the floating-point conversion specifier as indicated in [Table 109](#).

Table 109: Floating-point conversions [tab:facet.num.put.fp]

| State                                                                                     | stdio equivalent |
|-------------------------------------------------------------------------------------------|------------------|
| <code>floatfield == ios_base::fixed</code>                                                | <code>%f</code>  |
| <code>floatfield == ios_base::scientific &amp;&amp; !uppercase</code>                     | <code>%e</code>  |
| <code>floatfield == ios_base::scientific</code>                                           | <code>%E</code>  |
| <code>floatfield == (ios_base::fixed   ios_base::scientific) &amp;&amp; !uppercase</code> | <code>%a</code>  |
| <code>floatfield == (ios_base::fixed   ios_base::scientific)</code>                       | <code>%A</code>  |
| <code>!uppercase</code>                                                                   | <code>%g</code>  |
| <code>otherwise</code>                                                                    | <code>%G</code>  |

For conversions from an integral or floating-point type a length modifier is added to the conversion specifier as indicated in [Table 110](#).

Table 110: Length modifier [tab:facet.num.put.length]

| Type                            | Length modifier   |
|---------------------------------|-------------------|
| <code>long</code>               | <code>l</code>    |
| <code>long long</code>          | <code>ll</code>   |
| <code>unsigned long</code>      | <code>l</code>    |
| <code>unsigned long long</code> | <code>ll</code>   |
| <code>long double</code>        | <code>L</code>    |
| <code>otherwise</code>          | <code>none</code> |

The conversion specifier has the following optional additional qualifiers prepended as indicated in [Table 111](#).

Table 111: Numeric conversions [tab:facet.num.put.conv]

| Type(s)               | State     | stdio equivalent |
|-----------------------|-----------|------------------|
| an integral type      | showpos   | +                |
|                       | showbase  | #                |
| a floating-point type | showpos   | +                |
|                       | showpoint | #                |

For conversion from a floating-point type, if `floatfield != (ios_base::fixed | ios_base::scientific)`, `str.precision()` is specified as precision in the conversion specification. Otherwise, no precision is specified.

For conversion from `void*` the specifier is `%p`.

The representations at the end of stage 1 consists of the `char`'s that would be printed by a call of `printf(s, val)` where `s` is the conversion specifier determined above.

**Stage 2:** Any character `c` other than a decimal point(.) is converted to a `charT` via

```
use_facet<ctype<charT>>(loc).widen(c)
```

A local variable `punct` is initialized via

```
const num_punct<charT>& punct = use_facet<num_punct<charT>>(loc);
```

For arithmetic types, `punct.thousands_sep()` characters are inserted into the sequence as determined by the value returned by `punct.do_grouping()` using the method described in 28.4.4.1.3

Decimal point characters(.) are replaced by `punct.decimal_point()`

**Stage 3:** A local variable is initialized as

```
fmtflags adjustfield = (flags & (ios_base::adjustfield));
```

The location of any padding<sup>273</sup> is determined according to Table 112.

Table 112: Fill padding [tab:facet.num.put.fill]

| State                                                                                     | Location           |
|-------------------------------------------------------------------------------------------|--------------------|
| <code>adjustfield == ios_base::left</code>                                                | pad after          |
| <code>adjustfield == ios_base::right</code>                                               | pad before         |
| <code>adjustfield == internal</code> and a sign occurs in the representation              | pad after the sign |
| <code>adjustfield == internal</code> and representation after stage 1 began with 0x or 0X | pad after x or X   |
| <i>otherwise</i>                                                                          | pad before         |

If `str.width()` is nonzero and the number of `charT`'s in the sequence after stage 2 is less than `str.width()`, then enough `fill` characters are added to the sequence at the position indicated for padding to bring the length of the sequence to `str.width()`.

`str.width(0)` is called.

**Stage 4:** The sequence of `charT`'s at the end of stage 3 are output via

```
*out++ = c
```

```
iter_type do_put(iter_type out, ios_base& str, char_type fill, bool val) const;
```

<sup>5</sup> *Returns:* If `(str.flags() & ios_base::boolalpha) == 0` returns `do_put(out, str, fill, (int)val)`, otherwise obtains a string `s` as if by

```
string_type s =
 val ? use_facet<num_punct<charT>>(loc).truename()
 : use_facet<num_punct<charT>>(loc).falsename();
```

and then inserts each character `c` of `s` into `out` via `*out++ = c` and returns `out`.

<sup>273)</sup> The conversion specification `#o` generates a leading 0 which is *not* a padding character.

## 28.4.4 The numeric punctuation facet

### 28.4.4.1 Class template `numpunct`

#### 28.4.4.1.1 General

```

namespace std {
 template<class charT>
 class numpunct : public locale::facet {
public:
 using char_type = charT;
 using string_type = basic_string<charT>;

 explicit numpunct(size_t refs = 0);

 char_type decimal_point() const;
 char_type thousands_sep() const;
 string grouping() const;
 string_type truename() const;
 string_type falsename() const;

 static locale::id id;
};

protected:
 ~numpunct(); // virtual
 virtual char_type do_decimal_point() const;
 virtual char_type do_thousands_sep() const;
 virtual string do_grouping() const;
 virtual string_type do_truename() const; // for bool
 virtual string_type do_falsename() const; // for bool
};

}

```

<sup>1</sup> `numpunct<>` specifies numeric punctuation. The specializations required in [Table 102 \(28.3.1.2.1\)](#), namely `numpunct<wchar_t>` and `numpunct<char>`, provide classic "C" numeric formats, i.e., they contain information equivalent to that contained in the "C" locale or their wide character counterparts as if obtained by a call to `widen`.

<sup>2</sup> The syntax for number formats is as follows, where *digit* represents the radix set specified by the `fmtflags` argument value, and *thousands-sep* and *decimal-point* are the results of corresponding `numpunct<charT>` members. Integer values have the format:

```

intval:
 signopt units

sign:
 +
 -

units:
 digits
 digits thousands-sep units

digits:
 digit digitsopt

```

and floating-point values have:

```

floatval:
 signopt units fractionalopt exponentopt
 signopt decimal-point digits exponentopt

fractional:
 decimal-point digitsopt

exponent:
 e signopt digits

e:
 e
 E

```

where the number of digits between *thousands-seps* is as specified by `do_grouping()`. For parsing, if the *digits* portion contains no thousands-separators, no grouping constraint is applied.

#### 28.4.4.1.2 Members

[facet.numpunct.members]

```
char_type decimal_point() const;
1 Returns: do_decimal_point().

char_type thousands_sep() const;
2 Returns: do_thousands_sep().

string grouping() const;
3 Returns: do_grouping().

string_type truename() const;
string_type falsename() const;
4 Returns: do_truename() or do_falsename(), respectively.
```

#### 28.4.4.1.3 Virtual functions

[facet.numpunct.virtuals]

```
char_type do_decimal_point() const;
1 Returns: A character for use as the decimal radix separator. The required specializations return '.' or L'.'.

char_type do_thousands_sep() const;
2 Returns: A character for use as the digit group separator. The required specializations return ',', or L','.

string do_grouping() const;
3 Returns: A string vec used as a vector of integer values, in which each element vec[i] represents the number of digits274 in the group at position i, starting with position 0 as the rightmost group. If vec.size() <= i, the number is the same as group $(i - 1)$; if $(i < 0 \text{ || } \text{vec}[i] <= 0 \text{ || } \text{vec}[i] == \text{CHAR_MAX})$, the size of the digit group is unlimited.

4 The required specializations return the empty string, indicating no grouping.
```

```
string_type do_truename() const;
string_type do_falsename() const;
5 Returns: A string representing the name of the boolean value true or false, respectively.
6 In the base class implementation these names are "true" and "false", or L"true" and L"false".
```

#### 28.4.4.2 Class template numpunct\_byname

[locale.numpunctbyname]

```
namespace std {
 template<class charT>
 class numpunct_byname : public numpunct<charT> {
 // this class is specialized for char and wchar_t.
 public:
 using char_type = charT;
 using string_type = basic_string<charT>

 explicit numpunct_byname(const char*, size_t refs = 0);
 explicit numpunct_byname(const string&, size_t refs = 0);

 protected:
 ~numpunct_byname();
 };
}
```

---

<sup>274)</sup> Thus, the string "\003" specifies groups of 3 digits each, and "3" probably indicates groups of 51 (!) digits each, because 51 is the ASCII value of "3".

## 28.4.5 The collate category

### 28.4.5.1 Class template collate

#### 28.4.5.1.1 General

```
namespace std {
 template<class charT>
 class collate : public locale::facet {
 public:
 using char_type = charT;
 using string_type = basic_string<charT>;
 explicit collate(size_t refs = 0);

 int compare(const charT* low1, const charT* high1,
 const charT* low2, const charT* high2) const;
 string_type transform(const charT* low, const charT* high) const;
 long hash(const charT* low, const charT* high) const;

 static locale::id id;
 protected:
 ~collate();
 virtual int do_compare(const charT* low1, const charT* high1,
 const charT* low2, const charT* high2) const;
 virtual string_type do_transform(const charT* low, const charT* high) const;
 virtual long do_hash (const charT* low, const charT* high) const;
 };
}
```

- <sup>1</sup> The class `collate<charT>` provides features for use in the collation (comparison) and hashing of strings. A locale member function template, `operator()`, uses the collate facet to allow a locale to act directly as the predicate argument for standard algorithms (Clause 25) and containers operating on strings. The specializations required in Table 102 (28.3.1.2.1), namely `collate<char>` and `collate<wchar_t>`, apply lexicographic ordering (25.8.11).

- <sup>2</sup> Each function compares a string of characters \*p in the range [low, high).

#### 28.4.5.1.2 Members

[locale.collate.members]

```
int compare(const charT* low1, const charT* high1,
 const charT* low2, const charT* high2) const;
1 Returns: do_compare(low1, high1, low2, high2).
string_type transform(const charT* low, const charT* high) const;
2 Returns: do_transform(low, high).
long hash(const charT* low, const charT* high) const;
3 Returns: do_hash(low, high).
```

#### 28.4.5.1.3 Virtual functions

[locale.collate.virtuals]

```
int do_compare(const charT* low1, const charT* high1,
 const charT* low2, const charT* high2) const;
```

- <sup>1</sup> Returns: 1 if the first string is greater than the second, -1 if less, zero otherwise. The specializations required in Table 102 (28.3.1.2.1), namely `collate<char>` and `collate<wchar_t>`, implement a lexicographical comparison (25.8.11).

```
string_type do_transform(const charT* low, const charT* high) const;
```

- <sup>2</sup> Returns: A `basic_string<charT>` value that, compared lexicographically with the result of calling `transform()` on another string, yields the same result as calling `do_compare()` on the same two strings.<sup>275</sup>

<sup>275</sup>) This function is useful when one string is being compared to many other strings.

```
long do_hash(const charT* low, const charT* high) const;
```

<sup>3</sup> *Returns:* An integer value equal to the result of calling `hash()` on any other string for which `do_compare()` returns 0 (equal) when passed the two strings.

<sup>4</sup> *Recommended practice:* The probability that the result equals that for another string which does not compare equal should be very small, approaching `(1.0/numeric_limits<unsigned long>::max())`.

#### 28.4.5.2 Class template `collate_byname`

[`locale.collatebyname`]

```
namespace std {
 template<class charT>
 class collate_byname : public collate<charT> {
public:
 using string_type = basic_string<charT>

 explicit collate_byname(const char*, size_t refs = 0);
 explicit collate_byname(const string&, size_t refs = 0);

protected:
 ~collate_byname();
};

}
```

#### 28.4.6 The time category

[`category.time`]

##### 28.4.6.1 General

[`category.time.general`]

<sup>1</sup> Templates `time_get<charT, InputIterator>` and `time_put<charT, OutputIterator>` provide date and time formatting and parsing. All specifications of member functions for `time_put` and `time_get` in the subclasses of 28.4.6 only apply to the specializations required in Tables 102 and 103 (28.3.1.2.1). Their members use their `ios_base&`, `ios_base::iostate&`, and `fill` arguments as described in 28.4, and the `ctype<>` facet, to determine formatting details.

#### 28.4.6.2 Class template `time_get`

[`locale.time.get`]

##### 28.4.6.2.1 General

[`locale.time.get.general`]

```
namespace std {
 class time_base {
public:
 enum dateorder { no_order, dmy, mdy, ymd, ydm };

 template<class charT, class InputIterator = istreambuf_iterator<charT>>
 class time_get : public locale::facet, public time_base {
public:
 using char_type = charT;
 using iter_type = InputIterator;

 explicit time_get(size_t refs = 0);

 dateorder date_order() const { return do_date_order(); }
 iter_type get_time(iter_type s, iter_type end, ios_base& f,
 ios_base::iostate& err, tm* t) const;
 iter_type get_date(iter_type s, iter_type end, ios_base& f,
 ios_base::iostate& err, tm* t) const;
 iter_type get_weekday(iter_type s, iter_type end, ios_base& f,
 ios_base::iostate& err, tm* t) const;
 iter_type get_monthname(iter_type s, iter_type end, ios_base& f,
 ios_base::iostate& err, tm* t) const;
 iter_type get_year(iter_type s, iter_type end, ios_base& f,
 ios_base::iostate& err, tm* t) const;
 iter_type get(iter_type s, iter_type end, ios_base& f,
 ios_base::iostate& err, tm* t, char format, char modifier = 0) const;
 iter_type get(iter_type s, iter_type end, ios_base& f,
 ios_base::iostate& err, tm* t, const char_type* fmt,
 const char_type* fmtend) const;
};
```

```

 static locale::id id;

protected:
 ~time_get();
 virtual dateorder do_date_order() const;
 virtual iter_type do_get_time(iter_type s, iter_type end, ios_base&,
 ios_base::iostate& err, tm* t) const;
 virtual iter_type do_get_date(iter_type s, iter_type end, ios_base&,
 ios_base::iostate& err, tm* t) const;
 virtual iter_type do_get_weekday(iter_type s, iter_type end, ios_base&,
 ios_base::iostate& err, tm* t) const;
 virtual iter_type do_get_monthname(iter_type s, iter_type end, ios_base&,
 ios_base::iostate& err, tm* t) const;
 virtual iter_type do_get_year(iter_type s, iter_type end, ios_base&,
 ios_base::iostate& err, tm* t) const;
 virtual iter_type do_get(iter_type s, iter_type end, ios_base& f,
 ios_base::iostate& err, tm* t, char format, char modifier) const;
};

}

```

<sup>1</sup> `time_get` is used to parse a character sequence, extracting components of a time or date into a `struct tm` object. Each `get` member parses a format as produced by a corresponding format specifier to `time_put<>::put`. If the sequence being parsed matches the correct format, the corresponding members of the `struct tm` argument are set to the values used to produce the sequence; otherwise either an error is reported or unspecified values are assigned.<sup>276</sup>

<sup>2</sup> If the end iterator is reached during parsing by any of the `get()` member functions, the member sets `ios_base::eofbit` in `err`.

#### 28.4.6.2.2 Members

[`locale.time.get.members`]

```

dateorder date_order() const;

1 Returns: do_date_order().

iter_type get_time(iter_type s, iter_type end, ios_base& str,
 ios_base::iostate& err, tm* t) const;

2 Returns: do_get_time(s, end, str, err, t).

iter_type get_date(iter_type s, iter_type end, ios_base& str,
 ios_base::iostate& err, tm* t) const;

3 Returns: do_get_date(s, end, str, err, t).

iter_type get_weekday(iter_type s, iter_type end, ios_base& str,
 ios_base::iostate& err, tm* t) const;
iter_type get_monthname(iter_type s, iter_type end, ios_base& str,
 ios_base::iostate& err, tm* t) const;

4 Returns: do_get_weekday(s, end, str, err, t) or do_get_monthname(s, end, str, err, t).

iter_type get_year(iter_type s, iter_type end, ios_base& str,
 ios_base::iostate& err, tm* t) const;

5 Returns: do_get_year(s, end, str, err, t).

iter_type get(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err,
 tm* t, char format, char modifier = 0) const;

6 Returns: do_get(s, end, f, err, t, format, modifier).

iter_type get(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err,
 tm* t, const char_type* fmt, const char_type* fmtend) const;

7 Preconditions: [fmt, fmtend) is a valid range.

```

<sup>276)</sup> In other words, user confirmation is required for reliable parsing of user-entered dates and times, but machine-generated formats can be parsed reliably. This allows parsers to be aggressive about interpreting user variations on standard formats.

8     *Effects:* The function starts by evaluating `err = ios_base::goodbit`. It then enters a loop, reading zero or more characters from `s` at each iteration. Unless otherwise specified below, the loop terminates when the first of the following conditions holds:

- (8.1)     — The expression `fmt == fmtend` evaluates to `true`.
- (8.2)     — The expression `err == ios_base::goodbit` evaluates to `false`.
- (8.3)     — The expression `s == end` evaluates to `true`, in which case the function evaluates `err = ios_base::eofbit | ios_base::failbit`.
- (8.4)     — The next element of `fmt` is equal to `'%'`, optionally followed by a modifier character, followed by a conversion specifier character, `format`, together forming a conversion specification valid for the ISO/IEC 9945 function `strptime`. If the number of elements in the range `[fmt, fmtend]` is not sufficient to unambiguously determine whether the conversion specification is complete and valid, the function evaluates `err = ios_base::failbit`. Otherwise, the function evaluates `s = do_get(s, end, f, err, t, format, modifier)`, where the value of `modifier` is `'\0'` when the optional modifier is absent from the conversion specification. If `err == ios_base::goodbit` holds after the evaluation of the expression, the function increments `fmt` to point just past the end of the conversion specification and continues looping.
- (8.5)     — The expression `isspace(*fmt, f.getloc())` evaluates to `true`, in which case the function first increments `fmt` until `fmt == fmtend || !isspace(*fmt, f.getloc())` evaluates to `true`, then advances `s` until `s == end || !isspace(*s, f.getloc())` is `true`, and finally resumes looping.
- (8.6)     — The next character read from `s` matches the element pointed to by `fmt` in a case-insensitive comparison, in which case the function evaluates `++fmt, ++s` and continues looping. Otherwise, the function evaluates `err = ios_base::failbit`.

9     [*Note 1:* The function uses the `ctype<charT>` facet installed in `f`'s locale to determine valid whitespace characters. It is unspecified by what means the function performs case-insensitive comparison or whether multi-character sequences are considered while doing so. — *end note*]

10    *Returns:* `s`.

#### 28.4.6.2.3 Virtual functions

**[locale.time.get.virtuals]**

```
dateorder do_date_order() const;
```

1     *Returns:* An enumeration value indicating the preferred order of components for those date formats that are composed of day, month, and year.<sup>277</sup> Returns `no_order` if the date format specified by `'x'` contains other variable components (e.g., Julian day, week number, week day).

```
iter_type do_get_time(iter_type s, iter_type end, ios_base& str,
 ios_base::iostate& err, tm* t) const;
```

2     *Effects:* Reads characters starting at `s` until it has extracted those `struct tm` members, and remaining format characters, used by `time_put<>::put` to produce the format specified by `"%H:%M:%S"`, or until it encounters an error or end of sequence.

3     *Returns:* An iterator pointing immediately beyond the last character recognized as possibly part of a valid time.

```
iter_type do_get_date(iter_type s, iter_type end, ios_base& str,
 ios_base::iostate& err, tm* t) const;
```

4     *Effects:* Reads characters starting at `s` until it has extracted those `struct tm` members and remaining format characters used by `time_put<>::put` to produce one of the following formats, or until it encounters an error. The format depends on the value returned by `date_order()` as shown in [Table 113](#).

5     An implementation may also accept additional implementation-defined formats.

6     *Returns:* An iterator pointing immediately beyond the last character recognized as possibly part of a valid date.

<sup>277)</sup> This function is intended as a convenience only, for common formats, and can return `no_order` in valid locales.

Table 113: `do_get_date` effects [tab:locale.time.get.dogetdate]

| <code>date_order()</code> | <code>Format</code> |
|---------------------------|---------------------|
| <code>no_order</code>     | "%m%d%y"            |
| <code>dmy</code>          | "%d%m%y"            |
| <code>mdy</code>          | "%m%d%y"            |
| <code>ymd</code>          | "%y%m%d"            |
| <code>ydm</code>          | "%y%d%m"            |

```
iter_type do_get_weekday(iter_type s, iter_type end, ios_base& str,
 ios_base::iostate& err, tm* t) const;
iter_type do_get_monthname(iter_type s, iter_type end, ios_base& str,
 ios_base::iostate& err, tm* t) const;
```

7     *Effects:* Reads characters starting at `s` until it has extracted the (perhaps abbreviated) name of a weekday or month. If it finds an abbreviation that is followed by characters that can match a full name, it continues reading until it matches the full name or fails. It sets the appropriate `struct tm` member accordingly.

8     *Returns:* An iterator pointing immediately beyond the last character recognized as part of a valid name.

```
iter_type do_get_year(iter_type s, iter_type end, ios_base& str,
 ios_base::iostate& err, tm* t) const;
```

9     *Effects:* Reads characters starting at `s` until it has extracted an unambiguous year identifier. It is implementation-defined whether two-digit year numbers are accepted, and (if so) what century they are assumed to lie in. Sets the `t->tm_year` member accordingly.

10    *Returns:* An iterator pointing immediately beyond the last character recognized as part of a valid year identifier.

```
iter_type do_get(iter_type s, iter_type end, ios_base& f,
 ios_base::iostate& err, tm* t, char format, char modifier) const;
```

11    *Preconditions:* `t` points to an object.

12    *Effects:* The function starts by evaluating `err = ios_base::goodbit`. It then reads characters starting at `s` until it encounters an error, or until it has extracted and assigned those `struct tm` members, and any remaining format characters, corresponding to a conversion directive appropriate for the ISO/IEC 9945 function `strftime`, formed by concatenating '`%`', the `modifier` character, when non-NUL, and the `format` character. When the concatenation fails to yield a complete valid directive the function leaves the object pointed to by `t` unchanged and evaluates `err |= ios_base::failbit`. When `s == end` evaluates to `true` after reading a character the function evaluates `err |= ios_base::eofbit`.

13    For complex conversion directives such as `%c`, `%x`, or `%X`, or directives that involve the optional modifiers `E` or `O`, when the function is unable to unambiguously determine some or all `struct tm` members from the input sequence `[s, end)`, it evaluates `err |= ios_base::eofbit`. In such cases the values of those `struct tm` members are unspecified and may be outside their valid range.

14    *Remarks:* It is unspecified whether multiple calls to `do_get()` with the address of the same `struct tm` object will update the current contents of the object or simply overwrite its members. Portable programs should zero out the object before invoking the function.

15    *Returns:* An iterator pointing immediately beyond the last character recognized as possibly part of a valid input sequence for the given `format` and `modifier`.

#### 28.4.6.3 Class template `time_get_byname`

[`locale.time.getbyname`]

```
namespace std {
 template<class charT, class InputIterator = istreambuf_iterator<charT>>
 class time_get_byname : public time_get<charT, InputIterator> {
 public:
 using dateorder = time_base::dateorder;
 using iter_type = InputIterator;
```

```

 explicit time_get_byname(const char*, size_t refs = 0);
 explicit time_get_byname(const string&, size_t refs = 0);

protected:
 ~time_get_byname();
};

}

```

#### 28.4.6.4 Class template time\_put

[locale.time.put]

```

namespace std {
 template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
 class time_put : public locale::facet {
 public:
 using char_type = charT;
 using iter_type = OutputIterator;

 explicit time_put(size_t refs = 0);

 // the following is implemented in terms of other member functions.
 iter_type put(iter_type s, ios_base& f, char_type fill, const tm* tmb,
 const charT* pattern, const charT* pat_end) const;
 iter_type put(iter_type s, ios_base& f, char_type fill,
 const tm* tmb, char format, char modifier = 0) const;

 static locale::id id;

protected:
 ~time_put();
 virtual iter_type do_put(iter_type s, ios_base&, char_type, const tm* t,
 char format, char modifier) const;
};

}

```

##### 28.4.6.4.1 Members

[locale.time.put.members]

```

iter_type put(iter_type s, ios_base& str, char_type fill, const tm* t,
 const charT* pattern, const charT* pat_end) const;
iter_type put(iter_type s, ios_base& str, char_type fill, const tm* t,
 char format, char modifier = 0) const;

```

- 1 *Effects:* The first form steps through the sequence from *pattern* to *pat\_end*, identifying characters that are part of a format sequence. Each character that is not part of a format sequence is written to *s* immediately, and each format sequence, as it is identified, results in a call to *do\_put*; thus, format elements and other characters are interleaved in the output in the order in which they appear in the pattern. Format sequences are identified by converting each character *c* to a *char* value as if by *ct.narrow(c, 0)*, where *ct* is a reference to *ctype<charT>* obtained from *str.getloc()*. The first character of each sequence is equal to ‘%’, followed by an optional modifier character *mod*<sup>278</sup> and a format specifier character *spec* as defined for the function *strftime*. If no modifier character is present, *mod* is zero. For each valid format sequence identified, calls *do\_put(s, str, fill, t, spec, mod)*.
- 2 The second form calls *do\_put(s, str, fill, t, format, modifier)*.
- 3 [Note 1: The *fill* argument can be used in the implementation-defined formats or by derivations. A space character is a reasonable default for this argument. —end note]
- 4 *Returns:* An iterator pointing immediately after the last character produced.

##### 28.4.6.4.2 Virtual functions

[locale.time.put.virtuals]

```

iter_type do_put(iter_type s, ios_base&, char_type fill, const tm* t,
 char format, char modifier) const;

```

- 1 *Effects:* Formats the contents of the parameter *t* into characters placed on the output sequence *s*. Formatting is controlled by the parameters *format* and *modifier*, interpreted identically as the format

<sup>278</sup>) Although the C programming language defines no modifiers, most vendors do.

specifiers in the string argument to the standard library function `strftime()`, except that the sequence of characters produced for those specifiers that are described as depending on the C locale are instead implementation-defined.

[*Note 1*: Interpretation of the `modifier` argument is implementation-defined. — *end note*]

**Returns:** An iterator pointing immediately after the last character produced.

[*Note 2*: The `fill` argument can be used in the implementation-defined formats or by derivations. A space character is a reasonable default for this argument. — *end note*]

**Recommended practice:** Interpretation of the `modifier` should follow POSIX conventions. Implementations should refer to other standards such as POSIX for a specification of the character sequences produced for those specifiers described as depending on the C locale.

#### 28.4.6.5 Class template `time_put_byname`

[`locale.time.putbyname`]

```
namespace std {
 template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
 class time_put_byname : public time_put<charT, OutputIterator> {
 public:
 using char_type = charT;
 using iter_type = OutputIterator;

 explicit time_put_byname(const char*, size_t refs = 0);
 explicit time_put_byname(const string&, size_t refs = 0);

 protected:
 ~time_put_byname();
 };
}
```

#### 28.4.7 The monetary category

[`category.monetary`]

##### 28.4.7.1 General

[`category.monetary.general`]

- 1 These templates handle monetary formats. A template parameter indicates whether local or international monetary formats are to be used.
- 2 All specifications of member functions for `money_put` and `money_get` in the subclauses of 28.4.7 only apply to the specializations required in Tables 102 and 103 (28.3.1.2.1). Their members use their `ios_base&`, `ios_base::iostate&`, and `fill` arguments as described in 28.4, and the `moneypunct<>` and `ctype<>` facets, to determine formatting details.

#### 28.4.7.2 Class template `money_get`

[`locale.money.get`]

```
namespace std {
 template<class charT, class InputIterator = istreambuf_iterator<charT>>
 class money_get : public locale::facet {
 public:
 using char_type = charT;
 using iter_type = InputIterator;
 using string_type = basic_string<charT>;

 explicit money_get(size_t refs = 0);

 iter_type get(iter_type s, iter_type end, bool intl,
 ios_base& f, ios_base::iostate& err,
 long double& units) const;
 iter_type get(iter_type s, iter_type end, bool intl,
 ios_base& f, ios_base::iostate& err,
 string_type& digits) const;

 static locale::id id;

 protected:
 ~money_get();
 virtual iter_type do_get(iter_type, iter_type, bool, ios_base&,
 ios_base::iostate& err, long double& units) const;
 };
}
```

```

 virtual iter_type do_get(iter_type, iter_type, bool, ios_base&,
 ios_base::iostate& err, string_type& digits) const;
}
}

```

#### 28.4.7.2.1 Members

[locale.money.get.members]

```

iter_type get(iter_type s, iter_type end, bool intl, ios_base& f,
 ios_base::iostate& err, long double& quant) const;
iter_type get(iter_type s, iter_type end, bool intl, ios_base& f,
 ios_base::iostate& err, string_type& quant) const;

```

<sup>1</sup> Returns: do\_get(s, end, intl, f, err, quant).

#### 28.4.7.2.2 Virtual functions

[locale.money.get.virtuals]

```

iter_type do_get(iter_type s, iter_type end, bool intl, ios_base& str,
 ios_base::iostate& err, long double& units) const;
iter_type do_get(iter_type s, iter_type end, bool intl, ios_base& str,
 ios_base::iostate& err, string_type& digits) const;

```

<sup>1</sup> Effects: Reads characters from **s** to parse and construct a monetary value according to the format specified by a **moneypunct<charT, Intl>** facet reference **mp** and the character mapping specified by a **ctype<charT>** facet reference **ct** obtained from the locale returned by **str.getloc()**, and **str.flags()**. If a valid sequence is recognized, does not change **err**; otherwise, sets **err** to (**err|str.failbit**), or (**err|str.failbit|str.eofbit**) if no more characters are available, and does not change **units** or **digits**. Uses the pattern returned by **mp.neg\_format()** to parse all values. The result is returned as an integral value stored in **units** or as a sequence of digits possibly preceded by a minus sign (as produced by **ct.widen(c)** where **c** is '**-**' or in the range from '**0**' through '**9**' (inclusive)) stored in **digits**.

[Example 1: The sequence \$1,056.23 in a common United States locale would yield, for **units**, 105623, or, for **digits**, "105623". — end example]

If **mp.grouping()** indicates that no thousands separators are permitted, any such characters are not read, and parsing is terminated at the point where they first appear. Otherwise, thousands separators are optional; if present, they are checked for correct placement only after all format components have been read.

<sup>2</sup> Where **money\_base::space** or **money\_base::none** appears as the last element in the format pattern, no white space is consumed. Otherwise, where **money\_base::space** appears in any of the initial elements of the format pattern, at least one white space character is required. Where **money\_base::none** appears in any of the initial elements of the format pattern, white space is allowed but not required. If (**str.flags() & str.showbase**) is **false**, the currency symbol is optional and is consumed only if other characters are needed to complete the format; otherwise, the currency symbol is required.

<sup>3</sup> If the first character (if any) in the string **pos** returned by **mp.positive\_sign()** or the string **neg** returned by **mp.negative\_sign()** is recognized in the position indicated by **sign** in the format pattern, it is consumed and any remaining characters in the string are required after all the other format components.

[Example 2: If **showbase** is off, then for a **neg** value of "()" and a currency symbol of "L", in "(100 L)" the "L" is consumed; but if **neg** is "-", the "L" in "-100 L" is not consumed. — end example]

If **pos** or **neg** is empty, the sign component is optional, and if no sign is detected, the result is given the sign that corresponds to the source of the empty string. Otherwise, the character in the indicated position must match the first character of **pos** or **neg**, and the result is given the corresponding sign. If the first character of **pos** is equal to the first character of **neg**, or if both strings are empty, the result is given a positive sign.

<sup>4</sup> Digits in the numeric monetary component are extracted and placed in **digits**, or into a character buffer **buf1** for conversion to produce a value for **units**, in the order in which they appear, preceded by a minus sign if and only if the result is negative. The value **units** is produced as if by<sup>279</sup>

```

for (int i = 0; i < n; ++i)
 buf2[i] = src[find(atoms, atoms+sizeof(src), buf1[i]) - atoms];

```

<sup>279</sup>) The semantics here are different from **ct.narrow**.

```
buf2[n] = 0;
sscanf(buf2, "%Lf", &units);
```

where `n` is the number of characters placed in `buf1`, `buf2` is a character buffer, and the values `src` and `atoms` are defined as if by

```
static const char src[] = "0123456789-";
charT atoms[sizeof(src)];
ct.widen(src, src + sizeof(src) - 1, atoms);
```

<sup>5</sup> *Returns:* An iterator pointing immediately beyond the last character recognized as part of a valid monetary quantity.

#### 28.4.7.3 Class template `money_put`

[`locale.money.put`]

```
namespace std {
 template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
 class money_put : public locale::facet {
 public:
 using char_type = charT;
 using iter_type = OutputIterator;
 using string_type = basic_string<charT>;
 explicit money_put(size_t refs = 0);

 iter_type put(iter_type s, bool intl, ios_base& f,
 char_type fill, long double units) const;
 iter_type put(iter_type s, bool intl, ios_base& f,
 char_type fill, const string_type& digits) const;

 static locale::id id;
 protected:
 ~money_put();
 virtual iter_type do_put(iter_type, bool, ios_base&, char_type fill,
 long double units) const;
 virtual iter_type do_put(iter_type, bool, ios_base&, char_type fill,
 const string_type& digits) const;
 };
}
```

##### 28.4.7.3.1 Members

[`locale.money.put.members`]

```
iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, long double quant) const;
iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, const string_type& quant) const;
```

<sup>1</sup> *Returns:* `do_put(s, intl, f, loc, quant)`.

##### 28.4.7.3.2 Virtual functions

[`locale.money.put.virtuals`]

```
iter_type do_put(iter_type s, bool intl, ios_base& str,
 char_type fill, long double units) const;
iter_type do_put(iter_type s, bool intl, ios_base& str,
 char_type fill, const string_type& digits) const;
```

<sup>1</sup> *Effects:* Writes characters to `s` according to the format specified by a `moneypunct<charT, Intl>` facet reference `mp` and the character mapping specified by a `ctype<charT>` facet reference `ct` obtained from the locale returned by `str.getloc()`, and `str.flags()`. The argument `units` is transformed into a sequence of wide characters as if by

```
ct.widen(buf1, buf1 + sprintf(buf1, "%0Lf", units), buf2)
```

for character buffers `buf1` and `buf2`. If the first character in `digits` or `buf2` is equal to `ct.widen('')`, then the pattern used for formatting is the result of `mp.neg_format()`; otherwise the pattern is the result of `mp.pos_format()`. Digit characters are written, interspersed with any thousands separators and decimal point specified by the format, in the order they appear (after the optional leading minus sign) in `digits` or `buf2`. In `digits`, only the optional leading minus sign and the immediately subsequent digit

characters (as classified according to `ct`) are used; any trailing characters (including digits appearing after a non-digit character) are ignored. Calls `str.width(0)`.

- 2 *Remarks:* The currency symbol is generated if and only if `(str.flags() & str.showbase)` is nonzero. If the number of characters generated for the specified format is less than the value returned by `str.width()` on entry to the function, then copies of `fill` are inserted as necessary to pad to the specified width. For the value `af` equal to `(str.flags() & str.adjustfield)`, if `(af == str.internal)` is true, the fill characters are placed where `none` or `space` appears in the formatting pattern; otherwise if `(af == str.left)` is true, they are placed after the other characters; otherwise, they are placed before the other characters.

[*Note 1:* It is possible, with some combinations of format patterns and flag values, to produce output that cannot be parsed using `num_get<>::get`. — end note]

- 3 *Returns:* An iterator pointing immediately after the last character produced.

#### 28.4.7.4 Class template `moneypunct`

`[locale.moneypunct]`

##### 28.4.7.4.1 General

`[locale.moneypunct.general]`

```
namespace std {
 class money_base {
public:
 enum part { none, space, symbol, sign, value };
 struct pattern { char field[4]; };
};

template<class charT, bool International = false>
class moneypunct : public locale::facet, public money_base {
public:
 using char_type = charT;
 using string_type = basic_string<charT>

 explicit moneypunct(size_t refs = 0);

 charT decimal_point() const;
 charT thousands_sep() const;
 string grouping() const;
 string_type curr_symbol() const;
 string_type positive_sign() const;
 string_type negative_sign() const;
 int frac_digits() const;
 pattern pos_format() const;
 pattern neg_format() const;

 static locale::id id;
 static const bool intl = International;

protected:
 ~moneypunct();
 virtual charT do_decimal_point() const;
 virtual charT do_thousands_sep() const;
 virtual string do_grouping() const;
 virtual string_type do_curr_symbol() const;
 virtual string_type do_positive_sign() const;
 virtual string_type do_negative_sign() const;
 virtual int do_frac_digits() const;
 virtual pattern do_pos_format() const;
 virtual pattern do_neg_format() const;
};

}
```

<sup>1</sup> The `moneypunct<>` facet defines monetary formatting parameters used by `money_get<>` and `money_put<>`. A monetary format is a sequence of four components, specified by a `pattern` value `p`, such that the `part` value `static_cast<part>(p.field[i])` determines the  $i^{\text{th}}$  component of the format<sup>280</sup>. In the `field` member of

<sup>280</sup> An array of `char`, rather than an array of `part`, is specified for `pattern::field` purely for efficiency.

a pattern object, each value `symbol`, `sign`, `value`, and either `space` or `none` appears exactly once. The value `none`, if present, is not first; the value `space`, if present, is neither first nor last.

- 2 Where `none` or `space` appears, white space is permitted in the format, except where `none` appears at the end, in which case no white space is permitted. The value `space` indicates that at least one space is required at that position. Where `symbol` appears, the sequence of characters returned by `curr_symbol()` is permitted, and can be required. Where `sign` appears, the first (if any) of the sequence of characters returned by `positive_sign()` or `negative_sign()` (respectively as the monetary value is non-negative or negative) is required. Any remaining characters of the sign sequence are required after all other format components. Where `value` appears, the absolute numeric monetary value is required.
- 3 The format of the numeric monetary value is a decimal number:

*value*:  
*units* *fractional*<sub>opt</sub>  
*decimal-point* *digits*

*fractional*:  
*decimal-point* *digits*<sub>opt</sub>

if `frac_digits()` returns a positive value, or

*value*:  
*units*

otherwise. The symbol `decimal-point` indicates the character returned by `decimal_point()`. The other symbols are defined as follows:

*units*:  
*digits*  
*digits thousands-sep units*

*digits*:  
*adigit digits*<sub>opt</sub>

In the syntax specification, the symbol `adigit` is any of the values `ct.widen(c)` for `c` in the range '0' through '9' (inclusive) and `ct` is a reference of type `const ctype<charT>&` obtained as described in the definitions of `money_get<>` and `money_put<>`. The symbol `thousands-sep` is the character returned by `thousands_sep()`. The space character used is the value `ct.widen(' ')`. White space characters are those characters `c` for which `ci.is(space, c)` returns `true`. The number of digits required after the decimal point (if any) is exactly the value returned by `frac_digits()`.

- 4 The placement of thousands-separator characters (if any) is determined by the value returned by `grouping()`, defined identically as the member `numpunct<>::do_grouping()`.

#### 28.4.7.4.2 Members

[`locale.moneypunct.members`]

```
charT decimal_point() const;
charT thousands_sep() const;
string grouping() const;
string_type curr_symbol() const;
string_type positive_sign() const;
string_type negative_sign() const;
int frac_digits() const;
pattern pos_format() const;
pattern neg_format() const;
```

- 1 Each of these functions *F* returns the result of calling the corresponding virtual member function `do_F()`.

#### 28.4.7.4.3 Virtual functions

[`locale.moneypunct.virtuals`]

`charT do_decimal_point() const;`

- 1 *Returns*: The radix separator to use in case `do_frac_digits()` is greater than zero.<sup>281</sup>

`charT do_thousands_sep() const;`

- 2 *Returns*: The digit group separator to use in case `do_grouping()` specifies a digit grouping pattern.<sup>282</sup>

<sup>281</sup>) In common U.S. locales this is '.'.

<sup>282</sup>) In common U.S. locales this is ','.

```

string do_grouping() const;
3 Returns: A pattern defined identically as, but not necessarily equal to, the result of numpunct<charT>::do_grouping().283

string_type do_curr_symbol() const;
4 Returns: A string to use as the currency identifier symbol.

[Note 1: For specializations where the second template parameter is true, this is typically four characters long: a three-letter code as specified by ISO 4217 followed by a space. —end note]

string_type do_positive_sign() const;
string_type do_negative_sign() const;
5 Returns: do_positive_sign() returns the string to use to indicate a positive monetary value;284 do_negative_sign() returns the string to use to indicate a negative value.

int do_frac_digits() const;
6 Returns: The number of digits after the decimal radix separator, if any.285

pattern do_pos_format() const;
pattern do_neg_format() const;
7 Returns: The specializations required in Table 103 \(28.3.1.2.1\), namely
(7.1) — moneypunct<char>,
(7.2) — moneypunct<wchar_t>,
(7.3) — moneypunct<char, true>, and
(7.4) — moneypunct<wchar_t, true>,
return an object of type pattern initialized to { symbol, sign, none, value }.286

```

#### 28.4.7.5 Class template `moneypunct_byname`

[`locale.moneypunctbyname`]

```

namespace std {
 template<class charT, bool Intl = false>
 class moneypunct_byname : public moneypunct<charT, Intl> {
 public:
 using pattern = money_base::pattern;
 using string_type = basic_string<charT>

 explicit moneypunct_byname(const char*, size_t refs = 0);
 explicit moneypunct_byname(const string&, size_t refs = 0);

 protected:
 ~moneypunct_byname();
 };
}

```

#### 28.4.8 The message retrieval category

[`category.messages`]

##### 28.4.8.1 General

[`category.messages.general`]

<sup>1</sup> Class `messages<charT>` implements retrieval of strings from message catalogs.

##### 28.4.8.2 Class template `messages`

[`locale.messages`]

###### 28.4.8.2.1 General

[`locale.messages.general`]

```

namespace std {
 class messages_base {
 public:
 using catalog = unspecified signed integer type;
 };
}

```

<sup>283</sup>) To specify grouping by 3s, the value is "\003" *not* "3".

<sup>284</sup>) This is usually the empty string.

<sup>285</sup>) In common U.S. locales, this is 2.

<sup>286</sup>) Note that the international symbol returned by `do_curr_symbol()` usually contains a space, itself; for example, "USD ".

```

template<class charT>
class messages : public locale::facet, public messages_base {
public:
 using char_type = charT;
 using string_type = basic_string<charT>;
 explicit messages(size_t refs = 0);

 catalog open(const string& fn, const locale&) const;
 string_type get(catalog c, int set, int msgid,
 const string_type& dfault) const;
 void close(catalog c) const;

 static locale::id id;

protected:
 ~messages();
 virtual catalog do_open(const string&, const locale&) const;
 virtual string_type do_get(catalog, int set, int msgid,
 const string_type& dfault) const;
 virtual void do_close(catalog) const;
};

}

```

- <sup>1</sup> Values of type `messages_base::catalog` usable as arguments to members `get` and `close` can be obtained only by calling member `open`.

#### 28.4.8.2.2 Members

[`locale.messages.members`]

```

catalog open(const string& name, const locale& loc) const;
1 Returns: do_open(name, loc).
string_type get(catalog cat, int set, int msgid, const string_type& dfault) const;
2 Returns: do_get(cat, set, msgid, dfault).
void close(catalog cat) const;
3 Effects: Calls do_close(cat).

```

#### 28.4.8.2.3 Virtual functions

[`locale.messages.virtuals`]

```

catalog do_open(const string& name, const locale& loc) const;
1 Returns: A value that may be passed to get() to retrieve a message from the message catalog identified by the string name according to an implementation-defined mapping. The result can be used until it is passed to close().
2 Returns a value less than 0 if no such catalog can be opened.
3 Remarks: The locale argument loc is used for character set code conversion when retrieving messages, if needed.

string_type do_get(catalog cat, int set, int msgid, const string_type& dfault) const;
4 Preconditions: cat is a catalog obtained from open() and not yet closed.
5 Returns: A message identified by arguments set, msgid, and dfault, according to an implementation-defined mapping. If no such message can be found, returns dfault.

void do_close(catalog cat) const;
6 Preconditions: cat is a catalog obtained from open() and not yet closed.
7 Effects: Releases unspecified resources associated with cat.
8 Remarks: The limit on such resources, if any, is implementation-defined.

```

28.4.8.3 Class template `messages_byname`[`locale.messagesbyname`]

```
namespace std {
 template<class charT>
 class messages_byname : public messages<charT> {
public:
 using catalog = messages_base::catalog;
 using string_type = basic_string<charT>;

 explicit messages_byname(const char*, size_t refs = 0);
 explicit messages_byname(const string&, size_t refs = 0);

protected:
 ~messages_byname();
};

}
```

## 28.5 C library locales

[`c.locales`]28.5.1 Header `<clocale>` synopsis[`clocale.syn`]

```
namespace std {
 struct lconv;

 char* setlocale(int category, const char* locale);
 lconv* localeconv();
}

#define NULL see 17.2.3
#define LC_ALL see below
#define LC_COLLATE see below
#define LC_CTYPE see below
#define LC_MONETARY see below
#define LC_NUMERIC see below
#define LC_TIME see below
```

<sup>1</sup> The contents and meaning of the header `<clocale>` are the same as the C standard library header `<locale.h>`.

## 28.5.2 Data races

[`clocale.data.races`]

<sup>1</sup> Calls to the function `setlocale` may introduce a data race ([16.4.6.10](#)) with other calls to `setlocale` or with calls to the functions listed in [Table 114](#).

SEE ALSO: ISO C 7.11

Table 114: Potential `setlocale` data races [tab:`setlocale.data.races`]

|                      |                       |                        |                         |                       |

# 29 Input/output library [input.output]

## 29.1 General

[**input.output.general**]

- <sup>1</sup> This Clause describes components that C++ programs may use to perform input/output operations.
- 2 The following subclauses describe requirements for stream parameters, and components for forward declarations of iostreams, predefined iostreams objects, base iostreams classes, stream buffering, stream formatting and manipulators, string streams, and file streams, as summarized in [Table 115](#).

Table 115: Input/output library summary [tab:iostreams.summary]

| Subclause                         | Header                           |
|-----------------------------------|----------------------------------|
| 29.2 Requirements                 |                                  |
| 29.3 Forward declarations         | <iostreamfwd>                    |
| 29.4 Standard iostream objects    | <iostream>                       |
| 29.5 Iostreams base classes       | <ios>                            |
| 29.6 Stream buffers               | <streambuf>                      |
| 29.7 Formatting and manipulators  | <iomanip>, <iostream>, <ostream> |
| 29.8 String streams               | <sstream>                        |
| 29.9 File streams                 | <fstream>                        |
| 29.10 Synchronized output streams | <syncstream>                     |
| 29.11 File systems                | <filesystem>                     |
| 29.12 C library files             | <cstdio>, <cinttypes>            |

- <sup>3</sup> [Note 1: [Figure 7](#) illustrates relationships among various types described in this Clause. A line from **A** to **B** indicates that **A** is an alias (e.g., a `typedef`) for **B** or that **A** is defined in terms of **B**.

Figure 7: Stream position, offset, and size types [fig:iostreams.streampos]

— end note ]

## 29.2 Iostreams requirements

[**iostreams.requirements**]

### 29.2.1 Imbue limitations

[**iostream.limitations.imbue**]

- <sup>1</sup> No function described in [Clause 29](#) except for `ios_base::imbue` and `basic_filebuf::pubimbue` causes any instance of `basic_ios::imbue` or `basic_streambuf::imbue` to be called. If any user function called from a function declared in [Clause 29](#) or as an overriding virtual function of any class declared in [Clause 29](#) calls `imbue`, the behavior is undefined.

### 29.2.2 Positioning type limitations

[**iostreams.limits.pos**]

- <sup>1</sup> The classes of [Clause 29](#) with template arguments `charT` and `traits` behave as described if `traits::pos_type` and `traits::off_type` are `streampos` and `streamoff` respectively. Except as noted explicitly below, their behavior when `traits::pos_type` and `traits::off_type` are other types is implementation-defined.
- <sup>2</sup> In the classes of [Clause 29](#), a template parameter with name `charT` represents a member of the set of types containing `char`, `wchar_t`, and any other implementation-defined character types that meet the requirements for a character on which any of the iostream components can be instantiated.

### 29.2.3 Thread safety

[**iostreams.threadsafety**]

- <sup>1</sup> Concurrent access to a stream object ([29.8](#), [29.9](#)), stream buffer object ([29.6](#)), or C Library stream ([29.12](#)) by multiple threads may result in a data race ([6.9.2](#)) unless otherwise specified ([29.4](#)).  
*[Note 1: Data races result in undefined behavior ([6.9.2](#)). — end note]*
- <sup>2</sup> If one thread makes a library call *a* that writes a value to a stream and, as a result, another thread reads this value from the stream through a library call *b* such that this does not result in a data race, then *a*'s write synchronizes with *b*'s read.

## 29.3 Forward declarations

[**iostream.forward**]

### 29.3.1 Header <iosfwd> synopsis

[**iosfwd.syn**]

```
namespace std {
 template<class charT> struct char_traits;
 template<> struct char_traits<char>;
 template<> struct char_traits<char8_t>;
 template<> struct char_traits<char16_t>;
 template<> struct char_traits<char32_t>;

using u8streampos = fpos<char_traits<char8_t>::state_type>;
using u16streampos = fpos<char_traits<char16_t>::state_type>;
using u32streampos = fpos<char_traits<char32_t>::state_type>;
}

```

<sup>1</sup> Default template arguments are described as appearing both in `<iostream>` and in the synopsis of other headers but it is well-formed to include both `<iostream>` and one or more of the other headers.<sup>287</sup>

---

<sup>287)</sup> It is the implementation's responsibility to implement headers so that including `<iostream>` and other headers does not violate the rules about multiple occurrences of default arguments.

### 29.3.2 Overview

[**iostream.forward.overview**]

- <sup>1</sup> The class template specialization `basic_ios<charT, traits>` serves as a virtual base class for the class templates `basic_istream`, `basic_ostream`, and class templates derived from them. `basic_iostream` is a class template derived from both `basic_istream<charT, traits>` and `basic_ostream<charT, traits>`.
- <sup>2</sup> The class template specialization `basic_streambuf<charT, traits>` serves as a base class for class templates `basic_stringbuf`, `basic_filebuf`, and `basic_syncbuf`.
- <sup>3</sup> The class template specialization `basic_istream<charT, traits>` serves as a base class for class templates `basic_iostream` and `basic_ifstream`.
- <sup>4</sup> The class template specialization `basic_ostream<charT, traits>` serves as a base class for class templates `basic_ostringstream`, `basic_ofstream`, and `basic_osyncstream`.
- <sup>5</sup> The class template specialization `basic_iostream<charT, traits>` serves as a base class for class templates `basic_stringstream` and `basic_fstream`.
- <sup>6</sup> [Note 1: For each of the class templates above, the program is ill-formed if `traits::char_type` is not the same type as `charT` (21.2). — end note]
- <sup>7</sup> Other *typedef-names* define instances of class templates specialized for `char` or `wchar_t` types.
- <sup>8</sup> Specializations of the class template `fpos` are used for specifying file position information.  
[Example 1: The types `streampos` and `wstreampos` are used for positioning streams specialized on `char` and `wchar_t` respectively. — end example]
- <sup>9</sup> [Note 2: This synopsis suggests a circularity between `streampos` and `char_traits<char>`. An implementation can avoid this circularity by substituting equivalent types. — end note]

## 29.4 Standard iostream objects

[**iostream.objects**]

### 29.4.1 Header <iostream> synopsis

[**iostream.syn**]

```
#include <ios> // see 29.5.1
#include <streambuf> // see 29.6.1
#include <iostream> // see 29.7.1
#include <ostream> // see 29.7.2
```

```
namespace std {
 extern istream cin;
 extern ostream cout;
 extern ostream cerr;
 extern ostream clog;

 extern wistream wcin;
 extern wostream wcout;
 extern wostream wcerr;
 extern wostream wclog;
}
```

### 29.4.2 Overview

[**iostream.objects.overview**]

- <sup>1</sup> In this Clause, the type name `FILE` refers to the type `FILE` declared in `<cstdio>` (29.12.1).
- <sup>2</sup> The header `<iostream>` declares objects that associate objects with the standard C streams provided for by the functions declared in `<cstdio>`, and includes all the headers necessary to use these objects.
- <sup>3</sup> The objects are constructed and the associations are established at some time prior to or during the first time an object of class `ios_base::Init` is constructed, and in any case before the body of `main` (6.9.3.1) begins execution. The objects are not destroyed during program execution.<sup>288</sup>
- <sup>4</sup> *Recommended practice:* If it is possible for them to do so, implementations should initialize the objects earlier than required.
- <sup>5</sup> The results of including `<iostream>` in a translation unit shall be as if `<iostream>` defined an instance of `ios_base::Init` with static storage duration.

<sup>288</sup>) Constructors and destructors for objects with static storage duration can access these objects to read input from `stdin` or write output to `stdout` or `stderr`.

- <sup>6</sup> Mixing operations on corresponding wide- and narrow-character streams follows the same semantics as mixing such operations on FILEs, as specified in the C standard library.
- <sup>7</sup> Concurrent access to a synchronized (29.5.3.5) standard iostream object's formatted and unformatted input (29.7.4.2) and output (29.7.5.2) functions or a standard C stream by multiple threads does not result in a data race (6.9.2).

[*Note 1*: Unynchronized concurrent use of these objects and streams by multiple threads can result in interleaved characters. — *end note*]

SEE ALSO: ISO C 7.21.2

#### 29.4.3 Narrow stream objects

[narrow.stream.objects]

`istream cin;`

- <sup>1</sup> The object `cin` controls input from a stream buffer associated with the object `stdin`, declared in `<cstdio>` (29.12.1).
- <sup>2</sup> After the object `cin` is initialized, `cin.tie()` returns `&cout`. Its state is otherwise the same as required for `basic_ios<char>::init` (29.5.5.2).

`ostream cout;`

- <sup>3</sup> The object `cout` controls output to a stream buffer associated with the object `stdout`, declared in `<cstdio>` (29.12.1).

`ostream cerr;`

- <sup>4</sup> The object `cerr` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (29.12.1).
- <sup>5</sup> After the object `cerr` is initialized, `cerr.flags() & unitbuf` is nonzero and `cerr.tie()` returns `&cout`. Its state is otherwise the same as required for `basic_ios<char>::init` (29.5.5.2).

`ostream clog;`

- <sup>6</sup> The object `clog` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (29.12.1).

#### 29.4.4 Wide stream objects

[wide.stream.objects]

`wistream wcin;`

- <sup>1</sup> The object `wcin` controls input from a stream buffer associated with the object `stdin`, declared in `<cstdio>` (29.12.1).
- <sup>2</sup> After the object `wcin` is initialized, `wcin.tie()` returns `&wcout`. Its state is otherwise the same as required for `basic_ios<wchar_t>::init` (29.5.5.2).

`wostream wcout;`

- <sup>3</sup> The object `wcout` controls output to a stream buffer associated with the object `stdout`, declared in `<cstdio>` (29.12.1).

`wostream wcerr;`

- <sup>4</sup> The object `wcerr` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (29.12.1).
- <sup>5</sup> After the object `wcerr` is initialized, `wcerr.flags() & unitbuf` is nonzero and `wcerr.tie()` returns `&wcout`. Its state is otherwise the same as required for `basic_ios<wchar_t>::init` (29.5.5.2).

`wostream wclog;`

- <sup>6</sup> The object `wclog` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (29.12.1).

## 29.5 Iostreams base classes

### 29.5.1 Header <iostream> synopsis

```
#include <iostream> // see 29.3.1

namespace std {
 using streamoff = implementation-defined;
 using streamsize = implementation-defined;
 template<class stateT> class fpos;

 class ios_base;
 template<class charT, class traits = char_traits<charT>>
 class basic_ios;

 // 29.5.6, manipulators
 ios_base& boolalpha (ios_base& str);
 ios_base& noboolalpha(ios_base& str);

 ios_base& showbase (ios_base& str);
 ios_base& noshowbase (ios_base& str);

 ios_base& showpoint (ios_base& str);
 ios_base& noshowpoint(ios_base& str);

 ios_base& showpos (ios_base& str);
 ios_base& noshowpos (ios_base& str);

 ios_base& skipws (ios_base& str);
 ios_base& noskipws (ios_base& str);

 ios_base& uppercase (ios_base& str);
 ios_base& nouppercase(ios_base& str);

 ios_base& unitbuf (ios_base& str);
 ios_base& nounitbuf (ios_base& str);

 // 29.5.6.2, adjustfield
 ios_base& internal (ios_base& str);
 ios_base& left (ios_base& str);
 ios_base& right (ios_base& str);

 // 29.5.6.3, basefield
 ios_base& dec (ios_base& str);
 ios_base& hex (ios_base& str);
 ios_base& oct (ios_base& str);

 // 29.5.6.4, floatfield
 ios_base& fixed (ios_base& str);
 ios_base& scientific (ios_base& str);
 ios_base& hexfloat (ios_base& str);
 ios_base& defaultfloat(ios_base& str);

 // 29.5.7, error reporting
 enum class io_errc {
 stream = 1
 };

 template<> struct is_error_code_enum<io_errc> : public true_type { };
 error_code make_error_code(io_errc e) noexcept;
 error_condition make_error_condition(io_errc e) noexcept;
 const error_category& iostream_category() noexcept;
}
```

[iostreams.base]

[ios.syn]

## 29.5.2 Types

[stream.types]

```
using streamoff = implementation-defined;
```

- 1 The type **streamoff** is a synonym for one of the signed basic integral types of sufficient size to represent the maximum possible file size for the operating system.<sup>289</sup>

```
using streamsize = implementation-defined;
```

- 2 The type **streamsize** is a synonym for one of the signed basic integral types. It is used to represent the number of characters transferred in an I/O operation, or the size of I/O buffers.<sup>290</sup>

## 29.5.3 Class ios\_base

[ios.base]

### 29.5.3.1 General

[ios.base.general]

```
namespace std {
 class ios_base {
 public:
 class failure; // see below

 // 29.5.3.2.2, fmtflags
 using fmtflags = T1;
 static constexpr fmtflags boolalpha = unspecified;
 static constexpr fmtflags dec = unspecified;
 static constexpr fmtflags fixed = unspecified;
 static constexpr fmtflags hex = unspecified;
 static constexpr fmtflags internal = unspecified;
 static constexpr fmtflags left = unspecified;
 static constexpr fmtflags oct = unspecified;
 static constexpr fmtflags right = unspecified;
 static constexpr fmtflags scientific = unspecified;
 static constexpr fmtflags showbase = unspecified;
 static constexpr fmtflags showpoint = unspecified;
 static constexpr fmtflags showpos = unspecified;
 static constexpr fmtflags skipws = unspecified;
 static constexpr fmtflags unitbuf = unspecified;
 static constexpr fmtflags uppercase = unspecified;
 static constexpr fmtflags adjustfield = see below;
 static constexpr fmtflags basefield = see below;
 static constexpr fmtflags floatfield = see below;

 // 29.5.3.2.3, iostate
 using iostate = T2;
 static constexpr iostate badbit = unspecified;
 static constexpr iostate eofbit = unspecified;
 static constexpr iostate failbit = unspecified;
 static constexpr iostate goodbit = see below;

 // 29.5.3.2.4, openmode
 using openmode = T3;
 static constexpr openmode app = unspecified;
 static constexpr openmode ate = unspecified;
 static constexpr openmode binary = unspecified;
 static constexpr openmode in = unspecified;
 static constexpr openmode out = unspecified;
 static constexpr openmode trunc = unspecified;

 // 29.5.3.2.5, seekdir
 using seekdir = T4;
 static constexpr seekdir beg = unspecified;
 static constexpr seekdir cur = unspecified;
 static constexpr seekdir end = unspecified;
```

<sup>289</sup>) Typically long long.

<sup>290</sup>) **streamsize** is used in most places where ISO C would use **size\_t**.

```

class Init;

// 29.5.3.3, fmtflags state
fmtflags flags() const;
fmtflags flags(fmtflags fmtfl);
fmtflags setf(fmtflags fmtfl);
fmtflags setf(fmtflags fmtfl, fmtflags mask);
void unsetf(fmtflags mask);

streamsize precision() const;
streamsize precision(streamsize prec);
streamsize width() const;
streamsize width(streamsize wide);

// 29.5.3.4, locales
locale imbue(const locale& loc);
locale getloc() const;

// 29.5.3.6, storage
static int xalloc();
long& iword(int idx);
void*& pword(int idx);

// destructor
virtual ~ios_base();

// 29.5.3.7, callbacks
enum event { erase_event, imbue_event, copyfmt_event };
using event_callback = void (*)(event, ios_base&, int idx);
void register_callback(event_callback fn, int idx);

ios_base(const ios_base&) = delete;
ios_base& operator=(const ios_base&) = delete;

static bool sync_with_stdio(bool sync = true);

protected:
 ios_base();

private:
 static int index; // exposition only
 long* iarray; // exposition only
 void** parray; // exposition only
};

}

1 ios_base defines several member types:
(1.1) — a type failure, defined as either a class derived from system_error or a synonym for a class derived from system_error;
(1.2) — a class Init;
(1.3) — three bitmask types, fmtflags, iostate, and openmode;
(1.4) — an enumerated type, seekdir.

2 It maintains several kinds of data:
(2.1) — state information that reflects the integrity of the stream buffer;
(2.2) — control information that influences how to interpret (format) input sequences and how to generate (format) output sequences;
(2.3) — additional information that is stored by the program for its private use.

3 [Note 1: For the sake of exposition, the maintained data is presented here as:

```

- (3.1) — `static int index`, specifies the next available unique index for the integer or pointer arrays maintained for the private use of the program, initialized to an unspecified value;
  - (3.2) — `long* iarray`, points to the first element of an arbitrary-length `long` array maintained for the private use of the program;
  - (3.3) — `void** parray`, points to the first element of an arbitrary-length pointer array maintained for the private use of the program.
- *end note*

**29.5.3.2 Types**

[ios.types]

**29.5.3.2.1 Class ios\_base::failure**

[ios.failure]

```
namespace std {
 class ios_base::failure : public system_error {
 public:
 explicit failure(const string& msg, const error_code& ec = io_errc::stream);
 explicit failure(const char* msg, const error_code& ec = io_errc::stream);
 };
 }
}
```

<sup>1</sup> An implementation is permitted to define `ios_base::failure` as a synonym for a class with equivalent functionality to class `ios_base::failure` shown in this subclause.

[*Note 1*: When `ios_base::failure` is a synonym for another type, that type is required to provide a nested type `failure` to emulate the injected-class-name. — *end note*]

The class `failure` defines the base class for the types of all objects thrown as exceptions, by functions in the `iostreams` library, to report errors detected during stream buffer operations.

<sup>2</sup> When throwing `ios_base::failure` exceptions, implementations should provide values of `ec` that identify the specific reason for the failure.

[*Note 2*: Errors arising from the operating system would typically be reported as `system_category()` errors with an error value of the error number reported by the operating system. Errors arising from within the stream library would typically be reported as `error_code(io_errc::stream, ostream_category())`. — *end note*]

```
explicit failure(const string& msg, const error_code& ec = io_errc::stream);
```

<sup>3</sup> *Effects*: Constructs the base class with `msg` and `ec`.

```
explicit failure(const char* msg, const error_code& ec = io_errc::stream);
```

<sup>4</sup> *Effects*: Constructs the base class with `msg` and `ec`.

**29.5.3.2.2 Type ios\_base::fmtflags**

[ios.fmtflags]

```
using fmtflags = T1;
```

<sup>1</sup> The type `fmtflags` is a bitmask type (16.3.3.4). Setting its elements has the effects indicated in Table 116.

<sup>2</sup> Type `fmtflags` also defines the constants indicated in Table 117.

**29.5.3.2.3 Type ios\_base::iostate**

[ios.iostate]

```
using iostate = T2;
```

<sup>1</sup> The type `iostate` is a bitmask type (16.3.3.4) that contains the elements indicated in Table 118.

<sup>2</sup> Type `iostate` also defines the constant:

(2.1) — `goodbit`, the value zero.

**29.5.3.2.4 Type ios\_base::openmode**

[ios.openmode]

```
using openmode = T3;
```

<sup>1</sup> The type `openmode` is a bitmask type (16.3.3.4). It contains the elements indicated in Table 119.

**29.5.3.2.5 Type ios\_base::seekdir**

[ios.seekdir]

```
using seekdir = T4;
```

<sup>1</sup> The type `seekdir` is an enumerated type (16.3.3.3) that contains the elements indicated in Table 120.

Table 116: `fmtflags` effects [tab:ios.fmtflags]

| Element                 | Effect(s) if set                                                                                                                                   |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>boolalpha</code>  | insert and extract <code>bool</code> type in alphabetic format                                                                                     |
| <code>dec</code>        | converts integer input or generates integer output in decimal base                                                                                 |
| <code>fixed</code>      | generate floating-point output in fixed-point notation                                                                                             |
| <code>hex</code>        | converts integer input or generates integer output in hexadecimal base                                                                             |
| <code>internal</code>   | adds fill characters at a designated internal point in certain generated output, or identical to <code>right</code> if no such point is designated |
| <code>left</code>       | adds fill characters on the right (final positions) of certain generated output                                                                    |
| <code>oct</code>        | converts integer input or generates integer output in octal base                                                                                   |
| <code>right</code>      | adds fill characters on the left (initial positions) of certain generated output                                                                   |
| <code>scientific</code> | generates floating-point output in scientific notation                                                                                             |
| <code>showbase</code>   | generates a prefix indicating the numeric base of generated integer output                                                                         |
| <code>showpoint</code>  | generates a decimal-point character unconditionally in generated floating-point output                                                             |
| <code>showpos</code>    | generates a + sign in non-negative generated numeric output                                                                                        |
| <code>skipws</code>     | skips leading whitespace before certain input operations                                                                                           |
| <code>unitbuf</code>    | flushes output after each output operation                                                                                                         |
| <code>uppercase</code>  | replaces certain lowercase letters with their uppercase equivalents in generated output                                                            |

Table 117: `fmtflags` constants [tab:ios.fmtflags.const]

| Constant                 | Allowable values                                               |
|--------------------------|----------------------------------------------------------------|
| <code>adjustfield</code> | <code>left</code>   <code>right</code>   <code>internal</code> |
| <code>basefield</code>   | <code>dec</code>   <code>oct</code>   <code>hex</code>         |
| <code>floatfield</code>  | <code>scientific</code>   <code>fixed</code>                   |

Table 118: `iostate` effects [tab:ios.iostate]

| Element              | Effect(s) if set                                                                                                                                 |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>badbit</code>  | indicates a loss of integrity in an input or output sequence (such as an irrecoverable read error from a file);                                  |
| <code>eofbit</code>  | indicates that an input operation reached the end of an input sequence;                                                                          |
| <code>failbit</code> | indicates that an input operation failed to read the expected characters, or that an output operation failed to generate the desired characters. |

Table 119: `openmode` effects [tab:ios.openmode]

| Element             | Effect(s) if set                                                  |
|---------------------|-------------------------------------------------------------------|
| <code>app</code>    | seek to end before each write                                     |
| <code>ate</code>    | open and seek to end immediately after opening                    |
| <code>binary</code> | perform input and output in binary mode (as opposed to text mode) |
| <code>in</code>     | open for input                                                    |
| <code>out</code>    | open for output                                                   |
| <code>trunc</code>  | truncate an existing stream when opening                          |

Table 120: `seekdir` effects [tab:ios.seekdir]

| Element          | Meaning                                                                                 |
|------------------|-----------------------------------------------------------------------------------------|
| <code>beg</code> | request a seek (for subsequent input or output) relative to the beginning of the stream |
| <code>cur</code> | request a seek relative to the current position within the sequence                     |
| <code>end</code> | request a seek relative to the current end of the sequence                              |

29.5.3.2.6 Class `ios_base::Init`[`ios.init`]

```
namespace std {
 class ios_base::Init {
 public:
 Init();
 Init(const Init&) = default;
 ~Init();
 Init& operator=(const Init&) = default;
 private:
 static int init_cnt; // exposition only
 };
}
```

- <sup>1</sup> The class `Init` describes an object whose construction ensures the construction of the eight objects declared in `<iostream>` (29.4) that associate file stream buffers with the standard C streams provided for by the functions declared in `<cstdio>` (29.12.1).
- <sup>2</sup> For the sake of exposition, the maintained data is presented here as:

- (2.1) — `static int init_cnt`, counts the number of constructor and destructor calls for class `Init`, initialized to zero.

`Init();`

- <sup>3</sup> *Effects*: Constructs and initializes the objects `cin`, `cout`, `cerr`, `clog`, `wcin`, `wcout`, `wcerr`, and `wclog` if they have not already been constructed and initialized.

`~Init();`

- <sup>4</sup> *Effects*: If there are no other instances of the class still in existence, calls `cout.flush()`, `cerr.flush()`, `clog.flush()`, `wcout.flush()`, `wcerr.flush()`, `wclog.flush()`.

## 29.5.3.3 State functions

[`fmtflags.state`]`fmtflags flags() const;`

- <sup>1</sup> *Returns*: The format control information for both input and output.

`fmtflags flags(fmtflags fmtfl);`

- <sup>2</sup> *Postconditions*: `fmtfl == flags()`.

- <sup>3</sup> *Returns*: The previous value of `flags()`.

`fmtflags setf(fmtflags fmtfl);`

- <sup>4</sup> *Effects*: Sets `fmtfl` in `flags()`.

- <sup>5</sup> *Returns*: The previous value of `flags()`.

`fmtflags setf(fmtflags fmtfl, fmtflags mask);`

- <sup>6</sup> *Effects*: Clears `mask` in `flags()`, sets `fmtfl & mask` in `flags()`.

- <sup>7</sup> *Returns*: The previous value of `flags()`.

`void unsetf(fmtflags mask);`

- <sup>8</sup> *Effects*: Clears `mask` in `flags()`.

`streamsize precision() const;`

- <sup>9</sup> *Returns*: The precision to generate on certain output conversions.

`streamsize precision(streamsize prec);`

- <sup>10</sup> *Postconditions*: `prec == precision()`.

- <sup>11</sup> *Returns*: The previous value of `precision()`.

`streamsize width() const;`

- <sup>12</sup> *Returns*: The minimum field width (number of characters) to generate on certain output conversions.

```
streamsize width(streamsize wide);
13 Postconditions: wide == width().
14 Returns: The previous value of width().
```

**29.5.3.4 Functions**

[ios.base.locales]

```
locale imbue(const locale& loc);
```

1     *Effects:* Calls each registered callback pair (*fn*, *idx*) (29.5.3.7) as (\**fn*)(imbue\_event, \*this, *idx*) at such a time that a call to *ios\_base::getloc()* from within *fn* returns the new locale value *loc*.

2     *Postconditions:* *loc* == *getloc()*.

3     *Returns:* The previous value of *getloc()*.

```
locale getloc() const;
```

4     *Returns:* If no locale has been imbued, a copy of the global C++ locale, *locale()*, in effect at the time of construction. Otherwise, returns the imbued locale, to be used to perform locale-dependent input and output operations.

**29.5.3.5 Static members**

[ios.members.static]

```
static bool sync_with_stdio(bool sync = true);
```

1     *Returns:* *true* if the previous state of the standard iostream objects (29.4) was synchronized and otherwise returns *false*. The first time it is called, the function returns *true*.

2     *Effects:* If any input or output operation has occurred using the standard streams prior to the call, the effect is implementation-defined. Otherwise, called with a *false* argument, it allows the standard streams to operate independently of the standard C streams.

3     When a standard iostream object *str* is *synchronized* with a standard stdio stream *f*, the effect of inserting a character *c* by

```
fputc(f, c);
```

is the same as the effect of

```
str.rdbuf()->sputc(c);
```

for any sequences of characters; the effect of extracting a character *c* by

```
c = fgetc(f);
```

is the same as the effect of

```
c = str.rdbuf()->sbumpc();
```

for any sequences of characters; and the effect of pushing back a character *c* by

```
ungetc(c, f);
```

is the same as the effect of

```
str.rdbuf()->sputbackc(c);
```

for any sequence of characters.<sup>291</sup>

**29.5.3.6 Storage functions**

[ios.base.storage]

```
static int xalloc();
```

1     *Returns:* *index*++.

2     *Remarks:* Concurrent access to this function by multiple threads does not result in a data race (6.9.2).

```
long& iword(int idx);
```

3     *Preconditions:* *idx* is a value obtained by a call to *xalloc*.

4     *Effects:* If *iarray* is a null pointer, allocates an array of *long* of unspecified size and stores a pointer to its first element in *iarray*. The function then extends the array pointed at by *iarray* as necessary

<sup>291</sup>) This implies that operations on a standard iostream object can be mixed arbitrarily with operations on the corresponding stdio stream. In practical terms, synchronization usually means that a standard iostream object and a standard stdio object share a buffer.

to include the element `iarray[idx]`. Each newly allocated element of the array is initialized to zero. The reference returned is invalid after any other operations on the object.<sup>292</sup> However, the value of the storage referred to is retained, so that until the next call to `copyfmt`, calling `iword` with the same index yields another reference to the same value. If the function fails<sup>293</sup> and `*this` is a base class subobject of a `basic_ios`<> object or subobject, the effect is equivalent to calling `basic_ios`<>::`setstate(badbit)` on the derived object (which may throw `failure`).

5     >Returns: On success `iarray[idx]`. On failure, a valid `long&` initialized to 0.

`void*& pword(int idx);`

6     `Preconditions:` `idx` is a value obtained by a call to `xalloc`.

7     `Effects:` If `parray` is a null pointer, allocates an array of pointers to `void` of unspecified size and stores a pointer to its first element in `parray`. The function then extends the array pointed at by `parray` as necessary to include the element `parray[idx]`. Each newly allocated element of the array is initialized to a null pointer. The reference returned is invalid after any other operations on the object. However, the value of the storage referred to is retained, so that until the next call to `copyfmt`, calling `pword` with the same index yields another reference to the same value. If the function fails<sup>294</sup> and `*this` is a base class subobject of a `basic_ios`<> object or subobject, the effect is equivalent to calling `basic_ios`<>::`setstate(badbit)` on the derived object (which may throw `failure`).

8     >Returns: On success `parray[idx]`. On failure a valid `void*&` initialized to 0.

9     `Remarks:` After a subsequent call to `pword(int)` for the same object, the earlier return value may no longer be valid.

### 29.5.3.7 Callbacks

[ios.base.callback]

`void register_callback(event_callback fn, int idx);`

1     `Preconditions:` The function `fn` does not throw exceptions.

2     `Effects:` Registers the pair `(fn, idx)` such that during calls to `imbue()` (29.5.3.4), `copyfmt()`, or `~ios_base()` (29.5.3.8), the function `fn` is called with argument `idx`. Functions registered are called when an event occurs, in opposite order of registration. Functions registered while a callback function is active are not called until the next event.

3     `Remarks:` Identical pairs are not merged. A function registered twice will be called twice.

### 29.5.3.8 Constructors and destructor

[ios.base.cons]

`ios_base();`

1     `Effects:` Each `ios_base` member has an indeterminate value after construction. The object's members shall be initialized by calling `basic_ios::init` before the object's first use or before it is destroyed, whichever comes first; otherwise the behavior is undefined.

`~ios_base();`

2     `Effects:` Calls each registered callback pair `(fn, idx)` (29.5.3.7) as `(*fn)(erase_event, *this, idx)` at such time that any `ios_base` member function called from within `fn` has well-defined results.

### 29.5.4 Class template fpos

[fpos]

```
namespace std {
 template<class stateT> class fpos {
 public:
 // 29.5.4.1, members
 stateT state() const;
 void state(stateT);
 private:
 stateT st; // exposition only
 };
}
```

292) An implementation is free to implement both the integer array pointed at by `iarray` and the pointer array pointed at by `parray` as sparse data structures, possibly with a one-element cache for each.

293) For example, because it cannot allocate space.

294) For example, because it cannot allocate space.

**29.5.4.1 Members**[**fpos.members**]

```
void state(stateT s);
1 Effects: Assigns s to st.

stateT state() const;
2 Returns: Current value of st.
```

**29.5.4.2 Requirements**[**fpos.operations**]

- <sup>1</sup> An **fpos** type specifies file position information. It holds a state object whose type is equal to the template parameter **stateT**. Type **stateT** shall meet the *Cpp17DefaultConstructible* ([Table 27](#)), *Cpp17CopyConstructible* ([Table 29](#)), *Cpp17CopyAssignable* ([Table 31](#)), and *Cpp17Destructible* ([Table 32](#)) requirements. If *is\_trivially\_copy\_constructible\_v<stateT>* is true, then **fpos<stateT>** has a trivial copy constructor. If *is\_trivially\_copy\_assignable<stateT>* is true, then **fpos<stateT>** has a trivial copy assignment operator. If *is\_trivially\_destructible\_v<stateT>* is true, then **fpos<stateT>** has a trivial destructor. All specializations of **fpos** meet the *Cpp17DefaultConstructible*, *Cpp17CopyConstructible*, *Cpp17CopyAssignable*, *Cpp17Destructible*, and *Cpp17EqualityComparable* ([Table 25](#)) requirements. In addition, the expressions shown in [Table 121](#) are valid and have the indicated semantics. In that table,

- (1.1) — P refers to an instance of **fpos**,
- (1.2) — p and q refer to values of type P or const P,
- (1.3) — pl and ql refer to modifiable lvalues of type P,
- (1.4) — O refers to type **streamoff**, and
- (1.5) — o refers to a value of type **streamoff** or const **streamoff**.

Table 121: Position type requirements [tab:fpos.operations]

| Expression          | Return type         | Operational semantics | Assertion/note pre-/post-condition                                                      |
|---------------------|---------------------|-----------------------|-----------------------------------------------------------------------------------------|
| P(o)                | P                   | converts from offset  | <i>Effects:</i> Value-initializes the state object.                                     |
| P p(o);<br>P p = o; |                     |                       | <i>Effects:</i> Value-initializes the state object.<br><i>Postconditions:</i> p == P(o) |
| P()                 | P                   | P(O)                  |                                                                                         |
| P p;                |                     | P p(0);               |                                                                                         |
| O(p)                | streamoff           | converts to offset    | P(O(p)) == p                                                                            |
| p != q              | convertible to bool | !(p == q)             |                                                                                         |
| p + o               | P                   | + offset              | <i>Remarks:</i> With ql = p + o;, then: ql - o == p                                     |
| pl += o             | P&                  | += offset             | <i>Remarks:</i> With ql = pl; before the +=, then: pl - o == ql                         |
| p - o               | P                   | - offset              | <i>Remarks:</i> With ql = p - o;, then: ql + o == p                                     |
| pl -= o             | P&                  | = offset              | <i>Remarks:</i> With ql = pl; before the -=, then: pl + o == ql                         |
| o + p               | convertible to P    | p + o                 | P(o + p) == p + o                                                                       |
| p - q               | streamoff           | distance              | p == q + (p - q)                                                                        |

- <sup>2</sup> Stream operations that return a value of type **traits::pos\_type** return P(O(-1)) as an invalid value to signal an error. If this value is used as an argument to any **istream**, **ostream**, or **streambuf** member that accepts a value of type **traits::pos\_type** then the behavior of that function is undefined.

## 29.5.5 Class template basic\_ios

[ios]

### 29.5.5.1 Overview

[ios.overview]

```

namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_ios : public ios_base {
public:
 using char_type = charT;
 using int_type = typename traits::int_type;
 using pos_type = typename traits::pos_type;
 using off_type = typename traits::off_type;
 using traits_type = traits;

}

```

### 29.5.5.2 Constructors

[basic.ios.cons]

```
explicit basic_ios(basic_streambuf<charT, traits>* sb);
```

1     *Effects:* Assigns initial values to its member objects by calling `init(sb)`.

```
basic_ios();
```

2     *Effects:* Leaves its member objects uninitialized. The object shall be initialized by calling `basic_ios::init` before its first use or before it is destroyed, whichever comes first; otherwise the behavior is undefined.

```
~basic_ios();
```

3     *Remarks:* The destructor does not destroy `rdbuf()`.

```
void init(basic_streambuf<charT, traits>* sb);
```

4     *Postconditions:* The postconditions of this function are indicated in [Table 122](#).

Table 122: `basic_ios::init()` effects [tab:basic.ios.cons]

| Element                   | Value                                                                                          |
|---------------------------|------------------------------------------------------------------------------------------------|
| <code>rdbuf()</code>      | <code>sb</code>                                                                                |
| <code>tie()</code>        | <code>0</code>                                                                                 |
| <code>rdstate()</code>    | <code>goodbit</code> if <code>sb</code> is not a null pointer, otherwise <code>badbit</code> . |
| <code>exceptions()</code> | <code>goodbit</code>                                                                           |
| <code>flags()</code>      | <code>skipws   dec</code>                                                                      |
| <code>width()</code>      | <code>0</code>                                                                                 |
| <code>precision()</code>  | <code>6</code>                                                                                 |
| <code>fill()</code>       | <code>widen(' ')</code>                                                                        |
| <code>getloc()</code>     | a copy of the value returned by <code>locale()</code>                                          |
| <code>iarray</code>       | a null pointer                                                                                 |
| <code>parray</code>       | a null pointer                                                                                 |

### 29.5.5.3 Member functions

[basic.ios.members]

```
basic_ostream<charT, traits>* tie() const;
```

1     *Returns:* An output sequence that is *tied* to (synchronized with) the sequence controlled by the stream buffer.

```
basic_ostream<charT, traits>* tie(basic_ostream<charT, traits>* tiestr);
```

2     *Preconditions:* If `tiestr` is not null, `tiestr` is not reachable by traversing the linked list of tied stream objects starting from `tiestr->tie()`.

3     *Postconditions:* `tiestr == tie()`.

4     *Returns:* The previous value of `tie()`.

```
basic_streambuf<charT, traits>* rdbuf() const;
```

5     *Returns:* A pointer to the `streambuf` associated with the stream.

```
basic_streambuf<charT, traits>* rdbuf(basic_streambuf<charT, traits>* sb);
```

6     *Effects:* Calls `clear()`.

7     *Postconditions:* `sb == rdbuf()`.

8     *Returns:* The previous value of `rdbuf()`.

```
locale imbue(const locale& loc);
```

9     *Effects:* Calls `ios_base::imbue(loc)` ([29.5.3.4](#)) and if `rdbuf() != 0` then `rdbuf()->pubimbue(loc)` ([29.6.3.3.1](#)).

10    *Returns:* The prior value of `ios_base::imbue()`.

```

char narrow(char_type c, char dfault) const;
11 Returns: use_facet<ctype<char_type>>(getloc()).narrow(c, dfault)

char_type widen(char c) const;
12 Returns: use_facet<ctype<char_type>>(getloc()).widen(c)

char_type fill() const;
13 Returns: The character used to pad (fill) an output conversion to the specified field width.

char_type fill(char_type fillch);
14 Postconditions: traits::eq(fillch, fill()).

15 Returns: The previous value of fill().

basic_ios& copyfmt(const basic_ios& rhs);
16 Effects: If (this == addressof(rhs)) is true does nothing. Otherwise assigns to the member objects
 of *this the corresponding member objects of rhs as follows:
(16.1) — calls each registered callback pair (fn, idx) as (*fn)(erase_event, *this, idx);
(16.2) — then, assigns to the member objects of *this the corresponding member objects of rhs, except
 that
(16.2.1) — rdstate(), rdbuf(), and exceptions() are left unchanged;
(16.2.2) — the contents of arrays pointed at by pword and iword are copied, not the pointers themselves;295
 and
(16.2.3) — if any newly stored pointer values in *this point at objects stored outside the object rhs and
 those objects are destroyed when rhs is destroyed, the newly stored pointer values are altered
 to point at newly constructed copies of the objects;
(16.3) — then, calls each callback pair that was copied from rhs as (*fn)(copyfmt_event, *this, idx);
(16.4) — then, calls exceptions(rhs.exceptions()).

17 [Note 1: The second pass through the callback pairs permits a copied pword value to be zeroed, or to have its
 referent deep copied or reference counted, or to have other special action taken. —end note]

18 Postconditions: The postconditions of this function are indicated in Table 123.

```

Table 123: `basic_ios::copyfmt()` effects [tab:basic.ios.copyfmt]

| Element      | Value                         |
|--------------|-------------------------------|
| rdbuf()      | <i>unchanged</i>              |
| tie()        | <code>rhs.tie()</code>        |
| rdstate()    | <i>unchanged</i>              |
| exceptions() | <code>rhs.exceptions()</code> |
| flags()      | <code>rhs.flags()</code>      |
| width()      | <code>rhs.width()</code>      |
| precision()  | <code>rhs.precision()</code>  |
| fill()       | <code>rhs.fill()</code>       |
| getloc()     | <code>rhs.getloc()</code>     |

19 Returns: \*this.

```

void move(basic_ios& rhs);
void move(basic_ios&& rhs);

```

20 Postconditions: \*this has the state that rhs had before the function call, except that rdbuf() returns
 `nullptr`. rhs is in a valid but unspecified state, except that rhs.rdbuf() returns the same value as it
 returned before the function call, and rhs.tie() returns `nullptr`.

<sup>295</sup>) This suggests an infinite amount of copying, but the implementation can keep track of the maximum element of the arrays that is nonzero.

```

void swap(basic_ios& rhs) noexcept;
21 Effects: The states of *this and rhs are exchanged, except that rdbuf() returns the same value as it
 returned before the function call, and rhs.rdbuf() returns the same value as it returned before the
 function call.

void set_rdbuf(basic_streambuf<charT, traits>* sb);
22 Preconditions: sb != nullptr is true.
23 Effects: Associates the basic_streambuf object pointed to by sb with this stream without calling
 clear().
24 Postconditions: rdbuf() == sb is true.
25 Throws: Nothing.

```

**29.5.5.4 Flags functions**

[iostate.flags]

```
explicit operator bool() const;
```

1     >Returns: !fail().

```
bool operator!() const;
```

2     >Returns: fail().

```
iostate rdstate() const;
```

3     >Returns: The error state of the stream buffer.

```
void clear(iostate state = goodbit);
```

4     Postconditions: If rdbuf() != 0 then state == rdstate(); otherwise rdstate() == (state |  
ios\_base::badbit).

5     Effects: If ((state | (rdbuf() ? goodbit : badbit)) & exceptions()) == 0, returns. Otherwise, the function throws an object of class ios\_base::failure (29.5.3.2.1), constructed with implementation-defined argument values.

```
void setstate(iostate state);
```

6     Effects: Calls clear(rdstate() | state) (which may throw ios\_base::failure (29.5.3.2.1)).

```
bool good() const;
```

7     >Returns: rdstate() == 0

```
bool eof() const;
```

8     >Returns: true if eofbit is set in rdstate().

```
bool fail() const;
```

9     >Returns: true if failbit or badbit is set in rdstate().<sup>296</sup>

```
bool bad() const;
```

10   >Returns: true if badbit is set in rdstate().

```
iostate exceptions() const;
```

11   >Returns: A mask that determines what elements set in rdstate() cause exceptions to be thrown.

```
void exceptions(iostate except);
```

12   Postconditions: except == exceptions().

13   Effects: Calls clear(rdstate()).

**29.5.6 ios\_base manipulators**

[std.ios.manip]

**29.5.6.1 fmtflags manipulators**

[fmtflags.manip]

<sup>1</sup> Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

<sup>296</sup>) Checking badbit also for fail() is historical practice.

```
ios_base& boolalpha(ios_base& str);
2 Effects: Calls str.setf(ios_base::boolalpha).
3 Returns: str.

ios_base& noboolalpha(ios_base& str);
4 Effects: Calls str.unsetf(ios_base::boolalpha).
5 Returns: str.

ios_base& showbase(ios_base& str);
6 Effects: Calls str.setf(ios_base::showbase).
7 Returns: str.

ios_base& noshowbase(ios_base& str);
8 Effects: Calls str.unsetf(ios_base::showbase).
9 Returns: str.

ios_base& showpoint(ios_base& str);
10 Effects: Calls str.setf(ios_base::showpoint).
11 Returns: str.

ios_base& noshowpoint(ios_base& str);
12 Effects: Calls str.unsetf(ios_base::showpoint).
13 Returns: str.

ios_base& showpos(ios_base& str);
14 Effects: Calls str.setf(ios_base::showpos).
15 Returns: str.

ios_base& noshowpos(ios_base& str);
16 Effects: Calls str.unsetf(ios_base::showpos).
17 Returns: str.

ios_base& skipws(ios_base& str);
18 Effects: Calls str.setf(ios_base::skipws).
19 Returns: str.

ios_base& noskipws(ios_base& str);
20 Effects: Calls str.unsetf(ios_base::skipws).
21 Returns: str.

ios_base& uppercase(ios_base& str);
22 Effects: Calls str.setf(ios_base::uppercase).
23 Returns: str.

ios_base& nouppercase(ios_base& str);
24 Effects: Calls str.unsetf(ios_base::uppercase).
25 Returns: str.

ios_base& unitbuf(ios_base& str);
26 Effects: Calls str.setf(ios_base::unitbuf).
27 Returns: str.

ios_base& nounitbuf(ios_base& str);
28 Effects: Calls str.unsetf(ios_base::unitbuf).
```

29       >Returns: str.

#### 29.5.6.2 adjustfield manipulators

[adjustfield.manip]

1 Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

ios\_base& internal(ios\_base& str);

2     *Effects:* Calls str.setf(ios\_base::internal, ios\_base::adjustfield).

3       >Returns: str.

ios\_base& left(ios\_base& str);

4     *Effects:* Calls str.setf(ios\_base::left, ios\_base::adjustfield).

5       >Returns: str.

ios\_base& right(ios\_base& str);

6     *Effects:* Calls str.setf(ios\_base::right, ios\_base::adjustfield).

7       >Returns: str.

#### 29.5.6.3 basefield manipulators

[basefield.manip]

1 Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

ios\_base& dec(ios\_base& str);

2     *Effects:* Calls str.setf(ios\_base::dec, ios\_base::basefield).

3       >Returns: str<sup>297</sup>.

ios\_base& hex(ios\_base& str);

4     *Effects:* Calls str.setf(ios\_base::hex, ios\_base::basefield).

5       >Returns: str.

ios\_base& oct(ios\_base& str);

6     *Effects:* Calls str.setf(ios\_base::oct, ios\_base::basefield).

7       >Returns: str.

#### 29.5.6.4 floatfield manipulators

[floatfield.manip]

1 Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

ios\_base& fixed(ios\_base& str);

2     *Effects:* Calls str.setf(ios\_base::fixed, ios\_base::floatfield).

3       >Returns: str.

ios\_base& scientific(ios\_base& str);

4     *Effects:* Calls str.setf(ios\_base::scientific, ios\_base::floatfield).

5       >Returns: str.

ios\_base& hexfloat(ios\_base& str);

6     *Effects:* Calls str.setf(ios\_base::fixed | ios\_base::scientific, ios\_base::floatfield).

7       >Returns: str.

8 [Note 1: The more obvious use of ios\_base::hex to specify hexadecimal floating-point format would change the meaning of existing well-defined programs. C++ 2003 gives no meaning to the combination of fixed and scientific.  
—end note]

ios\_base& defaultfloat(ios\_base& str);

9     *Effects:* Calls str.unsetf(ios\_base::floatfield).

10     >Returns: str.

<sup>297</sup>) The function signature dec(ios\_base&) can be called by the function signature basic\_ostream& stream::operator<<(ios\_base& (\*)(ios\_base&)) to permit expressions of the form cout << dec to change the format flags stored in cout.

### 29.5.7 Error reporting

[error.reporting]

```
error_code make_error_code(io_errc e) noexcept;
1 Returns: error_code(static_cast<int>(e), iostream_category()).
```

```
error_condition make_error_condition(io_errc e) noexcept;
2 Returns: error_condition(static_cast<int>(e), iostream_category()).
```

```
const error_category& iostream_category() noexcept;
3 Returns: A reference to an object of a type derived from class error_category.
```

```
4 The object's default_error_condition and equivalent virtual functions shall behave as specified for the class error_category. The object's name virtual function shall return a pointer to the string "iostream".
```

## 29.6 Stream buffers

[stream.buffers]

### 29.6.1 Header <streambuf> synopsis

[streambuf.syn]

```
namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_streambuf;
 using streambuf = basic_streambuf<char>;
 using wstreambuf = basic_streambuf<wchar_t>;
}
```

- 1 The header <streambuf> defines types that control input from and output to *character* sequences.

### 29.6.2 Stream buffer requirements

[streambuf.reqts]

- 1 Stream buffers can impose various constraints on the sequences they control. Some constraints are:
  - (1.1) — The controlled input sequence can be not readable.
  - (1.2) — The controlled output sequence can be not writable.
  - (1.3) — The controlled sequences can be associated with the contents of other representations for character sequences, such as external files.
  - (1.4) — The controlled sequences can support operations *directly* to or from associated sequences.
  - (1.5) — The controlled sequences can impose limitations on how the program can read characters from a sequence, write characters to a sequence, put characters back into an input sequence, or alter the stream position.
- 2 Each sequence is characterized by three pointers which, if non-null, all point into the same *charT* array object. The array object represents, at any moment, a (sub)sequence of characters from the sequence. Operations performed on a sequence alter the values stored in these pointers, perform reads and writes directly to or from associated sequences, and alter “the stream position” and conversion state as needed to maintain this subsequence relationship. The three pointers are:
  - (2.1) — the *beginning pointer*, or lowest element address in the array (called *xbeg* here);
  - (2.2) — the *next pointer*, or next element address that is a current candidate for reading or writing (called *xnext* here);
  - (2.3) — the *end pointer*, or first element address beyond the end of the array (called *xend* here).
- 3 The following semantic constraints shall always apply for any set of three pointers for a sequence, using the pointer names given immediately above:
  - (3.1) — If *xnext* is not a null pointer, then *xbeg* and *xend* shall also be non-null pointers into the same *charT* array, as described above; otherwise, *xbeg* and *xend* shall also be null.
  - (3.2) — If *xnext* is not a null pointer and *xnext* < *xend* for an output sequence, then a *write position* is available. In this case, *\*xnext* shall be assignable as the next element to write (to put, or to store a character value, into the sequence).
  - (3.3) — If *xnext* is not a null pointer and *xbeg* < *xnext* for an input sequence, then a *putback position* is available. In this case, *xnext[-1]* shall have a defined value and is the next (preceding) element to store a character that is put back into the input sequence.

- (3.4) — If `xnext` is not a null pointer and `xnext < xend` for an input sequence, then a *read position* is available. In this case, `*xnext` shall have a defined value and is the next element to read (to get, or to obtain a character value, from the sequence).

### 29.6.3 Class template `basic_streambuf`

#### 29.6.3.1 General

[`streambuf`]

[`streambuf.general`]

```
namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_streambuf {
 public:
 using char_type = charT;
 using int_type = typename traits::int_type;
 using pos_type = typename traits::pos_type;
 using off_type = typename traits::off_type;
 using traits_type = traits;

 virtual ~basic_streambuf();

 // 29.6.3.3.1, locales
 locale pubimbuf(const locale& loc);
 locale getloc() const;

 // 29.6.3.3.2, buffer and positioning
 basic_streambuf* pubsetbuf(char_type* s, streamsize n);
 pos_type pubseekoff(off_type off, ios_base::seekdir way,
 ios_base::openmode which
 = ios_base::in | ios_base::out);
 pos_type pubseekpos(pos_type sp,
 ios_base::openmode which
 = ios_base::in | ios_base::out);
 int pubsync();

 // get and put areas
 // 29.6.3.3, get area
 streamsize in_avail();
 int_type snextc();
 int_type sbumpc();
 int_type sgetc();
 streamsize sgetn(char_type* s, streamsize n);

 // 29.6.3.4, putback
 int_type sputbackc(char_type c);
 int_type sungetc();

 // 29.6.3.5, put area
 int_type sputc(char_type c);
 streamsize sputn(const char_type* s, streamsize n);

 protected:
 basic_streambuf();
 basic_streambuf(const basic_streambuf& rhs);
 basic_streambuf& operator=(const basic_streambuf& rhs);

 void swap(basic_streambuf& rhs);

 // 29.6.3.4.2, get area access
 char_type* eback() const;
 char_type* gptr() const;
 char_type* egptr() const;
 void gbump(int n);
 void setg(char_type* gbeg, char_type* gnext, char_type* gend);
 };
}
```

```

// 29.6.3.4.3, put area access
char_type* pbase() const;
char_type* pptr() const;
char_type* eptr() const;
void pbump(int n);
void setp(char_type* pbeg, char_type* pend);

// 29.6.3.5, virtual functions
// 29.6.3.5.1, locales
virtual void imbue(const locale& loc);

// 29.6.3.5.2, buffer management and positioning
virtual basic_streambuf* setbuf(char_type* s, streamsize n);
virtual pos_type seekoff(off_type off, ios_base::seekdir way,
 ios_base::openmode which
 = ios_base::in | ios_base::out);
virtual pos_type seekpos(pos_type sp,
 ios_base::openmode which
 = ios_base::in | ios_base::out);
virtual int sync();

// 29.6.3.5.3, get area
virtual streamsize showmanyc();
virtual streamsize xsgetn(char_type* s, streamsize n);
virtual int_type underflow();
virtual int_type uflow();

// 29.6.3.5.4, putback
virtual int_type pbackfail(int_type c = traits::eof());

// 29.6.3.5.5, put area
virtual streamsize xsputn(const char_type* s, streamsize n);
virtual int_type overflow(int_type c = traits::eof());
};

}

```

- <sup>1</sup> The class template `basic_streambuf` serves as an abstract base class for deriving various *stream buffers* whose objects each control two *character sequences*:

- (1.1) — a character *input sequence*;
- (1.2) — a character *output sequence*.

### 29.6.3.2 Constructors

[`streambuf.cons`]

`basic_streambuf()`;

- <sup>1</sup> *Effects:* Initializes.<sup>298</sup>

- (1.1) — all pointer member objects to null pointers,
- (1.2) — the `getloc()` member to a copy the global locale, `locale()`, at the time of construction.

- <sup>2</sup> *Remarks:* Once the `getloc()` member is initialized, results of calling locale member functions, and of members of facets so obtained, can safely be cached until the next time the member `imbue` is called.

`basic_streambuf(const basic_streambuf& rhs);`

- <sup>3</sup> *Postconditions:*

- (3.1) — `eback() == rhs.eback()`
- (3.2) — `gptr() == rhs.gptr()`
- (3.3) — `egptr() == rhs.egptr()`
- (3.4) — `pbase() == rhs.pbase()`

---

<sup>298</sup>) The default constructor is protected for class `basic_streambuf` to assure that only objects for classes derived from this class can be constructed.

(3.5) — `pptr() == rhs.pptr()`  
 (3.6) — `epptr() == rhs.epptr()`  
 (3.7) — `getloc() == rhs.getloc()`

`~basic_streambuf();`

4 *Effects:* None.

### 29.6.3.3 Public member functions

[streambuf.members]

#### 29.6.3.3.1 Locales

[streambuf.locales]

`locale pubimbue(const locale& loc);`

1 *Effects:* Calls `imbue(loc)`.

2 *Postconditions:* `loc == getloc()`.

3 *Returns:* Previous value of `getloc()`.

`locale getloc() const;`

4 *Returns:* If `pubimbue()` has ever been called, then the last value of `loc` supplied, otherwise the current global locale, `locale()`, in effect at the time of construction. If called after `pubimbue()` has been called but before `pubimbue` has returned (i.e., from within the call of `imbue()`) then it returns the previous value.

#### 29.6.3.3.2 Buffer management and positioning

[streambuf.buffer]

`basic_streambuf* pubsetbuf(char_type* s, streamsize n);`

1 *Returns:* `setbuf(s, n)`.

`pos_type pubseekoff(off_type off, ios_base::seekdir way,  
                  ios_base::openmode which  
                  = ios_base::in | ios_base::out);`

2 *Returns:* `seekoff(off, way, which)`.

`pos_type pubseekpos(pos_type sp,  
                  ios_base::openmode which  
                  = ios_base::in | ios_base::out);`

3 *Returns:* `seekpos(sp, which)`.

`int pubsync();`

4 *Returns:* `sync()`.

#### 29.6.3.3.3 Get area

[streambuf.pub.get]

`streamsize in_avail();`

1 *Returns:* If a read position is available, returns `egptr() - gptr()`. Otherwise returns `showmany()` (29.6.3.5.3).

`int_type snextc();`

2 *Effects:* Calls `sbumpc()`.

3 *Returns:* If that function returns `traits::eof()`, returns `traits::eof()`. Otherwise, returns `sgetc()`.

`int_type sbumpc();`

4 *Effects:* If the input sequence read position is not available, returns `uflow()`. Otherwise, returns `traits::to_int_type(*gptr())` and increments the next pointer for the input sequence.

`int_type sgetc();`

5 *Returns:* If the input sequence read position is not available, returns `underflow()`. Otherwise, returns `traits::to_int_type(*gptr())`.

```
streamsize sgetn(char_type* s, streamsize n);
6 Returns: xsgetn(s, n).
```

**29.6.3.3.4 Putback**

[streambuf.pub.pback]

```
int_type sputbackc(char_type c);
```

1     *Effects:* If the input sequence putback position is not available, or if `traits::eq(c, gptr()[-1])` is `false`, returns `pbackfail(traits::to_int_type(c))`. Otherwise, decrements the next pointer for the input sequence and returns `traits::to_int_type(*gptr())`.

```
int_type sungetc();
```

2     *Effects:* If the input sequence putback position is not available, returns `pbackfail()`. Otherwise, decrements the next pointer for the input sequence and returns `traits::to_int_type(*gptr())`.

**29.6.3.3.5 Put area**

[streambuf.pub.put]

```
int_type sputc(char_type c);
```

1     *Effects:* If the output sequence write position is not available, returns `overflow(traits::to_int_type(c))`. Otherwise, stores `c` at the next pointer for the output sequence, increments the pointer, and returns `traits::to_int_type(c)`.

```
streamsize sputn(const char_type* s, streamsize n);
```

2     Returns: xsputn(s, n).

**29.6.3.4 Protected member functions**

[streambuf.protected]

**29.6.3.4.1 Assignment**

[streambuf.assign]

```
basic_streambuf& operator=(const basic_streambuf& rhs);
```

1     *Postconditions:*

- (1.1) — `eback() == rhs.eback()`
- (1.2) — `gptr() == rhs.gptr()`
- (1.3) — `egptr() == rhs.egptr()`
- (1.4) — `pbase() == rhs.pbase()`
- (1.5) — `pptr() == rhs.pptr()`
- (1.6) — `epptr() == rhs.epptr()`
- (1.7) — `getloc() == rhs.getloc()`

2     *Returns:* `*this`.

```
void swap(basic_streambuf& rhs);
```

3     *Effects:* Swaps the data members of `rhs` and `*this`.

**29.6.3.4.2 Get area access**

[streambuf.get.area]

```
char_type* eback() const;
```

1     *Returns:* The beginning pointer for the input sequence.

```
char_type* gptr() const;
```

2     *Returns:* The next pointer for the input sequence.

```
char_type* egptr() const;
```

3     *Returns:* The end pointer for the input sequence.

```
void gbump(int n);
```

4     *Effects:* Adds `n` to the next pointer for the input sequence.

```
void setg(char_type* gbeg, char_type* gnex, char_type* gend);
```

5     *Postconditions:* `gbeg == eback()`, `gnex == gptr()`, and `gend == egptr()` are all true.

**29.6.3.4.3 Put area access**

[streambuf.put.area]

`char_type* pbase() const;`

1     *Returns:* The beginning pointer for the output sequence.

`char_type* pptr() const;`

2     *Returns:* The next pointer for the output sequence.

`char_type* epptr() const;`

3     *Returns:* The end pointer for the output sequence.

`void pbump(int n);`

4     *Effects:* Adds `n` to the next pointer for the output sequence.

`void setp(char_type* pbeg, char_type* pend);`

5     *Postconditions:* `pbeg == pbase()`, `pbeg == pptr()`, and `pend == epptr()` are all true.

**29.6.3.5 Virtual functions**

[streambuf.virtuals]

**29.6.3.5.1 Locales**

[streambuf.virt.locales]

`void imbue(const locale&);`

1     *Effects:* Change any translations based on locale.

2     *Remarks:* Allows the derived class to be informed of changes in locale at the time they occur. Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.

3     *Default behavior:* Does nothing.

**29.6.3.5.2 Buffer management and positioning**

[streambuf.virt.buffer]

`basic_streambuf* setbuf(char_type* s, streamsize n);`

1     *Effects:* Influences stream buffering in a way that is defined separately for each class derived from `basic_streambuf` in this Clause (29.8.2.5, 29.9.2.5).

2     *Default behavior:* Does nothing. Returns `this`.

`pos_type seekoff(off_type off, ios_base::seekdir way,  
                 ios_base::openmode which  
                 = ios_base::in | ios_base::out);`

3     *Effects:* Alters the stream positions within one or more of the controlled sequences in a way that is defined separately for each class derived from `basic_streambuf` in this Clause (29.8.2.5, 29.9.2.5).

4     *Default behavior:* Returns `pos_type(off_type(-1))`.

`pos_type seekpos(pos_type sp,  
                 ios_base::openmode which  
                 = ios_base::in | ios_base::out);`

5     *Effects:* Alters the stream positions within one or more of the controlled sequences in a way that is defined separately for each class derived from `basic_streambuf` in this Clause (29.8.2, 29.9.2).

6     *Default behavior:* Returns `pos_type(off_type(-1))`.

`int sync();`

7     *Effects:* Synchronizes the controlled sequences with the arrays. That is, if `pbase()` is non-null the characters between `pbase()` and `pptr()` are written to the controlled sequence. The pointers may then be reset as appropriate.

8     *Returns:* -1 on failure. What constitutes failure is determined by each derived class (29.9.2.5).

9     *Default behavior:* Returns zero.

## 29.6.3.5.3 Get area

[streambuf.virt.get]

`streamsize showmany()`<sup>299</sup>

1     *Returns:* An estimate of the number of characters available in the sequence, or -1. If it returns a positive value, then successive calls to `underflow()` will not return `traits::eof()` until at least that number of characters have been extracted from the stream. If `showmany()` returns -1, then calls to `underflow()` or `uflow()` will fail.<sup>300</sup>

2     *Default behavior:* Returns zero.

3     *Remarks:* Uses `traits::eof()`.

`streamsize xsgetn(char_type* s, streamsize n);`

4     *Effects:* Assigns up to `n` characters to successive elements of the array whose first element is designated by `s`. The characters assigned are read from the input sequence as if by repeated calls to `sbumpc()`. Assigning stops when either `n` characters have been assigned or a call to `sbumpc()` would return `traits::eof()`.

5     *Returns:* The number of characters assigned.<sup>301</sup>

6     *Remarks:* Uses `traits::eof()`.

`int_type underflow();`

7     *Remarks:* The public members of `basic_streambuf` call this virtual function only if `gptr()` is null or `gptr() >= egptr()`.

8     *Returns:* `traits::to_int_type(c)`, where `c` is the first *character* of the *pending sequence*, without moving the input sequence position past it. If the pending sequence is null then the function returns `traits::eof()` to indicate failure.

9     The *pending sequence* of characters is defined as the concatenation of

- (9.1) — the empty sequence if `gptr()` is null, otherwise the characters in `[gptr(), egptr())`, followed by
- (9.2) — some (possibly empty) sequence of characters read from the input sequence.

10    The *result character* is the first character of the pending sequence if it is non-empty, otherwise the next character that would be read from the input sequence.

11    The *backup sequence* is the empty sequence if `eback()` is null, otherwise the characters in `[eback(), gptr())`.

12    *Effects:* The function sets up the `gptr()` and `egptr()` such that if the pending sequence is non-empty, then `egptr()` is non-null and the characters in `[gptr(), egptr())` are the characters in the pending sequence, otherwise either `gptr()` is null or `gptr() == egptr()`.

13    If `eback()` and `gptr()` are non-null then the function is not constrained as to their contents, but the “usual backup condition” is that either

- (13.1) — the backup sequence contains at least `gptr() - eback()` characters, in which case the characters in `[eback(), gptr())` agree with the last `gptr() - eback()` characters of the backup sequence, or
- (13.2) — the characters in `[gptr() - n, gptr())` agree with the backup sequence (where `n` is the length of the backup sequence).

14    *Default behavior:* Returns `traits::eof()`.

`int_type uflow();`

15    *Preconditions:* The constraints are the same as for `underflow()`, except that the result character is transferred from the pending sequence to the backup sequence, and the pending sequence is not empty before the transfer.

299) The morphemes of `showmany` are “es-how-many-see”, not “show-manic”.

300) `underflow` or `uflow` can fail by throwing an exception prematurely. The intention is not only that the calls will not return `eof()` but that they will return “immediately”.

301) Classes derived from `basic_streambuf` can provide more efficient ways to implement `xsgetn()` and `xspoutn()` by overriding these definitions from the base class.

16     *Default behavior:* Calls `underflow()`. If `underflow()` returns `traits::eof()`, returns `traits::eof()`. Otherwise, returns the value of `traits::to_int_type(*gptr())` and increment the value of the next pointer for the input sequence.

17     *Returns:* `traits::eof()` to indicate failure.

#### 29.6.3.5.4 Putback

[`streambuf.virt.pback`]

```
int_type pbackfail(int_type c = traits::eof());
```

1     *Remarks:* The public functions of `basic_streambuf` call this virtual function only when `gptr()` is null, `gptr() == eback()`, or `traits::eq(traits::to_char_type(c), gptr()[-1])` returns `false`. Other calls shall also satisfy that constraint.

The *pending sequence* is defined as for `underflow()`, with the modifications that

- (1.1) — If `traits::eq_int_type(c, traits::eof())` returns `true`, then the input sequence is backed up one character before the pending sequence is determined.
- (1.2) — If `traits::eq_int_type(c, traits::eof())` returns `false`, then `c` is prepended. Whether the input sequence is backed up or modified in any other way is unspecified.

2     *Postconditions:* On return, the constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

3     *Returns:* `traits::eof()` to indicate failure. Failure may occur because the input sequence cannot be backed up, or if for some other reason the pointers cannot be set consistent with the constraints. `pbackfail()` is called only when put back has really failed.

4     Returns some value other than `traits::eof()` to indicate success.

5     *Default behavior:* Returns `traits::eof()`.

#### 29.6.3.5.5 Put area

[`streambuf.virt.put`]

```
streamsize xsputn(const char_type* s, streamsize n);
```

1     *Effects:* Writes up to `n` characters to the output sequence as if by repeated calls to `sputc(c)`. The characters written are obtained from successive elements of the array whose first element is designated by `s`. Writing stops when either `n` characters have been written or a call to `sputc(c)` would return `traits::eof()`. It is unspecified whether the function calls `overflow()` when `pptr() == epptr()` becomes `true` or whether it achieves the same effects by other means.

2     *Returns:* The number of characters written.

```
int_type overflow(int_type c = traits::eof());
```

3     *Effects:* Consumes some initial subsequence of the characters of the *pending sequence*. The pending sequence is defined as the concatenation of

- (3.1) — the empty sequence if `pbase()` is null, otherwise the `pptr() - pbase()` characters beginning at `pbase()`, followed by
- (3.2) — the empty sequence if `traits::eq_int_type(c, traits::eof())` returns `true`, otherwise the sequence consisting of `c`.

4     *Remarks:* The member functions `sputc()` and `sputn()` call this function in case that no room can be found in the put buffer enough to accommodate the argument character sequence.

5     *Preconditions:* Every overriding definition of this virtual function obeys the following constraints:

- (5.1) — The effect of consuming a character on the associated output sequence is specified.<sup>302</sup>
- (5.2) — Let `r` be the number of characters in the pending sequence not consumed. If `r` is nonzero then `pbase()` and `pptr()` are set so that: `pptr() - pbase() == r` and the `r` characters starting at `pbase()` are the associated output stream. In case `r` is zero (all characters of the pending sequence have been consumed) then either `pbase()` is set to `nullptr`, or `pbase()` and `pptr()` are both set to the same non-null value.

<sup>302</sup>) That is, for each class derived from an instance of `basic_streambuf` in this Clause (29.8.2, 29.9.2), a specification of how consuming a character effects the associated output sequence is given. There is no requirement on a program-defined class.

(5.3) — The function may fail if either appending some character to the associated output stream fails or if it is unable to establish `pbase()` and `pptr()` according to the above rules.

6     >Returns: `traits::eof()` or throws an exception if the function fails.

Otherwise, returns some value other than `traits::eof()` to indicate success.<sup>303</sup>

7     Default behavior: Returns `traits::eof()`.

## 29.7 Formatting and manipulators

[`iostream.format`]

### 29.7.1 Header <istream> synopsis

[`istream.syn`]

```
namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_istream;

 using istream = basic_istream<char>;
 using wistream = basic_istream<wchar_t>;

 template<class charT, class traits = char_traits<charT>>
 class basic_iostream;

 using iostream = basic_iostream<char>;
 using wiostream = basic_iostream<wchar_t>;

 template<class charT, class traits>
 basic_istream<charT, traits>& ws(basic_istream<charT, traits>& is);

 template<class Istream, class T>
 Istream&& operator>>(Istream&& is, T&& x);
}
```

### 29.7.2 Header <ostream> synopsis

[`ostream.syn`]

```

}

```

## 29.7.4 Input streams

[input.streams]

### 29.7.4.1 General

[input.streams.general]

- <sup>1</sup> The header <iostream> defines two types and a function signature that control input from a stream buffer along with a function template that extracts from stream rvalues.

### 29.7.4.2 Class template basic\_istream

[istream]

#### 29.7.4.2.1 General

[istream.general]

```

namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_istream : virtual public basic_ios<charT, traits> {
 public:
 // types (inherited from basic_ios (29.5.5))
 using char_type = charT;
 using int_type = typename traits::int_type;
 using pos_type = typename traits::pos_type;
 using off_type = typename traits::off_type;
 using traits_type = traits;

 // 29.7.4.2.2, constructor/destructor
 explicit basic_istream(basic_streambuf<charT, traits>* sb);
 virtual ~basic_istream();

 // 29.7.4.2.4, prefix/suffix
 class sentry;

 // 29.7.4.3, formatted input
 basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& (*pf)(basic_istream<charT, traits>&));
 basic_istream<charT, traits>&
 operator>>(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
 basic_istream<charT, traits>&
 operator>>(ios_base& (*pf)(ios_base&));

 basic_istream<charT, traits>& operator>>(bool& n);
 basic_istream<charT, traits>& operator>>(short& n);
 basic_istream<charT, traits>& operator>>(unsigned short& n);
 };
}

```

```

basic_istream<charT, traits>& operator>>(int& n);
basic_istream<charT, traits>& operator>>(unsigned int& n);
basic_istream<charT, traits>& operator>>(long& n);
basic_istream<charT, traits>& operator>>(unsigned long& n);
basic_istream<charT, traits>& operator>>(long long& n);
basic_istream<charT, traits>& operator>>(unsigned long long& n);
basic_istream<charT, traits>& operator>>(float& f);
basic_istream<charT, traits>& operator>>(double& f);
basic_istream<charT, traits>& operator>>(long double& f);

basic_istream<charT, traits>& operator>>(void*& p);
basic_istream<charT, traits>& operator>>(basic_streambuf<char_type, traits>* sb);

// 29.7.4.4, unformatted input
streamsize gcount() const;
int_type get();
basic_istream<charT, traits>& get(char_type& c);
basic_istream<charT, traits>& get(char_type* s, streamsize n);
basic_istream<charT, traits>& get(char_type* s, streamsize n, char_type delim);
basic_istream<charT, traits>& get(basic_streambuf<char_type, traits>& sb);
basic_istream<charT, traits>& get(basic_streambuf<char_type, traits>& sb, char_type delim);

basic_istream<charT, traits>& getline(char_type* s, streamsize n);
basic_istream<charT, traits>& getline(char_type* s, streamsize n, char_type delim);

basic_istream<charT, traits>& ignore(streamsize n = 1, int_type delim = traits::eof());
int_type peek();
basic_istream<charT, traits>& read (char_type* s, streamsize n);
streamsize readsome(char_type* s, streamsize n);

basic_istream<charT, traits>& putback(char_type c);
basic_istream<charT, traits>& unget();
int sync();

pos_type tellg();
basic_istream<charT, traits>& seekg(pos_type);
basic_istream<charT, traits>& seekg(off_type, ios_base::seekdir);

protected:
// 29.7.4.2.2, copy/move constructor
basic_istream(const basic_istream&) = delete;
basic_istream(basic_istream&& rhs);

// 29.7.4.2.3, assign and swap
basic_istream& operator=(const basic_istream&) = delete;
basic_istream& operator=(basic_istream&& rhs);
void swap(basic_istream& rhs);
};

// 29.7.4.3.3, character extraction templates
template<class charT, class traits>
basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>&, charT&);
template<class traits>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, unsigned char&);
template<class traits>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, signed char&);

template<class charT, class traits, size_t N>
basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>&, charT(&)[N]);
template<class traits, size_t N>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, unsigned char(&)[N]);
template<class traits, size_t N>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, signed char(&)[N]);
}

}

```

- <sup>1</sup> The class template `basic_istream` defines a number of member function signatures that assist in reading and interpreting input from sequences controlled by a stream buffer.
- <sup>2</sup> Two groups of member function signatures share common properties: the *formatted input functions* (or *extractors*) and the *unformatted input functions*. Both groups of input functions are described as if they obtain (or *extract*) input *characters* by calling `rdbuf()>sbumpc()` or `rdbuf()>sgetc()`. They may use other public members of `istream`.
- <sup>3</sup> If `rdbuf()>sbumpc()` or `rdbuf()>sgetc()` returns `traits::eof()`, then the input function, except as explicitly noted otherwise, completes its actions and does `setstate(eofbit)`, which may throw `ios_base::failure` (29.5.5.4), before returning.
- <sup>4</sup> If one of these called functions throws an exception, then unless explicitly noted otherwise, the input function sets `badbit` in the error state. If `badbit` is set in `exceptions()`, the input function rethrows the exception without completing its actions, otherwise it does not throw anything and proceeds as if the called function had returned a failure indication.

**29.7.4.2.2 Constructors**

[istream.cons]

`explicit basic_istream(basic_streambuf<charT, traits>* sb);`<sup>1</sup> *Effects:* Initializes the base class subobject with `basic_ios::init(sb)` (29.5.5.2).<sup>2</sup> *Postconditions:* `gcount() == 0`.`basic_istream(basic_istream&& rhs);`<sup>3</sup> *Effects:* Default constructs the base class, copies the `gcount()` from `rhs`, calls `basic_ios<charT, traits>::move(rhs)` to initialize the base class, and sets the `gcount()` for `rhs` to 0.`virtual ~basic_istream();`<sup>4</sup> *Remarks:* Does not perform any operations of `rdbuf()`.**29.7.4.2.3 Assignment and swap**

[istream.assign]

`basic_istream& operator=(basic_istream&& rhs);`<sup>1</sup> *Effects:* Equivalent to: `swap(rhs)`.<sup>2</sup> *Returns:* `*this`.`void swap(basic_istream& rhs);`<sup>3</sup> *Effects:* Calls `basic_ios<charT, traits>::swap(rhs)`. Exchanges the values returned by `gcount()` and `rhs.gcount()`.**29.7.4.2.4 Class `basic_istream::sentry`**

[istream.sentry]

```
namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_istream<charT, traits>::sentry {
 bool ok_; // exposition only
 public:
 explicit sentry(basic_istream<charT, traits>& is, bool noskipws = false);
 ~sentry();
 explicit operator bool() const { return ok_; }
 sentry(const sentry&) = delete;
 sentry& operator=(const sentry&) = delete;
 };
}
```

<sup>1</sup> The class `sentry` defines a class that is responsible for doing exception safe prefix and suffix operations.`explicit sentry(basic_istream<charT, traits>& is, bool noskipws = false);`<sup>2</sup> *Effects:* If `is.good()` is `false`, calls `is.setstate(failbit)`. Otherwise, prepares for formatted or unformatted input. First, if `is.tie()` is not a null pointer, the function calls `is.tie()->flush()` to synchronize the output sequence with any associated external C stream. Except that this call can be suppressed if the put area of `is.tie()` is empty. Further an implementation is allowed to defer the call to `flush` until a call of `is.rdbuf()->underflow()` occurs. If no such call occurs before

the **sentry** object is destroyed, the call to **flush** may be eliminated entirely.<sup>304</sup> If **noskipws** is zero and **is.flags() & ios\_base::skipws** is nonzero, the function extracts and discards each character as long as the next available input character **c** is a whitespace character. If **is.rdbuf()->sbufpc()** or **is.rdbuf()->sgetc()** returns **traits::eof()**, the function calls **setstate(failbit | eofbit)** (which may throw **ios\_base::failure**).

3     *Remarks:* The constructor

```
explicit sentry(basic_istream<charT, traits>& is, bool noskipws = false)
```

uses the currently imbued locale in **is**, to determine whether the next input character is whitespace or not.

4     To decide if the character **c** is a whitespace character, the constructor performs as if it executes the following code fragment:

```
const ctype<charT>& ctype = use_facet<ctype<charT>>(is.getloc());
if (ctype.is(ctype.space, c) != 0)
 // c is a whitespace character.
```

5     If, after any preparation is completed, **is.good()** is **true**, **ok\_ != false** otherwise, **ok\_ == false**. During preparation, the constructor may call **setstate(failbit)** (which may throw **ios\_base::failure** (29.5.5.4)).<sup>305</sup>

```
~sentry();
```

6     *Effects:* None.

```
explicit operator bool() const;
```

7     *Returns:* **ok\_**.

### 29.7.4.3 Formatted input functions

[istream.formatted]

#### 29.7.4.3.1 Common requirements

[istream.formatted.reqmts]

1     Each formatted input function begins execution by constructing an object of class **sentry** with the **noskipws** (second) argument **false**. If the **sentry** object returns **true**, when converted to a value of type **bool**, the function endeavors to obtain the requested input. If an exception is thrown during input then **ios\_base::badbit** is turned on<sup>306</sup> in **\*this**'s error state. If **(exceptions() & badbit) != 0** then the exception is rethrown. In any case, the formatted input function destroys the **sentry** object. If no exception has been thrown, it returns **\*this**.

#### 29.7.4.3.2 Arithmetic extractors

[istream.formatted.arithmetic]

```
operator>>(unsigned short& val);
operator>>(unsigned int& val);
operator>>(long& val);
operator>>(unsigned long& val);
operator>>(long long& val);
operator>>(unsigned long long& val);
operator>>(float& val);
operator>>(double& val);
operator>>(long double& val);
operator>>(bool& val);
operator>>(void*& val);
```

1     As in the case of the inserters, these extractors depend on the locale's **num\_get<>** (28.4.3.2) object to perform parsing the input stream data. These extractors behave as formatted input functions (as described in 29.7.4.3.1). After a **sentry** object is constructed, the conversion occurs as if performed by the following code fragment:

```
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
iostate err = iostate::goodbit;
use_facet<numget>(loc).get(*this, 0, *this, err, val);
setstate(err);
```

304) This will be possible only in functions that are part of the library. The semantics of the constructor used in user code is as specified.

305) The **sentry** constructor and destructor can also perform additional implementation-dependent operations.

306) This is done without causing an **ios\_base::failure** to be thrown.

In the above fragment, `loc` stands for the private member of the `basic_ios` class.

[*Note 1:* The first argument provides an object of the `istreambuf_iterator` class which is an iterator pointed to an input stream. It bypasses istreams and uses streambufs directly. — *end note*]

Class `locale` relies on this type as its interface to `istream`, so that it does not need to depend directly on `istream`.

```
operator>>(short& val);
```

- 2 The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

```
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
iostate err = ios_base::goodbit;
long lval;
use_facet<numget>(loc).get(*this, 0, *this, err, lval);
if (lval < numeric_limits<short>::min()) {
 err |= ios_base::failbit;
 val = numeric_limits<short>::min();
} else if (numeric_limits<short>::max() < lval) {
 err |= ios_base::failbit;
 val = numeric_limits<short>::max();
} else
 val = static_cast<short>(lval);
setstate(err);

operator>>(int& val);
```

- 3 The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

```
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
iostate err = ios_base::goodbit;
long lval;
use_facet<numget>(loc).get(*this, 0, *this, err, lval);
if (lval < numeric_limits<int>::min()) {
 err |= ios_base::failbit;
 val = numeric_limits<int>::min();
} else if (numeric_limits<int>::max() < lval) {
 err |= ios_base::failbit;
 val = numeric_limits<int>::max();
} else
 val = static_cast<int>(lval);
setstate(err);
```

#### 29.7.4.3.3 basic\_istream::operator>>

[`istream.extractors`]

```
basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& (*pf)(basic_istream<charT, traits>&));
```

- 1 *Effects:* None. This extractor does not behave as a formatted input function (as described in [29.7.4.3.1](#)).

- 2 *Returns:* `pf(*this)`.<sup>307</sup>

```
basic_istream<charT, traits>&
operator>>(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
```

- 3 *Effects:* Calls `pf(*this)`. This extractor does not behave as a formatted input function (as described in [29.7.4.3.1](#)).

- 4 *Returns:* `*this`.

```
basic_istream<charT, traits>& operator>>(ios_base& (*pf)(ios_base&));
```

- 5 *Effects:* Calls `pf(*this)`.<sup>308</sup> This extractor does not behave as a formatted input function (as described in [29.7.4.3.1](#)).

- 6 *Returns:* `*this`.

<sup>307</sup> See, for example, the function signature `ws(basic_istream&)` ([29.7.4.5](#)).

<sup>308</sup> See, for example, the function signature `dec(ios_base&)` ([29.5.6.3](#)).

```
template<class charT, class traits, size_t N>
 basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& in, charT (&s)[N]);
template<class traits, size_t N>
 basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, unsigned char (&s)[N]);
template<class traits, size_t N>
 basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, signed char (&s)[N]);
```

7     *Effects:* Behaves like a formatted input member (as described in 29.7.4.3.1) of `in`. After a `sentry` object is constructed, `operator>>` extracts characters and stores them into `s`. If `width()` is greater than zero, `n` is `min(size_t(width()), N)`. Otherwise `n` is `N`. `n` is the maximum number of characters stored.

8     Characters are extracted and stored until any of the following occurs:

- (8.1) — `n-1` characters are stored;
- (8.2) — end of file occurs on the input sequence;
- (8.3) — letting `ct` be `use_facet<ctype<charT>>(in.getloc())`, `ct.is(ct.space, c)` is `true`.

9     `operator>>` then stores a null byte (`charT()`) in the next position, which may be the first position if no characters were extracted. `operator>>` then calls `width(0)`.

10    If the function extracted no characters, it calls `setstate(failbit)`, which may throw `ios_base::failure` (29.5.5.4).

11    *Returns:* `in`.

```
template<class charT, class traits>
 basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& in, charT& c);
template<class traits>
 basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, unsigned char& c);
template<class traits>
 basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, signed char& c);
```

12    *Effects:* Behaves like a formatted input member (as described in 29.7.4.3.1) of `in`. After a `sentry` object is constructed a character is extracted from `in`, if one is available, and stored in `c`. Otherwise, the function calls `in.setstate(failbit)`.

13    *Returns:* `in`.

```
basic_istream<charT, traits>& operator>>(basic_streambuf<charT, traits>* sb);
```

14    *Effects:* Behaves as an unformatted input function (29.7.4.4). If `sb` is null, calls `setstate(failbit)`, which may throw `ios_base::failure` (29.5.5.4). After a `sentry` object is constructed, extracts characters from `*this` and inserts them in the output sequence controlled by `sb`. Characters are extracted and inserted until any of the following occurs:

- (14.1) — end-of-file occurs on the input sequence;
- (14.2) — inserting in the output sequence fails (in which case the character to be inserted is not extracted);
- (14.3) — an exception occurs (in which case the exception is caught).

15    If the function inserts no characters, it calls `setstate(failbit)`, which may throw `ios_base::failure` (29.5.5.4). If it inserted no characters because it caught an exception thrown while extracting characters from `*this` and `failbit` is set in `exceptions()` (29.5.5.4), then the caught exception is rethrown.

16    *Returns:* `*this`.

#### 29.7.4.4 Unformatted input functions

[`istream.unformatted`]

1    Each unformatted input function begins execution by constructing an object of class `sentry` with the default argument `noskipws` (second) argument `true`. If the `sentry` object returns `true`, when converted to a value of type `bool`, the function endeavors to obtain the requested input. Otherwise, if the `sentry` constructor exits by throwing an exception or if the `sentry` object returns `false`, when converted to a value of type `bool`, the function returns without attempting to obtain any input. In either case the number of extracted characters is set to 0; unformatted input functions taking a character array of nonzero size as an argument shall also store a null character (using `charT()`) in the first location of the array. If an exception is thrown during input then

`ios_base::badbit` is turned on<sup>309</sup> in `*this`'s error state. (Exceptions thrown from `basic_ios<>::clear()` are not caught or rethrown.) If `(exceptions() & badbit) != 0` then the exception is rethrown. It also counts the number of characters extracted. If no exception has been thrown it ends by storing the count in a member object and returning the value specified. In any event the `sentry` object is destroyed before leaving the unformatted input function.

`streamsize gcount() const;`

2     *Effects:* None. This member function does not behave as an unformatted input function (as described above).

3     *Returns:* The number of characters extracted by the last unformatted input member function called for the object.

`int_type get();`

4     *Effects:* Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts a character `c`, if one is available. Otherwise, the function calls `setstate(failbit)`, which may throw `ios_base::failure` (29.5.5.4).

5     *Returns:* `c` if available, otherwise `traits::eof()`.

`basic_istream<charT, traits>& get(char_type& c);`

6     *Effects:* Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts a character, if one is available, and assigns it to `c`.<sup>310</sup> Otherwise, the function calls `setstate(failbit)` (which may throw `ios_base::failure` (29.5.5.4)).

7     *Returns:* `*this`.

`basic_istream<charT, traits>& get(char_type* s, streamsize n, char_type delim);`

8     *Effects:* Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts characters and stores them into successive locations of an array whose first element is designated by `s`.<sup>311</sup> Characters are extracted and stored until any of the following occurs:

(8.1) — `n` is less than one or `n - 1` characters are stored;

(8.2) — end-of-file occurs on the input sequence (in which case the function calls `setstate eofbit)`);

(8.3) — `traits::eq(c, delim)` for the next available input character `c` (in which case `c` is not extracted).

9     If the function stores no characters, it calls `setstate(failbit)` (which may throw `ios_base::failure` (29.5.5.4)). In any case, if `n` is greater than zero it then stores a null character into the next successive location of the array.

10    *Returns:* `*this`.

`basic_istream<charT, traits>& get(char_type* s, streamsize n);`

11    *Effects:* Calls `get(s, n, widen('\n'))`.

12    *Returns:* Value returned by the call.

`basic_istream<charT, traits>& get(basic_streambuf<char_type, traits>& sb, char_type delim);`

13    *Effects:* Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts characters and inserts them in the output sequence controlled by `sb`. Characters are extracted and inserted until any of the following occurs:

(13.1) — end-of-file occurs on the input sequence;

(13.2) — inserting in the output sequence fails (in which case the character to be inserted is not extracted);

(13.3) — `traits::eq(c, delim)` for the next available input character `c` (in which case `c` is not extracted);

(13.4) — an exception occurs (in which case, the exception is caught but not rethrown).

14    If the function inserts no characters, it calls `setstate(failbit)`, which may throw `ios_base::failure` (29.5.5.4).

<sup>309</sup> This is done without causing an `ios_base::failure` to be thrown.

<sup>310</sup> Note that this function is not overloaded on types `signed char` and `unsigned char`.

<sup>311</sup> Note that this function is not overloaded on types `signed char` and `unsigned char`.

15     *Returns:* `*this`.

`basic_istream<charT, traits>& get(basic_streambuf<char_type, traits>& sb);`

16     *Effects:* Calls `get(sb, widen('\n'))`.

17     *Returns:* Value returned by the call.

`basic_istream<charT, traits>& getline(char_type* s, streamsize n, char_type delim);`

18     *Effects:* Behaves as an unformatted input function (as described above). After constructing a sentry object, extracts characters and stores them into successive locations of an array whose first element is designated by `s`.<sup>312</sup> Characters are extracted and stored until one of the following occurs:

1. end-of-file occurs on the input sequence (in which case the function calls `setstate(eofbit)`);
2. `traits::eq(c, delim)` for the next available input character `c` (in which case the input character is extracted but not stored);<sup>313</sup>
3. `n` is less than one or `n - 1` characters are stored (in which case the function calls `setstate(failbit)`).

19     These conditions are tested in the order shown.<sup>314</sup>

20     If the function extracts no characters, it calls `setstate(failbit)` (which may throw `ios_base::failure` (29.5.5.4)).<sup>315</sup>

21     In any case, if `n` is greater than zero, it then stores a null character (using `charT()`) into the next successive location of the array.

22     *Returns:* `*this`.

23     *[Example 1:*

```
#include <iostream>

int main() {
 using namespace std;
 const int line_buffer_size = 100;

 char buffer[line_buffer_size];
 int line_number = 0;
 while (cin.getline(buffer, line_buffer_size, '\n') || cin.gcount()) {
 int count = cin.gcount();
 if (cin.eof())
 cout << "Partial final line"; // cin.fail() is false
 else if (cin.fail()) {
 cout << "Partial long line";
 cin.clear(cin.rdstate() & ~ios_base::failbit);
 } else {
 count--;
 cout << "Line " << ++line_number;
 }
 cout << " (" << count << " chars): " << buffer << endl;
 }
}
```

— *end example*

`basic_istream<charT, traits>& getline(char_type* s, streamsize n);`

24     *Returns:* `getline(s, n, widen('\n'))`

312) Note that this function is not overloaded on types `signed char` and `unsigned char`.

313) Since the final input character is “extracted”, it is counted in the `gcount()`, even though it is not stored.

314) This allows an input line which exactly fills the buffer, without setting `failbit`. This is different behavior than the historical AT&T implementation.

315) This implies an empty input line will not cause `failbit` to be set.

```
basic_istream<charT, traits>& ignore(streamsize n = 1, int_type delim = traits::eof());
```

25     *Effects:* Behaves as an unformatted input function (as described above). After constructing a sentry object, extracts characters and discards them. Characters are extracted until any of the following occurs:

(25.1)     —  $n \neq \text{numeric\_limits<} \text{streamsize} \text{>} :: \text{max}()$  (17.3.5) and  $n$  characters have been extracted so far

(25.2)     — end-of-file occurs on the input sequence (in which case the function calls `setstate(eofbit)`, which may throw `ios_base::failure` (29.5.5.4));

(25.3)     — `traits::eq_int_type(traits::to_int_type(c), delim)` for the next available input character  $c$  (in which case  $c$  is extracted).

26     *Remarks:* The last condition will never occur if `traits::eq_int_type(delim, traits::eof())`.

27     *Returns:* `*this`.

```
int_type peek();
```

28     *Effects:* Behaves as an unformatted input function (as described above). After constructing a sentry object, reads but does not extract the current input character.

29     *Returns:* `traits::eof()` if `good()` is `false`. Otherwise, returns `rdbuf()>sgetc()`.

```
basic_istream<charT, traits>& read(char_type* s, streamsize n);
```

30     *Effects:* Behaves as an unformatted input function (as described above). After constructing a sentry object, if `!good()` calls `setstate(failbit)` which may throw an exception, and return. Otherwise extracts characters and stores them into successive locations of an array whose first element is designated by  $s$ .<sup>316</sup> Characters are extracted and stored until either of the following occurs:

(30.1)     —  $n$  characters are stored;

(30.2)     — end-of-file occurs on the input sequence (in which case the function calls `setstate(failbit | eofbit)`, which may throw `ios_base::failure` (29.5.5.4)).

31     *Returns:* `*this`.

```
streamsize readsome(char_type* s, streamsize n);
```

32     *Effects:* Behaves as an unformatted input function (as described above). After constructing a sentry object, if `!good()` calls `setstate(failbit)` which may throw an exception, and return. Otherwise extracts characters and stores them into successive locations of an array whose first element is designated by  $s$ . If `rdbuf()>in_avail() == -1`, calls `setstate(eofbit)` (which may throw `ios_base::failure` (29.5.5.4)), and extracts no characters;

(32.1)     — If `rdbuf()>in_avail() == 0`, extracts no characters

(32.2)     — If `rdbuf()>in_avail() > 0`, extracts  $\min(rdbuf()>in_avail(), n)$ .

33     *Returns:* The number of characters extracted.

```
basic_istream<charT, traits>& putback(char_type c);
```

34     *Effects:* Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`. After constructing a sentry object, if `!good()` calls `setstate(failbit)` which may throw an exception, and return. If `rdbuf()` is not null, calls `rdbuf()>sputbackc(c)`. If `rdbuf()` is null, or if `sputbackc` returns `traits::eof()`, calls `setstate(badbit)` (which may throw `ios_base::failure` (29.5.5.4)).

[Note 1: This function extracts no characters, so the value returned by the next call to `gcount()` is 0. — end note]

35     *Returns:* `*this`.

```
basic_istream<charT, traits>& unget();
```

36     *Effects:* Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`. After constructing a sentry object, if `!good()` calls `setstate(failbit)` which may throw an exception, and return. If `rdbuf()` is not null, calls `rdbuf()>sungetc()`. If `rdbuf()`

<sup>316</sup> Note that this function is not overloaded on types `signed char` and `unsigned char`.

is null, or if `sungetc` returns `traits::eof()`, calls `setstate(badbit)` (which may throw `ios_base::failure` (29.5.5.4)).

[*Note 2*: This function extracts no characters, so the value returned by the next call to `gcount()` is 0. — *end note*]

37     *Returns*: `*this`.

```
int sync();
```

38     *Effects*: Behaves as an unformatted input function (as described above), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `gcount()`. After constructing a sentry object, if `rdbuf()` is a null pointer, returns -1. Otherwise, calls `rdbuf()>pubsync()` and, if that function returns -1 calls `setstate(badbit)` (which may throw `ios_base::failure` (29.5.5.4)), and returns -1. Otherwise, returns zero.

```
pos_type tellg();
```

39     *Effects*: Behaves as an unformatted input function (as described above), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `gcount()`.

40     *Returns*: After constructing a sentry object, if `fail() != false`, returns `pos_type(-1)` to indicate failure. Otherwise, returns `rdbuf()>pubseekoff(0, cur, in)`.

```
basic_istream<charT, traits>& seekg(pos_type pos);
```

41     *Effects*: Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`, it does not count the number of characters extracted, and it does not affect the value returned by subsequent calls to `gcount()`. After constructing a sentry object, if `fail() != true`, executes `rdbuf()>pubseekpos(pos, ios_base::in)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

42     *Returns*: `*this`.

```
basic_istream<charT, traits>& seekg(off_type off, ios_base::seekdir dir);
```

43     *Effects*: Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`, does not count the number of characters extracted, and does not affect the value returned by subsequent calls to `gcount()`. After constructing a sentry object, if `fail() != true`, executes `rdbuf()>pubseekoff(off, dir, ios_base::in)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

44     *Returns*: `*this`.

#### 29.7.4.5 Standard basic\_istream manipulators

[**istream.manip**]

1     Each instantiation of the function template specified in this subclause is a designated addressable function (16.4.5.2.1).

```
template<class charT, class traits>
basic_istream<charT, traits>& ws(basic_istream<charT, traits>& is);
```

2     *Effects*: Behaves as an unformatted input function (29.7.4.4), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `is.gcount()`. After constructing a sentry object extracts characters as long as the next available character `c` is whitespace or until there are no more characters in the sequence. Whitespace characters are distinguished with the same criterion as used by `sentry::sentry` (29.7.4.2.4). If `ws` stops extracting characters because there are no more available it sets `eofbit`, but not `failbit`.

3     *Returns*: `is`.

#### 29.7.4.6 Rvalue stream extraction

[**istream.rvalue**]

```
template<class Istream, class T>
Istream&& operator>>(Istream&& is, T&& x);
```

1     *Constraints*: The expression `is >> std::forward<T>(x)` is well-formed when treated as an unevaluated operand and `Istream` is publicly and unambiguously derived from `ios_base`.

2     *Effects*: Equivalent to:

```
 is >> std::forward<T>(x);
 return std::move(is);
```

#### 29.7.4.7 Class template `basic_iostream`

[`iostreamclass`]

##### 29.7.4.7.1 General

[`iostreamclass.general`]

```
namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_iostream
 : public basic_istream<charT, traits>,
 public basic_ostream<charT, traits> {
 public:
 using char_type = charT;
 using int_type = typename traits::int_type;
 using pos_type = typename traits::pos_type;
 using off_type = typename traits::off_type;
 using traits_type = traits;

 // 29.7.4.7.2, constructor
 explicit basic_iostream(basic_streambuf<charT, traits>* sb);

 // 29.7.4.7.3, destructor
 virtual ~basic_iostream();

 protected:
 // 29.7.4.7.2, constructor
 basic_iostream(const basic_iostream&) = delete;
 basic_iostream(basic_iostream&& rhs);

 // 29.7.4.7.4, assign and swap
 basic_iostream& operator=(const basic_iostream&) = delete;
 basic_iostream& operator=(basic_iostream&& rhs);
 void swap(basic_iostream& rhs);
 };
}
```

- <sup>1</sup> The class template `basic_iostream` inherits a number of functions that allow reading input and writing output to sequences controlled by a stream buffer.

##### 29.7.4.7.2 Constructors

[`iostream.cons`]

```
explicit basic_iostream(basic_streambuf<charT, traits>* sb);
```

- <sup>1</sup> *Effects:* Initializes the base class subobjects with `basic_istream<charT, traits>(sb)` (29.7.4.2) and `basic_ostream<charT, traits>(sb)` (29.7.5.2).

- <sup>2</sup> *Postconditions:* `rdbuf() == sb` and `gcount() == 0`.

```
basic_iostream(basic_iostream&& rhs);
```

- <sup>3</sup> *Effects:* Move constructs from the rvalue `rhs` by constructing the `basic_istream` base class with `move(rhs)`.

##### 29.7.4.7.3 Destructor

[`iostream.dest`]

```
virtual ~basic_iostream();
```

- <sup>1</sup> *Remarks:* Does not perform any operations on `rdbuf()`.

##### 29.7.4.7.4 Assignment and swap

[`iostream.assign`]

```
basic_iostream& operator=(basic_iostream&& rhs);
```

- <sup>1</sup> *Effects:* Equivalent to: `swap(rhs)`.

```
void swap(basic_iostream& rhs);
```

- <sup>2</sup> *Effects:* Calls `basic_istream<charT, traits>::swap(rhs)`.

## 29.7.5 Output streams

[output.streams]

### 29.7.5.1 General

[output.streams.general]

- 1 The header <ostream> defines a type and several function signatures that control output to a stream buffer along with a function template that inserts into stream rvalues.

### 29.7.5.2 Class template basic\_ostream

[ostream]

#### 29.7.5.2.1 General

[ostream.general]

```
namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_ostream : virtual public basic_ios<charT, traits> {
 public:
 // types (inherited from basic_ios (29.5.5))
 using char_type = charT;
 using int_type = typename traits::int_type;
 using pos_type = typename traits::pos_type;
 using off_type = typename traits::off_type;
 using traits_type = traits;

 // 29.7.5.2.2, constructor/destructor
 explicit basic_ostream(basic_streambuf<char_type, traits>* sb);
 virtual ~basic_ostream();

 // 29.7.5.2.4, prefix/suffix
 class sentry;

 // 29.7.5.3, formatted output
 basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& (*pf)(basic_ostream<charT, traits>&));
 basic_ostream<charT, traits>&
 operator<<(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
 basic_ostream<charT, traits>&

```

- <sup>1</sup> The class template `basic_ostream` defines a number of member function signatures that assist in formatting and writing output to output sequences controlled by a stream buffer.
- <sup>2</sup> Two groups of member function signatures share common properties: the *formatted output functions* (or *inserters*) and the *unformatted output functions*. Both groups of output functions generate (or *insert*) output *characters* by actions equivalent to calling `rdbuf()>sputc(int_type)`. They may use other public members of `basic_ostream` except that they shall not invoke any virtual members of `rdbuf()` except `overflow()`, `xspoutn()`, and `sync()`.
- <sup>3</sup> If one of these called functions throws an exception, then unless explicitly noted otherwise the output function sets `badbit` in the error state. If `badbit` is set in `exceptions()`, the output function rethrows the exception without completing its actions, otherwise it does not throw anything and proceeds as if the called function had returned a failure indication.
- <sup>4</sup> [Note 1: The deleted overloads of `operator<<` prevent formatting characters as integers and strings as pointers.  
— end note]

### 29.7.5.2.2 Constructors

[ostream.cons]

```

explicit basic_ostream(basic_streambuf<charT, traits>* sb);
1 Effects: Initializes the base class subobject with basic_ios<charT, traits>::init(sb) (29.5.5.2).
2 Postconditions: rdbuf() == sb.
basic_ostream(basic_ostream&& rhs);
3 Effects: Move constructs from the rvalue rhs. This is accomplished by default constructing the base class and calling basic_ios<charT, traits>::move(rhs) to initialize the base class.
virtual ~basic_ostream();
4 Remarks: Does not perform any operations on rdbuf().

```

### 29.7.5.2.3 Assignment and swap

[ostream.assign]

```

basic_ostream& operator=(basic_ostream&& rhs);
1 Effects: Equivalent to: swap(rhs).
2 Returns: *this.
void swap(basic_ostream& rhs);
3 Effects: Calls basic_ios<charT, traits>::swap(rhs).

```

### 29.7.5.2.4 Class `basic_ostream::sentry`

[ostream.sentry]

```

namespace std {
template<class charT, class traits = char_traits<charT>>
class basic_ostream<charT, traits>::sentry {
 bool ok_; // exposition only
public:
 explicit sentry(basic_ostream<charT, traits>& os);
 ~sentry();
 explicit operator bool() const { return ok_; }
}

```

```

 sentry(const sentry&) = delete;
 sentry& operator=(const sentry&) = delete;
};

}
}

```

- <sup>1</sup> The class **sentry** defines a class that is responsible for doing exception safe prefix and suffix operations.

**explicit** **sentry**(**basic\_ostream**<**charT**, **traits**>& **os**);

- <sup>2</sup> If **os.good()** is nonzero, prepares for formatted or unformatted output. If **os.tie()** is not a null pointer, calls **os.tie()>flush()**.<sup>317</sup>

- <sup>3</sup> If, after any preparation is completed, **os.good()** is true, **ok\_ == true** otherwise, **ok\_ == false**. During preparation, the constructor may call **setstate(failbit)** (which may throw **ios\_base::failure** (29.5.5.4)).<sup>318</sup>

**~sentry();**

- <sup>4</sup> If (**os.flags() & ios\_base::unitbuf**) && !**uncaught\_exceptions()** && **os.good()** is true, calls **os.rdbuf()>pubsync()**. If that function returns -1, sets **badbit** in **os.rdstate()** without propagating an exception.

**explicit operator bool() const;**

- <sup>5</sup> *Effects:* Returns **ok\_**.

### 29.7.5.2.5 Seek members

[**ostream.seeks**]

- <sup>1</sup> Each seek member function begins execution by constructing an object of class **sentry**. It returns by destroying the **sentry** object.

**pos\_type tellp();**

- <sup>2</sup> *Returns:* If **fail() != false**, returns **pos\_type(-1)** to indicate failure. Otherwise, returns **rdbuf()>pubseekoff(0, cur, out)**.

**basic\_ostream<charT, traits>& seekp(pos\_type pos);**

- <sup>3</sup> *Effects:* If **fail() != true**, executes **rdbuf()>pubseekpos(pos, ios\_base::out)**. In case of failure, the function calls **setstate(failbit)** (which may throw **ios\_base::failure**).

- <sup>4</sup> *Returns:* **\*this**.

**basic\_ostream<charT, traits>& seekp(off\_type off, ios\_base::seekdir dir);**

- <sup>5</sup> *Effects:* If **fail() != true**, executes **rdbuf()>pubseekoff(off, dir, ios\_base::out)**. In case of failure, the function calls **setstate(failbit)** (which may throw **ios\_base::failure**).

- <sup>6</sup> *Returns:* **\*this**.

### 29.7.5.3 Formatted output functions

[**ostream.formatted**]

#### 29.7.5.3.1 Common requirements

[**ostream.formatted.reqmts**]

- <sup>1</sup> Each formatted output function begins execution by constructing an object of class **sentry**. If this object returns **true** when converted to a value of type **bool**, the function endeavors to generate the requested output. If the generation fails, then the formatted output function does **setstate(ios\_base::failbit)**, which can throw an exception. If an exception is thrown during output, then **ios\_base::badbit** is turned on<sup>319</sup> in **\*this**'s error state. If (**exceptions()&badbit**) != 0 then the exception is rethrown. Whether or not an exception is thrown, the **sentry** object is destroyed before leaving the formatted output function. If no exception is thrown, the result of the formatted output function is **\*this**.

- <sup>2</sup> The descriptions of the individual formatted output functions describe how they perform output and do not mention the **sentry** object.

- <sup>3</sup> If a formatted output function of a stream **os** determines padding, it does so as follows. Given a **charT** character sequence **seq** where **charT** is the character type of the stream, if the length of **seq** is less than **os.width()**, then enough copies of **os.fill()** are added to this sequence as necessary to pad to a width of

<sup>317</sup>) The call **os.tie()>flush()** does not necessarily occur if the function can determine that no synchronization is necessary.

<sup>318</sup>) The **sentry** constructor and destructor can also perform additional implementation-dependent operations.

<sup>319</sup>) This is done without causing an **ios\_base::failure** to be thrown.

`os.width()` characters. If `(os.flags() & ios_base::adjustfield) == ios_base::left` is true, the fill characters are placed after the character sequence; otherwise, they are placed before the character sequence.

### 29.7.5.3.2 Arithmetic inserters

[`ostream.inserters.arithmetic`]

```
operator<<(bool val);
operator<<(short val);
operator<<(unsigned short val);
operator<<(int val);
operator<<(unsigned int val);
operator<<(long val);
operator<<(unsigned long val);
operator<<(long long val);
operator<<(unsigned long long val);
operator<<(float val);
operator<<(double val);
operator<<(long double val);
operator<<(const void* val);
```

- 1 *Effects:* The classes `num_get`<> and `num_put`<> handle locale-dependent numeric formatting and parsing. These inserter functions use the imbued `locale` value to perform numeric formatting. When `val` is of type `bool`, `long`, `unsigned long`, `long long`, `unsigned long long`, `double`, `long double`, or `const void*`, the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<
 num_put<charT, ostreambuf_iterator<charT, traits>>
 >(getloc()).put(*this, *this, fill(), val).failed();
```

When `val` is of type `short` the formatting conversion occurs as if it performed the following code fragment:

```
ios_base::fmtflags baseflags = ios_base::flags() & ios_base::basefield;
bool failed = use_facet<
 num_put<charT, ostreambuf_iterator<charT, traits>>
 >(getloc()).put(*this, *this, fill(),
 baseflags == ios_base::oct || baseflags == ios_base::hex
 ? static_cast<long>(static_cast<unsigned short>(val))
 : static_cast<long>(val)).failed();
```

When `val` is of type `int` the formatting conversion occurs as if it performed the following code fragment:

```
ios_base::fmtflags baseflags = ios_base::flags() & ios_base::basefield;
bool failed = use_facet<
 num_put<charT, ostreambuf_iterator<charT, traits>>
 >(getloc()).put(*this, *this, fill(),
 baseflags == ios_base::oct || baseflags == ios_base::hex
 ? static_cast<long>(static_cast<unsigned int>(val))
 : static_cast<long>(val)).failed();
```

When `val` is of type `unsigned short` or `unsigned int` the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<
 num_put<charT, ostreambuf_iterator<charT, traits>>
 >(getloc()).put(*this, *this, fill(),
 static_cast<unsigned long>(val)).failed();
```

When `val` is of type `float` the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<
 num_put<charT, ostreambuf_iterator<charT, traits>>
 >(getloc()).put(*this, *this, fill(),
 static_cast<double>(val)).failed();
```

- 2 The first argument provides an object of the `ostreambuf_iterator`<> class which is an iterator for class `basic_ostream`<>. It bypasses `ostreams` and uses `streambufs` directly. Class `locale` relies on these types as its interface to `ostreams`, since for flexibility it has been abstracted away from direct dependence on `ostream`. The second parameter is a reference to the base class subobject of type

`ios_base`. It provides formatting specifications such as field width, and a locale from which to obtain other facets. If `failed` is `true` then does `setstate(badbit)`, which may throw an exception, and returns.

3     *Returns:* `*this`.

### 29.7.5.3.3 `basic_ostream::operator<<`

[`ostream.inserters`]

```
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& (*pf)(basic_ostream<charT, traits>&));
```

1     *Effects:* None. Does not behave as a formatted output function (as described in 29.7.5.3.1).

2     *Returns:* `pf(*this)`.<sup>320</sup>

```
basic_ostream<charT, traits>&
operator<<(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
```

3     *Effects:* Calls `pf(*this)`. This inserter does not behave as a formatted output function (as described in 29.7.5.3.1).

4     *Returns:* `*this`.<sup>321</sup>

```
basic_ostream<charT, traits>& operator<<(ios_base& (*pf)(ios_base&));
```

5     *Effects:* Calls `pf(*this)`. This inserter does not behave as a formatted output function (as described in 29.7.5.3.1).

6     *Returns:* `*this`.

```
basic_ostream<charT, traits>& operator<<(basic_streambuf<charT, traits>* sb);
```

7     *Effects:* Behaves as an unformatted output function (29.7.5.4). After the sentry object is constructed, if `sb` is null calls `setstate(badbit)` (which may throw `ios_base::failure`).

8     Gets characters from `sb` and inserts them in `*this`. Characters are read from `sb` and inserted until any of the following occurs:

- (8.1) — end-of-file occurs on the input sequence;
- (8.2) — inserting in the output sequence fails (in which case the character to be inserted is not extracted);
- (8.3) — an exception occurs while getting a character from `sb`.

9     If the function inserts no characters, it calls `setstate(failbit)` (which may throw `ios_base::failure` (29.5.5.4)). If an exception was thrown while extracting a character, the function sets `failbit` in the error state, and if `failbit` is set in `exceptions()` the caught exception is rethrown.

10    *Returns:* `*this`.

```
basic_ostream<charT, traits>& operator<<(nullptr_t);
```

11    *Effects:* Equivalent to:

```
 return *this << s;
```

where `s` is an implementation-defined NTCTS (3.32).

### 29.7.5.3.4 Character inserter function templates

[`ostream.inserters.character`]

```
template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, charT c);
template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, char c);
// specialization
template<class traits>
basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, char c);
// signed and unsigned
template<class traits>
basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, signed char c);
```

<sup>320</sup>) See, for example, the function signature `endl(basic_ostream&)` (29.7.5.5).

<sup>321</sup>) See, for example, the function signature `dec(ios_base&)` (29.5.6.3).

```
template<class traits>
basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, unsigned char c);
```

1    *Effects:* Behaves as a formatted output function (29.7.5.3.1) of *out*. Constructs a character sequence *seq*. If *c* has type *char* and the character type of the stream is not *char*, then *seq* consists of *out.widen(c)*; otherwise *seq* consists of *c*. Determines padding for *seq* as described in 29.7.5.3.1. Inserts *seq* into *out*. Calls *os.width(0)*.

2    *Returns:* *out*.

```
template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, const charT* s);
template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, const char* s);
template<class traits>
basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, const char* s);
template<class traits>
basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, const signed char* s);
template<class traits>
basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out,
 const unsigned char* s);
```

3    *Preconditions:* *s* is not a null pointer.

4    *Effects:* Behaves like a formatted inserter (as described in 29.7.5.3.1) of *out*. Creates a character sequence *seq* of *n* characters starting at *s*, each widened using *out.widen()* (29.5.5.3), where *n* is the number that would be computed as if by:

- (4.1) — *traits::length(s)* for the overload where the first argument is of type *basic\_ostream<charT, traits>&* and the second is of type *const charT\**, and also for the overload where the first argument is of type *basic\_ostream<char, traits>&* and the second is of type *const char\**,
- (4.2) — *char\_traits<char>::length(s)* for the overload where the first argument is of type *basic\_ostream<charT, traits>&* and the second is of type *const char\**,
- (4.3) — *traits::length(reinterpret\_cast<const char\*>(s))* for the other two overloads.

Determines padding for *seq* as described in 29.7.5.3.1. Inserts *seq* into *out*. Calls *width(0)*.

5    *Returns:* *out*.

#### 29.7.5.4 Unformatted output functions

**[ostream.unformatted]**

1    Each unformatted output function begins execution by constructing an object of class *sentry*. If this object returns *true*, while converting to a value of type *bool*, the function endeavors to generate the requested output. If an exception is thrown during output, then *ios\_base::badbit* is turned on<sup>322</sup> in *\*this*'s error state. If (*exceptions() & badbit*) != 0 then the exception is rethrown. In any case, the unformatted output function ends by destroying the *sentry* object, then, if no exception was thrown, returning the value specified for the unformatted output function.

```
basic_ostream<charT, traits>& put(char_type c);
```

2    *Effects:* Behaves as an unformatted output function (as described above). After constructing a *sentry* object, inserts the character *c*, if possible.<sup>323</sup>

3    Otherwise, calls *setstate(badbit)* (which may throw *ios\_base::failure* (29.5.5.4)).

4    *Returns:* *\*this*.

```
basic_ostream& write(const char_type* s, streamsize n);
```

5    *Effects:* Behaves as an unformatted output function (as described above). After constructing a *sentry* object, obtains characters to insert from successive locations of an array whose first element is designated by *s*.<sup>324</sup> Characters are inserted until either of the following occurs:

- (5.1) — *n* characters are inserted;

<sup>322</sup>) This is done without causing an *ios\_base::failure* to be thrown.

<sup>323</sup>) Note that this function is not overloaded on types *signed char* and *unsigned char*.

<sup>324</sup>) Note that this function is not overloaded on types *signed char* and *unsigned char*.

(5.2) — inserting in the output sequence fails (in which case the function calls `setstate(badbit)`, which may throw `ios_base::failure` (29.5.5.4)).

6     >Returns: `*this`.

`basic_ostream& flush();`

7     *Effects*: Behaves as an unformatted output function (as described above). If `rdbuf()` is not a null pointer, constructs a sentry object. If this object returns `true` when converted to a value of type `bool` the function calls `rdbuf()>pubsync()`. If that function returns -1 calls `setstate(badbit)` (which may throw `ios_base::failure` (29.5.5.4)). Otherwise, if the sentry object returns `false`, does nothing.

8     >Returns: `*this`.

### 29.7.5.5 Standard manipulators

[**ostream.manip**]

1     Each instantiation of any of the function templates specified in this subclause is a designated addressable function (16.4.5.2.1).

`template<class charT, class traits>`  
`basic_ostream<charT, traits>& endl(basic_ostream<charT, traits>& os);`

2     *Effects*: Calls `os.put(os.widen('\n'))`, then `os.flush()`.

3     >Returns: `os`.

`template<class charT, class traits>`  
`basic_ostream<charT, traits>& ends(basic_ostream<charT, traits>& os);`

4     *Effects*: Inserts a null character into the output sequence: calls `os.put(charT())`.

5     >Returns: `os`.

`template<class charT, class traits>`  
`basic_ostream<charT, traits>& flush(basic_ostream<charT, traits>& os);`

6     *Effects*: Calls `os.flush()`.

7     >Returns: `os`.

`template<class charT, class traits>`  
`basic_ostream<charT, traits>& emit_on_flush(basic_ostream<charT, traits>& os);`

8     *Effects*: If `os.rdbuf()` is a `basic_syncbuf<charT, traits, Allocator>*`, called `buf` for the purpose of exposition, calls `buf->set_emit_on_sync(true)`. Otherwise this manipulator has no effect.

[*Note 1*: To work around the issue that the `Allocator` template argument cannot be deduced, implementations can introduce an intermediate base class to `basic_syncbuf` that manages its `emit_on_sync` flag. — *end note*]

9     >Returns: `os`.

`template<class charT, class traits>`  
`basic_ostream<charT, traits>& noemit_on_flush(basic_ostream<charT, traits>& os);`

10    *Effects*: If `os.rdbuf()` is a `basic_syncbuf<charT, traits, Allocator>*`, called `buf` for the purpose of exposition, calls `buf->set_emit_on_sync(false)`. Otherwise this manipulator has no effect.

11    >Returns: `os`.

`template<class charT, class traits>`  
`basic_ostream<charT, traits>& flush_emit(basic_ostream<charT, traits>& os);`

12    *Effects*: Calls `os.flush()`. Then, if `os.rdbuf()` is a `basic_syncbuf<charT, traits, Allocator>*`, called `buf` for the purpose of exposition, calls `buf->emit()`.

13    >Returns: `os`.

### 29.7.5.6 Rvalue stream insertion

[**ostream.rvalue**]

`template<class Ostream, class T>`  
`Ostream&& operator<<(Ostream&& os, const T& x);`

1     *Constraints*: The expression `os << x` is well-formed when treated as an unevaluated operand and `Ostream` is publicly and unambiguously derived from `ios_base`.

- 2    *Effects:* As if by: `os << x;`  
 3    *Returns:* `std::move(os)`.

## 29.7.6 Standard manipulators

[**std.manip**]

- 1 The header `<iomanip>` defines several functions that support extractors and inserters that alter information maintained by class `ios_base` and its derived classes.

*unspecified* `resetiosflags(ios_base::fmtflags mask);`

- 2 *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << resetiosflags(mask)` behaves as if it called `f(out, mask)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> resetiosflags(mask)` behaves as if it called `f(in, mask)`, where the function `f` is defined as:<sup>325</sup>

```
void f(ios_base& str, ios_base::fmtflags mask) {
 // reset specified flags
 str.setf(ios_base::fmtflags(0), mask);
}
```

The expression `out << resetiosflags(mask)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> resetiosflags(mask)` has type `basic_istream<charT, traits>&` and value `in`.

*unspecified* `setiosflags(ios_base::fmtflags mask);`

- 3 *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setiosflags(mask)` behaves as if it called `f(out, mask)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setiosflags(mask)` behaves as if it called `f(in, mask)`, where the function `f` is defined as:

```
void f(ios_base& str, ios_base::fmtflags mask) {
 // set specified flags
 str.setf(mask);
}
```

The expression `out << setiosflags(mask)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setiosflags(mask)` has type `basic_istream<charT, traits>&` and value `in`.

*unspecified* `setbase(int base);`

- 4 *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setbase(base)` behaves as if it called `f(out, base)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setbase(base)` behaves as if it called `f(in, base)`, where the function `f` is defined as:

```
void f(ios_base& str, int base) {
 // set basefield
 str.setf(base == 8 ? ios_base::oct :
 base == 10 ? ios_base::dec :
 base == 16 ? ios_base::hex :
 ios_base::fmtflags(0), ios_base::basefield);
}
```

The expression `out << setbase(base)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setbase(base)` has type `basic_istream<charT, traits>&` and value `in`.

*unspecified* `setfill(char_type c);`

- 5 *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` and `c` has type `charT` then the expression `out << setfill(c)` behaves as if it called `f(out, c)`, where the function `f` is defined as:

<sup>325</sup>) The expression `cin >> resetiosflags(ios_base::skipws)` clears `ios_base::skipws` in the format flags stored in the `basic_istream<charT, traits>` object `cin` (the same as `cin >> noskipws`), and the expression `cout << resetiosflags(ios_base::showbase)` clears `ios_base::showbase` in the format flags stored in the `basic_ostream<charT, traits>` object `cout` (the same as `cout << noshowbase`).

```
template<class charT, class traits>
void f(basic_ios<charT, traits>& str, charT c) {
 // set fill character
 str.fill(c);
}
```

The expression `out << setfill(c)` has type `basic_ostream<charT, traits>&` and value `out`.

*unspecified* `setprecision(int n);`

- 6 *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setprecision(n)` behaves as if it called `f(out, n)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setprecision(n)` behaves as if it called `f(in, n)`, where the function `f` is defined as:

```
void f(ios_base& str, int n) {
 // set precision
 str.precision(n);
}
```

The expression `out << setprecision(n)` has type `basic_ostream<charT, traits>&` and value `out`.  
The expression `in >> setprecision(n)` has type `basic_istream<charT, traits>&` and value `in`.

*unspecified* `setw(int n);`

- 7 *Returns:* An object of unspecified type such that if `out` is an instance of `basic_ostream<charT, traits>` then the expression `out << setw(n)` behaves as if it called `f(out, n)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setw(n)` behaves as if it called `f(in, n)`, where the function `f` is defined as:

```
void f(ios_base& str, int n) {
 // set width
 str.width(n);
}
```

The expression `out << setw(n)` has type `basic_ostream<charT, traits>&` and value `out`.  
The expression `in >> setw(n)` has type `basic_istream<charT, traits>&` and value `in`.

### 29.7.7 Extended manipulators

[ext.manip]

- 1 The header `<iomanip>` defines several functions that support extractors and inserters that allow for the parsing and formatting of sequences and values for money and time.

`template<class moneyT> unspecified get_money(moneyT& mon, bool intl = false);`

- 2 *Mandates:* The type `moneyT` is either `long double` or a specialization of the `basic_string` template ([Clause 21](#)).

- 3 *Effects:* The expression `in >> get_money(mon, intl)` described below behaves as a formatted input function ([29.7.4.3.1](#)).

- 4 *Returns:* An object of unspecified type such that if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> get_money(mon, intl)` behaves as if it called `f(in, mon, intl)`, where the function `f` is defined as:

```
template<class charT, class traits, class moneyT>
void f(basic_ios<charT, traits>& str, moneyT& mon, bool intl) {
 using Iter = istreambuf_iterator<charT, traits>;
 using MoneyGet = money_get<charT, Iter>;

 ios_base::iostate err = ios_base::goodbit;
 const MoneyGet& mg = use_facet<MoneyGet>(str.getloc());

 mg.get(Iter(str.rdbuf()), Iter(), intl, str, err, mon);

 if (ios_base::goodbit != err)
 str.setstate(err);
}
```

The expression `in >> get_money(mon, intl)` has type `basic_istream<charT, traits>&` and value `in`.

```
template<class moneyT> unspecified put_money(const moneyT& mon, bool intl = false);
```

5     *Mandates:* The type `moneyT` is either `long double` or a specialization of the `basic_string` template ([Clause 21](#)).

6     *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << put_money(mon, intl)` behaves as a formatted output function ([29.7.5.3.1](#)) that calls `f(out, mon, intl)`, where the function `f` is defined as:

```
template<class charT, class traits, class moneyT>
void f(basic_ios<charT, traits>& str, const moneyT& mon, bool intl) {
 using Iter = ostreambuf_iterator<charT, traits>;
 using MoneyPut = money_put<charT, Iter>;

 const MoneyPut& mp = use_facet<MoneyPut>(str.getloc());
 const Iter end = mp.put(Iter(str.rdbuf()), intl, str, str.fill(), mon);

 if (end.failed())
 str.setstate(ios_base::badbit);
}
```

The expression `out << put_money(mon, intl)` has type `basic_ostream<charT, traits>&` and value `out`.

```
template<class charT> unspecified get_time(struct tm* tmb, const charT* fmt);
```

7     *Preconditions:* The argument `tmb` is a valid pointer to an object of type `struct tm`, and `[fmt, fmt + char_traits<charT>::length(fmt)]` is a valid range.

8     *Returns:* An object of unspecified type such that if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> get_time(tmb, fmt)` behaves as if it called `f(in, tmb, fmt)`, where the function `f` is defined as:

```
template<class charT, class traits>
void f(basic_ios<charT, traits>& str, struct tm* tmb, const charT* fmt) {
 using Iter = istreambuf_iterator<charT, traits>;
 using TimeGet = time_get<charT, Iter>;

 ios_base::iostate err = ios_base::goodbit;
 const TimeGet& tg = use_facet<TimeGet>(str.getloc());

 tg.get(Iter(str.rdbuf()), Iter(), str, err, tmb,
 fmt, fmt + traits::length(fmt));

 if (err != ios_base::goodbit)
 str.setstate(err);
}
```

The expression `in >> get_time(tmb, fmt)` has type `basic_istream<charT, traits>&` and value `in`.

```
template<class charT> unspecified put_time(const struct tm* tmb, const charT* fmt);
```

9     *Preconditions:* The argument `tmb` is a valid pointer to an object of type `struct tm`, and `[fmt, fmt + char_traits<charT>::length(fmt)]` is a valid range.

10    *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << put_time(tmb, fmt)` behaves as if it called `f(out, tmb, fmt)`, where the function `f` is defined as:

```
template<class charT, class traits>
void f(basic_ios<charT, traits>& str, const struct tm* tmb, const charT* fmt) {
 using Iter = ostreambuf_iterator<charT, traits>;
 using TimePut = time_put<charT, Iter>;

 const TimePut& tp = use_facet<TimePut>(str.getloc());
```

```

const Iter end = tp.put(Iter(str.rdbuf()), str, str.fill(), tmb,
fmt, fmt + traits::length(fmt));

if (end.failed())
 str.setstate(ios_base::badbit);
}

```

The expression `out << put_time(tmb, fmt)` has type `basic_ostream<charT, traits>&` and value `out`.

### 29.7.8 Quoted manipulators

[**quoted.manip**]

- <sup>1</sup> [Note 1: Quoted manipulators provide string insertion and extraction of quoted strings (for example, XML and CSV formats). Quoted manipulators are useful in ensuring that the content of a string with embedded spaces remains unchanged if inserted and then extracted via stream I/O. —*end note*]

```

template<class charT>
unspecified quoted(const charT* s, charT delim = charT('\"'), charT escape = charT('\\'));
template<class charT, class traits, class Allocator>
unspecified quoted(const basic_string<charT, traits, Allocator>& s,
 charT delim = charT('\"'), charT escape = charT('\\'));
template<class charT, class traits>
unspecified quoted(basic_string_view<charT, traits> s,
 charT delim = charT('\"'), charT escape = charT('\\'));

```

- <sup>2</sup> *Returns:* An object of unspecified type such that if `out` is an instance of `basic_ostream` with member type `char_type` the same as `charT` and with member type `traits_type`, which in the second and third forms is the same as `traits`, then the expression `out << quoted(s, delim, escape)` behaves as a formatted output function (29.7.5.3.1) of `out`. This forms a character sequence `seq`, initially consisting of the following elements:

- (2.1) — `delim`.
- (2.2) — Each character in `s`. If the character to be output is equal to `escape` or `delim`, as determined by `traits_type::eq`, first output `escape`.
- (2.3) — `delim`.

Let `x` be the number of elements initially in `seq`. Then padding is determined for `seq` as described in 29.7.5.3.1, `seq` is inserted as if by calling `out.rdbuf()> sputn(seq, n)`, where `n` is the larger of `out.width()` and `x`, and `out.width(0)` is called. The expression `out << quoted(s, delim, escape)` has type `basic_ostream<charT, traits>&` and value `out`.

```

template<class charT, class traits, class Allocator>
unspecified quoted(basic_string<charT, traits, Allocator>& s,
 charT delim = charT('\"'), charT escape = charT('\\'));

```

<sup>3</sup> *Returns:* An object of unspecified type such that:

- (3.1) — If `in` is an instance of `basic_istream` with member types `char_type` and `traits_type` the same as `charT` and `traits`, respectively, then the expression `in >> quoted(s, delim, escape)` behaves as if it extracts the following characters from `in` using `operator>>(basic_istream<charT, traits>&, charT&)` (29.7.4.3.3) which may throw `ios_base::failure` (29.5.3.2.1):
  - (3.1.1) — If the first character extracted is equal to `delim`, as determined by `traits_type::eq`, then:
    - (3.1.1.1) — Turn off the `skipws` flag.
    - (3.1.1.2) — `s.clear()`
    - (3.1.1.3) — Until an unescaped `delim` character is reached or `!in`, extract characters from `in` and append them to `s`, except that if an `escape` is reached, ignore it and append the next character to `s`.
    - (3.1.1.4) — Discard the final `delim` character.
    - (3.1.1.5) — Restore the `skipws` flag to its original value.
  - (3.1.2) — Otherwise, `in >> s`.

- (3.2) — If `out` is an instance of `basic_ostream` with member types `char_type` and `traits_type` the same as `chart` and `traits`, respectively, then the expression `out << quoted(s, delim, escape)` behaves as specified for the `const basic_string<charT, traits, Allocator>&` overload of the `quoted` function.
- (3.3) — The expression `in >> quoted(s, delim, escape)` has type `basic_istream<charT, traits>&` and value `in`.
- (3.4) — The expression `out << quoted(s, delim, escape)` has type `basic_ostream<charT, traits>&` and value `out`.

## 29.8 String-based streams

[string.streams]

### 29.8.1 Header <sstream> synopsis

[sstream.syn]

```
namespace std {
 template<class charT, class traits = char_traits<charT>,
 class Allocator = allocator<charT>>
 class basic_stringbuf;

 using stringbuf = basic_stringbuf<char>;
 using wstringbuf = basic_stringbuf<wchar_t>;

 template<class charT, class traits = char_traits<charT>,
 class Allocator = allocator<charT>>
 class basic_istringstream;

 using istringstream = basic_istringstream<char>;
 using wistringstream = basic_istringstream<wchar_t>;

 template<class charT, class traits = char_traits<charT>,
 class Allocator = allocator<charT>>
 class basic_ostringstream;
 using ostringstream = basic_ostringstream<char>;
 using wostringstream = basic_ostringstream<wchar_t>;

 template<class charT, class traits = char_traits<charT>,
 class Allocator = allocator<charT>>
 class basic_stringstream;
 using stringstream = basic_stringstream<char>;
 using wstringstream = basic_stringstream<wchar_t>;
}
```

- <sup>1</sup> The header `<sstream>` defines four class templates and eight types that associate stream buffers with objects of class `basic_string`, as described in 21.3.

## 29.8.2 Class template basic\_stringbuf

[stringbuf]

### 29.8.2.1 General

[stringbuf.general]

```
namespace std {
 template<class charT, class traits = char_traits<charT>,
 class Allocator = allocator<charT>>
 class basic_stringbuf : public basic_streambuf<charT, traits> {
 public:
 using char_type = charT;
 using int_type = typename traits::int_type;
 using pos_type = typename traits::pos_type;
 using off_type = typename traits::off_type;
 using traits_type = traits;
 using allocator_type = Allocator;

 // 29.8.2.2, constructors
 basic_stringbuf() : basic_stringbuf(ios_base::in | ios_base::out) {}
 explicit basic_stringbuf(ios_base::openmode which);
```

```

explicit basic_stringbuf(
 const basic_string<charT, traits, Allocator>& s,
 ios_base::openmode which = ios_base::in | ios_base::out);
explicit basic_stringbuf(const Allocator& a)
 : basic_stringbuf(ios_base::in | ios_base::out, a) {}
basic_stringbuf(ios_base::openmode which, const Allocator& a);
explicit basic_stringbuf(
 basic_string<charT, traits, Allocator>&& s,
 ios_base::openmode which = ios_base::in | ios_base::out);
template<class SAlloc>
basic_stringbuf(
 const basic_string<charT, traits, SAlloc>& s, const Allocator& a)
 : basic_stringbuf(s, ios_base::in | ios_base::out, a) {}
template<class SAlloc>
basic_stringbuf(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which, const Allocator& a);
template<class SAlloc>
explicit basic_stringbuf(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which = ios_base::in | ios_base::out);
basic_stringbuf(const basic_stringbuf&) = delete;
basic_stringbuf(basic_stringbuf&& rhs);
basic_stringbuf(basic_stringbuf&& rhs, const Allocator& a);

// 29.8.2.3, assign and swap
basic_stringbuf& operator=(const basic_stringbuf&) = delete;
basic_stringbuf& operator=(basic_stringbuf&& rhs);
void swap(basic_stringbuf& rhs) noexcept(see below);

// 29.8.2.4, getters and setters
allocator_type get_allocator() const noexcept;

basic_string<charT, traits, Allocator> str() const &;
template<class SAlloc>
 basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
basic_string<charT, traits, Allocator> str() &&;
basic_string_view<charT, traits> view() const noexcept;

void str(const basic_string<charT, traits, Allocator>& s);
template<class SAlloc>
 void str(const basic_string<charT, traits, SAlloc>& s);
void str(basic_string<charT, traits, Allocator>&& s);

protected:
 // 29.8.2.5, overridden virtual functions
 int_type underflow() override;
 int_type pbackfail(int_type c = traits::eof()) override;
 int_type overflow (int_type c = traits::eof()) override;
 basic_streambuf<charT, traits>* setbuf(charT*, streamsize) override;

 pos_type seekoff(off_type off, ios_base::seekdir way,
 ios_base::openmode which
 = ios_base::in | ios_base::out) override;
 pos_type seekpos(pos_type sp,
 ios_base::openmode which
 = ios_base::in | ios_base::out) override;

private:
 ios_base::openmode mode; // exposition only
 basic_string<charT, traits, Allocator> buf; // exposition only
 void init_buf_ptrs(); // exposition only
};

```

```
template<class charT, class traits, class Allocator>
void swap(basic_stringbuf<charT, traits, Allocator>& x,
 basic_stringbuf<charT, traits, Allocator>& y) noexcept(noexcept(x.swap(y)));
}
```

- 1 The class `basic_stringbuf` is derived from `basic_streambuf` to associate possibly the input sequence and possibly the output sequence with a sequence of arbitrary *characters*. The sequence can be initialized from, or made available as, an object of class `basic_string`.
- 2 For the sake of exposition, the maintained data and internal pointer initialization is presented here as:
  - (2.1) — `ios_base::openmode mode`, has `in` set if the input sequence can be read, and `out` set if the output sequence can be written.
  - (2.2) — `basic_string<charT, traits, Allocator> buf` contains the underlying character sequence.
  - (2.3) — `init_buf_ptrs()` sets the base class' get area (29.6.3.4.2) and put area (29.6.3.4.3) pointers after initializing, moving from, or assigning to `buf` accordingly.

### 29.8.2.2 Constructors

[`stringbuf.cons`]

```
explicit basic_stringbuf(ios_base::openmode which);
```

- 1 *Effects*: Initializes the base class with `basic_streambuf()` (29.6.3.2), and `mode` with `which`. It is implementation-defined whether the sequence pointers (`eback()`, `gptr()`, `egptr()`, `pbase()`, `pptr()`, `eptr()`) are initialized to null pointers.
- 2 *Postconditions*: `str().empty()` is true.

```
explicit basic_stringbuf(
 const basic_string<charT, traits, Allocator>& s,
 ios_base::openmode which = ios_base::in | ios_base::out);
```

- 3 *Effects*: Initializes the base class with `basic_streambuf()` (29.6.3.2), `mode` with `which`, and `buf` with `s`, then calls `init_buf_ptrs()`.

```
basic_stringbuf(ios_base::openmode which, const Allocator &a);
```

- 4 *Effects*: Initializes the base class with `basic_streambuf()` (29.6.3.2), `mode` with `which`, and `buf` with `a`, then calls `init_buf_ptrs()`.

- 5 *Postconditions*: `str().empty()` is true.

```
explicit basic_stringbuf(
 basic_string<charT, traits, Allocator>&& s,
 ios_base::openmode which = ios_base::in | ios_base::out);
```

- 6 *Effects*: Initializes the base class with `basic_streambuf()` (29.6.3.2), `mode` with `which`, and `buf` with `std::move(s)`, then calls `init_buf_ptrs()`.

```
template<class SAlloc>
basic_stringbuf(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which, const Allocator &a);
```

- 7 *Effects*: Initializes the base class with `basic_streambuf()` (29.6.3.2), `mode` with `which`, and `buf` with `{s,a}`, then calls `init_buf_ptrs()`.

```
template<class SAlloc>
explicit basic_stringbuf(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which = ios_base::in | ios_base::out);
```

- 8 *Constraints*: `is_same_v<SAlloc, Allocator>` is false.

- 9 *Effects*: Initializes the base class with `basic_streambuf()` (29.6.3.2), `mode` with `which`, and `buf` with `s`, then calls `init_buf_ptrs()`.

```
basic_stringbuf(basic_stringbuf&& rhs);
basic_stringbuf(basic_stringbuf&& rhs, const Allocator& a);
```

10     *Effects:* Copy constructs the base class from `rhs` and initializes `mode` with `rhs.mode`. In the first form `buf` is initialized from `std::move(rhs).str()`. In the second form `buf` is initialized from `{std::move(rhs).str(), a}`. It is implementation-defined whether the sequence pointers in `*this` (`eback()`, `gptr()`, `egptr()`, `pbase()`, `pptr()`, `epptr()`) obtain the values which `rhs` had.

11     *Postconditions:* Let `rhs_p` refer to the state of `rhs` just prior to this construction and let `rhs_a` refer to the state of `rhs` just after this construction.

- (11.1)     — `str() == rhs_p.str()`
- (11.2)     — `gptr() - eback() == rhs_p.gptr() - rhs_p.eback()`
- (11.3)     — `egptr() - eback() == rhs_p.egptr() - rhs_p.eback()`
- (11.4)     — `pptr() - pbase() == rhs_p.pptr() - rhs_p.pbase()`
- (11.5)     — `epptr() - pbase() == rhs_p.epptr() - rhs_p.pbase()`
- (11.6)     — `if (eback()) eback() != rhs_a.eback()`
- (11.7)     — `if (gptr()) gptr() != rhs_a.gptr()`
- (11.8)     — `if (egptr()) egptr() != rhs_a.egptr()`
- (11.9)     — `if (pbase()) pbase() != rhs_a.pbase()`
- (11.10)     — `if (pptr()) pptr() != rhs_a.pptr()`
- (11.11)     — `if (epptr()) epptr() != rhs_a.epptr()`
- (11.12)     — `getloc() == rhs_p.getloc()`
- (11.13)     — `rhs` is empty but usable, as if `std::move(rhs).str()` was called.

### 29.8.2.3 Assignment and swap

[`stringbuf.assign`]

```
basic_stringbuf& operator=(basic_stringbuf&& rhs);
```

1     *Effects:* After the move assignment `*this` has the observable state it would have had if it had been move constructed from `rhs` (see 29.8.2.2).

2     *Returns:* `*this`.

```
void swap(basic_stringbuf& rhs) noexcept(see below);
```

3     *Preconditions:* `allocator_traits<Allocator>::propagate_on_container_swap::value` is true or `get_allocator() == s.get_allocator()` is true.

4     *Effects:* Exchanges the state of `*this` and `rhs`.

5     *Remarks:* The expression inside `noexcept` is equivalent to:

```
allocator_traits<Allocator>::propagate_on_container_swap::value ||
allocator_traits<Allocator>::is_always_equal::value.
```

```
template<class charT, class traits, class Allocator>
void swap(basic_stringbuf<charT, traits, Allocator>& x,
 basic_stringbuf<charT, traits, Allocator>& y) noexcept(noexcept(x.swap(y)));
```

6     *Effects:* Equivalent to: `x.swap(y)`.

### 29.8.2.4 Member functions

[`stringbuf.members`]

1     The member functions getting the underlying character sequence all refer to a `high_mark` value, where `high_mark` represents the position one past the highest initialized character in the buffer. Characters can be initialized by writing to the stream, by constructing the `basic_stringbuf` passing a `basic_string` argument, or by calling one of the `str` member functions passing a `basic_string` as an argument. In the latter case, all characters initialized prior to the call are now considered uninitialized (except for those characters re-initialized by the new `basic_string`).

```
void init_buf_ptrs(); // exposition only
```

2     *Effects:* Initializes the input and output sequences from `buf` according to `mode`.

3       *Postconditions:*

- (3.1)     — If `ios_base::out` is set in `mode`, `pbase()` points to `buf.front()` and `epptr() >= pbase() + buf.size()` is true;
  - in addition, if `ios_base::ate` is set in `mode`, `pptr() == pbase() + buf.size()` is true,
  - otherwise `pptr() == pbase()` is true.
- (3.2)     — If `ios_base::in` is set in `mode`, `eback()` points to `buf.front()`, and `(gptr() == eback() && egptr() == eback() + buf.size())` is true.

4       [*Note 1*: For efficiency reasons, stream buffer operations can violate invariants of `buf` while it is held encapsulated in the `basic_stringbuf`, e.g., by writing to characters in the range  $[buf.data() + buf.size(), buf.data() + buf.capacity()]$ . All operations retrieving a `basic_string` from `buf` ensure that the `basic_string` invariants hold on the returned value. — *end note*]

allocator\_type `get_allocator()` const noexcept;

5       *Returns:* `buf.get_allocator()`.

`basic_string<charT, traits, Allocator> str() const &;`

6       *Effects:* Equivalent to:

```
return basic_string<charT, traits, Allocator>(view(), get_allocator());
```

`template<class SAlloc>`

`basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;`

7       *Constraints:* `SAlloc` is a type that qualifies as an allocator ([22.2.1](#)).

8       *Effects:* Equivalent to:

```
return basic_string<charT, traits, SAlloc>(view(), sa);
```

`basic_string<charT, traits, Allocator> str() &&;`

9       *Returns:* A `basic_string<charT, traits, Allocator>` object move constructed from the `basic_stringbuf`'s underlying character sequence in `buf`. This can be achieved by first adjusting `buf` to have the same content as `view()`.

10      *Postconditions:* The underlying character sequence `buf` is empty and `pbase()`, `pptr()`, `epptr()`, `eback()`, `gptr()`, and `egptr()` are initialized as if by calling `init_buf_ptrs()` with an empty `buf`.

`basic_string_view<charT, traits> view() const noexcept;`

11      Let `sv` be `basic_string_view<charT, traits>`.

12      *Returns:* A `sv` object referring to the `basic_stringbuf`'s underlying character sequence in `buf`:

- (12.1)     — If `ios_base::out` is set in `mode`, then `sv(pbase(), high_mark-pbase())` is returned.
- (12.2)     — Otherwise, if `ios_base::in` is set in `mode`, then `sv(eback(), egptr()-eback())` is returned.
- (12.3)     — Otherwise, `sv()` is returned.

13      [*Note 2*: Using the returned `sv` object after destruction or invalidation of the character sequence underlying `*this` is undefined behavior, unless `sv.empty()` is true. — *end note*]

`void str(const basic_string<charT, traits, Allocator>& s);`

14      *Effects:* Equivalent to:

```
buf = s;
init_buf_ptrs();
```

`template<class SAlloc>`

`void str(const basic_string<charT, traits, SAlloc>& s);`

15      *Constraints:* `is_same_v<SAlloc, Allocator>` is false.

16      *Effects:* Equivalent to:

```
buf = s;
init_buf_ptrs();
```

```
void str(basic_string<charT, traits, Allocator>&& s);
17 Effects: Equivalent to:
 buf = std::move(s);
 init_buf_ptrs();
```

### 29.8.2.5 Overridden virtual functions

[stringbuf.virtuals]

```
int_type underflow() override;
```

1     *Returns*: If the input sequence has a read position available, returns `traits::to_int_type(*gptr())`. Otherwise, returns `traits::eof()`. Any character in the underlying buffer which has been initialized is considered to be part of the input sequence.

```
int_type pbackfail(int_type c = traits::eof()) override;
```

2     *Effects*: Puts back the character designated by `c` to the input sequence, if possible, in one of three ways:

(2.1)    — If `traits::eq_int_type(c, traits::eof())` returns `false` and if the input sequence has a putback position available, and if `traits::eq(to_char_type(c), gptr()[-1])` returns `true`, assigns `gptr() - 1` to `gptr()`.

*Returns*: `c`.

(2.2)    — If `traits::eq_int_type(c, traits::eof())` returns `false` and if the input sequence has a putback position available, and if `mode & ios_base::out` is nonzero, assigns `c` to `*--gptr()`.

*Returns*: `c`.

(2.3)    — If `traits::eq_int_type(c, traits::eof())` returns `true` and if the input sequence has a putback position available, assigns `gptr() - 1` to `gptr()`.

*Returns*: `traits::not_eof(c)`.

3     *Returns*: As specified above, or `traits::eof()` to indicate failure.

4     *Remarks*: If the function can succeed in more than one of these ways, it is unspecified which way is chosen.

```
int_type overflow(int_type c = traits::eof()) override;
```

5     *Effects*: Appends the character designated by `c` to the output sequence, if possible, in one of two ways:

(5.1)    — If `traits::eq_int_type(c, traits::eof())` returns `false` and if either the output sequence has a write position available or the function makes a write position available (as described below), the function calls `sputc(c)`.

*Signals success* by returning `c`.

(5.2)    — If `traits::eq_int_type(c, traits::eof())` returns `true`, there is no character to append.

*Signals success* by returning a value other than `traits::eof()`.

6     *Remarks*: The function can alter the number of write positions available as a result of any call.

7     *Returns*: As specified above, or `traits::eof()` to indicate failure.

8     The function can make a write position available only if `ios_base::out` is set in `mode`. To make a write position available, the function reallocates (or initially allocates) an array object with a sufficient number of elements to hold the current array object (if any), plus at least one additional write position. If `ios_base::in` is set in `mode`, the function alters the read end pointer `egptr()` to point just past the new write position.

```
pos_type seekoff(off_type off, ios_base::seekdir way,
 ios_base::openmode which
 = ios_base::in | ios_base::out) override;
```

9     *Effects*: Alters the stream position within one of the controlled sequences, if possible, as indicated in [Table 124](#).

10    For a sequence to be positioned, the function determines `newoff` as indicated in [Table 125](#). If the sequence's next pointer (either `gptr()` or `pptr()`) is a null pointer and `newoff` is nonzero, the positioning operation fails.

Table 124: `seekoff` positioning [tab:stringbuf.seekoff.pos]

| Conditions                                                                                                                                                                          | Result                                            |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------|
| <code>ios_base::in</code> is set in <code>which</code>                                                                                                                              | positions the input sequence                      |
| <code>ios_base::out</code> is set in <code>which</code>                                                                                                                             | positions the output sequence                     |
| both <code>ios_base::in</code> and <code>ios_base::out</code> are set in <code>which</code> and either<br><code>way == ios_base::beg</code> or<br><code>way == ios_base::end</code> | positions both the input and the output sequences |
| Otherwise                                                                                                                                                                           | the positioning operation fails.                  |

Table 125: `newoff` values [tab:stringbuf.seekoff.newoff]

| Condition                         | <code>newoff</code> Value                                                            |
|-----------------------------------|--------------------------------------------------------------------------------------|
| <code>way == ios_base::beg</code> | 0                                                                                    |
| <code>way == ios_base::cur</code> | the next pointer minus the beginning pointer ( <code>xnext - xbeg</code> ).          |
| <code>way == ios_base::end</code> | the high mark pointer minus the beginning pointer ( <code>high_mark - xbeg</code> ). |

- 11 If  $(\text{newoff} + \text{off}) < 0$ , or if `newoff + off` refers to an uninitialized character (29.8.2.4), the positioning operation fails. Otherwise, the function assigns `xbeg + newoff + off` to the next pointer `xnext`.
- 12 *Returns:* `pos_type(newoff)`, constructed from the resultant offset `newoff` (of type `off_type`), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is `pos_type(off_type(-1))`.

```
pos_type seekpos(pos_type sp,
 ios_base::openmode which
 = ios_base::in | ios_base::out) override;
Effects: Equivalent to seekoff(off_type(sp), ios_base::beg, which).
Returns: sp to indicate success, or pos_type(off_type(-1)) to indicate failure.

basic_streambuf<charT, traits>* setbuf(charT* s, streamsize n);
Effects: implementation-defined, except that setbuf(0, 0) has no effect.
Returns: this.
```

### 29.8.3 Class template `basic_istringstream`

[`istringstream`]

#### 29.8.3.1 General

```
namespace std {
 template<class charT, class traits = char_traits<charT>,
 class Allocator = allocator<charT>>
 class basic_istringstream : public basic_istream<charT, traits> {
public:
 using char_type = charT;
 using int_type = typename traits::int_type;
 using pos_type = typename traits::pos_type;
 using off_type = typename traits::off_type;
 using traits_type = traits;
 using allocator_type = Allocator;

 // 29.8.3.2, constructors
 basic_istringstream() : basic_istringstream(ios_base::in) {}
 explicit basic_istringstream(ios_base::openmode which);
```

```

explicit basic_istringstream(
 const basic_string<charT, traits, Allocator>& s,
 ios_base::openmode which = ios_base::in);
basic_istringstream(ios_base::openmode which, const Allocator& a);
explicit basic_istringstream(
 basic_string<charT, traits, Allocator>&& s,
 ios_base::openmode which = ios_base::in);
template<class SAlloc>
basic_istringstream(
 const basic_string<charT, traits, SAlloc>& s, const Allocator& a)
: basic_istringstream(s, ios_base::in, a) {}
template<class SAlloc>
basic_istringstream(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which, const Allocator& a);
template<class SAlloc>
explicit basic_istringstream(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which = ios_base::in);
basic_istringstream(const basic_istringstream&) = delete;
basic_istringstream(basic_istringstream&& rhs);

// 29.8.3.3, assign and swap
basic_istringstream& operator=(const basic_istringstream&) = delete;
basic_istringstream& operator=(basic_istringstream&& rhs);
void swap(basic_istringstream& rhs);

// 29.8.3.4, members
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
basic_string<charT, traits, Allocator> str() const &;
template<class SAlloc>
basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
basic_string<charT, traits, Allocator> str() &&;
basic_string_view<charT, traits> view() const noexcept;

void str(const basic_string<charT, traits, Allocator>& s);
template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);
void str(basic_string<charT, traits, Allocator>&& s);

private:
 basic_stringbuf<charT, traits, Allocator> sb; // exposition only
};

template<class charT, class traits, class Allocator>
void swap(basic_istringstream<charT, traits, Allocator>& x,
 basic_istringstream<charT, traits, Allocator>& y);
}

```

<sup>1</sup> The class `basic_istringstream<charT, traits, Allocator>` supports reading objects of class `basic_string<charT, traits, Allocator>`. It uses a `basic_stringbuf<charT, traits, Allocator>` object to control the associated storage. For the sake of exposition, the maintained data is presented here as:

(1.1) — `sb`, the `stringbuf` object.

### 29.8.3.2 Constructors

[`istringstream.cons`]

```
explicit basic_istringstream(ios_base::openmode which);
```

<sup>1</sup> *Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (29.7.4.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which | ios_base::in)` (29.8.2.2).

```

explicit basic_istringstream(
 const basic_string<charT, traits, Allocator>& s,
 ios_base::openmode which = ios_base::in);

2 Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (29.7.4.2)
 and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::in) (29.8.2.2).

basic_istringstream(ios_base::openmode which, const Allocator& a);

3 Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (29.7.4.2)
 and sb with basic_stringbuf<charT, traits, Allocator>(which | ios_base::in, a) (29.8.2.2).

explicit basic_istringstream(
 basic_string<charT, traits, Allocator>&& s,
 ios_base::openmode which = ios_base::in);

4 Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (29.7.4.2)
 and sb with basic_stringbuf<charT, traits, Allocator>(std::move(s), which | ios_base::in) (29.8.2.2).

template<class SAlloc>
basic_istringstream(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which, const Allocator& a);

5 Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (29.7.4.2)
 and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::in, a) (29.8.2.2).

template<class SAlloc>
explicit basic_istringstream(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which = ios_base::in);

6 Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (29.7.4.2)
 and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::in) (29.8.2.2).

basic_istringstream(basic_istringstream&& rhs);

7 Effects: Move constructs from the rvalue rhs. This is accomplished by move constructing the
 base class, and the contained basic_stringbuf. Then calls basic_istream<charT, traits>::set_
 _rdbuf(addressof(sb)) to install the contained basic_stringbuf.

```

### 29.8.3.3 Assignment and swap

[istringstream.assign]

```

void swap(basic_istringstream& rhs);

1 Effects: Equivalent to:
 basic_istream<charT, traits>::swap(rhs);
 sb.swap(rhs.sb);

template<class charT, class traits, class Allocator>
void swap(basic_istringstream<charT, traits, Allocator>& x,
 basic_istringstream<charT, traits, Allocator>& y);

```

2 Effects: Equivalent to: x.swap(y).

### 29.8.3.4 Member functions

[istringstream.members]

```

basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

1 Returns: const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(sb));

basic_string<charT, traits, Allocator> str() const &;

```

2 Effects: Equivalent to: return rdbuf()->str();

```

template<class SAlloc>
basic_string<charT,traits,SAlloc> str(const SAlloc& sa) const;
3 Effects: Equivalent to: return rdbuf()->str(sa);

basic_string<charT,traits,Allocator> str() &&;
4 Effects: Equivalent to: return std::move(*rdbuf()).str();

basic_string_view<charT, traits> view() const noexcept;
5 Effects: Equivalent to: return rdbuf()->view();

void str(const basic_string<charT, traits, Allocator>& s);
6 Effects: Equivalent to: rdbuf()->str(s);

template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);
7 Effects: Equivalent to: rdbuf()->str(s);

void str(basic_string<charT, traits, Allocator>&& s);
8 Effects: Equivalent to: rdbuf()->str(std::move(s));

```

## 29.8.4 Class template basic\_ostringstream

[ostringstream]

### 29.8.4.1 General

[ostringstream.general]

```

namespace std {
 template<class charT, class traits = char_traits<charT>,
 class Allocator = allocator<charT>>
 class basic_ostringstream : public basic_ostream<charT, traits> {
public:
 using char_type = charT;
 using int_type = typename traits::int_type;
 using pos_type = typename traits::pos_type;
 using off_type = typename traits::off_type;
 using traits_type = traits;
 using allocator_type = Allocator;

 // 29.8.4.2, constructors
 basic_ostringstream() : basic_ostringstream(ios_base::out) {}
 explicit basic_ostringstream(ios_base::openmode which);
 explicit basic_ostringstream(
 const basic_string<charT, traits, Allocator>& s,
 ios_base::openmode which = ios_base::out);
 basic_ostringstream(ios_base::openmode which, const Allocator& a);
 explicit basic_ostringstream(
 basic_string<charT, traits, Allocator>&& s,
 ios_base::openmode which = ios_base::out);
 template<class SAlloc>
 basic_ostringstream(
 const basic_string<charT, traits, SAlloc>& s, const Allocator& a)
 : basic_ostringstream(s, ios_base::out, a) {}
 template<class SAlloc>
 basic_ostringstream(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which, const Allocator& a);
 template<class SAlloc>
 explicit basic_ostringstream(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which = ios_base::out);
 basic_ostringstream(const basic_ostringstream&) = delete;
 basic_ostringstream(basic_ostringstream&& rhs);

 // 29.8.4.3, assign and swap
 basic_ostringstream& operator=(const basic_ostringstream&) = delete;
}

```

```

basic_ostringstream& operator=(basic_ostringstream&& rhs);
void swap(basic_ostringstream& rhs);

// 29.8.4.4, members
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

basic_string<charT, traits, Allocator> str() const &;
template<class SAlloc>
basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
basic_string<charT, traits, Allocator> str() &&;
basic_string_view<charT, traits> view() const noexcept;

void str(const basic_string<charT, traits, Allocator>& s);
template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);
void str(basic_string<charT, traits, Allocator>&& s);

private:
 basic_stringbuf<charT, traits, Allocator> sb; // exposition only
};

template<class charT, class traits, class Allocator>
void swap(basic_ostringstream<charT, traits, Allocator>& x,
 basic_ostringstream<charT, traits, Allocator>& y);
}

```

- <sup>1</sup> The class `basic_ostringstream<charT, traits, Allocator>` supports writing objects of class `basic_string<charT, traits, Allocator>`. It uses a `basic_stringbuf` object to control the associated storage. For the sake of exposition, the maintained data is presented here as:

- (1.1) — `sb`, the `stringbuf` object.

### 29.8.4.2 Constructors

[`ostringstream.cons`]

```
explicit basic_ostringstream(ios_base::openmode which);
```

- <sup>1</sup> *Effects*: Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (29.7.5.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which | ios_base::out)` (29.8.2.2).

```
explicit basic_ostringstream(
 const basic_string<charT, traits, Allocator>& s,
 ios_base::openmode which = ios_base::out);
```

- <sup>2</sup> *Effects*: Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (29.7.5.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out)` (29.8.2.2).

```
basic_ostringstream(ios_base::openmode which, const Allocator& a);
```

- <sup>3</sup> *Effects*: Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (29.7.5.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which | ios_base::out, a)` (29.8.2.2).

```
explicit basic_ostringstream(
 basic_string<charT, traits, Allocator>&& s,
 ios_base::openmode which = ios_base::out);
```

- <sup>4</sup> *Effects*: Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (29.7.5.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(std::move(s), which | ios_base::out)` (29.8.2.2).

```
template<class SAlloc>
basic_ostringstream(
 const basic_string<charT, traits, SAlloc>& s, ios_base::openmode which, const Allocator& a);
```

- <sup>5</sup> *Effects*: Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (29.7.5.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out, a)` (29.8.2.2).

```

template<class SAlloc>
explicit basic_ostringstream(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which = ios_base::out);

6 Constraints: is_same_v<SAlloc, Allocator> is false.

7 Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (29.7.5.2)
 and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out)
 (29.8.2.2).

 basic_ostringstream(basic_ostringstream&& rhs);

8 Effects: Move constructs from the rvalue rhs. This is accomplished by move constructing the
 base class, and the contained basic_stringbuf. Then calls basic_ostream<charT, traits>::set_-_
 rdbuf(addressof(sb)) to install the contained basic_stringbuf.

```

**29.8.4.3 Assignment and swap**[`ostringstream.assign`]

```
void swap(basic_ostringstream& rhs);
```

1 *Effects:* Equivalent to:

```
 basic_ostream<charT, traits>::swap(rhs);
 sb.swap(rhs.sb);
```

```
template<class charT, class traits, class Allocator>
void swap(basic_ostringstream<charT, traits, Allocator>& x,
 basic_ostringstream<charT, traits, Allocator>& y);
```

2 *Effects:* Equivalent to: `x.swap(y)`.

**29.8.4.4 Member functions**[`ostringstream.members`]

```
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
```

1 *Returns:* `const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(sb))`.

```
basic_string<charT, traits, Allocator> str() const &;
```

2 *Effects:* Equivalent to: `return rdbuf()->str()`.

```
template<class SAlloc>
basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
```

3 *Effects:* Equivalent to: `return rdbuf()->str(sa)`.

```
basic_string<charT, traits, Allocator> str() &&;
```

4 *Effects:* Equivalent to: `return std::move(*rdbuf()).str()`.

```
basic_string_view<charT, traits> view() const noexcept;
```

5 *Effects:* Equivalent to: `return rdbuf()->view()`.

```
void str(const basic_string<charT, traits, Allocator>& s);
```

6 *Effects:* Equivalent to: `rdbuf()->str(s)`.

```
template<class SAlloc>
```

```
void str(const basic_string<charT, traits, SAlloc>& s);
```

7 *Effects:* Equivalent to: `rdbuf()->str(s)`.

```
void str(basic_string<charT, traits, Allocator>&& s);
```

8 *Effects:* Equivalent to: `rdbuf()->str(std::move(s))`.

29.8.5 Class template `basic_stringstream`[`stringstream`]

## 29.8.5.1 General

[`stringstream.general`]

```

namespace std {
 template<class charT, class traits = char_traits<charT>,
 class Allocator = allocator<charT>>
 class basic_stringstream : public basic_iostream<charT, traits> {
public:
 using char_type = charT;
 using int_type = typename traits::int_type;
 using pos_type = typename traits::pos_type;
 using off_type = typename traits::off_type;
 using traits_type = traits;
 using allocator_type = Allocator;

 // 29.8.5.2, constructors
 basic_stringstream() : basic_stringstream(ios_base::out | ios_base::in) {}
 explicit basic_stringstream(ios_base::openmode which);
 explicit basic_stringstream(
 const basic_string<charT, traits, Allocator>& s,
 ios_base::openmode which = ios_base::out | ios_base::in);
 basic_stringstream(ios_base::openmode which, const Allocator& a);
 explicit basic_stringstream(
 basic_string<charT, traits, Allocator>&& s,
 ios_base::openmode which = ios_base::out | ios_base::in);
 template<class SAlloc>
 basic_stringstream(
 const basic_string<charT, traits, SAlloc>& s, const Allocator& a)
 : basic_stringstream(s, ios_base::out | ios_base::in, a) {}
 template<class SAlloc>
 basic_stringstream(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which, const Allocator& a);
 template<class SAlloc>
 explicit basic_stringstream(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which = ios_base::out | ios_base::in);
 basic_stringstream(const basic_stringstream&) = delete;
 basic_stringstream(basic_stringstream&& rhs);

 // 29.8.5.3, assign and swap
 basic_stringstream& operator=(const basic_stringstream&) = delete;
 basic_stringstream& operator=(basic_stringstream&& rhs);
 void swap(basic_stringstream& rhs);

 // 29.8.5.4, members
 basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

 basic_string<charT, traits, Allocator> str() const &;
 template<class SAlloc>
 basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
 basic_string<charT, traits, Allocator> str() &&;
 basic_string_view<charT, traits> view() const noexcept;

 void str(const basic_string<charT, traits, Allocator>& s);
 template<class SAlloc>
 void str(const basic_string<charT, traits, SAlloc>& s);
 void str(basic_string<charT, traits, Allocator>&& s);

private:
 basic_stringbuf<charT, traits> sb; // exposition only
};

```

```
template<class charT, class traits, class Allocator>
void swap(basic_stringstream<charT, traits, Allocator>& x,
 basic_stringstream<charT, traits, Allocator>& y);
}
```

- 1 The class template `basic_stringstream<charT, traits>` supports reading and writing from objects of class `basic_string<charT, traits, Allocator>`. It uses a `basic_stringbuf<charT, traits, Allocator>` object to control the associated sequence. For the sake of exposition, the maintained data is presented here as

- (1.1) — `sb`, the `stringbuf` object.

### 29.8.5.2 Constructors

[`stringstream.cons`]

```
explicit basic_stringstream(ios_base::openmode which);
```

- 1 *Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` ([29.7.4.7.2](#)) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which)`.

```
explicit basic_stringstream(
 const basic_string<charT, traits, Allocator>& s,
 ios_base::openmode which = ios_base::out | ios_base::in);
```

- 2 *Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` ([29.7.4.7.2](#)) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which)`.

```
basic_stringstream(ios_base::openmode which, const Allocator& a);
```

- 3 *Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` ([29.7.4.7.2](#)) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which, a)` ([29.8.2.2](#)).

```
explicit basic_stringstream(
 basic_string<charT, traits, Allocator>&& s,
 ios_base::openmode which = ios_base::out | ios_base::in);
```

- 4 *Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` ([29.7.4.7.2](#)) and `sb` with `basic_stringbuf<charT, traits, Allocator>(std::move(s), which)` ([29.8.2.2](#)).

```
template<class SAlloc>
basic_stringstream(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which, const Allocator& a);
```

- 5 *Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` ([29.7.4.7.2](#)) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which, a)` ([29.8.2.2](#)).

```
template<class SAlloc>
explicit basic_stringstream(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which = ios_base::out | ios_base::in);
```

- 6 *Constraints:* `is_same_v<SAlloc, Allocator>` is false.

- 7 *Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` ([29.7.4.7.2](#)) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which)` ([29.8.2.2](#)).

```
basic_stringstream(basic_stringstream&& rhs);
```

- 8 *Effects:* Move constructs from the rvalue `rhs`. This is accomplished by move constructing the base class, and the contained `basic_stringbuf`. Then calls `basic_istream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_stringbuf`.

### 29.8.5.3 Assignment and swap

[`stringstream.assign`]

```
void swap(basic_stringstream& rhs);
```

- 1 *Effects:* Equivalent to:

```
basic_iostream<charT, traits>::swap(rhs);
sb.swap(rhs.sb);
```

```
template<class charT, class traits, class Allocator>
void swap(basic_stringstream<charT, traits, Allocator>& x,
 basic_stringstream<charT, traits, Allocator>& y);
```

2     *Effects:* Equivalent to: `x.swap(y)`.

#### 29.8.5.4 Member functions

[`stringstream.members`]

```
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
```

1     *Returns:* `const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(sb))`.

```
basic_string<charT, traits, Allocator> str() const &;
```

2     *Effects:* Equivalent to: `return rdbuf()->str()`;

```
template<class SAlloc>
basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
```

3     *Effects:* Equivalent to: `return rdbuf()->str(sa)`;

```
basic_string<charT, traits, Allocator> str() &&;
```

4     *Effects:* Equivalent to: `return std::move(*rdbuf()).str()`;

```
basic_string_view<charT, traits> view() const noexcept;
```

5     *Effects:* Equivalent to: `return rdbuf()->view()`;

```
void str(const basic_string<charT, traits, Allocator>& s);
```

6     *Effects:* Equivalent to: `rdbuf()->str(s)`;

```
template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);
```

7     *Effects:* Equivalent to: `rdbuf()->str(s)`;

```
void str(basic_string<charT, traits, Allocator>&& s);
```

8     *Effects:* Equivalent to: `rdbuf()->str(std::move(s))`;

### 29.9 File-based streams

[`file.streams`]

#### 29.9.1 Header `<fstream>` synopsis

[`fstream.syn`]

```
namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_filebuf;
 using filebuf = basic_filebuf<char>;
 using wfilebuf = basic_filebuf<wchar_t>;

 template<class charT, class traits = char_traits<charT>>
 class basic_ifstream;
 using ifstream = basic_ifstream<char>;
 using wifstream = basic_ifstream<wchar_t>;

 template<class charT, class traits = char_traits<charT>>
 class basic_ofstream;
 using ofstream = basic_ofstream<char>;
 using wofstream = basic_ofstream<wchar_t>;

 template<class charT, class traits = char_traits<charT>>
 class basic_fstream;
 using fstream = basic_fstream<char>;
 using wfstream = basic_fstream<wchar_t>;
}
```

<sup>1</sup> The header `<fstream>` defines four class templates and eight types that associate stream buffers with files and assist reading and writing files.

<sup>2</sup> [Note 1: The class template `basic_filebuf` treats a file as a source or sink of bytes. In an environment that uses a large character set, the file typically holds multibyte character sequences and the `basic_filebuf` object converts those multibyte sequences into wide character sequences. — *end note*]

<sup>3</sup> In subclause 29.9, member functions taking arguments of `const filesystem::path::value_type*` are only be provided on systems where `filesystem::path::value_type` (29.11.6) is not `char`.

[Note 2: These functions enable class path support for systems with a wide native path character type, such as `wchar_t`. — *end note*]

## 29.9.2 Class template `basic_filebuf`

[`filebuf`]

### 29.9.2.1 General

[`filebuf.general`]

```
namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_filebuf : public basic_streambuf<charT, traits> {
 public:
 using char_type = charT;
 using int_type = typename traits::int_type;
 using pos_type = typename traits::pos_type;
 using off_type = typename traits::off_type;
 using traits_type = traits;

 // 29.9.2.2, constructors/destructor
 basic_filebuf();
 basic_filebuf(const basic_filebuf&) = delete;
 basic_filebuf(basic_filebuf&& rhs);
 virtual ~basic_filebuf();

 // 29.9.2.3, assign and swap
 basic_filebuf& operator=(const basic_filebuf&) = delete;
 basic_filebuf& operator=(basic_filebuf&& rhs);
 void swap(basic_filebuf& rhs);

 // 29.9.2.4, members
 bool is_open() const;
 basic_filebuf* open(const char* s, ios_base::openmode mode);
 basic_filebuf* open(const filesystem::path::value_type* s,
 ios_base::openmode mode); // wide systems only; see 29.9.1
 basic_filebuf* open(const string& s,
 ios_base::openmode mode);
 basic_filebuf* open(const filesystem::path& s,
 ios_base::openmode mode);
 basic_filebuf* close();

 protected:
 // 29.9.2.5, overridden virtual functions
 streamsize showmany() override;
 int_type underflow() override;
 int_type uflow() override;
 int_type pbackfail(int_type c = traits::eof()) override;
 int_type overflow (int_type c = traits::eof()) override;

 basic_streambuf<charT, traits>* setbuf(char_type* s,
 streamsize n) override;
 pos_type seekoff(off_type off, ios_base::seekdir way,
 ios_base::openmode which
 = ios_base::in | ios_base::out) override;
 pos_type seekpos(pos_type sp,
 ios_base::openmode which
 = ios_base::in | ios_base::out) override;
 int sync() override;
 void imbue(const locale& loc) override;
 };
}
```

```
template<class charT, class traits>
void swap(basic_filebuf<charT, traits>& x,
 basic_filebuf<charT, traits>& y);
}
```

- 1 The class `basic_filebuf<charT, traits>` associates both the input sequence and the output sequence with a file.
- 2 The restrictions on reading and writing a sequence controlled by an object of class `basic_filebuf<charT, traits>` are the same as for reading and writing with the C standard library FILEs.
- 3 In particular:
  - (3.1) — If the file is not open for reading the input sequence cannot be read.
  - (3.2) — If the file is not open for writing the output sequence cannot be written.
  - (3.3) — A joint file position is maintained for both the input sequence and the output sequence.
- 4 An instance of `basic_filebuf` behaves as described in [29.9.2](#) provided `traits::pos_type` is `fpos<traits::state_type>`. Otherwise the behavior is undefined.
- 5 In order to support file I/O and multibyte/wide character conversion, conversions are performed using members of a facet, referred to as `a_codecvt` in following subclauses, obtained as if by

```
const codecvt<charT, char, typename traits::state_type>& a_codecvt =
 use_facet<codecvt<charT, char, typename traits::state_type>>(getloc());
```

### 29.9.2.2 Constructors

[filebuf.cons]

```
basic_filebuf();
```

- 1 *Effects:* Initializes the base class with `basic_streambuf<charT, traits>()` ([29.6.3.2](#)).

- 2 *Postconditions:* `is_open() == false`.

```
basic_filebuf(basic_filebuf&& rhs);
```

- 3 *Effects:* It is implementation-defined whether the sequence pointers in `*this` (`eback()`, `gptr()`, `egptr()`, `pbase()`, `pptr()`, `epptr()`) obtain the values which `rhs` had. Whether they do or not, `*this` and `rhs` reference separate buffers (if any at all) after the construction. Additionally `*this` references the file which `rhs` did before the construction, and `rhs` references no file after the construction. The openmode, locale and any other state of `rhs` is also copied.

- 4 *Postconditions:* Let `rhs_p` refer to the state of `rhs` just prior to this construction and let `rhs_a` refer to the state of `rhs` just after this construction.

- (4.1) — `is_open() == rhs_p.is_open()`
- (4.2) — `rhs_a.is_open() == false`
- (4.3) — `gptr() - eback() == rhs_p.gptr() - rhs_p.eback()`
- (4.4) — `egptr() - eback() == rhs_p.egptr() - rhs_p.eback()`
- (4.5) — `pptr() - pbase() == rhs_p.pptr() - rhs_p.pbase()`
- (4.6) — `epptr() - pbase() == rhs_p.epptr() - rhs_p.pbase()`
- (4.7) — `if (eback()) eback() != rhs_a.eback()`
- (4.8) — `if (gptr()) gptr() != rhs_a.gptr()`
- (4.9) — `if (egptr()) egptr() != rhs_a.egptr()`
- (4.10) — `if (pbase()) pbase() != rhs_a.pbase()`
- (4.11) — `if (pptr()) pptr() != rhs_a.pptr()`
- (4.12) — `if (epptr()) epptr() != rhs_a.epptr()`

```
virtual ~basic_filebuf();
```

- 5 *Effects:* Calls `close()`. If an exception occurs during the destruction of the object, including the call to `close()`, the exception is caught but not rethrown (see [16.4.6.13](#)).

### 29.9.2.3 Assignment and swap

[filebuf.assign]

```
basic_filebuf& operator=(basic_filebuf&& rhs);
```

1    *Effects:* Calls `close()` then move assigns from `rhs`. After the move assignment `*this` has the observable state it would have had if it had been move constructed from `rhs` (see [29.9.2.2](#)).

2    *Returns:* `*this`.

```
void swap(basic_filebuf& rhs);
```

3    *Effects:* Exchanges the state of `*this` and `rhs`.

```
template<class charT, class traits>
void swap(basic_filebuf<charT, traits>& x,
 basic_filebuf<charT, traits>& y);
```

4    *Effects:* Equivalent to: `x.swap(y)`.

### 29.9.2.4 Member functions

[filebuf.members]

```
bool is_open() const;
```

1    *Returns:* `true` if a previous call to `open` succeeded (returned a non-null value) and there has been no intervening call to `close`.

```
basic_filebuf* open(const char* s, ios_base::openmode mode);
basic_filebuf* open(const filesystem::path::value_type* s,
 ios_base::openmode mode); // wide systems only; see 29.9.1
```

2    *Preconditions:* `s` points to a NTCTS ([3.32](#)).

3    *Effects:* If `is_open() != false`, returns a null pointer. Otherwise, initializes the `filebuf` as required. It then opens the file to which `s` resolves, if possible, as if by a call to `fopen` with the second argument determined from `mode & ~ios_base::ate` as indicated in [Table 126](#). If `mode` is not some combination of flags shown in the table then the open fails.

Table 126: File open modes [tab:filebuf.open.modes]

| <code>ios_base</code> flag combination | <code>stdio</code> equivalent |                  |                    |                  |
|----------------------------------------|-------------------------------|------------------|--------------------|------------------|
| <code>binary</code>                    | <code>in</code>               | <code>out</code> | <code>trunc</code> | <code>app</code> |
|                                        | +                             |                  |                    | "w"              |
|                                        | +                             |                  | +                  | "a"              |
|                                        |                               |                  | +                  | "a"              |
|                                        | +                             | +                |                    | "w"              |
|                                        | +                             |                  |                    | "r"              |
|                                        | +                             | +                |                    | "r+"             |
|                                        | +                             | +                | +                  | "w+"             |
|                                        | +                             | +                |                    | "a+"             |
|                                        | +                             |                  | +                  | "a+"             |
|                                        | +                             | +                |                    | "wb"             |
|                                        | +                             | +                | +                  | "ab"             |
|                                        | +                             |                  | +                  | "ab"             |
|                                        | +                             | +                | +                  | "wb"             |
|                                        | +                             | +                |                    | "rb"             |
|                                        | +                             | +                | +                  | "r+b"            |
|                                        | +                             | +                | +                  | "w+b"            |
|                                        | +                             | +                | +                  | "a+b"            |
|                                        | +                             |                  | +                  | "a+b"            |

4    If the open operation succeeds and `ios_base::ate` is set in `mode`, positions the file to the end (as if by calling `fseek(file, 0, SEEK_END)`, where `file` is the pointer returned by calling `fopen`).<sup>326</sup>

<sup>326</sup>) The macro `SEEK_END` is defined, and the function signatures `fopen(const char*, const char*)` and `fseek(FILE*, long, int)` are declared, in `<cstdio>` ([29.12.1](#)).

- 5     If the repositioning operation fails, calls `close()` and returns a null pointer to indicate failure.  
 6     >Returns: `this` if successful, a null pointer otherwise.

```
basic_filebuf* open(const string& s, ios_base::openmode mode);
basic_filebuf* open(const filesystem::path& s, ios_base::openmode mode);
>Returns: open(s.c_str(), mode);
```

`basic_filebuf* close();`

- 8     `Effects:` If `is_open() == false`, returns a null pointer. If a put area exists, calls `overflow(traits::eof())` to flush characters. If the last virtual member function called on `*this` (between `underflow`, `overflow`, `seekoff`, and `seekpos`) was `overflow` then calls `a_codecvt.unshift` (possibly several times) to determine a termination sequence, inserts those characters and calls `overflow(traits::eof())` again. Finally, regardless of whether any of the preceding calls fails or throws an exception, the function closes the file (as if by calling `fclose(file)`). If any of the calls made by the function, including `fclose`, fails, `close` fails by returning a null pointer. If one of these calls throws an exception, the exception is caught and rethrown after closing the file.

9     >Returns: `this` on success, a null pointer otherwise.

10    `Postconditions:` `is_open() == false`.

### 29.9.2.5 Overridden virtual functions

[filebuf.virtuals]

```
streamsize showmany(c) override;
```

- 1     `Effects:` Behaves the same as `basic_streambuf::showmany(c)` (29.6.3.5).

- 2     `Remarks:` An implementation may provide an overriding definition for this function signature if it can determine whether more characters can be read from the input sequence.

```
int_type underflow() override;
```

- 3     `Effects:` Behaves according to the description of `basic_streambuf<charT, traits>::underflow()`, with the specialization that a sequence of characters is read from the input sequence as if by reading from the associated file into an internal buffer (`extern_buf`) and then as if by doing:

```
char extern_buf[XSIZE];
char* extern_end;
charT intern_buf[ISIZE];
charT* intern_end;
codecvt_base::result r =
 a_codecvt.in(state, extern_buf, extern_buf+XSIZE, extern_end,
 intern_buf, intern_buf+ISIZE, intern_end);
```

This shall be done in such a way that the class can recover the position (`fpos_t`) corresponding to each character between `intern_buf` and `intern_end`. If the value of `r` indicates that `a_codecvt.in()` ran out of space in `intern_buf`, retry with a larger `intern_buf`.

```
int_type uflow() override;
```

- 4     `Effects:` Behaves according to the description of `basic_streambuf<charT, traits>::uflow()`, with the specialization that a sequence of characters is read from the input with the same method as used by `underflow`.

```
int_type pbackfail(int_type c = traits::eof()) override;
```

- 5     `Effects:` Puts back the character designated by `c` to the input sequence, if possible, in one of three ways:

- (5.1)   — If `traits::eq_int_type(c, traits::eof())` returns `false` and if the function makes a putback position available and if `traits::eq(to_char_type(c), gptr()[-1])` returns `true`, decrements the next pointer for the input sequence, `gptr()`.

      >Returns: `c`.

- (5.2)   — If `traits::eq_int_type(c, traits::eof())` returns `false` and if the function makes a putback position available and if the function is permitted to assign to the putback position, decrements the next pointer for the input sequence, and stores `c` there.

      >Returns: `c`.

- (5.3) — If `traits::eq_int_type(c, traits::eof())` returns `true`, and if either the input sequence has a putback position available or the function makes a putback position available, decrements the next pointer for the input sequence, `gptr()`.

Returns: `traits::not_eof(c)`.

6 Returns: As specified above, or `traits::eof()` to indicate failure.

7 Remarks: If `is_open() == false`, the function always fails.

8 The function does not put back a character directly to the input sequence.

9 If the function can succeed in more than one of these ways, it is unspecified which way is chosen. The function can alter the number of putback positions available as a result of any call.

```
int_type overflow(int_type c = traits::eof()) override;
```

10 Effects: Behaves according to the description of `basic_streambuf<charT, traits>::overflow(c)`, except that the behavior of “consuming characters” is performed by first converting as if by:

```
charT* b = pbase();
charT* p = pptr();
charT* end;
char xbuf[XSIZE];
char* xbuf_end;
codecvt_base::result r =
 a_codecvt.out(state, b, p, end, xbuf, xbuf+XSIZE, xbuf_end);
```

and then

(10.1) — If `r == codecvt_base::error` then fail.

(10.2) — If `r == codecvt_base::noconv` then output characters from `b` up to (and not including) `p`.

(10.3) — If `r == codecvt_base::partial` then output to the file characters from `xbuf` up to `xbuf_end`, and repeat using characters from `end` to `p`. If output fails, fail (without repeating).

(10.4) — Otherwise output from `xbuf` to `xbuf_end`, and fail if output fails. At this point if `b != p` and `b == end` (`xbuf` isn’t large enough) then increase `XSIZE` and repeat from the beginning.

11 Returns: `traits::not_eof(c)` to indicate success, and `traits::eof()` to indicate failure. If `is_open() == false`, the function always fails.

```
basic_streambuf* setbuf(char_type* s, streamsize n) override;
```

12 Effects: If `setbuf(0, 0)` is called on a stream before any I/O has occurred on that stream, the stream becomes unbuffered. Otherwise the results are implementation-defined. “Unbuffered” means that `pbase()` and `pptr()` always return null and output to the file should appear as soon as possible.

```
pos_type seekoff(off_type off, ios_base::seekdir way,
 ios_base::openmode which
 = ios_base::in | ios_base::out) override;
```

13 Effects: Let `width` denote `a_codecvt.encoding()`. If `is_open() == false`, or `off != 0 && width <= 0`, then the positioning operation fails. Otherwise, if `way != basic_ios::cur` or `off != 0`, and if the last operation was output, then update the output sequence and write any unshift sequence. Next, seek to the new position: if `width > 0`, call `fseek(file, width * off, whence)`, otherwise call `fseek(file, 0, whence)`.

14 Remarks: “The last operation was output” means either the last virtual operation was overflow or the put buffer is non-empty. “Write any unshift sequence” means, if `width` is less than zero then call `a_codecvt.unshift(state, xbuf, xbuf+XSIZE, xbuf_end)` and output the resulting unshift sequence. The function determines one of three values for the argument `whence`, of type `int`, as indicated in [Table 127](#).

15 Returns: A newly constructed `pos_type` object that stores the resultant stream position, if possible. If the positioning operation fails, or if the object cannot represent the resultant stream position, returns `pos_type(off_type(-1))`.

Table 127: `seekoff` effects [tab:filebuf.seekoff]

| way                         | Value | stdio Equivalent      |
|-----------------------------|-------|-----------------------|
| <code>basic_ios::beg</code> |       | <code>SEEK_SET</code> |
| <code>basic_ios::cur</code> |       | <code>SEEK_CUR</code> |
| <code>basic_ios::end</code> |       | <code>SEEK_END</code> |

```
pos_type seekpos(pos_type sp,
 ios_base::openmode which
 = ios_base::in | ios_base::out) override;
```

16 Alters the file position, if possible, to correspond to the position stored in `sp` (as described below). Altering the file position performs as follows:

1. if (`om & ios_base::out`) != 0, then update the output sequence and write any unshift sequence;
2. set the file position to `sp` as if by a call to `fsetpos`;
3. if (`om & ios_base::in`) != 0, then update the input sequence;

where `om` is the open mode passed to the last call to `open()`. The operation fails if `is_open()` returns `false`.

17 If `sp` is an invalid stream position, or if the function positions neither sequence, the positioning operation fails. If `sp` has not been obtained by a previous successful call to one of the positioning functions (`seekoff` or `seekpos`) on the same file the effects are undefined.

18 Returns: `sp` on success. Otherwise returns `pos_type(off_type(-1))`.

```
int sync() override;
```

19 Effects: If a put area exists, calls `filebuf::overflow` to write the characters to the file, then flushes the file as if by calling `fflush(file)`. If a get area exists, the effect is implementation-defined.

```
void imbue(const locale& loc) override;
```

20 Preconditions: If the file is not positioned at its beginning and the encoding of the current locale as determined by `a_codecvt.encoding()` is state-dependent (28.4.2.5.3) then that facet is the same as the corresponding facet of `loc`.

21 Effects: Causes characters inserted or extracted after this call to be converted according to `loc` until another call of `imbue`.

22 Remarks: This may require reconversion of previously converted characters. This in turn may require the implementation to be able to reconstruct the original contents of the file.

### 29.9.3 Class template `basic_ifstream`

[`ifstream`]

#### 29.9.3.1 General

[`ifstream.general`]

```
namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_ifstream : public basic_istream<charT, traits> {
public:
 using char_type = charT;
 using int_type = typename traits::int_type;
 using pos_type = typename traits::pos_type;
 using off_type = typename traits::off_type;
 using traits_type = traits;

 // 29.9.3.2, constructors
 basic_ifstream();
 explicit basic_ifstream(const char* s,
 ios_base::openmode mode = ios_base::in);
 explicit basic_ifstream(const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::in); // wide systems only; see 29.9.1
 explicit basic_ifstream(const string& s,
 ios_base::openmode mode = ios_base::in);
```

```

explicit basic_ifstream(const filesystem::path& s,
 ios_base::openmode mode = ios_base::in);
basic_ifstream(const basic_ifstream&) = delete;
basic_ifstream(basic_ifstream&& rhs);

// 29.9.3.3, assign and swap
basic_ifstream& operator=(const basic_ifstream&) = delete;
basic_ifstream& operator=(basic_ifstream&& rhs);
void swap(basic_ifstream& rhs);

// 29.9.3.4, members
basic_filebuf<charT, traits>* rdbuf() const;

bool is_open() const;
void open(const char* s, ios_base::openmode mode = ios_base::in);
void open(const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::in); // wide systems only; see 29.9.1
void open(const string& s, ios_base::openmode mode = ios_base::in);
void open(const filesystem::path& s, ios_base::openmode mode = ios_base::in);
void close();
private:
 basic_filebuf<charT, traits> sb; // exposition only
};

template<class charT, class traits>
void swap(basic_ifstream<charT, traits>& x,
 basic_ifstream<charT, traits>& y);
}

```

- <sup>1</sup> The class `basic_ifstream<charT, traits>` supports reading from named files. It uses a `basic_filebuf<charT, traits>` object to control the associated sequence. For the sake of exposition, the maintained data is presented here as:

- (1.1) — `sb`, the `filebuf` object.

### 29.9.3.2 Constructors

[ifstream.cons]

`basic_ifstream();`

- <sup>1</sup> *Effects*: Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (29.7.4.2.2) and `sb` with `basic_filebuf<charT, traits>()` (29.9.2.2).

```

explicit basic_ifstream(const char* s,
 ios_base::openmode mode = ios_base::in);
explicit basic_ifstream(const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::in); // wide systems only; see 29.9.1

```

- <sup>2</sup> *Effects*: Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (29.7.4.2.2) and `sb` with `basic_filebuf<charT, traits>()` (29.9.2.2), then calls `rdbuf()->open(s, mode | ios_base::in)`. If that function returns a null pointer, calls `setstate(failbit)`.

```

explicit basic_ifstream(const string& s,
 ios_base::openmode mode = ios_base::in);
explicit basic_ifstream(const filesystem::path& s,
 ios_base::openmode mode = ios_base::in);

```

- <sup>3</sup> *Effects*: Equivalent to: `basic_ifstream(s.c_str(), mode)`.

`basic_ifstream(basic_ifstream&& rhs);`

- <sup>4</sup> *Effects*: Move constructs the base class, and the contained `basic_filebuf`. Then calls `basic_istream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_filebuf`.

### 29.9.3.3 Assignment and swap

[ifstream.assign]

```
void swap(basic_ifstream& rhs);

1 Effects: Exchanges the state of *this and rhs by calling basic_istream<charT, traits>::swap(rhs) and sb.swap(rhs.sb).

template<class charT, class traits>
void swap(basic_ifstream<charT, traits>& x,
 basic_ifstream<charT, traits>& y);

2 Effects: Equivalent to: x.swap(y).
```

### 29.9.3.4 Member functions

[ifstream.members]

```
basic_filebuf<charT, traits>* rdbuf() const;

1 Returns: const_cast<basic_filebuf<charT, traits>*>(addressof(sb));

bool is_open() const;

2 Returns: rdbuf()->is_open();

void open(const char* s, ios_base::openmode mode = ios_base::in);
void open(const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::in); // wide systems only; see 29.9.1

3 Effects: Calls rdbuf()->open(s, mode | ios_base::in). If that function does not return a null pointer calls clear(), otherwise calls setstate(failbit) (which may throw ios_base::failure) (29.5.5.4).

void open(const string& s, ios_base::openmode mode = ios_base::in);
void open(const filesystem::path& s, ios_base::openmode mode = ios_base::in);

4 Effects: Calls open(s.c_str(), mode).

void close();

5 Effects: Calls rdbuf()->close() and, if that function returns a null pointer, calls setstate(failbit) (which may throw ios_base::failure) (29.5.5.4).
```

### 29.9.4 Class template basic\_ofstream

[ofstream]

#### 29.9.4.1 General

[ofstream.general]

```
namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_ofstream : public basic_ostream<charT, traits> {
 public:
 using char_type = charT;
 using int_type = typename traits::int_type;
 using pos_type = typename traits::pos_type;
 using off_type = typename traits::off_type;
 using traits_type = traits;

 // 29.9.4.2, constructors
 basic_ofstream();
 explicit basic_ofstream(const char* s,
 ios_base::openmode mode = ios_base::out);
 explicit basic_ofstream(const filesystem::path::value_type* s, // wide systems only; see 29.9.1
 ios_base::openmode mode = ios_base::out);
 explicit basic_ofstream(const string& s,
 ios_base::openmode mode = ios_base::out);
 explicit basic_ofstream(const filesystem::path& s,
 ios_base::openmode mode = ios_base::out);
 basic_ofstream(const basic_ofstream&) = delete;
 basic_ofstream(basic_ofstream&& rhs);

 // 29.9.4.3, assign and swap
 basic_ofstream& operator=(const basic_ofstream&) = delete;
```

```

basic_ofstream& operator=(basic_ofstream&& rhs);
void swap(basic_ofstream& rhs);

// 29.9.4.4, members
basic_filebuf<charT, traits>* rdbuf() const;

bool is_open() const;
void open(const char* s, ios_base::openmode mode = ios_base::out);
void open(const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::out); // wide systems only; see 29.9.1
void open(const string& s, ios_base::openmode mode = ios_base::out);
void open(const filesystem::path& s, ios_base::openmode mode = ios_base::out);
void close();

private:
 basic_filebuf<charT, traits> sb; // exposition only
};

template<class charT, class traits>
void swap(basic_ofstream<charT, traits>& x,
 basic_ofstream<charT, traits>& y);
}

```

- <sup>1</sup> The class `basic_ofstream<charT, traits>` supports writing to named files. It uses a `basic_filebuf<charT, traits>` object to control the associated sequence. For the sake of exposition, the maintained data is presented here as:

- (1.1) — `sb`, the `filebuf` object.

#### 29.9.4.2 Constructors

[`ofstream.cons`]

```
basic_ofstream();
```

- <sup>1</sup> *Effects*: Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` ([29.7.5.2.2](#)) and `sb` with `basic_filebuf<charT, traits>()` ([29.9.2.2](#)).

```
explicit basic_ofstream(const char* s,
 ios_base::openmode mode = ios_base::out);
explicit basic_ofstream(const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::out); // wide systems only; see 29.9.1
```

- <sup>2</sup> *Effects*: Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` ([29.7.5.2.2](#)) and `sb` with `basic_filebuf<charT, traits>()` ([29.9.2.2](#)), then calls `rdbuf()>open(s, mode | ios_base::out)`. If that function returns a null pointer, calls `setstate(failbit)`.

```
explicit basic_ofstream(const string& s,
 ios_base::openmode mode = ios_base::out);
explicit basic_ofstream(const filesystem::path& s,
 ios_base::openmode mode = ios_base::out);
```

- <sup>3</sup> *Effects*: Equivalent to: `basic_ofstream(s.c_str(), mode)`.

```
basic_ofstream(basic_ofstream&& rhs);
```

- <sup>4</sup> *Effects*: Move constructs the base class, and the contained `basic_filebuf`. Then calls `basic_ostream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_filebuf`.

#### 29.9.4.3 Assignment and swap

[`ofstream.assign`]

```
void swap(basic_ofstream& rhs);
```

- <sup>1</sup> *Effects*: Exchanges the state of `*this` and `rhs` by calling `basic_ostream<charT, traits>::swap(rhs)` and `sb.swap(rhs.sb)`.

```
template<class charT, class traits>
void swap(basic_ofstream<charT, traits>& x,
 basic_ofstream<charT, traits>& y);
```

- <sup>2</sup> *Effects*: Equivalent to: `x.swap(y)`.

## 29.9.4.4 Member functions

[ofstream.members]

```

basic_filebuf<charT, traits>* rdbuf() const;
1 Returns: const_cast<basic_filebuf<charT, traits>*>(addressof(sb)).

bool is_open() const;
2 Returns: rdbuf()->is_open().

void open(const char* s, ios_base::openmode mode = ios_base::out);
void open(const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::out); // wide systems only; see 29.9.1
3 Effects: Calls rdbuf()->open(s, mode | ios_base::out). If that function does not return a null
pointer calls clear(), otherwise calls setstate(failbit) (which may throw ios_base::failure)
(29.5.5.4).

void close();

4 Effects: Calls rdbuf()->close() and, if that function fails (returns a null pointer), calls setstate(
failbit) (which may throw ios_base::failure) (29.5.5.4).

void open(const string& s, ios_base::openmode mode = ios_base::out);
void open(const filesystem::path& s, ios_base::openmode mode = ios_base::out);

5 Effects: Calls open(s.c_str(), mode).

```

## 29.9.5 Class template basic\_fstream

[fstream]

## 29.9.5.1 General

[fstream.general]

```

namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_fstream : public basic_iostream<charT, traits> {
public:
 using char_type = charT;
 using int_type = typename traits::int_type;
 using pos_type = typename traits::pos_type;
 using off_type = typename traits::off_type;
 using traits_type = traits;

 // 29.9.5.2, constructors
 basic_fstream();
 explicit basic_fstream(
 const char* s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
 explicit basic_fstream(
 const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::in|ios_base::out); // wide systems only; see 29.9.1
 explicit basic_fstream(
 const string& s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
 explicit basic_fstream(
 const filesystem::path& s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
 basic_fstream(const basic_fstream&) = delete;
 basic_fstream(basic_fstream&& rhs);

 // 29.9.5.3, assign and swap
 basic_fstream& operator=(const basic_fstream&) = delete;
 basic_fstream& operator=(basic_fstream&& rhs);
 void swap(basic_fstream& rhs);

 // 29.9.5.4, members
 basic_filebuf<charT, traits>* rdbuf() const;
 bool is_open() const;

```

```

void open(
 const char* s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
void open(
 const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::in|ios_base::out); // wide systems only; see 29.9.1
void open(
 const string& s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
void open(
 const filesystem::path& s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
void close();

private:
 basic_filebuf<charT, traits> sb; // exposition only
};

template<class charT, class traits>
void swap(basic_fstream<charT, traits>& x,
 basic_fstream<charT, traits>& y);
}

```

- <sup>1</sup> The class template `basic_fstream<charT, traits>` supports reading and writing from named files. It uses a `basic_filebuf<charT, traits>` object to control the associated sequences. For the sake of exposition, the maintained data is presented here as:

- (1.1) — `sb`, the `basic_filebuf` object.

### 29.9.5.2 Constructors

[`fstream.cons`]

```
basic_fstream();
```

- <sup>1</sup> *Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` ([29.7.4.7.2](#)) and `sb` with `basic_filebuf<charT, traits>()`.

```

explicit basic_fstream(
 const char* s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
explicit basic_fstream(
 const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::in | ios_base::out); // wide systems only; see 29.9.1

```

- <sup>2</sup> *Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` ([29.7.4.7.2](#)) and `sb` with `basic_filebuf<charT, traits>()`. Then calls `rdbuf()>open(s, mode)`. If that function returns a null pointer, calls `setstate(failbit)`.

```

explicit basic_fstream(
 const string& s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
explicit basic_fstream(
 const filesystem::path& s,
 ios_base::openmode mode = ios_base::in | ios_base::out);

```

- <sup>3</sup> *Effects:* Equivalent to: `basic_fstream(s.c_str(), mode)`.

```
basic_fstream(basic_fstream&& rhs);
```

- <sup>4</sup> *Effects:* Move constructs the base class, and the contained `basic_filebuf`. Then calls `basic_istream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_filebuf`.

### 29.9.5.3 Assignment and swap

[`fstream.assign`]

```
void swap(basic_fstream& rhs);
```

- <sup>1</sup> *Effects:* Exchanges the state of `*this` and `rhs` by calling `basic_iostream<charT, traits>::swap(rhs)` and `sb.swap(rhs.sb)`.

```
template<class charT, class traits>
void swap(basic_fstream<charT, traits>& x,
 basic_fstream<charT, traits>& y);
```

2     *Effects:* Equivalent to: `x.swap(y)`.

#### 29.9.5.4 Member functions

[**fstream.members**]

```
basic_filebuf<charT, traits>* rdbuf() const;
```

1     *Returns:* `const_cast<basic_filebuf<charT, traits>*>(addressof(sb))`.

```
bool is_open() const;
```

2     *Returns:* `rdbuf()>is_open()`.

```
void open(
 const char* s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
```

```
void open(
 const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::in | ios_base::out); // wide systems only; see 29.9.1
```

3     *Effects:* Calls `rdbuf()>open(s, mode)`. If that function does not return a null pointer calls `clear()`, otherwise calls `setstate(failbit)` (which may throw `ios_base::failure`) (29.5.5.4).

```
void open(
 const string& s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
```

```
void open(
 const filesystem::path& s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
```

4     *Effects:* Calls `open(s.c_str(), mode)`.

```
void close();
```

5     *Effects:* Calls `rdbuf()>close()` and, if that function returns a null pointer, calls `setstate(failbit)` (which may throw `ios_base::failure`) (29.5.5.4).

### 29.10 Synchronized output streams

[**syncstream**]

#### 29.10.1 Header <syncstream> synopsis

[**syncstream.syn**]

```
#include <ostream> // see 29.7.2
```

```
namespace std {
 template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
 class basic_syncbuf;

 using syncbuf = basic_syncbuf<char>;
 using wsyncbuf = basic_syncbuf<wchar_t>;

 template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
 class basic_osyncstream;

 using osyncstream = basic_osyncstream<char>;
 using wosyncstream = basic_osyncstream<wchar_t>;
}
```

<sup>1</sup> The header <syncstream> provides a mechanism to synchronize execution agents writing to the same stream.

#### 29.10.2 Class template basic\_syncbuf

[**syncstream.syncbuf**]

##### 29.10.2.1 Overview

[**syncstream.syncbuf.overview**]

```
namespace std {
 template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
 class basic_syncbuf : public basic_streambuf<charT, traits> {
 public:
 using char_type = charT;
```

```

using int_type = typename traits::int_type;
using pos_type = typename traits::pos_type;
using off_type = typename traits::off_type;
using traits_type = traits;
using allocator_type = Allocator;

using streambuf_type = basic_streambuf<charT, traits>;

// 29.10.2.2, construction and destruction
basic_syncbuf()
 : basic_syncbuf(nullptr) {}
explicit basic_syncbuf(streambuf_type* obuf)
 : basic_syncbuf(obuf, Allocator()) {}
basic_syncbuf(streambuf_type*, const Allocator&);
basic_syncbuf(basic_syncbuf&&);
~basic_syncbuf();

// 29.10.2.3, assignment and swap
basic_syncbuf& operator=(basic_syncbuf&&);
void swap(basic_syncbuf&);

// 29.10.2.4, member functions
bool emit();
streambuf_type* get_wrapped() const noexcept;
allocator_type get_allocator() const noexcept;
void set_emit_on_sync(bool) noexcept;

protected:
// 29.10.2.5, overridden virtual functions
int sync() override;

private:
streambuf_type* wrapped; // exposition only
bool emit_on_sync{}; // exposition only
};

// 29.10.2.6, specialized algorithms
template<class charT, class traits, class Allocator>
void swap(basic_syncbuf<charT, traits, Allocator>&,
 basic_syncbuf<charT, traits, Allocator>&);
}

```

- <sup>1</sup> Class template `basic_syncbuf` stores character data written to it, known as the associated output, into internal buffers allocated using the object's allocator. The associated output is transferred to the wrapped stream buffer object `*wrapped` when `emit()` is called or when the `basic_syncbuf` object is destroyed. Such transfers are atomic with respect to transfers by other `basic_syncbuf` objects with the same wrapped stream buffer object.

### 29.10.2.2 Construction and destruction

[syncstream.syncbuf.cons]

`basic_syncbuf(streambuf_type* obuf, const Allocator& allocator);`

- <sup>1</sup> *Effects:* Sets `wrapped` to `obuf`.

- <sup>2</sup> *Remarks:* A copy of `allocator` is used to allocate memory for internal buffers holding the associated output.

- <sup>3</sup> *Throws:* Nothing unless an exception is thrown by the construction of a mutex or by memory allocation.

- <sup>4</sup> *Postconditions:* `get_wrapped() == obuf` and `get_allocator() == allocator` are true.

`basic_syncbuf(basic_syncbuf&& other);`

- <sup>5</sup> *Postconditions:* The value returned by `this->get_wrapped()` is the value returned by `other.get_wrapped()` prior to calling this constructor. Output stored in `other` prior to calling this constructor will be stored in `*this` afterwards. `other.rdbuf()->pbase() == other.rdbuf()->pptr()` and `other.get_wrapped() == nullptr` are true.

6     *Remarks:* This constructor disassociates `other` from its wrapped stream buffer, ensuring destruction of `other` produces no output.

7     `~basic_syncbuf();`

8     *Effects:* Calls `emit()`.

9     *Throws:* Nothing. If an exception is thrown from `emit()`, the destructor catches and ignores that exception.

### 29.10.2.3 Assignment and swap

[`syncstream.syncbuf.assign`]

`basic_syncbuf& operator=(basic_syncbuf&& rhs) noexcept;`

1     *Effects:* Calls `emit()` then move assigns from `rhs`. After the move assignment `*this` has the observable state it would have had if it had been move constructed from `rhs` (29.10.2.2).

2     *Returns:* `*this`.

3     *Postconditions:*

(3.1)     — `rhs.get_wrapped() == nullptr` is true.

(3.2)     — `this->get_allocator() == rhs.get_allocator()` is true when

`allocator_traits<Allocator>::propagate_on_container_move_assignment::value`  
is true; otherwise, the allocator is unchanged.

4     *Remarks:* This assignment operator disassociates `rhs` from its wrapped stream buffer, ensuring destruction of `rhs` produces no output.

`void swap(basic_syncbuf& other) noexcept;`

5     *Preconditions:* Either `allocator_traits<Allocator>::propagate_on_container_swap::value` is true or `this->get_allocator() == other.get_allocator()` is true.

6     *Effects:* Exchanges the state of `*this` and `other`.

### 29.10.2.4 Member functions

[`syncstream.syncbuf.members`]

`bool emit();`

1     *Effects:* Atomically transfers the associated output of `*this` to the stream buffer `*wrapped`, so that it appears in the output stream as a contiguous sequence of characters. `wrapped->pubsync()` is called if and only if a call was made to `sync()` since the most recent call to `emit()`, if any.

2     *Returns:* `true` if all of the following conditions hold; otherwise `false`:

(2.1)     — `wrapped == nullptr` is false.

(2.2)     — All of the characters in the associated output were successfully transferred.

(2.3)     — The call to `wrapped->pubsync()` (if any) succeeded.

3     *Postconditions:* On success, the associated output is empty.

4     *Synchronization:* All `emit()` calls transferring characters to the same stream buffer object appear to execute in a total order consistent with the “happens before” relation (6.9.2.2), where each `emit()` call synchronizes with subsequent `emit()` calls in that total order.

5     *Remarks:* May call member functions of `wrapped` while holding a lock uniquely associated with `wrapped`.

`streambuf_type* get_wrapped() const noexcept;`

6     *Returns:* `wrapped`.

`allocator_type get_allocator() const noexcept;`

7     *Returns:* A copy of the allocator that was set in the constructor or assignment operator.

`void set_emit_on_sync(bool b) noexcept;`

8     *Effects:* `emit_on_sync = b`.

### 29.10.2.5 Overridden virtual functions

[syncstream.syncbuf.virtuals]

```
int sync() override;
```

<sup>1</sup> *Effects:* Records that the wrapped stream buffer is to be flushed. Then, if `emit_on_sync` is `true`, calls `emit()`.

[*Note 1:* If `emit_on_sync` is `false`, the actual flush is delayed until a call to `emit()`. — *end note*]

<sup>2</sup> *Returns:* If `emit()` was called and returned `false`, returns `-1`; otherwise `0`.

### 29.10.2.6 Specialized algorithms

[syncstream.syncbuf.special]

```
template<class charT, class traits, class Allocator>
void swap(basic_syncbuf<charT, traits, Allocator>& a,
 basic_syncbuf<charT, traits, Allocator>& b) noexcept;
```

<sup>1</sup> *Effects:* Equivalent to `a.swap(b)`.

## 29.10.3 Class template `basic_osyncstream`

[syncstream.osyncstream]

### 29.10.3.1 Overview

[syncstream.osyncstream.overview]

```
namespace std {
 template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
 class basic_osyncstream : public basic_ostream<charT, traits> {
public:
 using char_type = charT;
 using int_type = typename traits::int_type;
 using pos_type = typename traits::pos_type;
 using off_type = typename traits::off_type;
 using traits_type = traits;

 using allocator_type = Allocator;
 using streambuf_type = basic_streambuf<charT, traits>;
 using syncbuf_type = basic_syncbuf<charT, traits, Allocator>;

 // 29.10.3.2, construction and destruction
 basic_osyncstream(streambuf_type*, const Allocator&);
 explicit basic_osyncstream(streambuf_type* obuf)
 : basic_osyncstream(obuf, Allocator{}) {}
 basic_osyncstream(basic_ostream<charT, traits>& os, const Allocator& allocator)
 : basic_osyncstream(os.rdbuf(), allocator{}) {}
 explicit basic_osyncstream(basic_ostream<charT, traits>& os)
 : basic_osyncstream(os, Allocator{}) {}
 basic_osyncstream(basic_osyncstream&&) noexcept;
 ~basic_osyncstream();

 // assignment
 basic_osyncstream& operator=(basic_osyncstream&&) noexcept;

 // 29.10.3.3, member functions
 void emit();
 streambuf_type* get_wrapped() const noexcept;
 syncbuf_type* rdbuf() const noexcept { return const_cast<syncbuf_type*>(addressof(sb)); }

private:
 syncbuf_type sb; // exposition only
};
```

<sup>1</sup> Allocator shall meet the *Cpp17Allocator* requirements ([Table 36](#)).

<sup>2</sup> [*Example 1:* A named variable can be used within a block statement for streaming.

```
{
 osyncstream bout(cout);
 bout << "Hello, ";
 bout << "World!";
 bout << endl; // flush is noted
```

```

bout << "and more!\n";
} // characters are transferred and cout is flushed
— end example]

```

- 3 [Example 2: A temporary object can be used for streaming within a single statement.

```
osyncstream(cout) << "Hello, " << "World!" << '\n';
```

In this example, cout is not flushed. — end example]

### 29.10.3.2 Construction and destruction

[syncstream.osyncstream.cons]

```
basic_osyncstream(streambuf_type* buf, const Allocator& allocator);
```

- 1 Effects: Initializes sb from buf and allocator. Initializes the base class with basic\_ostream<charT, traits>(addressof(sb)).

- 2 [Note 1: The member functions of the provided stream buffer can be called from emit() while a lock is held, which can result in a deadlock if used incautiously. — end note]

- 3 Postconditions: get\_wrapped() == buf is true.

```
basic_osyncstream(basic_osyncstream&& other) noexcept;
```

- 4 Effects: Move constructs the base class and sb from the corresponding subobjects of other, and calls basic\_ostream<charT, traits>::set\_rdbuf(addressof(sb)).

- 5 Postconditions: The value returned by get\_wrapped() is the value returned by os.get\_wrapped() prior to calling this constructor. nullptr == other.get\_wrapped() is true.

### 29.10.3.3 Member functions

[syncstream.osyncstream.members]

```
void emit();
```

- 1 Effects: Calls sb.emit(). If that call returns false, calls setstate(ios\_base::badbit).

- 2 [Example 1: A flush on a basic\_osyncstream does not flush immediately:

```

{
 osyncstream bout(cout);
 bout << "Hello," << '\n'; // no flush
 bout.emit(); // characters transferred; cout not flushed
 bout << "World!" << endl; // flush noted; cout not flushed
 bout.emit(); // characters transferred; cout flushed
 bout << "Greetings." << '\n'; // no flush
} // characters transferred; cout not flushed
— end example]

```

- 3 [Example 2: The function emit() can be used to handle exceptions from operations on the underlying stream.

```

{
 osyncstream bout(cout);
 bout << "Hello, " << "World!" << '\n';
 try {
 bout.emit();
 } catch (...) {
 // handle exception
 }
}
— end example]

```

```
streambuf_type* get_wrapped() const noexcept;
```

- 4 Returns: sb.get\_wrapped().

- 5 [Example 3: Obtaining the wrapped stream buffer with get\_wrapped() allows wrapping it again with an osyncstream. For example,

```

{
 osyncstream bout1(cout);
 bout1 << "Hello, ";
{
 osyncstream(bout1.get_wrapped()) << "Goodbye, " << "Planet!" << '\n';
}

```

```

 }
 bout1 << "World!" << '\n';
}

```

produces the *uninterleaved* output

```

Goodbye, Planet!
Hello, World!

```

— end example]

## 29.11 File systems

[filesystems]

### 29.11.1 General

[fs.general]

- <sup>1</sup> Subclause 29.11 describes operations on file systems and their components, such as paths, regular files, and directories.
- <sup>2</sup> A *file system* is a collection of files and their attributes.
- <sup>3</sup> A *file* is an object within a file system that holds user or system data. Files can be written to, or read from, or both. A file has certain attributes, including type. File types include regular files and directories. Other types of files, such as symbolic links, may be supported by the implementation.
- <sup>4</sup> A *directory* is a file within a file system that acts as a container of directory entries that contain information about other files, possibly including other directory files. The *parent directory* of a directory is the directory that both contains a directory entry for the given directory and is represented by the dot-dot filename (29.11.6.2) in the given directory. The *parent directory* of other types of files is a directory containing a directory entry for the file under discussion.
- <sup>5</sup> A *link* is an object that associates a filename with a file. Several links can associate names with the same file. A *hard link* is a link to an existing file. Some file systems support multiple hard links to a file. If the last hard link to a file is removed, the file itself is removed.

[Note 1: A hard link can be thought of as a shared-ownership smart pointer to a file. — end note]

A *symbolic link* is a type of file with the property that when the file is encountered during pathname resolution (29.11.6), a string stored by the file is used to modify the pathname resolution.

[Note 2: Symbolic links are often called symlinks. A symbolic link can be thought of as a raw pointer to a file. If the file pointed to does not exist, the symbolic link is said to be a “dangling” symbolic link. — end note]

### 29.11.2 Conformance

[fs.conformance]

#### 29.11.2.1 General

[fs.conformance.general]

- <sup>1</sup> Conformance is specified in terms of behavior. Ideal behavior is not always implementable, so the conformance subclauses take that into account.

#### 29.11.2.2 POSIX conformance

[fs.conform.9945]

- <sup>1</sup> Some behavior is specified by reference to POSIX. How such behavior is actually implemented is unspecified.  
[Note 1: This constitutes an “as if” rule allowing implementations to call native operating system or other APIs. — end note]
- <sup>2</sup> Implementations should provide such behavior as it is defined by POSIX. Implementations shall document any behavior that differs from the behavior defined by POSIX. Implementations that do not support exact POSIX behavior should provide behavior as close to POSIX behavior as is reasonable given the limitations of actual operating systems and file systems. If an implementation cannot provide any reasonable behavior, the implementation shall report an error as specified in 29.11.5.

[Note 2: This allows users to rely on an exception being thrown or an error code being set when an implementation cannot provide any reasonable behavior. — end note]

- <sup>3</sup> Implementations are not required to provide behavior that is not supported by a particular file system.

[Example 1: The FAT file system used by some memory cards, camera memory, and floppy disks does not support hard links, symlinks, and many other features of more capable file systems, so implementations are not required to support those features on the FAT file system but instead are required to report an error as described above. — end example]

**29.11.2.3 Operating system dependent behavior conformance**

[fs.conform.os]

- <sup>1</sup> Behavior that is specified as being *operating system dependent* is dependent upon the behavior and characteristics of an operating system. The operating system an implementation is dependent upon is implementation-defined.
- <sup>2</sup> It is permissible for an implementation to be dependent upon an operating system emulator rather than the actual underlying operating system.

**29.11.2.4 File system race behavior**

[fs.race.behavior]

- <sup>1</sup> A *file system race* is the condition that occurs when multiple threads, processes, or computers interleave access and modification of the same object within a file system. Behavior is undefined if calls to functions provided by subclause 29.11 introduce a file system race.
- <sup>2</sup> If the possibility of a file system race would make it unreliable for a program to test for a precondition before calling a function described herein, *Preconditions*: is not specified for the function.

[*Note 1*: As a design practice, preconditions are not specified when it is unreasonable for a program to detect them prior to calling the function. — *end note*]

**29.11.3 Requirements**

[fs.req]

**29.11.3.1 General**

[fs.req.general]

- <sup>1</sup> Throughout subclause 29.11, `char`, `wchar_t`, `char8_t`, `char16_t`, and `char32_t` are collectively called *encoded character types*.
- <sup>2</sup> Functions with template parameters named `EcharT` shall not participate in overload resolution unless `EcharT` is one of the encoded character types.
- <sup>3</sup> Template parameters named `InputIterator` shall meet the *Cpp17InputIterator* requirements (23.3.5.3) and shall have a value type that is one of the encoded character types.
- <sup>4</sup> [*Note 1*: Use of an encoded character type implies an associated character set and encoding. Since `signed char` and `unsigned char` have no implied character set and encoding, they are not included as permitted types. — *end note*]
- <sup>5</sup> Template parameters named `Allocator` shall meet the *Cpp17Allocator* requirements (Table 36).

**29.11.3.2 Namespaces and headers**

[fs.req.namespace]

- <sup>1</sup> Unless otherwise specified, references to entities described in subclause 29.11 are assumed to be qualified with `::std::filesystem::`.

**29.11.4 Header <filesystem> synopsis**

[fs.filesystem.syn]

```
#include <compare> // see 17.11.1

namespace std::filesystem {
 // 29.11.6, paths
 class path;

 // 29.11.8, path non-member functions
 void swap(path& lhs, path& rhs) noexcept;

file_status symlink_status(const path& p);
file_status symlink_status(const path& p, error_code& ec) noexcept;

path temp_directory_path();
path temp_directory_path(error_code& ec);

path weakly_canonical(const path& p);
path weakly_canonical(const path& p, error_code& ec);
}

```

- <sup>1</sup> Implementations should ensure that the resolution and range of `file_time_type` reflect the operating system dependent resolution and range of file time values.

### 29.11.5 Error reporting

[`fs.err.report`]

- <sup>1</sup> Filesystem library functions often provide two overloads, one that throws an exception to report file system errors, and another that sets an `error_code`.

[*Note 1*: This supports two common use cases:

- (1.1) — Uses where file system errors are truly exceptional and indicate a serious failure. Throwing an exception is an appropriate response.
  - (1.2) — Uses where file system errors are routine and do not necessarily represent failure. Returning an error code is the most appropriate response. This allows application specific error handling, including simply ignoring the error.
- *end note*
- <sup>2</sup> Functions not having an argument of type `error_code&` handle errors as follows, unless otherwise specified:
- (2.1) — When a call by the implementation to an operating system or other underlying API results in an error that prevents the function from meeting its specifications, an exception of type `filesystem_error` shall be thrown. For functions with a single path argument, that argument shall be passed

to the `filesystem_error` constructor with a single path argument. For functions with two path arguments, the first of these arguments shall be passed to the `filesystem_error` constructor as the `path1` argument, and the second shall be passed as the `path2` argument. The `filesystem_error` constructor's `error_code` argument is set as appropriate for the specific operating system dependent error.

- (2.2) — Failure to allocate storage is reported by throwing an exception as described in 16.4.6.13.
- (2.3) — Destructors throw nothing.

3 Functions having an argument of type `error_code&` handle errors as follows, unless otherwise specified:

- (3.1) — If a call by the implementation to an operating system or other underlying API results in an error that prevents the function from meeting its specifications, the `error_code&` argument is set as appropriate for the specific operating system dependent error. Otherwise, `clear()` is called on the `error_code&` argument.

## 29.11.6 Class path

[`fs.class.path`]

### 29.11.6.1 General

[`fs.class.path.general`]

- 1 An object of class `path` represents a path and contains a pathname. Such an object is concerned only with the lexical and syntactic aspects of a path. The path does not necessarily exist in external storage, and the pathname is not necessarily valid for the current operating system or for a particular file system.
- 2 [Note 1: Class `path` is used to support the differences between the string types used by different operating systems to represent pathnames, and to perform conversions between encodings when necessary. — end note]
- 3 A *path* is a sequence of elements that identify the location of a file within a filesystem. The elements are the *root-name<sub>opt</sub>*, *root-directory<sub>opt</sub>*, and an optional sequence of *filenames* (29.11.6.2). The maximum number of elements in the sequence is operating system dependent (29.11.2.3).
- 4 An *absolute path* is a path that unambiguously identifies the location of a file without reference to an additional starting location. The elements of a path that determine if it is absolute are operating system dependent. A *relative path* is a path that is not absolute, and as such, only unambiguously identifies the location of a file when resolved relative to an implied starting location. The elements of a path that determine if it is relative are operating system dependent.

[Note 2: Pathnames “.” and “..” are relative paths. — end note]

- 5 A *pathname* is a character string that represents the name of a path. Pathnames are formatted according to the generic pathname format grammar (29.11.6.2) or according to an operating system dependent *native pathname format* accepted by the host operating system.
- 6 *Pathname resolution* is the operating system dependent mechanism for resolving a pathname to a particular file in a file hierarchy. There may be multiple pathnames that resolve to the same file.

[Example 1: POSIX specifies the mechanism in section 4.11, Pathname resolution. — end example]

```
namespace std::filesystem {
 class path {
 public:
 using value_type = see below;
 using string_type = basic_string<value_type>;
 static constexpr value_type preferred_separator = see below;

 // 29.11.8.1, enumeration format
 enum format;

 // 29.11.6.5.1, constructors and destructor
 path() noexcept;
 path(const path& p);
 path(path&& p) noexcept;
 path(string_type&& source, format fmt = auto_format);
 template<class Source>
 path(const Source& source, format fmt = auto_format);
 template<class InputIterator>
 path(InputIterator first, InputIterator last, format fmt = auto_format);
 template<class Source>
 path(const Source& source, const locale& loc, format fmt = auto_format);
 };
}
```

```

template<class InputIterator>

operator<<(basic_ostream<charT, traits>& os, const path& p);

```

```

 template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, path& p);
 };
}

```

- <sup>7</sup> `value_type` is a `typedef` for the operating system dependent encoded character type used to represent pathnames.
- <sup>8</sup> The value of the `preferred_separator` member is the operating system dependent *preferred-separator* character (29.11.6.2).
- <sup>9</sup> [Example 2: For POSIX-based operating systems, `value_type` is `char` and `preferred_separator` is the slash character ('/'). For Windows-based operating systems, `value_type` is `wchar_t` and `preferred_separator` is the backslash character (L'\\'). — end example]

### 29.11.6.2 Generic pathname format

[fs.path.generic]

*pathname*:

*root-name<sub>opt</sub>* *root-directory<sub>opt</sub>* *relative-path*

*root-name*:

operating system dependent sequences of characters  
implementation-defined sequences of characters

*root-directory*:

*directory-separator*

*relative-path*:

*filename*  
*filename directory-separator relative-path*  
an empty path

*filename*:

non-empty sequence of characters other than *directory-separator* characters

*directory-separator*:

*preferred-separator* *directory-separator<sub>opt</sub>*  
*fallback-separator* *directory-separator<sub>opt</sub>*

*preferred-separator*:

operating system dependent directory separator character

*fallback-separator*:

/, if *preferred-separator* is not /

- <sup>1</sup> A *filename* is the name of a file. The *dot* and *dot-dot* filenames, consisting solely of one and two period characters respectively, have special meaning. The following characteristics of filenames are operating system dependent:

- (1.1) — The permitted characters.

[Example 1: Some operating systems prohibit the ASCII control characters (0x00 – 0x1F) in filenames. — end example]

[Note 1: Wider portability can be achieved by limiting *filename* characters to the POSIX Portable Filename Character Set:

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z  
a b c d e f g h i j k l m n o p q r s t u v w x y z  
0 1 2 3 4 5 6 7 8 9 . \_ — end note]

- (1.2) — The maximum permitted length.

- (1.3) — Filenames that are not permitted.

- (1.4) — Filenames that have special meaning.

- (1.5) — Case awareness and sensitivity during path resolution.

- (1.6) — Special rules that may apply to file types other than regular files, such as directories.

- <sup>2</sup> Except in a *root-name*, multiple successive *directory-separator* characters are considered to be the same as one *directory-separator* character.

<sup>3</sup> The dot filename is treated as a reference to the current directory. The dot-dot filename is treated as a reference to the parent directory. What the dot-dot filename refers to relative to *root-directory* is implementation-defined. Specific filenames may have special meanings for a particular operating system.

<sup>4</sup> A *root-name* identifies the starting location for pathname resolution (29.11.6). If there are no operating system dependent *root-names*, at least one implementation-defined *root-name* is required.

[*Note 2*: Many operating systems define a name beginning with two *directory-separator* characters as a *root-name* that identifies network or other resource locations. Some operating systems define a single letter followed by a colon as a drive specifier – a *root-name* identifying a specific device such as a disk drive. — *end note*]

<sup>5</sup> If a *root-name* is otherwise ambiguous, the possibility with the longest sequence of characters is chosen.

[*Note 3*: On a POSIX-like operating system, it is impossible to have a *root-name* and a *relative-path* without an intervening *root-directory* element. — *end note*]

<sup>6</sup> *Normalization* of a generic format pathname means:

1. If the path is empty, stop.
2. Replace each slash character in the *root-name* with a *preferred-separator*.
3. Replace each *directory-separator* with a *preferred-separator*.

[*Note 4*: The generic pathname grammar defines *directory-separator* as one or more slashes and *preferred-separators*. — *end note*]

4. Remove each dot filename and any immediately following *directory-separator*.
5. As long as any appear, remove a non-dot-dot filename immediately followed by a *directory-separator* and a dot-dot filename, along with any immediately following *directory-separator*.
6. If there is a *root-directory*, remove all dot-dot filenames and any *directory-separators* immediately following them.

[*Note 5*: These dot-dot filenames attempt to refer to nonexistent parent directories. — *end note*]

7. If the last filename is dot-dot, remove any trailing *directory-separator*.
8. If the path is empty, add a dot.

The result of normalization is a path in *normal form*, which is said to be *normalized*.

### 29.11.6.3 Conversions

[**fs.path.cvt**]

#### 29.11.6.3.1 Argument format conversions

[**fs.path.fmt.cvt**]

<sup>1</sup> [*Note 1*: The format conversions described in this subclause are not applied on POSIX-based operating systems because on these systems:

- (1.1) — The generic format is acceptable as a native path.
  - (1.2) — There is no need to distinguish between native format and generic format in function arguments.
  - (1.3) — Paths for regular files and paths for directories share the same syntax.
- *end note*]

<sup>2</sup> Several functions are defined to accept *detected-format* arguments, which are character sequences. A detected-format argument represents a path using either a pathname in the generic format (29.11.6.2) or a pathname in the native format (29.11.6). Such an argument is taken to be in the generic format if and only if it matches the generic format and is not acceptable to the operating system as a native path.

<sup>3</sup> [*Note 2*: Some operating systems have no unambiguous way to distinguish between native format and generic format arguments. This is by design as it simplifies use for operating systems that do not require disambiguation. An implementation for an operating system where disambiguation is required is permitted to distinguish between the formats. — *end note*]

<sup>4</sup> Pathnames are converted as needed between the generic and native formats in an operating-system-dependent manner. Let  $G(n)$  and  $N(g)$  in a mathematical sense be the implementation's functions that convert native-to-generic and generic-to-native formats respectively. If  $g=G(n)$  for some  $n$ , then  $G(N(g))=g$ ; if  $n=N(g)$  for some  $g$ , then  $N(G(n))=n$ .

[*Note 3*: Neither  $G$  nor  $N$  need be invertible. — *end note*]

<sup>5</sup> If the native format requires paths for regular files to be formatted differently from paths for directories, the path shall be treated as a directory path if its last element is a *directory-separator*, otherwise it shall be treated as a path to a regular file.

- <sup>6</sup> [Note 4: A path stores a native format pathname (29.11.6.5.6) and acts as if it also stores a generic format pathname, related as given below. The implementation can generate the generic format pathname based on the native format pathname (and possibly other information) when requested. — end note]
- <sup>7</sup> When a path is constructed from or is assigned a single representation separate from any path, the other representation is selected by the appropriate conversion function (*G* or *N*).
- <sup>8</sup> When the (new) value *p* of one representation of a path is derived from the representation of that or another path, a value *q* is chosen for the other representation. The value *q* converts to *p* (by *G* or *N* as appropriate) if any such value does so; *q* is otherwise unspecified.
- [Note 5: If *q* is the result of converting any path at all, it is the result of converting *p*. — end note]

### 29.11.6.3.2 Type and encoding conversions

[fs.path.type.cvt]

- <sup>1</sup> The *native encoding* of an ordinary character string is the operating system dependent current encoding for pathnames (29.11.6). The *native encoding* for wide character strings is the implementation-defined execution wide-character set encoding (5.3).
- <sup>2</sup> For member function arguments that take character sequences representing paths and for member functions returning strings, value type and encoding conversion is performed if the value type of the argument or return value differs from `path::value_type`. For the argument or return value, the method of conversion and the encoding to be converted to is determined by its value type:

- (2.1) — `char`: The encoding is the native ordinary encoding. The method of conversion, if any, is operating system dependent.
- [Note 1: For POSIX-based operating systems `path::value_type` is `char` so no conversion from `char` value type arguments or to `char` value type return values is performed. For Windows-based operating systems, the native ordinary encoding is determined by calling a Windows API function. — end note]
- [Note 2: This results in behavior identical to other C and C++ standard library functions that perform file operations using ordinary character strings to identify paths. Changing this behavior would be surprising and error prone. — end note]
- (2.2) — `wchar_t`: The encoding is the native wide encoding. The method of conversion is unspecified.
- [Note 3: For Windows-based operating systems `path::value_type` is `wchar_t` so no conversion from `wchar_t` value type arguments or to `wchar_t` value type return values is performed. — end note]
- (2.3) — `char8_t`: The encoding is UTF-8. The method of conversion is unspecified.
- (2.4) — `char16_t`: The encoding is UTF-16. The method of conversion is unspecified.
- (2.5) — `char32_t`: The encoding is UTF-32. The method of conversion is unspecified.

- <sup>3</sup> If the encoding being converted to has no representation for source characters, the resulting converted characters, if any, are unspecified. Implementations should not modify member function arguments if already of type `path::value_type`.

### 29.11.6.4 Requirements

[fs.path.req]

- <sup>1</sup> In addition to the requirements (29.11.3), function template parameters named `Source` shall be one of:
- (1.1) — `basic_string<EcharT, traits, Allocator>`. A function argument `const Source& source` shall have an effective range `[source.begin(), source.end()]`.
- (1.2) — `basic_string_view<EcharT, traits>`. A function argument `const Source& source` shall have an effective range `[source.begin(), source.end()]`.
- (1.3) — A type meeting the *Cpp17InputIterator* requirements that iterates over a NTCTS. The value type shall be an encoded character type. A function argument `const Source& source` shall have an effective range `[source, end]` where `end` is the first iterator value with an element value equal to `iterator_traits<Source>::value_type()`.
- (1.4) — A character array that after array-to-pointer decay results in a pointer to the start of a NTCTS. The value type shall be an encoded character type. A function argument `const Source& source` shall have an effective range `[source, end]` where `end` is the first iterator value with an element value equal to `iterator_traits<decay_t<Source>>::value_type()`.
- <sup>2</sup> Functions taking template parameters named `Source` shall not participate in overload resolution unless `Source` denotes a type other than `path`, and either
- (2.1) — `Source` is a specialization of `basic_string` or `basic_string_view`, or

- (2.2) — the `qualified-id iterator_traits<decay_t<Source>>::value_type` is valid and denotes a possibly `const` encoded character type (13.10.3).
- 3 [Note 1: See path conversions (29.11.6.3) for how the value types above and their encodings convert to `path::value_type` and its encoding. — end note]
- 4 Arguments of type `Source` shall not be null pointers.

## 29.11.6.5 Members

[`fs.path.member`]

### 29.11.6.5.1 Constructors

[`fs.path.construct`]

`path() noexcept;`

1 *Postconditions:* `empty() == true`.

`path(const path& p);`  
`path(path&& p) noexcept;`

2 *Effects:* Constructs an object of class `path` having the same pathname in the native and generic formats, respectively, as the original value of `p`. In the second form, `p` is left in a valid but unspecified state.

`path(string_type&& source, format fmt = auto_format);`

3 *Effects:* Constructs an object of class `path` for which the pathname in the detected-format of `source` has the original value of `source` (29.11.6.3.1), converting format if required (29.11.6.3.1). `source` is left in a valid but unspecified state.

```
template<class Source>
path(const Source& source, format fmt = auto_format);
template<class InputIterator>
path(InputIterator first, InputIterator last, format fmt = auto_format);
```

4 *Effects:* Let `s` be the effective range of `source` (29.11.6.4) or the range `[first, last)`, with the encoding converted if required (29.11.6.3). Finds the detected-format of `s` (29.11.6.3.1) and constructs an object of class `path` for which the pathname in that format is `s`.

```
template<class Source>
path(const Source& source, const locale& loc, format fmt = auto_format);
template<class InputIterator>
path(InputIterator first, InputIterator last, const locale& loc, format fmt = auto_format);
```

5 *Mandates:* The value type of `Source` and `InputIterator` is `char`.

6 *Effects:* Let `s` be the effective range of `source` or the range `[first, last)`, after converting the encoding as follows:

- (6.1) — If `value_type` is `wchar_t`, converts to the native wide encoding (29.11.6.3.2) using the `codecvt<wchar_t, char, mbstate_t>` facet of `loc`.
- (6.2) — Otherwise a conversion is performed using the `codecvt<wchar_t, char, mbstate_t>` facet of `loc`, and then a second conversion to the current ordinary encoding.

7 Finds the detected-format of `s` (29.11.6.3.1) and constructs an object of class `path` for which the pathname in that format is `s`.

[*Example 1:* A string is to be read from a database that is encoded in ISO/IEC 8859-1, and used to create a directory:

```
namespace fs = std::filesystem;
std::string latin1_string = read_latin1_data();
codecvt_8859_1<wchar_t> latin1_facet;
std::locale latin1_locale(std::locale(), latin1_facet);
fs::create_directory(fs::path(latin1_string, latin1_locale));
```

For POSIX-based operating systems, the path is constructed by first using `latin1_facet` to convert ISO/IEC 8859-1 encoded `latin1_string` to a wide character string in the native wide encoding (29.11.6.3.2). The resulting wide string is then converted to an ordinary character pathname string in the current native ordinary encoding. If the native wide encoding is UTF-16 or UTF-32, and the current native ordinary encoding is UTF-8, all of the characters in the ISO/IEC 8859-1 character set will be converted to their Unicode representation, but for other native ordinary encodings some characters may have no representation.

For Windows-based operating systems, the path is constructed by using `latin1_facet` to convert ISO/IEC 8859-1 encoded `latin1_string` to a UTF-16 encoded wide character pathname string. All of the characters in the ISO/IEC 8859-1 character set will be converted to their Unicode representation. — *end example*

#### 29.11.6.5.2 Assignments

[`fs.path.assign`]

```
path& operator=(const path& p);
1 Effects: If *this and p are the same object, has no effect. Otherwise, sets both respective pathnames
of *this to the respective pathnames of p.
2 Returns: *this.

path& operator=(path&& p) noexcept;
3 Effects: If *this and p are the same object, has no effect. Otherwise, sets both respective pathnames
of *this to the respective pathnames of p. p is left in a valid but unspecified state.
[Note 1: A valid implementation is swap(p). — end note]
4 Returns: *this.

path& operator=(string_type&& source);
path& assign(string_type&& source);
5 Effects: Sets the pathname in the detected-format of source to the original value of source. source
is left in a valid but unspecified state.
6 Returns: *this.

template<class Source>
path& operator=(const Source& source);
template<class Source>
path& assign(const Source& source);
template<class InputIterator>
path& assign(InputIterator first, InputIterator last);
7 Effects: Let s be the effective range of source (29.11.6.4) or the range [first, last), with the
encoding converted if required (29.11.6.3). Finds the detected-format of s (29.11.6.3.1) and sets the
pathname in that format to s.
8 Returns: *this.
```

#### 29.11.6.5.3 Appends

[`fs.path.append`]

1 The append operations use `operator/=` to denote their semantic effect of appending *preferred-separator* when needed.

```
path& operator/=(const path& p);
2 Effects: If p.is_absolute() || (p.has_root_name() && p.root_name() != root_name()), then
operator=(p).
3 Otherwise, modifies *this as if by these steps:
(3.1) — If p.has_root_directory(), then removes any root directory and relative path from the generic
format pathname. Otherwise, if !has_root_directory() && is_absolute() is true or if has_
filename() is true, then appends path::preferred_separator to the generic format pathname.
(3.2) — Then appends the native format pathname of p, omitting any root-name from its generic format
pathname, to the native format pathname.
```

4 [Example 1: Even if //host is interpreted as a *root-name*, and even if `operator/` appends a backslash as the
separator, both of the paths `path("//host")/"foo"` and `path("//host/")/"foo"` equal "`//host/foo`".

Expression examples:

```
// On POSIX,
path("foo") /= path(""); // yields path("foo/")
path("foo") /= path("/bar"); // yields path("/bar")

// On Windows,
path("foo") /= path(""); // yields path("foo\\")
path("foo") /= path("/bar"); // yields path("\\bar")
```

```

path("foo") /= path("c:/bar"); // yields path("c:/bar")
path("foo") /= path("c:");
path("c:") /= path("");
path("c:foo") /= path("/bar"); // yields path("c:/bar")
path("c:foo") /= path("c:bar"); // yields path("c:foo\\bar")
— end example]

```

5     >Returns: \*this.

```

template<class Source>
path& operator/=(const Source& source);
template<class Source>
path& append(const Source& source);
6 Effects: Equivalent to: return operator/=(path(source));
template<class InputIterator>
path& append(InputIterator first, InputIterator last);
7 Effects: Equivalent to: return operator/=(path(first, last));

```

#### 29.11.6.5.4 Concatenation

[fs.path.concat]

```

path& operator+=(const path& x);
path& operator+=(const string_type& x);
path& operator+=(basic_string_view<value_type> x);
path& operator+=(const value_type* x);
template<class Source>
path& operator+=(const Source& x);
template<class Source>
path& concat(const Source& x);

```

1     Effects: Appends path(x).native() to the pathname in the native format.

[Note 1: This directly manipulates the value of native(), which is not necessarily portable between operating systems. — end note]

2     >Returns: \*this.

```

path& operator+=(value_type x);
template<class EcharT>
path& operator+=(EcharT x);
3 Effects: Equivalent to: return *this += basic_string_view(&x, 1);

template<class InputIterator>
path& concat(InputIterator first, InputIterator last);
4 Effects: Equivalent to: return *this += path(first, last);

```

#### 29.11.6.5.5 Modifiers

[fs.path.modifiers]

```
void clear() noexcept;
```

1     Postconditions: empty() == true.

```
path& make_preferred();
```

2     Effects: Each directory-separator of the pathname in the generic format is converted to preferred-separator.

3     >Returns: \*this.

4     [Example 1:

```

path p("foo/bar");
std::cout << p << '\n';
p.make_preferred();
std::cout << p << '\n';

```

On an operating system where preferred-separator is a slash, the output is:

```

"foo/bar"
"foo/bar"

```

On an operating system where *preferred-separator* is a backslash, the output is:

```
"foo/bar"
"foo\bar"
— end example]
```

```
path& remove_filename();
```

5     *Effects*: Remove the generic format pathname of `filename()` from the generic format pathname.

6     *Postconditions*: `!has_filename()`.

7     *Returns*: `*this`.

8     [*Example 2*:

```
path("foo/bar").remove_filename(); // yields "foo/"
path("foo/").remove_filename(); // yields "foo/"
path("/foo").remove_filename(); // yields "/"
path("//").remove_filename(); // yields "/"
```

— end example]

```
path& replace_filename(const path& replacement);
```

9     *Effects*: Equivalent to:

```
remove_filename();
operator/=(replacement);
```

10    *Returns*: `*this`.

11    [*Example 3*:

```
path("/foo").replace_filename("bar"); // yields "/bar" on POSIX
path("//").replace_filename("bar"); // yields "/bar" on POSIX
```

— end example]

```
path& replace_extension(const path& replacement = path());
```

12    *Effects*:

(12.1) — Any existing `extension()` (29.11.6.5.9) is removed from the pathname in the generic format, then

(12.2) — If `replacement` is not empty and does not begin with a dot character, a dot character is appended to the pathname in the generic format, then

(12.3) — `operator+=(replacement);`.

13    *Returns*: `*this`.

```
void swap(path& rhs) noexcept;
```

14    *Effects*: Swaps the contents (in all formats) of the two paths.

15    *Complexity*: Constant time.

### 29.11.6.5.6 Native format observers

[`fs.path.native.obs`]

1    The string returned by all native format observers is in the native pathname format (29.11.6).

```
const string_type& native() const noexcept;
```

2     *Returns*: The pathname in the native format.

```
const value_type* c_str() const noexcept;
```

3     *Effects*: Equivalent to: `return native().c_str();`

```
operator string_type() const;
```

4     *Returns*: `native()`.

5     [*Note 1*: Conversion to `string_type` is provided so that an object of class `path` can be given as an argument to existing standard library file stream constructors and open functions. — end note]

```
template<class EcharT, class traits = char_traits<EcharT>,
 class Allocator = allocator<EcharT>>
basic_string<EcharT, traits, Allocator>
string(const Allocator& a = Allocator()) const;
```

6     *Returns:* native().

7     *Remarks:* All memory allocation, including for the return value, shall be performed by a. Conversion, if any, is specified by 29.11.6.3.

```
std::string string() const;
std::wstring wstring() const;
std::u8string u8string() const;
std::u16string u16string() const;
std::u32string u32string() const;
```

8     *Returns:* native().

9     *Remarks:* Conversion, if any, is performed as specified by 29.11.6.3.

#### 29.11.6.5.7 Generic format observers

[fs.path.generic.obs]

1     Generic format observer functions return strings formatted according to the generic pathname format (29.11.6.2). A single slash ('/') character is used as the *directory-separator*.

2     [*Example 1:* On an operating system that uses backslash as its *preferred-separator*,

```
path("foo\\bar").generic_string()
returns "foo/bar". — end example]
```

```
template<class EcharT, class traits = char_traits<EcharT>,
 class Allocator = allocator<EcharT>>
basic_string<EcharT, traits, Allocator>
generic_string(const Allocator& a = Allocator()) const;
```

3     *Returns:* The pathname in the generic format.

4     *Remarks:* All memory allocation, including for the return value, shall be performed by a. Conversion, if any, is specified by 29.11.6.3.

```
std::string generic_string() const;
std::wstring generic_wstring() const;
std::u8string generic_u8string() const;
std::u16string generic_u16string() const;
std::u32string generic_u32string() const;
```

5     *Returns:* The pathname in the generic format.

6     *Remarks:* Conversion, if any, is specified by 29.11.6.3.

#### 29.11.6.5.8 Compare

[fs.path.compare]

```
int compare(const path& p) const noexcept;
```

1     *Returns:*

(1.1)     — Let *rootNameComparison* be the result of *this->root\_name().native().compare(p.root\_name().native())*. If *rootNameComparison* is not 0, *rootNameComparison*.

(1.2)     — Otherwise, if !*this->has\_root\_directory()* and *p.has\_root\_directory()*, a value less than 0.

(1.3)     — Otherwise, if *this->has\_root\_directory()* and !*p.has\_root\_directory()*, a value greater than 0.

(1.4)     — Otherwise, if *native()* for the elements of *this->relative\_path()* are lexicographically less than *native()* for the elements of *p.relative\_path()*, a value less than 0.

(1.5)     — Otherwise, if *native()* for the elements of *this->relative\_path()* are lexicographically greater than *native()* for the elements of *p.relative\_path()*, a value greater than 0.

(1.6)     — Otherwise, 0.

```
int compare(const string_type& s) const;
int compare(basic_string_view<value_type> s) const;
int compare(const value_type* s) const;
```

2     *Effects:* Equivalent to: return compare(path(s));

#### 29.11.6.5.9 Decomposition

[fs.path.decompose]

```
path root_name() const;
```

1     *Returns:* *root-name*, if the pathname in the generic format includes *root-name*, otherwise path().

```
path root_directory() const;
```

2     *Returns:* *root-directory*, if the pathname in the generic format includes *root-directory*, otherwise path().

```
path root_path() const;
```

3     *Returns:* root\_name() / root\_directory().

```
path relative_path() const;
```

4     *Returns:* A path composed from the pathname in the generic format, if empty() is false, beginning with the first *filename* after root\_path(). Otherwise, path().

```
path parent_path() const;
```

5     *Returns:* \*this if has\_relative\_path() is false, otherwise a path whose generic format pathname is the longest prefix of the generic format pathname of \*this that produces one fewer element in its iteration.

```
path filename() const;
```

6     *Returns:* relative\_path().empty() ? path() : ---end().

7     [*Example 1:*

```
path("/foo/bar.txt").filename(); // yields "bar.txt"
path("/foo/bar").filename(); // yields "bar"
path("/foo/bar/").filename(); // yields ""
path("//").filename(); // yields ""
path("//host").filename(); // yields ""
path(".").filename(); // yields "."
path("../").filename(); // yields ".."
```

— end example]

```
path stem() const;
```

8     *Returns:* Let f be the generic format pathname of filename(). Returns a path whose pathname in the generic format is

(8.1)     — f, if it contains no periods other than a leading period or consists solely of one or two periods;

(8.2)     — otherwise, the prefix of f ending before its last period.

9     [*Example 2:*

```
std::cout << path("/foo/bar.txt").stem(); // outputs "bar"
path p = "foo.bar.baz.tar";
for (; !p.extension().empty(); p = p.stem())
 std::cout << p.extension() << '\n';
// outputs: .tar
// .baz
// .bar
```

— end example]

```
path extension() const;
```

10    *Returns:* A path whose pathname in the generic format is the suffix of filename() not included in stem().

11    [*Example 3:*

```
path("/foo/bar.txt").extension(); // yields ".txt" and stem() is "bar"
```

```

path("/foo/bar").extension(); // yields "" and stem() is "bar"
path("/foo/.profile").extension(); // yields "" and stem() is ".profile"
path(".bar").extension(); // yields "" and stem() is ".bar"
path("../bar").extension(); // yields ".bar" and stem() is "."
— end example]

```

12 [Note 1: The period is included in the return value so that it is possible to distinguish between no extension and an empty extension. — end note]

13 [Note 2: On non-POSIX operating systems, for a path p, it is possible that p.stem() + p.extension() == p.filename() is false, even though the generic format pathnames are the same. — end note]

#### 29.11.6.5.10 Query

[fs.path.query]

```
[[nodiscard]] bool empty() const noexcept;
```

1     >Returns: true if the pathname in the generic format is empty, otherwise false.

```
bool has_root_path() const;
```

2     >Returns: !root\_path().empty().

```
bool has_root_name() const;
```

3     >Returns: !root\_name().empty().

```
bool has_root_directory() const;
```

4     >Returns: !root\_directory().empty().

```
bool has_relative_path() const;
```

5     >Returns: !relative\_path().empty().

```
bool has_parent_path() const;
```

6     >Returns: !parent\_path().empty().

```
bool has_filename() const;
```

7     >Returns: !filename().empty().

```
bool has_stem() const;
```

8     >Returns: !stem().empty().

```
bool has_extension() const;
```

9     >Returns: !extension().empty().

```
bool is_absolute() const;
```

10   >Returns: true if the pathname in the native format contains an absolute path (29.11.6), otherwise false.

11 [Example 1: path("/") is\_absolute() is true for POSIX-based operating systems, and false for Windows-based operating systems. — end example]

```
bool is_relative() const;
```

12   >Returns: !is\_absolute().

#### 29.11.6.5.11 Generation

[fs.path.gen]

```
path lexically_normal() const;
```

1     >Returns: A path whose pathname in the generic format is the normal form (29.11.6.2) of the pathname in the generic format of \*this.

2 [Example 1:

```

assert(path("foo/./bar/..").lexically_normal() == "foo/");
assert(path("foo///bar/..").lexically_normal() == "foo/");

```

The above assertions will succeed. On Windows, the returned path's directory-separator characters will be backslashes rather than slashes, but that does not affect path equality. — end example]

`path lexically_relative(const path& base) const;`

3     *Returns:* `*this` made relative to `base`. Does not resolve (29.11.6) symlinks. Does not first normalize (29.11.6.2) `*this` or `base`.

4     *Effects:* If:

- (4.1)     — `root_name() != base.root_name()` is true, or
- (4.2)     — `is_absolute() != base.is_absolute()` is true, or
- (4.3)     — `!has_root_directory() && base.has_root_directory()` is true, or
- (4.4)     — any `filename` in `relative_path()` or `base.relative_path()` can be interpreted as a *root-name*, returns `path()`.

[*Note 1:* On a POSIX implementation, no `filename` in a *relative-path* is acceptable as a *root-name*. — *end note*]

Determines the first mismatched element of `*this` and `base` as if by:

```
auto [a, b] = mismatch(begin(), end(), base.begin(), base.end());
```

Then,

- (4.5)     — if `a == end()` and `b == base.end()`, returns `path(".")`; otherwise
- (4.6)     — let `n` be the number of `filename` elements in `[b, base.end()]` that are not dot or dot-dot or empty, minus the number that are dot-dot. If `n<0`, returns `path()`; otherwise
- (4.7)     — if `n == 0` and (`a == end()` || `a->empty()`), returns `path(".")`; otherwise
- (4.8)     — returns an object of class `path` that is default-constructed, followed by
  - application of `operator/=(path("...")) n times`, and then
  - application of `operator/=` for each element in `[a, end()]`.

5     *[Example 2:*

```
assert(path("/a/d").lexically_relative("/a/b/c") == ".../d");
assert(path("/a/b/c").lexically_relative("/a/d") == ".../b/c");
assert(path("a/b/c").lexically_relative("a") == "b/c");
assert(path("a/b/c").lexically_relative("a/b/c/x/y") == "...");
assert(path("a/b/c").lexically_relative("a/b/c") == ".");
assert(path("a/b").lexically_relative("c/d") == ".../a/b");
```

The above assertions will succeed. On Windows, the returned path's *directory-separator* characters will be backslashes rather than slashes, but that does not affect `path` equality. — *end example*]

6     *[Note 2:* If symlink following semantics are desired, use the operational function `relative()`. — *end note*]

7     *[Note 3:* If normalization (29.11.6.2) is needed to ensure consistent matching of elements, apply `lexically_normal()` to `*this`, `base`, or both. — *end note*]

`path lexically_proximate(const path& base) const;`

8     *Returns:* If the value of `lexically_relative(base)` is not an empty path, return it. Otherwise return `*this`.

9     *[Note 4:* If symlink following semantics are desired, use the operational function `proximate()`. — *end note*]

10     *[Note 5:* If normalization (29.11.6.2) is needed to ensure consistent matching of elements, apply `lexically_normal()` to `*this`, `base`, or both. — *end note*]

## 29.11.6.6 Iterators

[`fs.path.itr`]

1 Path iterators iterate over the elements of the pathname in the generic format (29.11.6.2).

2 A `path::iterator` is a constant iterator meeting all the requirements of a bidirectional iterator (23.3.5.6) except that, for dereferenceable iterators `a` and `b` of type `path::iterator` with `a == b`, there is no requirement that `*a` and `*b` are bound to the same object. Its `value_type` is `path`.

3 Calling any non-const member function of a `path` object invalidates all iterators referring to elements of that object.

4 For the elements of the pathname in the generic format, the forward traversal order is as follows:

- (4.1)     — The *root-name* element, if present.

- (4.2) — The *root-directory* element, if present.  
 [Note 1: The generic format is required to ensure lexicographical comparison works correctly. — end note]
- (4.3) — Each successive *filename* element, if present.
- (4.4) — An empty element, if a trailing non-root *directory-separator* is present.

5 The backward traversal order is the reverse of forward traversal.

```
iterator begin() const;
6 Returns: An iterator for the first present element in the traversal list above. If no elements are present,
 the end iterator.

iterator end() const;
7 Returns: The end iterator.
```

#### 29.11.6.7 Inserter and extractor

[fs.path.io]

```
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const path& p);
1 Effects: Equivalent to os << quoted(p.string<charT, traits>()).
[Note 1: The quoted function is described in 29.7.8. — end note]
2 Returns: os.

template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, path& p);
3 Effects: Equivalent to:
 basic_string<charT, traits> tmp;
 is >> quoted(tmp);
 p = tmp;
4 Returns: is.
```

#### 29.11.6.8 Non-member functions

[fs.path.nonmember]

```
void swap(path& lhs, path& rhs) noexcept;
1 Effects: Equivalent to lhs.swap(rhs).

size_t hash_value(const path& p) noexcept;
2 Returns: A hash value for the path p. If for two paths, p1 == p2 then hash_value(p1) == hash_value(p2).

friend bool operator==(const path& lhs, const path& rhs) noexcept;
3 Returns: lhs.compare(rhs) == 0.
4 [Note 1: Path equality and path equivalence have different semantics.
(4.1) — Equality is determined by the path non-member operator==, which considers the two paths' lexical
 representations only.
 [Example 1: path("foo") == "bar" is never true. — end example]
(4.2) — Equivalence is determined by the equivalent() non-member function, which determines if two paths
 resolve (29.11.6) to the same file system entity.
 [Example 2: equivalent("foo", "bar") will be true when both paths resolve to the same file. — end
 example]
 — end note]

friend strong_ordering operator<=(const path& lhs, const path& rhs) noexcept;
5 Returns: lhs.compare(rhs) <= 0.
```

```
friend path operator/(const path& lhs, const path& rhs);
6 Effects: Equivalent to: return path(lhs) /= rhs;
```

### 29.11.7 Class filesystem\_error [fs.class.filesystem.error]

#### 29.11.7.1 General [fs.class.filesystem.error.general]

```
namespace std::filesystem {
 class filesystem_error : public system_error {
public:
 filesystem_error(const string& what_arg, error_code ec);
 filesystem_error(const string& what_arg,
 const path& p1, error_code ec);
 filesystem_error(const string& what_arg,
 const path& p1, const path& p2, error_code ec);

 const path& path1() const noexcept;
 const path& path2() const noexcept;
 const char* what() const noexcept override;
};

}
```

- <sup>1</sup> The class `filesystem_error` defines the type of objects thrown as exceptions to report file system errors from functions described in subclause 29.11.

#### 29.11.7.2 Members [fs.filesystem.error.members]

- <sup>1</sup> Constructors are provided that store zero, one, or two paths associated with an error.

```
filesystem_error(const string& what_arg, error_code ec);
```

2 Postconditions:

- (2.1) — `code()` == `ec`,
- (2.2) — `path1().empty()` == `true`,
- (2.3) — `path2().empty()` == `true`, and
- (2.4) — `string_view(what()).find(what_arg.c_str()) != string_view::npos`.

```
filesystem_error(const string& what_arg, const path& p1, error_code ec);
```

3 Postconditions:

- (3.1) — `code()` == `ec`,
- (3.2) — `path1()` returns a reference to the stored copy of `p1`,
- (3.3) — `path2().empty()` == `true`, and
- (3.4) — `string_view(what()).find(what_arg.c_str()) != string_view::npos`.

```
filesystem_error(const string& what_arg, const path& p1, const path& p2, error_code ec);
```

4 Postconditions:

- (4.1) — `code()` == `ec`,
- (4.2) — `path1()` returns a reference to the stored copy of `p1`,
- (4.3) — `path2()` returns a reference to the stored copy of `p2`, and
- (4.4) — `string_view(what()).find(what_arg.c_str()) != string_view::npos`.

```
const path& path1() const noexcept;
```

- <sup>5</sup> Returns: A reference to the copy of `p1` stored by the constructor, or, if none, an empty path.

```
const path& path2() const noexcept;
```

- <sup>6</sup> Returns: A reference to the copy of `p2` stored by the constructor, or, if none, an empty path.

```
const char* what() const noexcept override;
```

- <sup>7</sup> *Returns:* An NTBS that incorporates the `what_arg` argument supplied to the constructor. The exact format is unspecified. Implementations should include the `system_error::what()` string and the pathnames of `path1` and `path2` in the native format in the returned string.

## 29.11.8 Enumerations

[fs.enum]

### 29.11.8.1 Enum `path::format`

[fs.enum.path.format]

- <sup>1</sup> This enum specifies constants used to identify the format of the character sequence, with the meanings listed in [Table 128](#).

Table 128: `Enum path::format` [tab:fs.enum.path.format]

| Name                        | Meaning                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>native_format</code>  | The native pathname format.                                                                                                                                                                                                                                                                                                                                     |
| <code>generic_format</code> | The generic pathname format.                                                                                                                                                                                                                                                                                                                                    |
| <code>auto_format</code>    | The interpretation of the format of the character sequence is implementation-defined. The implementation may inspect the content of the character sequence to determine the format.<br><i>Recommended practice:</i> For POSIX-based systems, native and generic formats are equivalent and the character sequence should always be interpreted in the same way. |

### 29.11.8.2 Enum class `file_type`

[fs.enum.file.type]

- <sup>1</sup> This enum class specifies constants used to identify file types, with the meanings listed in [Table 129](#). The values of the constants are distinct.

Table 129: `Enum class file_type` [tab:fs.enum.file.type]

| Constant                            | Meaning                                                                                                                                                                                                                                           |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>none</code>                   | The type of the file has not been determined or an error occurred while trying to determine the type.                                                                                                                                             |
| <code>not_found</code>              | Pseudo-type indicating the file was not found.<br>[Note 1: The file not being found is not considered an error while determining the type of a file. — <i>end note</i> ]                                                                          |
| <code>regular</code>                | Regular file                                                                                                                                                                                                                                      |
| <code>directory</code>              | Directory file                                                                                                                                                                                                                                    |
| <code>symlink</code>                | Symbolic link file                                                                                                                                                                                                                                |
| <code>block</code>                  | Block special file                                                                                                                                                                                                                                |
| <code>character</code>              | Character special file                                                                                                                                                                                                                            |
| <code>fifo</code>                   | FIFO or pipe file                                                                                                                                                                                                                                 |
| <code>socket</code>                 | Socket file                                                                                                                                                                                                                                       |
| <code>implementation-defined</code> | Implementations that support file systems having file types in addition to the above <code>file_type</code> types shall supply implementation-defined <code>file_type</code> constants to separately identify each of those additional file types |
| <code>unknown</code>                | The file exists but the type cannot be determined                                                                                                                                                                                                 |

### 29.11.8.3 Enum class `copy_options`

[fs.enum.copy.opts]

- <sup>1</sup> The `enum class` type `copy_options` is a bitmask type ([16.3.3.3.4](#)) that specifies bitmask constants used to control the semantics of copy operations. The constants are specified in option groups with the meanings listed in [Table 130](#). The constant `none` represents the empty bitmask, and is shown in each option group for purposes of exposition; implementations shall provide only a single definition. Every other constant in the table represents a distinct bitmask element.

Table 130: Enum class `copy_options` [tab:fs.enum.copy.opts]

| <b>Option group controlling <code>copy_file</code> function effects for existing target files</b>   |                                                                                                                                                    |
|-----------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Constant</b>                                                                                     | <b>Meaning</b>                                                                                                                                     |
| <code>none</code>                                                                                   | (Default) Error; file already exists.                                                                                                              |
| <code>skip_existing</code>                                                                          | Do not overwrite existing file, do not report an error.                                                                                            |
| <code>overwrite_existing</code>                                                                     | Overwrite the existing file.                                                                                                                       |
| <code>update_existing</code>                                                                        | Overwrite the existing file if it is older than the replacement file.                                                                              |

| <code>set_uid</code>      | 04000            | <code>S_ISUID</code> | Set-user-ID on execution                                                                                                    |
| <code>set_gid</code>      | 02000            | <code>S_ISGID</code> | Set-group-ID on execution                                                                                                   |
| <code>sticky_bit</code>   | 01000            | <code>S_ISVTX</code> | Operating system dependent.                                                                                                 |
| <code>mask</code>         | 07777            |                      | <code>all   set_uid   set_gid   sticky_bit</code>                                                                           |
| <code>unknown</code>      | 0xFFFF           |                      | The permissions are not known, such as when a <code>file_status</code> object is created without specifying the permissions |

**29.11.8.4 Enum class perms**

[fs.enum.perms]

- <sup>1</sup> The enum class type `perms` is a bitmask type (16.3.3.4) that specifies bitmask constants used to identify file permissions, with the meanings listed in Table 131.

**29.11.8.5 Enum class perm\_options**

[fs.enum.perm.opts]

- <sup>1</sup> The enum class type `perm_options` is a bitmask type (16.3.3.4) that specifies bitmask constants used to control the semantics of permissions operations, with the meanings listed in Table 132. The bitmask constants are bitmask elements. In Table 132 `perm` denotes a value of type `perms` passed to `permissions`.

Table 132: Enum class `perm_options` [tab:fs.enum.perm.opts]

| Name                  | Meaning                                                                                                                                                               |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>replace</code>  | <code>permissions</code> shall replace the file's permission bits with <code>perm</code>                                                                              |
| <code>add</code>      | <code>permissions</code> shall replace the file's permission bits with the bitwise OR of <code>perm</code> and the file's current permission bits.                    |
| <code>remove</code>   | <code>permissions</code> shall replace the file's permission bits with the bitwise AND of the complement of <code>perm</code> and the file's current permission bits. |
| <code>nofollow</code> | <code>permissions</code> shall change the permissions of a symbolic link itself rather than the permissions of the file the link resolves to.                         |

**29.11.8.6 Enum class directory\_options**

[fs.enum.dir.opts]

- <sup>1</sup> The enum class type `directory_options` is a bitmask type (16.3.3.4) that specifies bitmask constants used to identify directory traversal options, with the meanings listed in Table 133. The constant `none` represents the empty bitmask; every other constant in the table represents a distinct bitmask element.

Table 133: Enum class `directory_options` [tab:fs.enum.dir.opts]

| Name                                  | Meaning                                                            |
|---------------------------------------|--------------------------------------------------------------------|
| <code>none</code>                     | (Default) Skip directory symlinks, permission denied is an error.  |
| <code>follow_directory_symlink</code> | Follow rather than skip directory symlinks.                        |
| <code>skip_permission_denied</code>   | Skip directories that would otherwise result in permission denied. |

**29.11.9 Class file\_status**

[fs.class.file.status]

**29.11.9.1 General**

[fs.class.file.status.general]

```
namespace std::filesystem {
 class file_status {
 public:
 // 29.11.9.2, constructors and destructor
 file_status() noexcept : file_status(file_type::none) {}
 explicit file_status(file_type ft,
 perms prms = perms::unknown) noexcept;
 file_status(const file_status&) noexcept = default;
 file_status(file_status&&) noexcept = default;
 ~file_status();

 // assignments
 file_status& operator=(const file_status&) noexcept = default;
 file_status& operator=(file_status&&) noexcept = default;

 // 29.11.9.4, modifiers
 void type(file_type ft) noexcept;
 void permissions(perms prms) noexcept;
```

```

// 29.11.9.3, observers
file_type type() const noexcept;
perms permissions() const noexcept;

friend bool operator==(const file_status& lhs, const file_status& rhs) noexcept
{ return lhs.type() == rhs.type() && lhs.permissions() == rhs.permissions(); }
};

}

```

- 1 An object of type `file_status` stores information about the type and permissions of a file.

### 29.11.9.2 Constructors

[fs.file.status.cons]

```
explicit file_status(file_type ft, perms prms = perms::unknown) noexcept;
```

1 Postconditions: `type() == ft` and `permissions() == prms`.

### 29.11.9.3 Observers

[fs.file.status.obs]

```
file_type type() const noexcept;
```

- 1 Returns: The value of `type()` specified by the postconditions of the most recent call to a constructor, `operator=`, or `type(file_type)` function.

```
perms permissions() const noexcept;
```

- 2 Returns: The value of `permissions()` specified by the postconditions of the most recent call to a constructor, `operator=`, or `permissions(perms)` function.

### 29.11.9.4 Modifiers

[fs.file.status.mods]

```
void type(file_type ft) noexcept;
```

- 1 Postconditions: `type() == ft`.

```
void permissions(perms prms) noexcept;
```

- 2 Postconditions: `permissions() == prms`.

## 29.11.10 Class `directory_entry`

[fs.class.directory.entry]

### 29.11.10.1 General

[fs.class.directory.entry.general]

```

namespace std::filesystem {
 class directory_entry {
 public:
 // 29.11.10.2, constructors and destructor
 directory_entry() noexcept = default;
 directory_entry(const directory_entry&) = default;
 directory_entry(directory_entry&&) noexcept = default;
 explicit directory_entry(const filesystem::path& p);
 directory_entry(const filesystem::path& p, error_code& ec);
 ~directory_entry();

 // assignments
 directory_entry& operator=(const directory_entry&) = default;
 directory_entry& operator=(directory_entry&&) noexcept = default;

 // 29.11.10.3, modifiers
 void assign(const filesystem::path& p);
 void assign(const filesystem::path& p, error_code& ec);
 void replace_filename(const filesystem::path& p);
 void replace_filename(const filesystem::path& p, error_code& ec);
 void refresh();
 void refresh(error_code& ec) noexcept;

 // 29.11.10.4, observers
 const filesystem::path& path() const noexcept;
 operator const filesystem::path&() const noexcept;
 bool exists() const;
 };
}

```

```

 bool exists(error_code& ec) const noexcept;
 bool is_block_file() const;
 bool is_block_file(error_code& ec) const noexcept;
 bool is_character_file() const;
 bool is_character_file(error_code& ec) const noexcept;
 bool is_directory() const;
 bool is_directory(error_code& ec) const noexcept;
 bool is_fifo() const;
 bool is_fifo(error_code& ec) const noexcept;
 bool is_other() const;
 bool is_other(error_code& ec) const noexcept;
 bool is_regular_file() const;
 bool is_regular_file(error_code& ec) const noexcept;
 bool is_socket() const;
 bool is_socket(error_code& ec) const noexcept;
 bool is_symlink() const;
 bool is_symlink(error_code& ec) const noexcept;
 uintmax_t file_size() const;
 uintmax_t file_size(error_code& ec) const noexcept;
 uintmax_t hard_link_count() const;
 uintmax_t hard_link_count(error_code& ec) const noexcept;
 file_time_type last_write_time() const;
 file_time_type last_write_time(error_code& ec) const noexcept;
 file_status status() const;
 file_status status(error_code& ec) const noexcept;
 file_status symlink_status() const;
 file_status symlink_status(error_code& ec) const noexcept;

 bool operator==(const directory_entry& rhs) const noexcept;
 strong_ordering operator<=(const directory_entry& rhs) const noexcept;

private:
 filesystem::path pathobject; // exposition only
 friend class directory_iterator; // exposition only
};

}

```

- <sup>1</sup> A `directory_entry` object stores a path object and may store additional objects for file attributes such as hard link count, status, symlink status, file size, and last write time.
- <sup>2</sup> Implementations should store such additional file attributes during directory iteration if their values are available and storing the values would allow the implementation to eliminate file system accesses by `directory_entry` observer functions (29.11.13). Such stored file attribute values are said to be *cached*.
- <sup>3</sup> [Note 1: For purposes of exposition, class `directory_iterator` (29.11.11) is shown above as a friend of class `directory_entry`. Friendship allows the `directory_iterator` implementation to cache already available attribute values directly into a `directory_entry` object without the cost of an unneeded call to `refresh()`. —end note]
- <sup>4</sup> [Example 1:

```

using namespace std::filesystem;

// use possibly cached last write time to minimize disk accesses
for (auto&& x : directory_iterator("."))

{
 std::cout << x.path() << " " << x.last_write_time() << std::endl;
}

// call refresh() to refresh a stale cache
for (auto&& x : directory_iterator("."))

{
 lengthy_function(x.path()); // cache becomes stale
 x.refresh();
 std::cout << x.path() << " " << x.last_write_time() << std::endl;
}

```

On implementations that do not cache the last write time, both loops will result in a potentially expensive call to the `std::filesystem::last_write_time` function. On implementations that do cache the last write time, the first loop will use the cached value and so will not result in a potentially expensive call to the `std::filesystem::last_write_time` function. The code is portable to any implementation, regardless of whether or not it employs caching. —end example]

### 29.11.10.2 Constructors

[fs.dir.entry.cons]

```
explicit directory_entry(const filesystem::path& p);
directory_entry(const filesystem::path& p, error_code& ec);
```

1    *Effects:* Calls `refresh()` or `refresh(ec)`, respectively.

2    *Postconditions:* `path() == p` if no error occurs, otherwise `path() == filesystem::path()`.

3    *Throws:* As specified in [29.11.5](#).

### 29.11.10.3 Modifiers

[fs.dir.entry.mods]

```
void assign(const filesystem::path& p);
void assign(const filesystem::path& p, error_code& ec);
```

1    *Effects:* Equivalent to `pathobject = p`, then `refresh()` or `refresh(ec)`, respectively. If an error occurs, the values of any cached attributes are unspecified.

2    *Throws:* As specified in [29.11.5](#).

```
void replace_filename(const filesystem::path& p);
void replace_filename(const filesystem::path& p, error_code& ec);
```

3    *Effects:* Equivalent to `pathobject.replace_filename(p)`, then `refresh()` or `refresh(ec)`, respectively. If an error occurs, the values of any cached attributes are unspecified.

*Throws:* As specified in [29.11.5](#).

```
void refresh();
void refresh(error_code& ec) noexcept;
```

4    *Effects:* Stores the current values of any cached attributes of the file `p` resolves to. If an error occurs, an error is reported ([29.11.5](#)) and the values of any cached attributes are unspecified.

5    *Throws:* As specified in [29.11.5](#).

6    [Note 1: Implementations of `directory_iterator` ([29.11.11](#)) are prohibited from directly or indirectly calling the `refresh` function as described in [29.11.11.1](#). —end note]

### 29.11.10.4 Observers

[fs.dir.entry.obs]

1    Unqualified function names in the *Returns:* elements of the `directory_entry` observers described below refer to members of the `std::filesystem` namespace.

```
const filesystem::path& path() const noexcept;
operator const filesystem::path&() const noexcept;
```

2    *Returns:* `pathobject`.

```
bool exists() const;
bool exists(error_code& ec) const noexcept;
```

3    *Returns:* `exists(this->status())` or `exists(this->status(ec))`, respectively.

4    *Throws:* As specified in [29.11.5](#).

```
bool is_block_file() const;
bool is_block_file(error_code& ec) const noexcept;
```

5    *Returns:* `is_block_file(this->status())` or `is_block_file(this->status(ec))`, respectively.

6    *Throws:* As specified in [29.11.5](#).

```
bool is_character_file() const;
bool is_character_file(error_code& ec) const noexcept;
```

7    *Returns:* `is_character_file(this->status())` or `is_character_file(this->status(ec))`, respectively.

8       *Throws:* As specified in [29.11.5](#).

```
bool is_directory() const;
bool is_directory(error_code& ec) const noexcept;
```

9       *Returns:* `is_directory(this->status())` or `is_directory(this->status(ec))`, respectively.

10      *Throws:* As specified in [29.11.5](#).

```
bool is_fifo() const;
bool is_fifo(error_code& ec) const noexcept;
```

11     *Returns:* `is_fifo(this->status())` or `is_fifo(this->status(ec))`, respectively.

12     *Throws:* As specified in [29.11.5](#).

```
bool is_other() const;
bool is_other(error_code& ec) const noexcept;
```

13     *Returns:* `is_other(this->status())` or `is_other(this->status(ec))`, respectively.

14     *Throws:* As specified in [29.11.5](#).

```
bool is_regular_file() const;
bool is_regular_file(error_code& ec) const noexcept;
```

15     *Returns:* `is_regular_file(this->status())` or `is_regular_file(this->status(ec))`, respectively.

16     *Throws:* As specified in [29.11.5](#).

```
bool is_socket() const;
bool is_socket(error_code& ec) const noexcept;
```

17     *Returns:* `is_socket(this->status())` or `is_socket(this->status(ec))`, respectively.

18     *Throws:* As specified in [29.11.5](#).

```
bool is_symlink() const;
bool is_symlink(error_code& ec) const noexcept;
```

19     *Returns:* `is_symlink(this->symlink_status())` or `is_symlink(this->symlink_status(ec))`, respectively.

20     *Throws:* As specified in [29.11.5](#).

```
uintmax_t file_size() const;
uintmax_t file_size(error_code& ec) const noexcept;
```

21     *Returns:* If cached, the file size attribute value. Otherwise, `file_size(path())` or `file_size(path(), ec)`, respectively.

22     *Throws:* As specified in [29.11.5](#).

```
uintmax_t hard_link_count() const;
uintmax_t hard_link_count(error_code& ec) const noexcept;
```

23     *Returns:* If cached, the hard link count attribute value. Otherwise, `hard_link_count(path())` or `hard_link_count(path(), ec)`, respectively.

24     *Throws:* As specified in [29.11.5](#).

```
file_time_type last_write_time() const;
file_time_type last_write_time(error_code& ec) const noexcept;
```

25     *Returns:* If cached, the last write time attribute value. Otherwise, `last_write_time(path())` or `last_write_time(path(), ec)`, respectively.

26     *Throws:* As specified in [29.11.5](#).

```
file_status status() const;
file_status status(error_code& ec) const noexcept;
```

27     *Returns:* If cached, the status attribute value. Otherwise, `status(path())` or `status(path(), ec)`, respectively.

28        *Throws:* As specified in [29.11.5](#).

```
file_status symlink_status() const;
file_status symlink_status(error_code& ec) const noexcept;
```

29        *Returns:* If cached, the symlink status attribute value. Otherwise, `symlink_status(path())` or `symlink_status(path(), ec)`, respectively.

30        *Throws:* As specified in [29.11.5](#).

```
bool operator==(const directory_entry& rhs) const noexcept;
```

31        *Returns:* `pathobject == rhs.pathobject`.

```
strong_ordering operator<=>(const directory_entry& rhs) const noexcept;
```

32        *Returns:* `pathobject <=> rhs.pathobject`.

## 29.11.11 Class `directory_iterator`

[`fs.class.directory.iterator`]

### 29.11.11.1 General

[`fs.class.directory.iterator.general`]

<sup>1</sup> An object of type `directory_iterator` provides an iterator for a sequence of `directory_entry` elements representing the path and any cached attribute values ([29.11.10](#)) for each file in a directory or in an implementation-defined directory-like file type.

[*Note 1:* For iteration into sub-directories, see class `recursive_directory_iterator` ([29.11.12](#)). — *end note*]

```
namespace std::filesystem {
 class directory_iterator {
 public:
 using iterator_category = input_iterator_tag;
 using value_type = directory_entry;
 using difference_type = ptrdiff_t;
 using pointer = const directory_entry*;
 using reference = const directory_entry&;
 // 29.11.11.2, member functions
 directory_iterator() noexcept;
 explicit directory_iterator(const path& p);
 directory_iterator(const path& p, directory_options options);
 directory_iterator(const path& p, error_code& ec);
 directory_iterator(const path& p, directory_options options,
 error_code& ec);
 directory_iterator(const directory_iterator& rhs);
 directory_iterator(directory_iterator&& rhs) noexcept;
 ~directory_iterator();

 directory_iterator& operator=(const directory_iterator& rhs);
 directory_iterator& operator=(directory_iterator&& rhs) noexcept;

 const directory_entry& operator*() const;
 const directory_entry* operator->() const;
 directory_iterator& operator++();
 directory_iterator& increment(error_code& ec);

 // other members as required by 23.3.5.3, input iterators
 };
}
```

<sup>2</sup> `directory_iterator` meets the *Cpp17InputIterator* requirements ([23.3.5.3](#)).

<sup>3</sup> If an iterator of type `directory_iterator` reports an error or is advanced past the last directory element, that iterator shall become equal to the end iterator value. The `directory_iterator` default constructor shall create an iterator equal to the end iterator value, and this shall be the only valid iterator for the end condition.

<sup>4</sup> The end iterator is not dereferenceable.

<sup>5</sup> Two end iterators are always equal. An end iterator shall not be equal to a non-end iterator.

- <sup>6</sup> The result of calling the `path()` member of the `directory_entry` object obtained by dereferencing a `directory_iterator` is a reference to a `path` object composed of the directory argument from which the iterator was constructed with filename of the directory entry appended as if by `operator/=`.
- <sup>7</sup> Directory iteration shall not yield directory entries for the current (dot) and parent (dot-dot) directories.
- <sup>8</sup> The order of directory entries obtained by dereferencing successive increments of a `directory_iterator` is unspecified.
- <sup>9</sup> Constructors and non-const `directory_iterator` member functions store the values of any cached attributes (29.11.10) in the `directory_entry` element returned by `operator*()`. `directory_iterator` member functions shall not directly or indirectly call any `directory_entry refresh` function.
- [*Note 2*: The exact mechanism for storing cached attribute values is not exposed to users. For exposition, class `directory_iterator` is shown in 29.11.10 as a friend of class `directory_entry`. — *end note*]
- <sup>10</sup> [*Note 3*: It is possible for a path obtained by dereferencing a directory iterator to not actually exist; for example if it is a symbolic link to a non-existent file. Recursively walking directory trees for purposes of removing and renaming entries can invalidate symbolic links that are being followed. — *end note*]
- <sup>11</sup> [*Note 4*: If a file is removed from or added to a directory after the construction of a `directory_iterator` for the directory, it is unspecified whether or not subsequently incrementing the iterator will ever result in an iterator referencing the removed or added directory entry. See POSIX `readdir_r`. — *end note*]

### 29.11.11.2 Members

[fs.dir.itr.members]

`directory_iterator() noexcept;`

- <sup>1</sup> *Effects*: Constructs the end iterator.

```
explicit directory_iterator(const path& p);
directory_iterator(const path& p, directory_options options);
directory_iterator(const path& p, error_code& ec);
directory_iterator(const path& p, directory_options options, error_code& ec);
```

- <sup>2</sup> *Effects*: For the directory that `p` resolves to, constructs an iterator for the first element in a sequence of `directory_entry` elements representing the files in the directory, if any; otherwise the end iterator. However, if

`(options & directory_options::skip_permission_denied) != directory_options::none`

and construction encounters an error indicating that permission to access `p` is denied, constructs the end iterator and does not report an error.

- <sup>3</sup> *Throws*: As specified in 29.11.5.

- <sup>4</sup> [*Note 1*: To iterate over the current directory, use `directory_iterator(".")` rather than `directory_iterator("")`. — *end note*]

```
directory_iterator(const directory_iterator& rhs);
directory_iterator(directory_iterator&& rhs) noexcept;
```

- <sup>5</sup> *Postconditions*: `*this` has the original value of `rhs`.

```
directory_iterator& operator=(const directory_iterator& rhs);
directory_iterator& operator=(directory_iterator&& rhs) noexcept;
```

- <sup>6</sup> *Effects*: If `*this` and `rhs` are the same object, the member has no effect.

- <sup>7</sup> *Postconditions*: `*this` has the original value of `rhs`.

- <sup>8</sup> *Returns*: `*this`.

```
directory_iterator& operator++();
directory_iterator& increment(error_code& ec);
```

- <sup>9</sup> *Effects*: As specified for the prefix increment operation of Input iterators (23.3.5.3).

- <sup>10</sup> *Returns*: `*this`.

- <sup>11</sup> *Throws*: As specified in 29.11.5.

### 29.11.11.3 Non-member functions

[fs.dir.itr.nonmembers]

- <sup>1</sup> These functions enable range access for `directory_iterator`.

```

directory_iterator begin(directory_iterator iter) noexcept;
2 Returns: iter.

directory_iterator end(const directory_iterator&) noexcept;
3 Returns: directory_iterator().

```

### 29.11.12 Class recursive\_directory\_iterator

[fs.class.rec.dir.itr]

#### 29.11.12.1 General

[fs.class.rec.dir.itr.general]

- <sup>1</sup> An object of type `recursive_directory_iterator` provides an iterator for a sequence of `directory_entry` elements representing the files in a directory or in an implementation-defined directory-like file type, and its sub-directories.

```

namespace std::filesystem {
 class recursive_directory_iterator {
 public:
 using iterator_category = input_iterator_tag;
 using value_type = directory_entry;
 using difference_type = ptrdiff_t;
 using pointer = const directory_entry*;
 using reference = const directory_entry&;

 // 29.11.12.2, constructors and destructor
 recursive_directory_iterator() noexcept;
 explicit recursive_directory_iterator(const path& p);
 recursive_directory_iterator(const path& p, directory_options options);
 recursive_directory_iterator(const path& p, directory_options options,
 error_code& ec);
 recursive_directory_iterator(const path& p, error_code& ec);
 recursive_directory_iterator(const recursive_directory_iterator& rhs);
 recursive_directory_iterator(recursive_directory_iterator&& rhs) noexcept;
 ~recursive_directory_iterator();

 // 29.11.12.2, observers
 directory_options options() const;
 int depth() const;
 bool recursion_pending() const;

 const directory_entry& operator*() const;
 const directory_entry* operator->() const;

 // 29.11.12.2, modifiers
 recursive_directory_iterator&
 operator=(const recursive_directory_iterator& rhs);
 recursive_directory_iterator&
 operator=(recursive_directory_iterator&& rhs) noexcept;

 recursive_directory_iterator& operator++();
 recursive_directory_iterator& increment(error_code& ec);

 void pop();
 void pop(error_code& ec);
 void disable_recursion_pending();

 // other members as required by 23.3.5.3, input iterators
 };
}

```

- <sup>2</sup> Calling `options`, `depth`, `recursion_pending`, `pop` or `disable_recursion_pending` on an iterator that is not dereferenceable results in undefined behavior.
- <sup>3</sup> The behavior of a `recursive_directory_iterator` is the same as a `directory_iterator` unless otherwise specified.

<sup>4</sup> [Note 1: If the directory structure being iterated over contains cycles then it is possible for the end iterator to be unreachable. —end note]

### 29.11.12.2 Members

[fs.rec.dir.itr.members]

```
recursive_directory_iterator() noexcept;
```

1     *Effects:* Constructs the end iterator.

```
explicit recursive_directory_iterator(const path& p);
recursive_directory_iterator(const path& p, directory_options options);
recursive_directory_iterator(const path& p, directory_options options, error_code& ec);
recursive_directory_iterator(const path& p, error_code& ec);
```

2     *Effects:* Constructs an iterator representing the first entry in the directory to which p resolves, if any; otherwise, the end iterator. However, if

```
(options & directory_options::skip_permission_denied) != directory_options::none
```

and construction encounters an error indicating that permission to access p is denied, constructs the end iterator and does not report an error.

3     *Postconditions:* options() == options for the signatures with a directory\_options argument, otherwise options() == directory\_options::none.

4     *Throws:* As specified in 29.11.5.

5     [Note 1: Use recursive\_directory\_iterator(".") rather than recursive\_directory\_iterator("") to iterate over the current directory. —end note]

6     [Note 2: By default, recursive\_directory\_iterator does not follow directory symlinks. To follow directory symlinks, specify options as directory\_options::follow\_directory\_symlink. —end note]

```
recursive_directory_iterator(const recursive_directory_iterator& rhs);
```

7     *Postconditions:*

- (7.1) — options() == rhs.options()
- (7.2) — depth() == rhs.depth()
- (7.3) — recursion\_pending() == rhs.recursion\_pending()

```
recursive_directory_iterator(recursive_directory_iterator&& rhs) noexcept;
```

8     *Postconditions:* options(), depth(), and recursion\_pending() have the values that rhs.options(), rhs.depth(), and rhs.recursion\_pending(), respectively, had before the function call.

```
recursive_directory_iterator& operator=(const recursive_directory_iterator& rhs);
```

9     *Effects:* If \*this and rhs are the same object, the member has no effect.

10     *Postconditions:*

- (10.1) — options() == rhs.options()
- (10.2) — depth() == rhs.depth()
- (10.3) — recursion\_pending() == rhs.recursion\_pending()

11     *Returns:* \*this.

```
recursive_directory_iterator& operator=(recursive_directory_iterator&& rhs) noexcept;
```

12     *Effects:* If \*this and rhs are the same object, the member has no effect.

13     *Postconditions:* options(), depth(), and recursion\_pending() have the values that rhs.options(), rhs.depth(), and rhs.recursion\_pending(), respectively, had before the function call.

14     *Returns:* \*this.

```
directory_options options() const;
```

15     *Returns:* The value of the argument passed to the constructor for the options parameter, if present, otherwise directory\_options::none.

16     *Throws:* Nothing.

```

int depth() const;
17 Returns: The current depth of the directory tree being traversed.
[Note 3: The initial directory is depth 0, its immediate subdirectories are depth 1, and so forth. —end note]
18 Throws: Nothing.

bool recursion_pending() const;
19 Returns: true if disable_recursion_pending() has not been called subsequent to the prior construction or increment operation, otherwise false.
20 Throws: Nothing.

recursive_directory_iterator& operator++();
recursive_directory_iterator& increment(error_code& ec);
21 Effects: As specified for the prefix increment operation of Input iterators (23.3.5.3), except that:
(21.1) — If there are no more entries at the current depth, then if depth() != 0 iteration over the parent directory resumes; otherwise *this = recursive_directory_iterator().
(21.2) — Otherwise if
 recursion_pending() && is_directory((*this)->status()) &&
 (!is_symlink((*this)->symlink_status()) ||
 (options() & directory_options::follow_directory_symlink) != directory_options::none)
 then either directory (*this)->path() is recursively iterated into or, if
 (options() & directory_options::skip_permission_denied) != directory_options::none
 and an error occurs indicating that permission to access directory (*this)->path() is denied,
 then directory (*this)->path() is treated as an empty directory and no error is reported.
22 Returns: *this.
23 Throws: As specified in 29.11.5.

void pop();
void pop(error_code& ec);
24 Effects: If depth() == 0, set *this to recursive_directory_iterator(). Otherwise, cease iteration of the directory currently being iterated over, and continue iteration over the parent directory.
25 Throws: As specified in 29.11.5.

26 Remarks: Any copies of the previous value of *this are no longer required to be dereferenceable nor to be in the domain of ==.

void disable_recursion_pending();
27 Postconditions: recursion_pending() == false.
28 [Note 4: disable_recursion_pending() is used to prevent unwanted recursion into a directory. —end note]
```

**29.11.12.3 Non-member functions**

[fs.rec.dir.itr.nonmembers]

- <sup>1</sup> These functions enable use of recursive\_directory\_iterator with range-based for statements.

```
recursive_directory_iterator begin(recursive_directory_iterator iter) noexcept;
```

- <sup>2</sup> Returns: iter.

```
recursive_directory_iterator end(const recursive_directory_iterator&) noexcept;
```

- <sup>3</sup> Returns: recursive\_directory\_iterator().

**29.11.13 Filesystem operation functions**

[fs.op.funcs]

**29.11.13.1 General**

[fs.op.funcs.general]

- <sup>1</sup> Filesystem operation functions query or modify files, including directories, in external storage.
- <sup>2</sup> [Note 1: Because hardware failures, network failures, file system races (29.11.2.4), and many other kinds of errors occur frequently in file system operations, any filesystem operation function, no matter how apparently innocuous, can encounter an error; see 29.11.5. —end note]

**29.11.13.2 Absolute**

[fs.op.absolute]

```
path absolute(const path& p);
path absolute(const path& p, error_code& ec);
```

1 *Effects*: Composes an absolute path referencing the same file system location as *p* according to the operating system (29.11.2.3).

2 *Returns*: The composed path. The signature with argument *ec* returns *path()* if an error occurs.

3 [Note 1: For the returned path, *rp*, *rp.is\_absolute()* is *true* unless an error occurs. —end note]

4 *Throws*: As specified in 29.11.5.

5 [Note 2: To resolve symlinks or perform other sanitization that can involve queries to secondary storage, such as hard disks, consider *canonical* (29.11.13.3). —end note]

6 [Note 3: Implementations are strongly encouraged to not query secondary storage, and not consider *!exists(p)* an error. —end note]

7 [Example 1: For POSIX-based operating systems, *absolute(p)* is simply *current\_path() / p*. For Windows-based operating systems, *absolute* typically has the same semantics as *GetFullPathNameW*. —end example]

**29.11.13.3 Canonical**

[fs.op.canonical]

```
path canonical(const path& p);
path canonical(const path& p, error_code& ec);
```

1 *Effects*: Converts *p* to an absolute path that has no symbolic link, dot, or dot-dot elements in its pathname in the generic format.

2 *Returns*: A path that refers to the same file system object as *absolute(p)*. The signature with argument *ec* returns *path()* if an error occurs.

3 *Throws*: As specified in 29.11.5.

4 *Remarks*: *!exists(p)* is an error.

**29.11.13.4 Copy**

[fs.op.copy]

```
void copy(const path& from, const path& to);
```

1 *Effects*: Equivalent to *copy(from, to, copy\_options::none)*.

```
void copy(const path& from, const path& to, error_code& ec);
```

2 *Effects*: Equivalent to *copy(from, to, copy\_options::none, ec)*.

```
void copy(const path& from, const path& to, copy_options options);
```

```
void copy(const path& from, const path& to, copy_options options,
 error_code& ec);
```

3 *Preconditions*: At most one element from each option group (29.11.8.3) is set in *options*.

4 *Effects*: Before the first use of *f* and *t*:

(4.1) — If

```
(options & copy_options::create_symlinks) != copy_options::none ||
(options & copy_options::skip_symlinks) != copy_options::none
```

then auto *f* = *symlink\_status(from)* and if needed auto *t* = *symlink\_status(to)*.

(4.2) — Otherwise, if

```
(options & copy_options::copy_symlinks) != copy_options::none
```

then auto *f* = *symlink\_status(from)* and if needed auto *t* = *status(to)*.

(4.3) — Otherwise, auto *f* = *status(from)* and if needed auto *t* = *status(to)*.

Effects are then as follows:

(4.4) — If *f.type()* or *t.type()* is an implementation-defined file type (29.11.8.2), then the effects are implementation-defined.

(4.5) — Otherwise, an error is reported as specified in 29.11.5 if:

(4.5.1) — *exists(f)* is *false*, or

- (4.5.2) — `equivalent(from, to)` is `true`, or
- (4.5.3) — `is_other(f) || is_other(t)` is `true`, or
- (4.5.4) — `is_directory(f) && is_regular_file(t)` is `true`.
- (4.6) — Otherwise, if `is_symlink(f)`, then:
  - (4.6.1) — If `(options & copy_options::skip_symlinks) != copy_options::none` then return.
  - (4.6.2) — Otherwise if
    - `!exists(t) && (options & copy_options::copy_symlinks) != copy_options::none`
    - then `copy_symlink(from, to)`.
  - (4.6.3) — Otherwise report an error as specified in [29.11.5](#).
- (4.7) — Otherwise, if `is_regular_file(f)`, then:
  - (4.7.1) — If `(options & copy_options::directories_only) != copy_options::none`, then return.
  - (4.7.2) — Otherwise, if `(options & copy_options::create_symlinks) != copy_options::none`, then create a symbolic link to the source file.
  - (4.7.3) — Otherwise, if `(options & copy_options::create_hard_links) != copy_options::none`, then create a hard link to the source file.
  - (4.7.4) — Otherwise, if `is_directory(t)`, then `copy_file(from, to/from.filename(), options)`.
  - (4.7.5) — Otherwise, `copy_file(from, to, options)`.
- (4.8) — Otherwise, if
  - `is_directory(f) && (options & copy_options::create_symlinks) != copy_options::none`
  - then report an error with an `error_code` argument equal to `make_error_code(errc::is_a_directory)`.
- (4.9) — Otherwise, if
  - `is_directory(f) && ((options & copy_options::recursive) != copy_options::none || options == copy_options::none)`
  - then:
    - (4.9.1) — If `exists(t)` is `false`, then `create_directory(to, from)`.
    - (4.9.2) — Then, iterate over the files in `from`, as if by
 

```
for (const directory_entry& x : directory_iterator(from))
 copy(x.path(), to/x.path().filename(),
 options | copy_options::in-recursive-copy);
```

where `in-recursive-copy` is a bitmask element of `copy_options` that is not one of the elements in [29.11.8.3](#).
- (4.10) — Otherwise, for the signature with argument `ec`, `ec.clear()`.
- (4.11) — Otherwise, no effects.

5      *Throws:* As specified in [29.11.5](#).

6      *Remarks:* For the signature with argument `ec`, any library functions called by the implementation shall have an `error_code` argument if applicable.

7      [Example 1: Given this directory structure:

```
/dir1
 file1
 file2
 dir2
 file3
```

Calling `copy("/dir1", "/dir3")` would result in:

```
/dir1
 file1
 file2
```

```

dir2
 file3
/dir3
 file1
 file2

```

Alternatively, calling `copy("/dir1", "/dir3", copy_options::recursive)` would result in:

```

kdir1
 file1
 file2
 dir2
 file3
kdir3
 file1
 file2
 dir2
 file3

```

— end example]

#### 29.11.13.5 Copy file

[`fs.op.copy.file`]

```

bool copy_file(const path& from, const path& to);
bool copy_file(const path& from, const path& to, error_code& ec);

```

1     *Returns*: `copy_file(from, to, copy_options::none)` or  
`copy_file(from, to, copy_options::none, ec)`, respectively.

2     *Throws*: As specified in [29.11.5](#).

```

bool copy_file(const path& from, const path& to, copy_options options);
bool copy_file(const path& from, const path& to, copy_options options,
 error_code& ec);

```

3     *Preconditions*: At most one element from each option group ([29.11.8.3](#)) is set in `options`.

4     *Effects*: As follows:

(4.1)     — Report an error as specified in [29.11.5](#) if:

(4.1.1)     — `is_regular_file(from)` is `false`, or

(4.1.2)     — `exists(to)` is `true` and `is_regular_file(to)` is `false`, or

(4.1.3)     — `exists(to)` is `true` and `equivalent(from, to)` is `true`, or

(4.1.4)     — `exists(to)` is `true` and

```

(options & (copy_options::skip_existing |
 copy_options::overwrite_existing |
 copy_options::update_existing)) == copy_options::none

```

(4.2)     — Otherwise, copy the contents and attributes of the file `from` resolves to, to the file `to` resolves to, if:

(4.2.1)     — `exists(to)` is `false`, or

(4.2.2)     — `(options & copy_options::overwrite_existing) != copy_options::none`, or

(4.2.3)     — `(options & copy_options::update_existing) != copy_options::none` and `from` is more recent than `to`, determined as if by use of the `last_write_time` function ([29.11.13.26](#)).

(4.3)     — Otherwise, no effects.

5     *Returns*: `true` if the `from` file was copied, otherwise `false`. The signature with argument `ec` returns `false` if an error occurs.

6     *Throws*: As specified in [29.11.5](#).

7     *Complexity*: At most one direct or indirect invocation of `status(to)`.

**29.11.13.6 Copy symlink**

[fs.op.copy.symlink]

```
void copy_symlink(const path& existing_symlink, const path& new_symlink);
void copy_symlink(const path& existing_symlink, const path& new_symlink,
 error_code& ec) noexcept;
```

- 1 *Effects:* Equivalent to *function*(*read\_symlink(existing\_symlink)*, *new\_symlink*) or *function*(*read\_symlink(existing\_symlink, ec)*, *new\_symlink, ec*), respectively, where in each case *function* is *create\_symlink* or *create\_directory\_symlink* as appropriate.
- 2 *Throws:* As specified in [29.11.5](#).

**29.11.13.7 Create directories**

[fs.op.create.directories]

```
bool create_directories(const path& p);
bool create_directories(const path& p, error_code& ec);
```

- 1 *Effects:* Calls *create\_directory()* for each element of *p* that does not exist.
- 2 *Returns:* *true* if a new directory was created for the directory *p* resolves to, otherwise *false*.
- 3 *Throws:* As specified in [29.11.5](#).

4 *Complexity:*  $\mathcal{O}(n)$  where *n* is the number of elements of *p*.

**29.11.13.8 Create directory**

[fs.op.create.directory]

```
bool create_directory(const path& p);
bool create_directory(const path& p, error_code& ec) noexcept;
```

- 1 *Effects:* Creates the directory *p* resolves to, as if by POSIX *mkdir* with a second argument of *static\_cast<int>(perms::all)*. If *mkdir* fails because *p* resolves to an existing directory, no error is reported. Otherwise on failure an error is reported.
- 2 *Returns:* *true* if a new directory was created, otherwise *false*.
- 3 *Throws:* As specified in [29.11.5](#).

```
bool create_directory(const path& p, const path& existing_p);
bool create_directory(const path& p, const path& existing_p, error_code& ec) noexcept;
```

- 4 *Effects:* Creates the directory *p* resolves to, with attributes copied from directory *existing\_p*. The set of attributes copied is operating system dependent. If *mkdir* fails because *p* resolves to an existing directory, no error is reported. Otherwise on failure an error is reported.

[*Note 1:* For POSIX-based operating systems, the attributes are those copied by native API *stat(existing\_p.c\_str(), &attributes\_stat)* followed by *mkdir(p.c\_str(), attributes\_stat.st\_mode)*. For Windows-based operating systems, the attributes are those copied by native API *CreateDirectoryExW(existing\_p.c\_str(), p.c\_str(), 0)*. — *end note*]

- 5 *Returns:* *true* if a new directory was created with attributes copied from directory *existing\_p*, otherwise *false*.

- 6 *Throws:* As specified in [29.11.5](#).

**29.11.13.9 Create directory symlink**

[fs.op.create.dir.symlink]

```
void create_directory_symlink(const path& to, const path& new_symlink);
void create_directory_symlink(const path& to, const path& new_symlink,
 error_code& ec) noexcept;
```

- 1 *Effects:* Establishes the postcondition, as if by POSIX *symlink()*.
- 2 *Postconditions:* *new\_symlink* resolves to a symbolic link file that contains an unspecified representation of *to*.
- 3 *Throws:* As specified in [29.11.5](#).
- 4 [*Note 1:* Some operating systems require symlink creation to identify that the link is to a directory. Thus, *create\_symlink()* (instead of *create\_directory\_symlink()*) cannot be used reliably to create directory symlinks. — *end note*]
- 5 [*Note 2:* Some operating systems do not support symbolic links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support symbolic links regardless of the operating system. — *end note*]

**29.11.13.10 Create hard link**

[fs.op.create.hard.lk]

```
void create_hard_link(const path& to, const path& new_hard_link);
void create_hard_link(const path& to, const path& new_hard_link,
 error_code& ec) noexcept;
```

1 *Effects*: Establishes the postcondition, as if by POSIX `link()`.

2 *Postconditions*:

- (2.1) — `exists(to) && exists(new_hard_link) && equivalent(to, new_hard_link)`
- (2.2) — The contents of the file or directory `to` resolves to are unchanged.

3 *Throws*: As specified in [29.11.5](#).

4 [Note 1: Some operating systems do not support hard links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support hard links regardless of the operating system. Some file systems limit the number of links per file. — *end note*]

**29.11.13.11 Create symlink**

[fs.op.create.symlink]

```
void create_symlink(const path& to, const path& new_symlink);
void create_symlink(const path& to, const path& new_symlink,
 error_code& ec) noexcept;
```

1 *Effects*: Establishes the postcondition, as if by POSIX `symlink()`.

2 *Postconditions*: `new_symlink` resolves to a symbolic link file that contains an unspecified representation of `to`.

3 *Throws*: As specified in [29.11.5](#).

4 [Note 1: Some operating systems do not support symbolic links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support symbolic links regardless of the operating system. — *end note*]

**29.11.13.12 Current path**

[fs.op.current.path]

```
path current_path();
path current_path(error_code& ec);
```

1 *Returns*: The absolute path of the current working directory, whose pathname in the native format is obtained as if by POSIX `getcwd()`. The signature with argument `ec` returns `path()` if an error occurs.

2 *Throws*: As specified in [29.11.5](#).

3 *Remarks*: The current working directory is the directory, associated with the process, that is used as the starting location in pathname resolution for relative paths.

4 [Note 1: The `current_path()` name was chosen to emphasize that the returned value is a path, not just a single directory name. — *end note*]

5 [Note 2: The current path as returned by many operating systems is a dangerous global variable, and can be changed unexpectedly by third-party or system library functions, or by another thread. — *end note*]

```
void current_path(const path& p);
void current_path(const path& p, error_code& ec) noexcept;
```

6 *Effects*: Establishes the postcondition, as if by POSIX `chdir()`.

7 *Postconditions*: `equivalent(p, current_path())`.

8 *Throws*: As specified in [29.11.5](#).

9 [Note 3: The current path for many operating systems is a dangerous global state, and can be changed unexpectedly by a third-party or system library functions, or by another thread. — *end note*]

**29.11.13.13 Equivalent**

[fs.op.equivalent]

```
bool equivalent(const path& p1, const path& p2);
bool equivalent(const path& p1, const path& p2, error_code& ec) noexcept;
```

1 *Returns*: `true`, if `p1` and `p2` resolve to the same file system entity, otherwise `false`. The signature with argument `ec` returns `false` if an error occurs.

2 Two paths are considered to resolve to the same file system entity if two candidate entities reside on the same device at the same location.

[*Note 1*: On POSIX platforms, this is determined as if by the values of the POSIX `stat` class, obtained as if by `stat()` for the two paths, having equal `st_dev` values and equal `st_ino` values. — *end note*]

3 *Remarks*: `!exists(p1) || !exists(p2)` is an error.

4 *Throws*: As specified in [29.11.5](#).

#### 29.11.13.14 Exists

[`fs.op.exists`]

```
bool exists(file_status s) noexcept;
```

1 *Returns*: `status_known(s) && s.type() != file_type::not_found`.

```
bool exists(const path& p);
```

```
bool exists(const path& p, error_code& ec) noexcept;
```

2 Let `s` be a `file_status`, determined as if by `status(p)` or `status(p, ec)`, respectively.

3 *Effects*: The signature with argument `ec` calls `ec.clear()` if `status_known(s)`.

4 *Returns*: `exists(s)`.

5 *Throws*: As specified in [29.11.5](#).

#### 29.11.13.15 File size

[`fs.op.file.size`]

```
uintmax_t file_size(const path& p);
```

```
uintmax_t file_size(const path& p, error_code& ec) noexcept;
```

1 *Effects*: If `exists(p)` is `false`, an error is reported ([29.11.5](#)).

2 *Returns*:

(2.1) — If `is_regular_file(p)`, the size in bytes of the file `p` resolves to, determined as if by the value of the POSIX `stat` class member `st_size` obtained as if by POSIX `stat()`.

(2.2) — Otherwise, the result is implementation-defined.

The signature with argument `ec` returns `static_cast<uintmax_t>(-1)` if an error occurs.

3 *Throws*: As specified in [29.11.5](#).

#### 29.11.13.16 Hard link count

[`fs.op.hard.lk.ct`]

```
uintmax_t hard_link_count(const path& p);
```

```
uintmax_t hard_link_count(const path& p, error_code& ec) noexcept;
```

1 *Returns*: The number of hard links for `p`. The signature with argument `ec` returns `static_cast<uintmax_t>(-1)` if an error occurs.

2 *Throws*: As specified in [29.11.5](#).

#### 29.11.13.17 Is block file

[`fs.op.is.block.file`]

```
bool is_block_file(file_status s) noexcept;
```

1 *Returns*: `s.type() == file_type::block`.

```
bool is_block_file(const path& p);
```

```
bool is_block_file(const path& p, error_code& ec) noexcept;
```

2 *Returns*: `is_block_file(status(p))` or `is_block_file(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3 *Throws*: As specified in [29.11.5](#).

#### 29.11.13.18 Is character file

[`fs.op.is.char.file`]

```
bool is_character_file(file_status s) noexcept;
```

1 *Returns*: `s.type() == file_type::character`.

```
bool is_character_file(const path& p);
bool is_character_file(const path& p, error_code& ec) noexcept;
```

2     *Returns:* `is_character_file(status(p))` or `is_character_file(status(p, ec))`, respectively.  
     The signature with argument `ec` returns `false` if an error occurs.

3     *Throws:* As specified in [29.11.5](#).

**29.11.13.19 Is directory**

[fs.op.is.directory]

```
bool is_directory(file_status s) noexcept;
1 Returns: s.type() == file_type::directory.
```

```
bool is_directory(const path& p);
bool is_directory(const path& p, error_code& ec) noexcept;
```

2     *Returns:* `is_directory(status(p))` or `is_directory(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3     *Throws:* As specified in [29.11.5](#).

**29.11.13.20 Is empty**

[fs.op.is.empty]

```
bool is_empty(const path& p);
bool is_empty(const path& p, error_code& ec);
```

1     *Effects:*

(1.1)   — Determine `file_status s`, as if by `status(p)` or `status(p, ec)`, respectively.

(1.2)   — For the signature with argument `ec`, return `false` if an error occurred.

(1.3)   — Otherwise, if `is_directory(s)`:

(1.3.1)   — Create a variable `itr`, as if by `directory_iterator itr(p)` or `directory_iterator itr(p, ec)`, respectively.

(1.3.2)   — For the signature with argument `ec`, return `false` if an error occurred.

(1.3.3)   — Otherwise, return `itr == directory_iterator()`.

(1.4)   — Otherwise:

(1.4.1)   — Determine `uintmax_t sz`, as if by `file_size(p)` or `file_size(p, ec)`, respectively.

(1.4.2)   — For the signature with argument `ec`, return `false` if an error occurred.

(1.4.3)   — Otherwise, return `sz == 0`.

2     *Throws:* As specified in [29.11.5](#).

**29.11.13.21 Is fifo**

[fs.op.is\_fifo]

```
bool is_fifo(file_status s) noexcept;
1 Returns: s.type() == file_type::fifo.
```

```
bool is_fifo(const path& p);
bool is_fifo(const path& p, error_code& ec) noexcept;
```

2     *Returns:* `is_fifo(status(p))` or `is_fifo(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3     *Throws:* As specified in [29.11.5](#).

**29.11.13.22 Is other**

[fs.op.is.other]

```
bool is_other(file_status s) noexcept;
1 Returns: exists(s) && !is_regular_file(s) && !is_directory(s) && !is_symlink(s).
```

```
bool is_other(const path& p);
bool is_other(const path& p, error_code& ec) noexcept;
```

2     *Returns:* `is_other(status(p))` or `is_other(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3        *Throws:* As specified in [29.11.5](#).

#### 29.11.13.23 Is regular file

[`fs.op.is.regular.file`]

`bool is_regular_file(file_status s) noexcept;`

1        *Returns:* `s.type() == file_type::regular`.

`bool is_regular_file(const path& p);`

2        *Returns:* `is_regular_file(status(p))`.

3        *Throws:* `filesystem_error` if `status(p)` would throw `filesystem_error`.

`bool is_regular_file(const path& p, error_code& ec) noexcept;`

4        *Effects:* Sets `ec` as if by `status(p, ec)`.

[*Note 1:* `file_type::none`, `file_type::not_found` and `file_type::unknown` cases set `ec` to error values. To distinguish between cases, call the `status` function directly. — *end note*]

5        *Returns:* `is_regular_file(status(p, ec))`. Returns `false` if an error occurs.

#### 29.11.13.24 Is socket

[`fs.op.is.socket`]

`bool is_socket(file_status s) noexcept;`

1        *Returns:* `s.type() == file_type::socket`.

`bool is_socket(const path& p);`

`bool is_socket(const path& p, error_code& ec) noexcept;`

2        *Returns:* `is_socket(status(p))` or `is_socket(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3        *Throws:* As specified in [29.11.5](#).

#### 29.11.13.25 Is symlink

[`fs.op.is.symlink`]

`bool is_symlink(file_status s) noexcept;`

1        *Returns:* `s.type() == file_type::symlink`.

`bool is_symlink(const path& p);`

`bool is_symlink(const path& p, error_code& ec) noexcept;`

2        *Returns:* `is_symlink(status(p))` or `is_symlink(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3        *Throws:* As specified in [29.11.5](#).

#### 29.11.13.26 Last write time

[`fs.op.last.write.time`]

`file_time_type last_write_time(const path& p);`

`file_time_type last_write_time(const path& p, error_code& ec) noexcept;`

1        *Returns:* The time of last data modification of `p`, determined as if by the value of the POSIX `stat` class member `st_mtime` obtained as if by POSIX `stat()`. The signature with argument `ec` returns `file_time_type::min()` if an error occurs.

2        *Throws:* As specified in [29.11.5](#).

`void last_write_time(const path& p, file_time_type new_time);`

`void last_write_time(const path& p, file_time_type new_time, error_code& ec) noexcept;`

3        *Effects:* Sets the time of last data modification of the file resolved to by `p` to `new_time`, as if by POSIX `futimens()`.

4        *Throws:* As specified in [29.11.5](#).

5        [*Note 1:* A postcondition of `last_write_time(p) == new_time` is not specified because it does not necessarily hold for file systems with coarse time granularity. — *end note*]

**29.11.13.27 Permissions**

[fs.op.permissions]

```
void permissions(const path& p, perms prms, perm_options opts=perm_options::replace);
void permissions(const path& p, perms prms, error_code& ec) noexcept;
void permissions(const path& p, perms prms, perm_options opts, error_code& ec);
```

1    *Preconditions:* Exactly one of the `perm_options` constants `replace`, `add`, or `remove` is present in `opts`.

2    *Remarks:* The second signature behaves as if it had an additional parameter `perm_options opts` with an argument of `perm_options::replace`.

3    *Effects:* Applies the action specified by `opts` to the file `p` resolves to, or to file `p` itself if `p` is a symbolic link and `perm_options::nofollow` is set in `opts`. The action is applied as if by POSIX `fchmodat()`.

4    [Note 1: Conceptually permissions are viewed as bits, but the actual implementation can use some other mechanism. —end note]

5    *Throws:* As specified in [29.11.5](#).

**29.11.13.28 Proximate**

[fs.op.proximate]

```
path proximate(const path& p, error_code& ec);
```

1    *Returns:* `proximate(p, current_path(), ec)`.

2    *Throws:* As specified in [29.11.5](#).

```
path proximate(const path& p, const path& base = current_path());
path proximate(const path& p, const path& base, error_code& ec);
```

3    *Returns:* For the first form:

```
weakly_canonical(p).lexically_proximate(weakly_canonical(base));
```

For the second form:

```
weakly_canonical(p, ec).lexically_proximate(weakly_canonical(base, ec));
```

or `path()` at the first error occurrence, if any.

4    *Throws:* As specified in [29.11.5](#).

**29.11.13.29 Read symlink**

[fs.op.read.symlink]

```
path read_symlink(const path& p);
path read_symlink(const path& p, error_code& ec);
```

1    *Returns:* If `p` resolves to a symbolic link, a `path` object containing the contents of that symbolic link. The signature with argument `ec` returns `path()` if an error occurs.

2    *Throws:* As specified in [29.11.5](#).

[Note 1: It is an error if `p` does not resolve to a symbolic link. —end note]

**29.11.13.30 Relative**

[fs.op.relative]

```
path relative(const path& p, error_code& ec);
```

1    *Returns:* `relative(p, current_path(), ec)`.

2    *Throws:* As specified in [29.11.5](#).

```
path relative(const path& p, const path& base = current_path());
path relative(const path& p, const path& base, error_code& ec);
```

3    *Returns:* For the first form:

```
weakly_canonical(p).lexically_relative(weakly_canonical(base));
```

For the second form:

```
weakly_canonical(p, ec).lexically_relative(weakly_canonical(base, ec));
```

or `path()` at the first error occurrence, if any.

4    *Throws:* As specified in [29.11.5](#).

**29.11.13.31 Remove**

[fs.op.remove]

```
bool remove(const path& p);
bool remove(const path& p, error_code& ec) noexcept;
```

- 1 *Effects:* If `exists(symlink_status(p, ec))`, the file `p` is removed as if by POSIX `remove()`.  
*[Note 1: A symbolic link is itself removed, rather than the file it resolves to. — end note]*
- 2 *Postconditions:* `exists(symlink_status(p))` is false.
- 3 *Returns:* false if `p` did not exist, otherwise true. The signature with argument `ec` returns false if an error occurs.
- 4 *Throws:* As specified in [29.11.5](#).

**29.11.13.32 Remove all**

[fs.op.remove.all]

```
uintmax_t remove_all(const path& p);
uintmax_t remove_all(const path& p, error_code& ec);
```

- 1 *Effects:* Recursively deletes the contents of `p` if it exists, then deletes file `p` itself, as if by POSIX `remove()`.  
*[Note 1: A symbolic link is itself removed, rather than the file it resolves to. — end note]*
- 2 *Postconditions:* `exists(symlink_status(p))` is false.
- 3 *Returns:* The number of files removed. The signature with argument `ec` returns `static_cast<uintmax_t>(-1)` if an error occurs.
- 4 *Throws:* As specified in [29.11.5](#).

**29.11.13.33 Rename**

[fs.op.rename]

```
void rename(const path& old_p, const path& new_p);
void rename(const path& old_p, const path& new_p, error_code& ec) noexcept;
```

- 1 *Effects:* Renames `old_p` to `new_p`, as if by POSIX `rename()`.  
*[Note 1:*
  - (1.1) — If `old_p` and `new_p` resolve to the same existing file, no action is taken.
  - (1.2) — Otherwise, the rename can include the following effects:
    - (1.2.1) — if `new_p` resolves to an existing non-directory file, `new_p` is removed; otherwise,
    - (1.2.2) — if `new_p` resolves to an existing directory, `new_p` is removed if empty on POSIX compliant operating systems but can be an error on other operating systems.*A symbolic link is itself renamed, rather than the file it resolves to. — end note]*
- 2 *Throws:* As specified in [29.11.5](#).

**29.11.13.34 Resize file**

[fs.op.resize.file]

```
void resize_file(const path& p, uintmax_t new_size);
void resize_file(const path& p, uintmax_t new_size, error_code& ec) noexcept;
```

- 1 *Effects:* Causes the size that would be returned by `file_size(p)` to be equal to `new_size`, as if by POSIX `truncate()`.
- 2 *Throws:* As specified in [29.11.5](#).

**29.11.13.35 Space**

[fs.op.space]

```
space_info space(const path& p);
space_info space(const path& p, error_code& ec) noexcept;
```

- 1 *Returns:* An object of type `space_info`. The value of the `space_info` object is determined as if by using POSIX `statvfs` to obtain a POSIX `struct statvfs`, and then multiplying its `f_blocks`, `f_bfree`, and `f_bavail` members by its `f_frszie` member, and assigning the results to the `capacity`, `free`, and `available` members respectively. Any members for which the value cannot be determined shall be set to `static_cast<uintmax_t>(-1)`. For the signature with argument `ec`, all members are set to `static_cast<uintmax_t>(-1)` if an error occurs.

2        *Throws:* As specified in 29.11.5.

3        *Remarks:* The value of member `space_info::available` is operating system dependent.

[Note 1: `available` can be less than `free`. — end note]

### 29.11.13.36 Status

[`fs.op.status`]

```
file_status status(const path& p);
```

1        *Effects:* As if:

```
error_code ec;
file_status result = status(p, ec);
if (result.type() == file_type::none)
 throw filesystem_error(implementation-supplied-message, p, ec);
return result;
```

2        *Returns:* See above.

3        *Throws:* `filesystem_error`.

[Note 1: `result` values of `file_status(file_type::not_found)` and `file_status(file_type::unknown)` are not considered failures and do not cause an exception to be thrown. — end note]

```
file_status status(const path& p, error_code& ec) noexcept;
```

4        *Effects:* If possible, determines the attributes of the file `p` resolves to, as if by using POSIX `stat()` to obtain a POSIX `struct stat`. If, during attribute determination, the underlying file system API reports an error, sets `ec` to indicate the specific error reported. Otherwise, `ec.clear()`.

[Note 2: This allows users to inspect the specifics of underlying API errors even when the value returned by `status()` is not `file_status(file_type::none)`. — end note]

5        Let `prms` denote the result of `(m & perms::mask)`, where `m` is determined as if by converting the `st_mode` member of the obtained `struct stat` to the type `perms`.

6        *Returns:*

(6.1)     — If `ec != error_code()`:

(6.1.1)     — If the specific error indicates that `p` cannot be resolved because some element of the path does not exist, returns `file_status(file_type::not_found)`.

(6.1.2)     — Otherwise, if the specific error indicates that `p` can be resolved but the attributes cannot be determined, returns `file_status(file_type::unknown)`.

(6.1.3)     — Otherwise, returns `file_status(file_type::none)`.

[Note 3: These semantics distinguish between `p` being known not to exist, `p` existing but not being able to determine its attributes, and there being an error that prevents even knowing if `p` exists. These distinctions are important to some use cases. — end note]

(6.2)     — Otherwise,

(6.2.1)     — If the attributes indicate a regular file, as if by POSIX `S_ISREG`, returns `file_status(file_type::regular, prms)`.

[Note 4: `file_type::regular` implies appropriate `<fstream>` operations would succeed, assuming no hardware, permission, access, or file system race errors. Lack of `file_type::regular` does not necessarily imply `<fstream>` operations would fail on a directory. — end note]

(6.2.2)     — Otherwise, if the attributes indicate a directory, as if by POSIX `S_ISDIR`, returns `file_status(file_type::directory, prms)`.

[Note 5: `file_type::directory` implies that calling `directory_iterator(p)` would succeed. — end note]

(6.2.3)     — Otherwise, if the attributes indicate a block special file, as if by POSIX `S_ISBLK`, returns `file_status(file_type::block, prms)`.

(6.2.4)     — Otherwise, if the attributes indicate a character special file, as if by POSIX `S_ISCHR`, returns `file_status(file_type::character, prms)`.

(6.2.5)     — Otherwise, if the attributes indicate a fifo or pipe file, as if by POSIX `S_ISFIFO`, returns `file_status(file_type::fifo, prms)`.

- (6.2.6) — Otherwise, if the attributes indicate a socket, as if by POSIX `S_ISSOCK`, returns `file_status(file_type::socket, prms)`.
- (6.2.7) — Otherwise, if the attributes indicate an implementation-defined file type (29.11.8.2), returns `file_status(file_type::A, prms)`, where `A` is the constant for the implementation-defined file type.
- (6.2.8) — Otherwise, returns `file_status(file_type::unknown, prms)`.

<sup>7</sup> *Remarks:* If a symbolic link is encountered during pathname resolution, pathname resolution continues using the contents of the symbolic link.

#### 29.11.13.37 Status known

[fs.op.status.known]

```
bool status_known(file_status s) noexcept;
```

<sup>1</sup> *Returns:* `s.type() != file_type::none`.

#### 29.11.13.38 Symlink status

[fs.op.symlink.status]

```
file_status symlink_status(const path& p);
file_status symlink_status(const path& p, error_code& ec) noexcept;
```

<sup>1</sup> *Effects:* Same as `status()`, above, except that the attributes of `p` are determined as if by using POSIX `lstat()` to obtain a POSIX `struct stat`.

<sup>2</sup> Let `prms` denote the result of `(m & perms::mask)`, where `m` is determined as if by converting the `st_mode` member of the obtained `struct stat` to the type `perms`.

<sup>3</sup> *Returns:* Same as `status()`, above, except that if the attributes indicate a symbolic link, as if by POSIX `S_ISLNK`, returns `file_status(file_type::symlink, prms)`. The signature with argument `ec` returns `file_status(file_type::none)` if an error occurs.

<sup>4</sup> *Remarks:* Pathname resolution terminates if `p` names a symbolic link.

<sup>5</sup> *Throws:* As specified in 29.11.5.

#### 29.11.13.39 Temporary directory path

[fs.op.temp.dir.path]

```
path temp_directory_path();
path temp_directory_path(error_code& ec);
```

<sup>1</sup> Let `p` be an unspecified directory path suitable for temporary files.

<sup>2</sup> *Effects:* If `exists(p)` is `false` or `is_directory(p)` is `false`, an error is reported (29.11.5).

<sup>3</sup> *Returns:* The path `p`. The signature with argument `ec` returns `path()` if an error occurs.

<sup>4</sup> *Throws:* As specified in 29.11.5.

<sup>5</sup> [Example 1: For POSIX-based operating systems, an implementation can return the path supplied by the first environment variable found in the list `TMPDIR`, `TMP`, `TEMP`, `TEMPDIR`, or if none of these are found, `"/tmp"`.]

For Windows-based operating systems, an implementation can return the path reported by the Windows `GetTempPath` API function. — end example]

#### 29.11.13.40 Weakly canonical

[fs.op.weakly.canonical]

```
path weakly_canonical(const path& p);
path weakly_canonical(const path& p, error_code& ec);
```

<sup>1</sup> *Returns:* `p` with symlinks resolved and the result normalized (29.11.6.2).

<sup>2</sup> *Effects:* Using `status(p)` or `status(p, ec)`, respectively, to determine existence, return a path composed by `operator/=` from the result of calling `canonical()` with a path argument composed of the leading elements of `p` that exist, if any, followed by the elements of `p` that do not exist, if any. For the first form, `canonical()` is called without an `error_code` argument. For the second form, `canonical()` is called with `ec` as an `error_code` argument, and `path()` is returned at the first error occurrence, if any.

<sup>3</sup> *Postconditions:* The returned path is in normal form (29.11.6.2).

- 4     *Remarks:* Implementations should avoid unnecessary normalization such as when `canonical` has already been called on the entirety of `p`.
- 5     *Throws:* As specified in [29.11.5](#).

## 29.12 C library files

#define PRIxMAX see below
#define SCNdMAX see below
#define SCNiMAX see below
#define SCNoMAX see below
#define SCNuMAX see below
#define SCNxMAX see below
#define PRIdPTR see below
#define PRIiPTR see below
#define PRIoPTR see below
#define PRIuPTR see below
#define PRIxPTR see below
#define PRIxPTR see below
#define SCNdPTR see below
#define SCNiPTR see below
#define SCNoPTR see below
#define SCNuPTR see below
#define SCNxPTR see below
```

- <sup>1</sup> The contents and meaning of the header <cinttypes> are the same as the C standard library header <inttypes.h>, with the following changes:
- (1.1) — The header <cinttypes> includes the header <cstdint> (17.4.2) instead of <stdint.h>, and
  - (1.2) — if and only if the type `intmax_t` designates an extended integer type (6.8.2), the following function signatures are added:

```
intmax_t abs(intmax_t);
imaxdiv_t div(intmax_t, intmax_t);
```

which shall have the same semantics as the function signatures `intmax_t imaxabs(intmax_t)` and `imaxdiv_t imaxdiv(intmax_t, intmax_t)`, respectively.

# 30 Regular expressions library

[re]

## 30.1 General

[re.general]

- <sup>1</sup> This Clause describes components that C++ programs may use to perform operations involving regular expression matching and searching.
- 2 The following subclauses describe a basic regular expression class template and its traits that can handle char-like (21.1) template arguments, two specializations of this class template that handle sequences of `char` and `wchar_t`, a class template that holds the result of a regular expression match, a series of algorithms that allow a character sequence to be operated upon by a regular expression, and two iterator types for enumerating regular expression matches, as summarized in [Table 134](#).

Table 134: Regular expressions library summary [tab:re.summary]

| Subclause                                        | Header                     |
|--------------------------------------------------|----------------------------|
| <a href="#">30.2</a> Definitions                 |                            |
| <a href="#">30.3</a> Requirements                |                            |
| <a href="#">30.5</a> Constants                   | <code>&lt;regex&gt;</code> |
| <a href="#">30.6</a> Exception type              |                            |
| <a href="#">30.7</a> Traits                      |                            |
| <a href="#">30.8</a> Regular expression template |                            |
| <a href="#">30.9</a> Submatches                  |                            |
| <a href="#">30.10</a> Match results              |                            |
| <a href="#">30.11</a> Algorithms                 |                            |
| <a href="#">30.12</a> Iterators                  |                            |
| <a href="#">30.13</a> Grammar                    |                            |

## 30.2 Definitions

[re.def]

- <sup>1</sup> The following definitions shall apply to this Clause:

### 30.2.1

[defns.regex.collating.element]

#### collating element

a sequence of one or more characters within the current locale that collate as if they were a single character.

### 30.2.2

[defns.regex.finite.state.machine]

#### finite state machine

an unspecified data structure that is used to represent a regular expression, and which permits efficient matches against the regular expression to be obtained.

### 30.2.3

[defns.regex.format.specifier]

#### format specifier

a sequence of one or more characters that is to be replaced with some part of a regular expression match.

### 30.2.4

[defns.regex.matched]

#### matched

a sequence of zero or more characters is matched by a regular expression when the characters in the sequence correspond to a sequence of characters defined by the pattern.

### 30.2.5

[defns.regex.primary.equivalence.class]

#### primary equivalence class

a set of one or more characters which share the same primary sort key: that is the sort key weighting that depends only upon character shape, and not accents, case, or locale specific tailorings.

**30.2.6****[defns.regex.regular.expression]****regular expression**

a pattern that selects specific strings from a set of character strings.

**30.2.7****[defns.regex.subexpression]****sub-expression**

a subset of a regular expression that has been marked by parenthesis.

**30.3 Requirements****[re.req]**

- 1 This subclause defines requirements on classes representing regular expression traits.  

[Note 1: The class template `regex_traits`, defined in 30.7, meets these requirements. —end note]
- 2 The class template `basic_regex`, defined in 30.8, needs a set of related types and functions to complete the definition of its semantics. These types and functions are provided as a set of member *typedef-names* and functions in the template parameter `traits` used by the `basic_regex` class template. This subclause defines the semantics of these members.
- 3 To specialize class template `basic_regex` for a character container `CharT` and its related regular expression traits class `Traits`, use `basic_regex<CharT, Traits>`.
- 4 In Table 135 X denotes a traits class defining types and functions for the character container type `charT`; u is an object of type X; v is an object of type `const X`; p is a value of type `const charT*`; I1 and I2 are input iterators (23.3.5.3); F1 and F2 are forward iterators (23.3.5.5); c is a value of type `const charT`; s is an object of type `X::string_type`; cs is an object of type `const X::string_type`; b is a value of type `bool`; I is a value of type `int`; cl is an object of type `X::char_class_type`, and loc is an object of type `X::locale_type`.

Table 135: Regular expression traits class requirements [tab:re.req]

| Expression                         | Return type                            | Assertion/note pre-/post-condition                                                                                                                                                                                                                 |
|------------------------------------|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>X::char_type</code>          | <code>charT</code>                     | The character container type used in the implementation of class template <code>basic_regex</code> .                                                                                                                                               |
| <code>X::string_type</code>        | <code>basic_string&lt;charT&gt;</code> |                                                                                                                                                                                                                                                    |
| <code>X::locale_type</code>        | A copy constructible type              | A type that represents the locale used by the traits class.                                                                                                                                                                                        |
| <code>X::char_class_type</code>    | A bitmask type (16.3.3.3.4).           | A bitmask type representing a particular character classification.                                                                                                                                                                                 |
| <code>X::length(p)</code>          | <code>size_t</code>                    | Yields the smallest i such that <code>p[i] == 0</code> . Complexity is linear in i.                                                                                                                                                                |
| <code>v.translate(c)</code>        | <code>X::char_type</code>              | Returns a character such that for any character d that is to be considered equivalent to c then <code>v.translate(c) == v.translate(d)</code> .                                                                                                    |
| <code>v.translate_nocase(c)</code> | <code>X::char_type</code>              | For all characters C that are to be considered equivalent to c when comparisons are to be performed without regard to case, then <code>v.translate_nocase(c) == v.translate_nocase(C)</code> .                                                     |
| <code>v.transform(F1, F2)</code>   | <code>X::string_type</code>            | Returns a sort key for the character sequence designated by the iterator range [F1, F2) such that if the character sequence [G1, G2) sorts before the character sequence [H1, H2) then <code>v.transform(G1, G2) &lt; v.transform(H1, H2)</code> . |

Table 135: Regular expression traits class requirements (continued)

| Expression                    | Return type        | Assertion/note pre-/post-condition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v.transform_primary(F1, F2)   | X::string_type     | Returns a sort key for the character sequence designated by the iterator range [F1, F2) such that if the character sequence [G1, G2) sorts before the character sequence [H1, H2) when character case is not considered then v.transform_primary(G1, G2) < v.transform_primary(H1, H2).                                                                                                                                                                                                                                                                                                                                                                                         |
| v.lookup_collatename(F1, F2)  | X::string_type     | Returns a sequence of characters that represents the collating element consisting of the character sequence designated by the iterator range [F1, F2). Returns an empty string if the character sequence is not a valid collating element.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| v.lookup_classname(F1, F2, b) | X::char_class_type | Converts the character sequence designated by the iterator range [F1, F2) into a value of a bitmask type that can subsequently be passed to <code>isctype</code> . Values returned from <code>lookup_classname</code> can be bitwise OR'ed together; the resulting value represents membership in either of the corresponding character classes. If <code>b</code> is <code>true</code> , the returned bitmask is suitable for matching characters without regard to their case. Returns 0 if the character sequence is not the name of a character class recognized by <code>X</code> . The value returned shall be independent of the case of the characters in the sequence. |
| v.isctype(c, cl)              | bool               | Returns <code>true</code> if character <code>c</code> is a member of one of the character classes designated by <code>cl</code> , <code>false</code> otherwise.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| v.value(c, I)                 | int                | Returns the value represented by the digit <code>c</code> in base <code>I</code> if the character <code>c</code> is a valid digit in base <code>I</code> ; otherwise returns -1.<br>[Note 2: The value of <code>I</code> will only be 8, 10, or 16.<br>— end note]                                                                                                                                                                                                                                                                                                                                                                                                              |
| u.imbue(loc)                  | X::locale_type     | Imbues <code>u</code> with the locale <code>loc</code> and returns the previous locale used by <code>u</code> if any.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| v.getloc()                    | X::locale_type     | Returns the current locale used by <code>v</code> , if any.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

<sup>5</sup> [Note 3: Class template `regex_traits` meets the requirements for a regular expression traits class when it is specialized for `char` or `wchar_t`. This class template is described in the header `<regex>`, and is described in 30.7. — end note]

### 30.4 Header `<regex>` synopsis

## 30.5 Namespace std::regex\_constants

[re.const]

### 30.5.1 General

[re.const.general]

- <sup>1</sup> The namespace `std::regex_constants` holds symbolic constants used by the regular expression library. This namespace provides three types, `syntax_option_type`, `match_flag_type`, and `error_type`, along with several constants of these types.

### 30.5.2 Bitmask type syntax\_option\_type

[re.synopt]

```

namespace std::regex_constants {
 using syntax_option_type = T1;
 inline constexpr syntax_option_type icase = unspecified;
 inline constexpr syntax_option_type nosubs = unspecified;
 inline constexpr syntax_option_type optimize = unspecified;
 inline constexpr syntax_option_type collate = unspecified;
 inline constexpr syntax_option_type ECMAScript = unspecified;
 inline constexpr syntax_option_type basic = unspecified;
 inline constexpr syntax_option_type extended = unspecified;
 inline constexpr syntax_option_type awk = unspecified;
 inline constexpr syntax_option_type grep = unspecified;
 inline constexpr syntax_option_type egrep = unspecified;
 inline constexpr syntax_option_type multiline = unspecified;
}

```

- <sup>1</sup> The type `syntax_option_type` is an implementation-defined bitmask type (16.3.3.3.4). Setting its elements has the effects listed in Table 136. A valid value of type `syntax_option_type` shall have at most one of the grammar elements `ECMAScript`, `basic`, `extended`, `awk`, `grep`, `egrep`, set. If no grammar element is set, the default grammar is `ECMAScript`.

### 30.5.3 Bitmask type match\_flag\_type

[re.matchflag]

```

namespace std::regex_constants {
 using match_flag_type = T2;
 inline constexpr match_flag_type match_default = {};
 inline constexpr match_flag_type match_not_bol = unspecified;
 inline constexpr match_flag_type match_not_eol = unspecified;
}

```

Table 136: `syntax_option_type` effects [tab:re.synopt]

| Element                 | Effect(s) if set                                                                                                                                                                                                                                                          |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>icase</code>      | Specifies that matching of regular expressions against a character container sequence shall be performed without regard to case.                                                                                                                                          |
| <code>nosubs</code>     | Specifies that no sub-expressions shall be considered to be marked, so that when a regular expression is matched against a character container sequence, no sub-expression matches shall be stored in the supplied <code>match_results</code> object.                     |
| <code>optimize</code>   | Specifies that the regular expression engine should pay more attention to the speed with which regular expressions are matched, and less to the speed with which regular expression objects are constructed. Otherwise it has no detectable effect on the program output. |
| <code>collate</code>    | Specifies that character ranges of the form " <code>[a-b]</code> " shall be locale sensitive.                                                                                                                                                                             |
| <code>ECMAScript</code> | Specifies that the grammar recognized by the regular expression engine shall be that used by ECMAScript in ECMA-262, as modified in <a href="#">30.13</a> .<br>SEE ALSO: ECMA-262 15.10                                                                                   |
| <code>basic</code>      | Specifies that the grammar recognized by the regular expression engine shall be that used by basic regular expressions in POSIX.<br>SEE ALSO: POSIX, Base Definitions and Headers, Section 9.3                                                                            |
| <code>extended</code>   | Specifies that the grammar recognized by the regular expression engine shall be that used by extended regular expressions in POSIX.<br>SEE ALSO: POSIX, Base Definitions and Headers, Section 9.4                                                                         |
| <code>awk</code>        | Specifies that the grammar recognized by the regular expression engine shall be that used by the utility <code>awk</code> in POSIX.                                                                                                                                       |
| <code>grep</code>       | Specifies that the grammar recognized by the regular expression engine shall be that used by the utility <code>grep</code> in POSIX.                                                                                                                                      |
| <code>egrep</code>      | Specifies that the grammar recognized by the regular expression engine shall be that used by the utility <code>grep</code> when given the <code>-E</code> option in POSIX.                                                                                                |
| <code>multiline</code>  | Specifies that <code>^</code> shall match the beginning of a line and <code>\$</code> shall match the end of a line, if the <code>ECMAScript</code> engine is selected.                                                                                                   |

```

inline constexpr match_flag_type match_not_bow = unspecified;
inline constexpr match_flag_type match_not_eow = unspecified;
inline constexpr match_flag_type match_any = unspecified;
inline constexpr match_flag_type match_not_null = unspecified;
inline constexpr match_flag_type match_continuous = unspecified;
inline constexpr match_flag_type match_prev_avail = unspecified;
inline constexpr match_flag_type format_default = {};
inline constexpr match_flag_type format_sed = unspecified;
inline constexpr match_flag_type format_no_copy = unspecified;
inline constexpr match_flag_type format_first_only = unspecified;
}

```

<sup>1</sup> The type `match_flag_type` is an implementation-defined bitmask type ([16.3.3.3.4](#)). The constants of that type, except for `match_default` and `format_default`, are bitmask elements. The `match_default` and `format_default` constants are empty bitmasks. Matching a regular expression against a sequence of characters `[first, last)` proceeds according to the rules of the grammar specified for the regular expression object, modified according to the effects listed in [Table 137](#) for any bitmask elements set.

Table 137: `regex_constants::match_flag_type` effects when obtaining a match against a character container sequence `[first, last)`. [tab:re.matchflag]

| Element                    | Effect(s) if set                                                                                                                                                                                                                        |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>match_not_bol</code> | The first character in the sequence <code>[first, last)</code> shall be treated as though it is not at the beginning of a line, so the character <code>^</code> in the regular expression shall not match <code>[first, first)</code> . |

Table 137: `regex_constants::match_flag_type` effects when obtaining a match against a character container sequence [`first`, `last`). (continued)

| Element                        | Effect(s) if set                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>match_not_eol</code>     | The last character in the sequence [ <code>first</code> , <code>last</code> ) shall be treated as though it is not at the end of a line, so the character "\$" in the regular expression shall not match [ <code>last</code> , <code>last</code> ).                                                                                                                                                                                                                         |
| <code>match_not_bow</code>     | The expression "\b" shall not match the sub-sequence [ <code>first</code> , <code>first</code> ).                                                                                                                                                                                                                                                                                                                                                                           |
| <code>match_not_eow</code>     | The expression "\b" shall not match the sub-sequence [ <code>last</code> , <code>last</code> ).                                                                                                                                                                                                                                                                                                                                                                             |
| <code>match_any</code>         | If more than one match is possible then any match is an acceptable result.                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>match_not_null</code>    | The expression shall not match an empty sequence.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>match_continuous</code>  | The expression shall only match a sub-sequence that begins at <code>first</code> .                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>match_prev_avail</code>  | -- <code>first</code> is a valid iterator position. When this flag is set the flags <code>match_not_bol</code> and <code>match_not_bow</code> shall be ignored by the regular expression algorithms (30.11) and iterators (30.12).                                                                                                                                                                                                                                          |
| <code>format_default</code>    | When a regular expression match is to be replaced by a new string, the new string shall be constructed using the rules used by the ECMAScript replace function in ECMA-262, part 15.5.4.11 String.prototype.replace. In addition, during search and replace operations all non-overlapping occurrences of the regular expression shall be located and replaced, and sections of the input that did not match the expression shall be copied unchanged to the output string. |
| <code>format_sed</code>        | When a regular expression match is to be replaced by a new string, the new string shall be constructed using the rules used by the sed utility in POSIX.                                                                                                                                                                                                                                                                                                                    |
| <code>format_no_copy</code>    | During a search and replace operation, sections of the character container sequence being searched that do not match the regular expression shall not be copied to the output string.                                                                                                                                                                                                                                                                                       |
| <code>format_first_only</code> | When specified during a search and replace operation, only the first occurrence of the regular expression shall be replaced.                                                                                                                                                                                                                                                                                                                                                |

### 30.5.4 Implementation-defined `error_type`

[re.err]

```
namespace std::regex_constants {
 using error_type = T3;
 inline constexpr error_type error_collate = unspecified;
 inline constexpr error_type error_ctype = unspecified;
 inline constexpr error_type error_escape = unspecified;
 inline constexpr error_type error_backref = unspecified;
 inline constexpr error_type error_brack = unspecified;
 inline constexpr error_type error_paren = unspecified;
 inline constexpr error_type error_brace = unspecified;
 inline constexpr error_type error_badbrace = unspecified;
 inline constexpr error_type error_range = unspecified;
 inline constexpr error_type error_space = unspecified;
 inline constexpr error_type error_badrepeat = unspecified;
 inline constexpr error_type error_complexity = unspecified;
 inline constexpr error_type error_stack = unspecified;
}
```

<sup>1</sup> The type `error_type` is an implementation-defined enumerated type (16.3.3.3). Values of type `error_type` represent the error conditions described in Table 138:

Table 138: `error_type` values in the C locale [tab:re.err]

| Value                      | Error condition                                                             |
|----------------------------|-----------------------------------------------------------------------------|
| <code>error_collate</code> | The expression contains an invalid collating element name.                  |
| <code>error_ctype</code>   | The expression contains an invalid character class name.                    |
| <code>error_escape</code>  | The expression contains an invalid escaped character, or a trailing escape. |
| <code>error_backref</code> | The expression contains an invalid back reference.                          |
| <code>error_brack</code>   | The expression contains mismatched [ and ].                                 |
| <code>error_paren</code>   | The expression contains mismatched ( and ).                                 |

Table 138: `error_type` values in the C locale (continued)

| Value                         | Error condition                                                                                                    |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <code>error_brace</code>      | The expression contains mismatched { and }                                                                         |
| <code>error_badbrace</code>   | The expression contains an invalid range in a {} expression.                                                       |
| <code>error_range</code>      | The expression contains an invalid character range, such as [b-a] in most encodings.                               |
| <code>error_space</code>      | There is insufficient memory to convert the expression into a finite state machine.                                |
| <code>error_badrepeat</code>  | One of *?+{ is not preceded by a valid regular expression.                                                         |
| <code>error_complexity</code> | The complexity of an attempted match against a regular expression exceeds a pre-set level.                         |
| <code>error_stack</code>      | There is insufficient memory to determine whether the regular expression matches the specified character sequence. |

### 30.6 Class `regex_error`

[re.badexp]

```
class regex_error : public runtime_error {
public:
 explicit regex_error(regex_constants::error_type ecode);
 regex_constants::error_type code() const;
};
```

- <sup>1</sup> The class `regex_error` defines the type of objects thrown as exceptions to report errors from the regular expression library.

- 1      `regex_error(regex_constants::error_type ecode);`
- 2      *Postconditions:* `ecode == code()`.
- 3      *Returns:* The error code that was passed to the constructor.

### 30.7 Class template `regex_traits`

[re.traits]

```
namespace std {
 template<class charT>
 struct regex_traits {
 using char_type = charT;
 using string_type = basic_string<char_type>;
 using locale_type = locale;
 using char_class_type = bitmask_type;

 regex_traits();
 static size_t length(const char_type* p);
 charT translate(charT c) const;
 charT translate_nocase(charT c) const;
 template<class ForwardIterator>
 string_type transform(ForwardIterator first, ForwardIterator last) const;
 template<class ForwardIterator>
 string_type transform_primary(
 ForwardIterator first, ForwardIterator last) const;
 template<class ForwardIterator>
 string_type lookup_collatename(
 ForwardIterator first, ForwardIterator last) const;
 template<class ForwardIterator>
 char_class_type lookup_classname(
 ForwardIterator first, ForwardIterator last, bool icase = false) const;
 bool isctype(charT c, char_class_type f) const;
 int value(charT ch, int radix) const;
 locale_type imbue(locale_type l);
 locale_type getloc() const;
 };
}
```

<sup>1</sup> The specializations `regex_traits<char>` and `regex_traits<wchar_t>` meet the requirements for a regular expression traits class (30.3).

`using char_class_type = bitmask_type;`

<sup>2</sup> The type `char_class_type` is used to represent a character classification and is capable of holding an implementation specific set returned by `lookup_classname`.

`static size_t length(const char_type* p);`

<sup>3</sup> *Returns:* `char_traits<charT>::length(p)`.

`charT translate(charT c) const;`

<sup>4</sup> *Returns:* `c`.

`charT translate_nocase(charT c) const;`

<sup>5</sup> *Returns:* `use_facet<ctype<charT>>(getloc()).tolower(c)`.

`template<class ForwardIterator>`

`string_type transform(ForwardIterator first, ForwardIterator last) const;`

<sup>6</sup> *Effects:* As if by:

```
string_type str(first, last);
return use_facet<collate<charT>>(
 getloc()).transform(str.data(), str.data() + str.length());
```

`template<class ForwardIterator>`

`string_type transform_primary(ForwardIterator first, ForwardIterator last) const;`

<sup>7</sup> *Effects:* If

`typeid(use_facet<collate<charT>>) == typeid(collate_byname<charT>)`

and the form of the sort key returned by `collate_byname<charT>::transform(first, last)` is known and can be converted into a primary sort key then returns that key, otherwise returns an empty string.

`template<class ForwardIterator>`

`string_type lookup_collatename(ForwardIterator first, ForwardIterator last) const;`

<sup>8</sup> *Returns:* A sequence of one or more characters that represents the collating element consisting of the character sequence designated by the iterator range `[first, last]`. Returns an empty string if the character sequence is not a valid collating element.

`template<class ForwardIterator>`

`char_class_type lookup_classname(`

`ForwardIterator first, ForwardIterator last, bool icase = false) const;`

<sup>9</sup> *Returns:* An unspecified value that represents the character classification named by the character sequence designated by the iterator range `[first, last]`. If the parameter `icase` is `true` then the returned mask identifies the character classification without regard to the case of the characters being matched, otherwise it does honor the case of the characters being matched.<sup>327</sup> The value returned shall be independent of the case of the characters in the character sequence. If the name is not recognized then returns `char_class_type()`.

<sup>10</sup> *Remarks:* For `regex_traits<char>`, at least the narrow character names in Table 139 shall be recognized. For `regex_traits<wchar_t>`, at least the wide character names in Table 139 shall be recognized.

`bool isctype(charT c, char_class_type f) const;`

<sup>11</sup> *Effects:* Determines if the character `c` is a member of the character classification represented by `f`.

<sup>12</sup> *Returns:* Given the following function declaration:

`// for exposition only`

`template<class C>`

`ctype_base::mask convert(typename regex_traits<C>::char_class_type f);`

<sup>327</sup> For example, if the parameter `icase` is `true` then `[[:lower:]]` is the same as `[[:alpha:]]`.

that returns a value in which each `ctype_base::mask` value corresponding to a value in `f` named in [Table 139](#) is set, then the result is determined as if by:

```
ctype_base::mask m = convert<charT>(f);
const ctype<charT>& ct = use_facet<ctype<charT>>(getloc());
if (ct.is(m, c)) {
 return true;
} else if (c == ct.widen('_')) {
 charT w[1] = { ct.widen('w') };
 char_class_type x = lookup_classname(w, w+1);
 return (f&x) == x;
} else {
 return false;
}
```

[*Example 1:*

```
regex_traits<char> t;
string d("d");
string u("upper");
regex_traits<char>::char_class_type f;
f = t.lookup_classname(d.begin(), d.end());
f != t.lookup_classname(u.begin(), u.end());
ctype_base::mask m = convert<char>(f); // m == ctype_base::digit|ctype_base::upper
```

— *end example*]

[*Example 2:*

```
regex_traits<char> t;
string w("w");
regex_traits<char>::char_class_type f;
f = t.lookup_classname(w.begin(), w.end());
t.isctype('A', f); // returns true
t.isctype('_', f); // returns true
t.isctype(' ', f); // returns false
```

— *end example*]

`int value(charT ch, int radix) const;`

13     *Preconditions:* The value of `radix` is 8, 10, or 16.

14     *Returns:* The value represented by the digit `ch` in base `radix` if the character `ch` is a valid digit in base `radix`; otherwise returns -1.

`locale_type imbue(locale_type loc);`

15     *Effects:* Imbues `this` with a copy of the locale `loc`.

[*Note 1:* Calling `imbue` with a different locale than the one currently in use invalidates all cached data held by `*this`. — *end note*]

16     *Returns:* If no locale has been previously imbued then a copy of the global locale in effect at the time of construction of `*this`, otherwise a copy of the last argument passed to `imbue`.

17     *Postconditions:* `getloc() == loc`.

`locale_type getloc() const;`

18     *Returns:* If no locale has been imbued then a copy of the global locale in effect at the time of construction of `*this`, otherwise a copy of the last argument passed to `imbue`.

## 30.8 Class template `basic_regex`

[`re.regex`]

### 30.8.1 General

[`re.regex.general`]

- 1 For a char-like type `charT`, specializations of class template `basic_regex` represent regular expressions constructed from character sequences of `charT` characters. In the rest of [30.8](#), `charT` denotes a given char-like type. Storage for a regular expression is allocated and freed as necessary by the member functions of class `basic_regex`.

Table 139: Character class names and corresponding ctype masks [tab:re.traits.classnames]

| Narrow character name | Wide character name | Corresponding ctype_base::mask value |
|-----------------------|---------------------|--------------------------------------|
| "alnum"               | L"alnum"            | ctype_base::alnum                    |
| "alpha"               | L"alpha"            | ctype_base::alpha                    |
| "blank"               | L"blank"            | ctype_base::blank                    |
| "cntrl"               | L"cntrl"            | ctype_base::cntrl                    |
| "digit"               | L"digit"            | ctype_base::digit                    |
| "d"                   | L"d"                | ctype_base::digit                    |
| "graph"               | L"graph"            | ctype_base::graph                    |
| "lower"               | L"lower"            | ctype_base::lower                    |
| "print"               | L"print"            | ctype_base::print                    |
| "punct"               | L"punct"            | ctype_base::punct                    |
| "space"               | L"space"            | ctype_base::space                    |
| "s"                   | L"s"                | ctype_base::space                    |
| "upper"               | L"upper"            | ctype_base::upper                    |
| "w"                   | L"w"                | ctype_base::alnum                    |
| "xdigit"              | L"xdigit"           | ctype_base::xdigit                   |

- <sup>2</sup> Objects of type specialization of `basic_regex` are responsible for converting the sequence of `charT` objects to an internal representation. It is not specified what form this representation takes, nor how it is accessed by algorithms that operate on regular expressions.

[Note 1: Implementations will typically declare some function templates as friends of `basic_regex` to achieve this.  
— end note]

- <sup>3</sup> The functions described in 30.8 report errors by throwing exceptions of type `regex_error`.

```

namespace std {
 template<class charT, class traits = regex_traits<charT>>
 class basic_regex {
 public:
 // types
 using value_type = charT;
 using traits_type = traits;
 using string_type = typename traits::string_type;
 using flag_type = regex_constants::syntax_option_type;
 using locale_type = typename traits::locale_type;

 // 30.5.2, constants
 static constexpr flag_type icase = regex_constants::icase;
 static constexpr flag_type nosubs = regex_constants::nosubs;
 static constexpr flag_type optimize = regex_constants::optimize;
 static constexpr flag_type collate = regex_constants::collate;

// 30.8.6, swap
void swap(basic_regex&);
};

template<class ForwardIterator>
basic_regex(ForwardIterator, ForwardIterator,
 regex_constants::syntax_option_type = regex_constants::ECMAScript)
-> basic_regex<typename iterator_traits<ForwardIterator>::value_type>;
}

```

### 30.8.2 Constructors

[re.regex.construct]

`basic_regex();`

1 *Postconditions:* `*this` does not match any character sequence.

explicit `basic_regex(const charT* p, flag_type f = regex_constants::ECMAScript);`

2 *Preconditions:* `[p, p + char_traits<charT>::length(p))` is a valid range.

3 *Effects:* The object's internal finite state machine is constructed from the regular expression contained in the sequence of characters `[p, p + char_traits<charT>::length(p))`, and interpreted according to the flags `f`.

4 *Postconditions:* `flags()` returns `f`. `mark_count()` returns the number of marked sub-expressions within the expression.

5 *Throws:* `regex_error` if `[p, p + char_traits<charT>::length(p))` is not a valid regular expression.

```

basic_regex(const charT* p, size_t len, flag_type f = regex_constants::ECMAScript);
6 Preconditions: [p, p + len) is a valid range.
7 Effects: The object's internal finite state machine is constructed from the regular expression contained
 in the sequence of characters [p, p + len), and interpreted according the flags specified in f.
8 Postconditions: flags() returns f. mark_count() returns the number of marked sub-expressions
 within the expression.
9 Throws: regex_error if [p, p + len) is not a valid regular expression.

basic_regex(const basic_regex& e);
10 Postconditions: flags() and mark_count() return e.flags() and e.mark_count(), respectively.

basic_regex(basic_regex&& e) noexcept;
11 Postconditions: flags() and mark_count() return the values that e.flags() and e.mark_count(),
 respectively, had before construction.

template<class ST, class SA>
 explicit basic_regex(const basic_string<charT, ST, SA>& s,
 flag_type f = regex_constants::ECMAScript);
12 Effects: The object's internal finite state machine is constructed from the regular expression contained
 in the string s, and interpreted according to the flags specified in f.
13 Postconditions: flags() returns f. mark_count() returns the number of marked sub-expressions
 within the expression.
14 Throws: regex_error if s is not a valid regular expression.

template<class ForwardIterator>
 basic_regex(ForwardIterator first, ForwardIterator last,
 flag_type f = regex_constants::ECMAScript);
15 Effects: The object's internal finite state machine is constructed from the regular expression contained
 in the sequence of characters [first, last), and interpreted according to the flags specified in f.
16 Postconditions: flags() returns f. mark_count() returns the number of marked sub-expressions
 within the expression.
17 Throws: regex_error if the sequence [first, last) is not a valid regular expression.

basic_regex(initializer_list<charT> il, flag_type f = regex_constants::ECMAScript);
18 Effects: Same as basic_regex(il.begin(), il.end(), f).

```

### 30.8.3 Assignment

[re.regex.assign]

```

basic_regex& operator=(const basic_regex& e);
1 Postconditions: flags() and mark_count() return e.flags() and e.mark_count(), respectively.

basic_regex& operator=(basic_regex&& e) noexcept;
2 Postconditions: flags() and mark_count() return the values that e.flags() and e.mark_count(),
 respectively, had before assignment. e is in a valid state with unspecified value.

basic_regex& operator=(const charT* p);
3 Effects: Equivalent to: return assign(p);

basic_regex& operator=(initializer_list<charT> il);
4 Effects: Equivalent to: return assign(il.begin(), il.end());

template<class ST, class SA>
 basic_regex& operator=(const basic_string<charT, ST, SA>& s);
5 Effects: Equivalent to: return assign(s);

```

```

basic_regex& assign(const basic_regex& e);
6 Effects: Equivalent to: return *this = e;

basic_regex& assign(basic_regex&& e) noexcept;
7 Effects: Equivalent to: return *this = std::move(e);

basic_regex& assign(const charT* p, flag_type f = regex_constants::ECMAScript);
8 Effects: Equivalent to: return assign(string_type(p), f);

basic_regex& assign(const charT* p, size_t len, flag_type f = regex_constants::ECMAScript);
9 Effects: Equivalent to: return assign(string_type(p, len), f);

template<class ST, class SA>
basic_regex& assign(const basic_string<charT, ST, SA>& s,
 flag_type f = regex_constants::ECMAScript);
10 Returns: *this.

Effects: Assigns the regular expression contained in the string s, interpreted according the flags specified in f. If an exception is thrown, *this is unchanged.

Postconditions: If no exception is thrown, flags() returns f and mark_count() returns the number of marked sub-expressions within the expression.

Throws: regex_error if s is not a valid regular expression.

template<class InputIterator>
basic_regex& assign(InputIterator first, InputIterator last,
 flag_type f = regex_constants::ECMAScript);
14 Effects: Equivalent to: return assign(string_type(first, last), f);

basic_regex& assign(initializer_list<charT> il,
 flag_type f = regex_constants::ECMAScript);
15 Effects: Equivalent to: return assign(il.begin(), il.end(), f);

```

**30.8.4 Constant operations**

[re.regex.operations]

`unsigned mark_count() const;`1     *Effects:* Returns the number of marked sub-expressions within the regular expression.`flag_type flags() const;`2     *Effects:* Returns a copy of the regular expression syntax flags that were passed to the object's constructor or to the last call to `assign`.**30.8.5 Locale**

[re.regex.locale]

`locale_type imbue(locale_type loc);`1     *Effects:* Returns the result of `traits_inst.imbue(loc)` where `traits_inst` is a (default-initialized) instance of the template type argument `traits` stored within the object. After a call to `imbue` the `basic_regex` object does not match any character sequence.`locale_type getloc() const;`2     *Effects:* Returns the result of `traits_inst.getloc()` where `traits_inst` is a (default-initialized) instance of the template parameter `traits` stored within the object.**30.8.6 Swap**

[re.regex.swap]

`void swap(basic_regex& e);`1     *Effects:* Swaps the contents of the two regular expressions.2     *Postconditions:* `*this` contains the regular expression that was in `e`, `e` contains the regular expression that was in `*this`.3     *Complexity:* Constant time.

### 30.8.7 Non-member functions

[re.regex.nonmemb]

```
template<class charT, class traits>
void swap(basic_regex<charT, traits>& lhs, basic_regex<charT, traits>& rhs);
1 Effects: Calls lhs.swap(rhs).
```

### 30.9 Class template sub\_match

[re.submatch]

#### 30.9.1 General

[re.submatch.general]

- <sup>1</sup> Class template sub\_match denotes the sequence of characters matched by a particular marked sub-expression.

```
namespace std {
 template<class BidirectionalIterator>
 class sub_match : public pair<BidirectionalIterator, BidirectionalIterator> {
public:
 using value_type =
 typename iterator_traits<BidirectionalIterator>::value_type;
 using difference_type =
 typename iterator_traits<BidirectionalIterator>::difference_type;
 using iterator = BidirectionalIterator;
 using string_type = basic_string<value_type>;
 bool matched;
 constexpr sub_match();
 difference_type length() const;
 operator string_type() const;
 string_type str() const;

 int compare(const sub_match& s) const;
 int compare(const string_type& s) const;
 int compare(const value_type* s) const;
};
}
```

#### 30.9.2 Members

[re.submatch.members]

```
constexpr sub_match();
1 Effects: Value-initializes the pair base class subobject and the member matched.
difference_type length() const;
2 Returns: matched ? distance(first, second) : 0.
operator string_type() const;
3 Returns: matched ? string_type(first, second) : string_type().
string_type str() const;
4 Returns: matched ? string_type(first, second) : string_type().
int compare(const sub_match& s) const;
5 Returns: str().compare(s.str());
int compare(const string_type& s) const;
6 Returns: str().compare(s);
int compare(const value_type* s) const;
7 Returns: str().compare(s).
```

#### 30.9.3 Non-member operators

[re.submatch.op]

- <sup>1</sup> Let *SM-CAT(I)* be

```
compare_three_way_result_t<basic_string<typename iterator_traits<I>::value_type>>
```

```

template<class BiIter>
bool operator==(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);
2 Returns: lhs.compare(rhs) == 0.

template<class BiIter>
auto operator<=(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);
3 Returns: static_cast<SM-CAT(BiIter)>(lhs.compare(rhs) <= 0).

template<class BiIter, class ST, class SA>
bool operator==(
 const sub_match<BiIter>& lhs,
 const basic_string<typename iterator_traits<BiIter>::value_type, ST, SA>& rhs);
4 Returns:
 lhs.compare(typename sub_match<BiIter>::string_type(rhs.data(), rhs.size())) == 0

template<class BiIter, class ST, class SA>
auto operator<=((
 const sub_match<BiIter>& lhs,
 const basic_string<typename iterator_traits<BiIter>::value_type, ST, SA>& rhs);
5 Returns:
 static_cast<SM-CAT(BiIter)>(lhs.compare(
 typename sub_match<BiIter>::string_type(rhs.data(), rhs.size()))
 <= 0
)

template<class BiIter>
bool operator==(const sub_match<BiIter>& lhs,
 const typename iterator_traits<BiIter>::value_type* rhs);
6 Returns: lhs.compare(rhs) == 0.

template<class BiIter>
auto operator<=(const sub_match<BiIter>& lhs,
 const typename iterator_traits<BiIter>::value_type* rhs);
7 Returns: static_cast<SM-CAT(BiIter)>(lhs.compare(rhs) <= 0).

template<class BiIter>
bool operator==(const sub_match<BiIter>& lhs,
 const typename iterator_traits<BiIter>::value_type& rhs);
8 Returns: lhs.compare(typename sub_match<BiIter>::string_type(1, rhs)) == 0.

template<class BiIter>
auto operator<=(const sub_match<BiIter>& lhs,
 const typename iterator_traits<BiIter>::value_type& rhs);
9 Returns:
 static_cast<SM-CAT(BiIter)>(lhs.compare(
 typename sub_match<BiIter>::string_type(1, rhs))
 <= 0
)

template<class charT, class ST, class BiIter>
basic_ostream<charT, ST>&
operator<<(basic_ostream<charT, ST>& os, const sub_match<BiIter>& m);
10 Returns: os << m.str().

```

### 30.10 Class template `match_results`

[`re.results`]

#### 30.10.1 General

[`re.results.general`]

- <sup>1</sup> Class template `match_results` denotes a collection of character sequences representing the result of a regular expression match. Storage for the collection is allocated and freed as necessary by the member functions of class template `match_results`.

- <sup>2</sup> The class template `match_results` meets the requirements of an allocator-aware container and of a sequence container (22.2.1, 22.2.3) except that only copy assignment, move assignment, and operations defined for const-qualified sequence containers are supported and that the semantics of the comparison operator functions are different from those required for a container.
- <sup>3</sup> A default-constructed `match_results` object has no fully established result state. A match result is *ready* when, as a consequence of a completed regular expression match modifying such an object, its result state becomes fully established. The effects of calling most member functions from a `match_results` object that is not ready are undefined.
- <sup>4</sup> The `sub_match` object stored at index 0 represents sub-expression 0, i.e., the whole match. In this case the `sub_match` member `matched` is always `true`. The `sub_match` object stored at index `n` denotes what matched the marked sub-expression `n` within the matched expression. If the sub-expression `n` participated in a regular expression match then the `sub_match` member `matched` evaluates to `true`, and members `first` and `second` denote the range of characters `[first, second)` which formed that match. Otherwise `matched` is `false`, and members `first` and `second` point to the end of the sequence that was searched.

[*Note 1:* The `sub_match` objects representing different sub-expressions that did not participate in a regular expression match need not be distinct. — *end note*]

```
namespace std {
 template<class BidirectionalIterator,
 class Allocator = allocator<sub_match<BidirectionalIterator>>>
 class match_results {
public:
 using value_type = sub_match<BidirectionalIterator>;
 using const_reference = const value_type&;
 using reference = value_type&;
 using const_iterator = implementation-defined;
 using iterator = const_iterator;
 using difference_type =
 typename iterator_traits<BidirectionalIterator>::difference_type;
 using size_type = typename allocator_traits<Allocator>::size_type;
 using allocator_type = Allocator;
 using char_type =
 typename iterator_traits<BidirectionalIterator>::value_type;
 using string_type = basic_string<char_type>;

 // 30.10.2, construct/copy/destroy
 match_results() : match_results(Allocator{}) {}
 explicit match_results(const Allocator&);
 match_results(const match_results& m);
 match_results(match_results&& m) noexcept;
 match_results& operator=(const match_results& m);
 match_results& operator=(match_results&& m);
 ~match_results();

 // 30.10.3, state
 bool ready() const;

 // 30.10.4, size
 size_type size() const;
 size_type max_size() const;
 [[nodiscard]] bool empty() const;

 // 30.10.5, element access
 difference_type length(size_type sub = 0) const;
 difference_type position(size_type sub = 0) const;
 string_type str(size_type sub = 0) const;
 const_reference operator[](size_type n) const;

 const_reference prefix() const;
 const_reference suffix() const;
 const_iterator begin() const;
 const_iterator end() const;
```

```

const_iterator cbegin() const;
const_iterator cend() const;

// 30.10.6, format
template<class OutputIter>
OutputIter
format(OutputIter out,
 const char_type* fmt_first, const char_type* fmt_last,
 regex_constants::match_flag_type flags = regex_constants::format_default) const;
template<class OutputIter, class ST, class SA>
OutputIter
format(OutputIter out,
 const basic_string<char_type, ST, SA>& fmt,
 regex_constants::match_flag_type flags = regex_constants::format_default) const;
template<class ST, class SA>
basic_string<char_type, ST, SA>
format(const basic_string<char_type, ST, SA>& fmt,
 regex_constants::match_flag_type flags = regex_constants::format_default) const;
string_type
format(const char_type* fmt,
 regex_constants::match_flag_type flags = regex_constants::format_default) const;

// 30.10.7, allocator
allocator_type get_allocator() const;

// 30.10.8, swap
void swap(match_results& that);
};

}

```

### 30.10.2 Constructors

[re.results.const]

`explicit match_results(const Allocator& a);`  
 1      *Postconditions:* `ready()` returns `false`. `size()` returns 0.

`match_results(match_results&& m)` noexcept;  
 2      *Effects:* The stored `Allocator` value is move constructed from `m.get_allocator()`.  
 3      *Postconditions:* As specified in [Table 140](#).

`match_results& operator=(const match_results& m);`  
 4      *Postconditions:* As specified in [Table 140](#).

`match_results& operator=(match_results&& m);`  
 5      *Postconditions:* As specified in [Table 140](#).

Table 140: `match_results` assignment operator effects [tab:re.results.const]

| Element                  | Value                                                      |
|--------------------------|------------------------------------------------------------|
| <code>ready()</code>     | <code>m.ready()</code>                                     |
| <code>size()</code>      | <code>m.size()</code>                                      |
| <code>str(n)</code>      | <code>m.str(n)</code> for all integers $n < m.size()$      |
| <code>prefix()</code>    | <code>m.prefix()</code>                                    |
| <code>suffix()</code>    | <code>m.suffix()</code>                                    |
| <code>(*this)[n]</code>  | <code>m[n]</code> for all integers $n < m.size()$          |
| <code>length(n)</code>   | <code>m.length(n)</code> for all integers $n < m.size()$   |
| <code>position(n)</code> | <code>m.position(n)</code> for all integers $n < m.size()$ |

**30.10.3 State**

[re.results.state]

`bool ready() const;`

1     *Returns:* true if \*this has a fully established result state, otherwise false.

**30.10.4 Size**

[re.results.size]

`size_type size() const;`

1     *Returns:* One plus the number of marked sub-expressions in the regular expression that was matched if \*this represents the result of a successful match. Otherwise returns 0.

[Note 1: The state of a `match_results` object can be modified only by passing that object to `regex_match` or `regex_search`. Subclauses 30.11.2 and 30.11.3 specify the effects of those algorithms on their `match_results` arguments. —end note]

`size_type max_size() const;`

2     *Returns:* The maximum number of `sub_match` elements that can be stored in \*this.

`[[nodiscard]] bool empty() const;`

3     *Returns:* size() == 0.

**30.10.5 Element access**

[re.results.acc]

`difference_type length(size_type sub = 0) const;`

1     *Preconditions:* ready() == true.

2     *Returns:* (\*this)[sub].length().

`difference_type position(size_type sub = 0) const;`

3     *Preconditions:* ready() == true.

4     *Returns:* The distance from the start of the target sequence to (\*this)[sub].first.

`string_type str(size_type sub = 0) const;`

5     *Preconditions:* ready() == true.

6     *Returns:* string\_type((\*this)[sub]).

`const_reference operator[](size_type n) const;`

7     *Preconditions:* ready() == true.

8     *Returns:* A reference to the `sub_match` object representing the character sequence that matched marked sub-expression n. If n == 0 then returns a reference to a `sub_match` object representing the character sequence that matched the whole regular expression. If n >= size() then returns a `sub_match` object representing an unmatched sub-expression.

`const_reference prefix() const;`

9     *Preconditions:* ready() == true.

10    *Returns:* A reference to the `sub_match` object representing the character sequence from the start of the string being matched/searched to the start of the match found.

`const_reference suffix() const;`

11    *Preconditions:* ready() == true.

12    *Returns:* A reference to the `sub_match` object representing the character sequence from the end of the match found to the end of the string being matched/searched.

`const_iterator begin() const;`  
`const_iterator cbegin() const;`

13    *Returns:* A starting iterator that enumerates over all the sub-expressions stored in \*this.

```
const_iterator end() const;
const_iterator cend() const;
```

14     >Returns: A terminating iterator that enumerates over all the sub-expressions stored in *\*this*.

### 30.10.6 Formatting

[re.results.form]

```
template<class OutputIter>
```

```
OutputIter format(
 OutputIter out,
 const char_type* fmt_first, const char_type* fmt_last,
 regex_constants::match_flag_type flags = regex_constants::format_default) const;
```

1     >*Preconditions*: ready() == true and OutputIter meets the requirements for a Cpp17OutputIterator (23.3.5.4).

2     >*Effects*: Copies the character sequence [fmt\_first, fmt\_last) to OutputIter out. Replaces each format specifier or escape sequence in the copied range with either the character(s) it represents or the sequence of characters within *\*this* to which it refers. The bitmasks specified in flags determine which format specifiers and escape sequences are recognized.

3     >Returns: out.

```
template<class OutputIter, class ST, class SA>
```

```
OutputIter format(
 OutputIter out,
 const basic_string<char_type, ST, SA>& fmt,
 regex_constants::match_flag_type flags = regex_constants::format_default) const;
```

4     >*Effects*: Equivalent to:

```
 return format(out, fmt.data(), fmt.data() + fmt.size(), flags);
```

```
template<class ST, class SA>
```

```
basic_string<char_type, ST, SA> format(
 const basic_string<char_type, ST, SA>& fmt,
 regex_constants::match_flag_type flags = regex_constants::format_default) const;
```

5     >*Preconditions*: ready() == true.

6     >*Effects*: Constructs an empty string result of type basic\_string<char\_type, ST, SA> and calls:

```
 format(back_inserter(result), fmt, flags);
```

7     >Returns: result.

```
string_type format(
```

```
 const char_type* fmt,
 regex_constants::match_flag_type flags = regex_constants::format_default) const;
```

8     >*Preconditions*: ready() == true.

9     >*Effects*: Constructs an empty string result of type string\_type and calls:

```
 format(back_inserter(result), fmt, fmt + char_traits<char_type>::length(fmt), flags);
```

10   >Returns: result.

### 30.10.7 Allocator

[re.results.all]

```
allocator_type get_allocator() const;
```

1     >Returns: A copy of the Allocator that was passed to the object's constructor or, if that allocator has been replaced, a copy of the most recent replacement.

### 30.10.8 Swap

[re.results.swap]

```
void swap(match_results& that);
```

1     >*Effects*: Swaps the contents of the two sequences.

2     >*Postconditions*: *\*this* contains the sequence of matched sub-expressions that were in *that*, *that* contains the sequence of matched sub-expressions that were in *\*this*.

3     >*Complexity*: Constant time.

```
template<class BidirectionalIterator, class Allocator>
void swap(match_results<BidirectionalIterator, Allocator>& m1,
 match_results<BidirectionalIterator, Allocator>& m2);
```

<sup>4</sup> Effects: As if by `m1.swap(m2)`.

### 30.10.9 Non-member functions

[re.results.nonmember]

```
template<class BidirectionalIterator, class Allocator>
bool operator==(const match_results<BidirectionalIterator, Allocator>& m1,
 const match_results<BidirectionalIterator, Allocator>& m2);
```

<sup>1</sup> Returns: `true` if neither match result is ready, `false` if one match result is ready and the other is not. If both match results are ready, returns `true` only if:

- (1.1) — `m1.empty() && m2.empty()`, or
- (1.2) — `!m1.empty() && !m2.empty()`, and the following conditions are satisfied:
  - (1.2.1) — `m1.prefix() == m2.prefix()`,
  - (1.2.2) — `m1.size() == m2.size() && equal(m1.begin(), m1.end(), m2.begin())`, and
  - (1.2.3) — `m1.suffix() == m2.suffix()`.

[Note 1: The algorithm `equal` is defined in [Clause 25](#). — end note]

## 30.11 Regular expression algorithms

[re.alg]

### 30.11.1 Exceptions

[re.exception]

<sup>1</sup> The algorithms described in subclause [30.11](#) may throw an exception of type `regex_error`. If such an exception `e` is thrown, `e.code()` shall return either `regex_constants::error_complexity` or `regex_constants::error_stack`.

### 30.11.2 regex\_match

[re.alg.match]

```
template<class BidirectionalIterator, class Allocator, class charT, class traits>
bool regex_match(BidirectionalIterator first, BidirectionalIterator last,
 match_results<BidirectionalIterator, Allocator>& m,
 const basic_regex<charT, traits>& e,
 regex_constants::match_flag_type flags = regex_constants::match_default);
```

<sup>1</sup> Preconditions: `BidirectionalIterator` meets the `Cpp17BidirectionalIterator` requirements ([23.3.5.6](#)).

<sup>2</sup> Effects: Determines whether there is a match between the regular expression `e`, and all of the character sequence [`first`, `last`). The parameter `flags` is used to control how the expression is matched against the character sequence. When determining if there is a match, only potential matches that match the entire character sequence are considered. Returns `true` if such a match exists, `false` otherwise.

[Example 1:

```
std::regex re("Get|GetValue");
std::cmatch m;
regex_search("GetValue", m, re); // returns true, and m[0] contains "Get"
regex_match ("GetValue", m, re); // returns true, and m[0] contains "GetValue"
regex_search("GetValues", m, re); // returns true, and m[0] contains "Get"
regex_match ("GetValues", m, re); // returns false
```

— end example]

<sup>3</sup> Postconditions: `m.ready() == true` in all cases. If the function returns `false`, then the effect on parameter `m` is unspecified except that `m.size()` returns 0 and `m.empty()` returns `true`. Otherwise the effects on parameter `m` are given in [Table 141](#).

Table 141: Effects of `regex_match` algorithm [tab:re.alg.match]

| Element                       | Value                           |
|-------------------------------|---------------------------------|
| <code>m.size()</code>         | <code>1 + e.mark_count()</code> |
| <code>m.empty()</code>        | <code>false</code>              |
| <code>m.prefix().first</code> | <code>first</code>              |

Table 141: Effects of `regex_match` algorithm (continued)

| Element                         | Value                                                                                                                                                                                             |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>m.prefix().second</code>  | <code>first</code>                                                                                                                                                                                |
| <code>m.prefix().matched</code> | <code>false</code>                                                                                                                                                                                |
| <code>m.suffix().first</code>   | <code>last</code>                                                                                                                                                                                 |
| <code>m.suffix().second</code>  | <code>last</code>                                                                                                                                                                                 |
| <code>m.suffix().matched</code> | <code>false</code>                                                                                                                                                                                |
| <code>m[0].first</code>         | <code>first</code>                                                                                                                                                                                |
| <code>m[0].second</code>        | <code>last</code>                                                                                                                                                                                 |
| <code>m[0].matched</code>       | <code>true</code>                                                                                                                                                                                 |
| <code>m[n].first</code>         | For all integers $0 < n < m.size()$ , the start of the sequence that matched sub-expression $n$ . Alternatively, if sub-expression $n$ did not participate in the match, then <code>last</code> . |
| <code>m[n].second</code>        | For all integers $0 < n < m.size()$ , the end of the sequence that matched sub-expression $n$ . Alternatively, if sub-expression $n$ did not participate in the match, then <code>last</code> .   |
| <code>m[n].matched</code>       | For all integers $0 < n < m.size()$ , <code>true</code> if sub-expression $n$ participated in the match, <code>false</code> otherwise.                                                            |

```

template<class BidirectionalIterator, class charT, class traits>
bool regex_match(BidirectionalIterator first, BidirectionalIterator last,
 const basic_regex<charT, traits>& e,
 regex_constants::match_flag_type flags = regex_constants::match_default);

4 Effects: Behaves “as if” by constructing an instance of match_results<BidirectionalIterator>
what, and then returning the result of regex_match(first, last, what, e, flags).
```

```

template<class charT, class Allocator, class traits>
bool regex_match(const charT* str,
 match_results<const charT*, Allocator>& m,
 const basic_regex<charT, traits>& e,
 regex_constants::match_flag_type flags = regex_constants::match_default);

5 Returns: regex_match(str, str + char_traits<charT>::length(str), m, e, flags).
```

```

template<class ST, class SA, class Allocator, class charT, class traits>
bool regex_match(const basic_string<charT, ST, SA>& s,
 match_results<typename basic_string<charT, ST, SA>::const_iterator,
 Allocator>& m,
 const basic_regex<charT, traits>& e,
 regex_constants::match_flag_type flags = regex_constants::match_default);

6 Returns: regex_match(s.begin(), s.end(), m, e, flags).
```

```

template<class charT, class traits>
bool regex_match(const charT* str,
 const basic_regex<charT, traits>& e,
 regex_constants::match_flag_type flags = regex_constants::match_default);

7 Returns: regex_match(str, str + char_traits<charT>::length(str), e, flags)
```

```

template<class ST, class SA, class charT, class traits>
bool regex_match(const basic_string<charT, ST, SA>& s,
 const basic_regex<charT, traits>& e,
 regex_constants::match_flag_type flags = regex_constants::match_default);

8 Returns: regex_match(s.begin(), s.end(), e, flags).
```

### 30.11.3 `regex_search`

[re.alg.search]

```

template<class BidirectionalIterator, class Allocator, class charT, class traits>
bool regex_search(BidirectionalIterator first, BidirectionalIterator last,
```

```
match_results<BidirectionalIterator, Allocator>& m,
const basic_regex<charT, traits>& e,
regex_constants::match_flag_type flags = regex_constants::match_default);
```

1    *Preconditions:* BidirectionalIterator meets the Cpp17BidirectionalIterator requirements (23.3.5.6).

2    *Effects:* Determines whether there is some sub-sequence within [first, last) that matches the regular expression e. The parameter flags is used to control how the expression is matched against the character sequence. Returns true if such a sequence exists, false otherwise.

3    *Postconditions:* m.ready() == true in all cases. If the function returns false, then the effect on parameter m is unspecified except that m.size() returns 0 and m.empty() returns true. Otherwise the effects on parameter m are given in Table 142.

Table 142: Effects of regex\_search algorithm [tab:re.alg.search]

| Element            | Value                                                                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| m.size()           | 1 + e.mark_count()                                                                                                                                                          |
| m.empty()          | false                                                                                                                                                                       |
| m.prefix().first   | first                                                                                                                                                                       |
| m.prefix().second  | m[0].first                                                                                                                                                                  |
| m.prefix().matched | m.prefix().first != m.prefix().second                                                                                                                                       |
| m.suffix().first   | m[0].second                                                                                                                                                                 |
| m.suffix().second  | last                                                                                                                                                                        |
| m.suffix().matched | m.suffix().first != m.suffix().second                                                                                                                                       |
| m[0].first         | The start of the sequence of characters that matched the regular expression                                                                                                 |
| m[0].second        | The end of the sequence of characters that matched the regular expression                                                                                                   |
| m[0].matched       | true                                                                                                                                                                        |
| m[n].first         | For all integers 0 < n < m.size(), the start of the sequence that matched sub-expression n. Alternatively, if sub-expression n did not participate in the match, then last. |
| m[n].second        | For all integers 0 < n < m.size(), the end of the sequence that matched sub-expression n. Alternatively, if sub-expression n did not participate in the match, then last.   |
| m[n].matched       | For all integers 0 < n < m.size(), true if sub-expression n participated in the match, false otherwise.                                                                     |

```
template<class charT, class Allocator, class traits>
bool regex_search(const charT* str, match_results<const charT*, Allocator>& m,
 const basic_regex<charT, traits>& e,
 regex_constants::match_flag_type flags = regex_constants::match_default);
```

4    *Returns:* regex\_search(str, str + char\_traits<charT>::length(str), m, e, flags).

```
template<class ST, class SA, class Allocator, class charT, class traits>
bool regex_search(const basic_string<charT, ST, SA>& s,
 match_results<typename basic_string<charT, ST, SA>::const_iterator,
 Allocator>& m,
 const basic_regex<charT, traits>& e,
 regex_constants::match_flag_type flags = regex_constants::match_default);
```

5    *Returns:* regex\_search(s.begin(), s.end(), m, e, flags).

```
template<class BidirectionalIterator, class charT, class traits>
bool regex_search(BidirectionalIterator first, BidirectionalIterator last,
 const basic_regex<charT, traits>& e,
 regex_constants::match_flag_type flags = regex_constants::match_default);
```

6    *Effects:* Behaves “as if” by constructing an object what of type match\_results<BidirectionalIterator> and returning regex\_search(first, last, what, e, flags).

```

template<class charT, class traits>
bool regex_search(const charT* str,
 const basic_regex<charT, traits>& e,
 regex_constants::match_flag_type flags = regex_constants::match_default);
7 Returns: regex_search(str, str + char_traits<charT>::length(str), e, flags).

template<class ST, class SA, class charT, class traits>
bool regex_search(const basic_string<charT, ST, SA>& s,
 const basic_regex<charT, traits>& e,
 regex_constants::match_flag_type flags = regex_constants::match_default);
8 Returns: regex_search(s.begin(), s.end(), e, flags).

```

### 30.11.4 regex\_replace

[re.alg.replace]

```

template<class OutputIterator, class BidirectionalIterator,
 class traits, class charT, class ST, class SA>
OutputIterator
regex_replace(OutputIterator out,
 BidirectionalIterator first, BidirectionalIterator last,
 const basic_regex<charT, traits>& e,
 const basic_string<charT, ST, SA>& fmt,
 regex_constants::match_flag_type flags = regex_constants::match_default);
template<class OutputIterator, class BidirectionalIterator, class traits, class charT>
OutputIterator
regex_replace(OutputIterator out,
 BidirectionalIterator first, BidirectionalIterator last,
 const basic_regex<charT, traits>& e,
 const charT* fmt,
 regex_constants::match_flag_type flags = regex_constants::match_default);

```

1 Effects: Constructs a `regex_iterator` object `i` as if by

```
regex_iterator<BidirectionalIterator, charT, traits> i(first, last, e, flags)
```

and uses `i` to enumerate through all of the matches `m` of type `match_results<BidirectionalIterator>` that occur within the sequence `[first, last]`. If no such matches are found and `!(flags & regex_constants::format_no_copy)`, then calls

```
out = copy(first, last, out)
```

If any matches are found then, for each such match:

(1.1) — If `!(flags & regex_constants::format_no_copy)`, calls

```
out = copy(m.prefix().first, m.prefix().second, out)
```

(1.2) — Then calls

```
out = m.format(out, fmt, flags)
```

for the first form of the function and

```
out = m.format(out, fmt, fmt + char_traits<charT>::length(fmt), flags)
```

for the second.

Finally, if such a match is found and `!(flags & regex_constants::format_no_copy)`, calls

```
out = copy(last_m.suffix().first, last_m.suffix().second, out)
```

where `last_m` is a copy of the last match found. If `flags & regex_constants::format_first_only` is nonzero, then only the first match found is replaced.

2 Returns: `out`.

```

template<class traits, class charT, class ST, class SA, class FST, class FSA>
basic_string<charT, ST, SA>
regex_replace(const basic_string<charT, ST, SA>& s,
 const basic_regex<charT, traits>& e,
 const basic_string<charT, FST, FSA>& fmt,
 regex_constants::match_flag_type flags = regex_constants::match_default);

```

```
template<class traits, class charT, class ST, class SA>
basic_string<charT, ST, SA>
 regex_replace(const basic_string<charT, ST, SA>& s,
 const basic_regex<charT, traits>& e,
 const charT* fmt,
 regex_constants::match_flag_type flags = regex_constants::match_default);
```

3     *Effects:* Constructs an empty string *result* of type `basic_string<charT, ST, SA>` and calls:

```
 regex_replace(back_inserter(result), s.begin(), s.end(), e, fmt, flags);
```

4     *Returns:* *result*.

```
template<class traits, class charT, class ST, class SA>
basic_string<charT>
 regex_replace(const charT* s,
 const basic_regex<charT, traits>& e,
 const basic_string<charT, ST, SA>& fmt,
 regex_constants::match_flag_type flags = regex_constants::match_default);
template<class traits, class charT>
basic_string<charT>
 regex_replace(const charT* s,
 const basic_regex<charT, traits>& e,
 const charT* fmt,
 regex_constants::match_flag_type flags = regex_constants::match_default);
```

5     *Effects:* Constructs an empty string *result* of type `basic_string<charT>` and calls:

```
 regex_replace(back_inserter(result), s, s + char_traits<charT>::length(s), e, fmt, flags);
```

6     *Returns:* *result*.

## 30.12 Regular expression iterators

[re.iterator]

### 30.12.1 Class template `regex_iterator`

[re.register]

#### 30.12.1.1 General

[re.register.general]

1 The class template `regex_iterator` is an iterator adaptor. It represents a new view of an existing iterator sequence, by enumerating all the occurrences of a regular expression within that sequence. A `regex_iterator` uses `regex_search` to find successive regular expression matches within the sequence from which it was constructed. After the iterator is constructed, and every time `operator++` is used, the iterator finds and stores a value of `match_results<BidirectionalIterator>`. If the end of the sequence is reached (`regex_search` returns `false`), the iterator becomes equal to the end-of-sequence iterator value. The default constructor constructs an end-of-sequence iterator object, which is the only legitimate iterator to be used for the end condition. The result of `operator*` on an end-of-sequence iterator is not defined. For any other iterator value a `const match_results<BidirectionalIterator>&` is returned. The result of `operator->` on an end-of-sequence iterator is not defined. For any other iterator value a `const match_results<BidirectionalIterator>*` is returned. It is impossible to store things into `regex_iterators`. Two end-of-sequence iterators are always equal. An end-of-sequence iterator is not equal to a non-end-of-sequence iterator. Two non-end-of-sequence iterators are equal when they are constructed from the same arguments.

```
namespace std {
 template<class BidirectionalIterator,
 class charT = typename iterator_traits<BidirectionalIterator>::value_type,
 class traits = regex_traits<charT>>
 class regex_iterator {
public:
 using regex_type = basic_regex<charT, traits>;
 using iterator_category = forward_iterator_tag;
 using value_type = match_results<BidirectionalIterator>;
 using difference_type = ptrdiff_t;
 using pointer = const value_type*;
 using reference = const value_type&;

 regex_iterator();
 regex_iterator(BidirectionalIterator a, BidirectionalIterator b,
 const regex_type& re,
 regex_constants::match_flag_type m = regex_constants::match_default);
```

```

 regex_iterator(BidirectionalIterator, BidirectionalIterator,
 const regex_type&&,
 regex_constants::match_flag_type = regex_constants::match_default) = delete;
 regex_iterator(const regex_iterator&);
 regex_iterator& operator=(const regex_iterator&);
 bool operator==(const regex_iterator&) const;
 const value_type& operator*() const;
 const value_type* operator->() const;
 regex_iterator& operator++();
 regex_iterator operator++(int);

private:
 BidirectionalIterator begin; // exposition only
 BidirectionalIterator end; // exposition only
 const regex_type* pregex; // exposition only
 regex_constants::match_flag_type flags; // exposition only
 match_results<BidirectionalIterator> match; // exposition only
};

}

```

- <sup>2</sup> An object of type `regex_iterator` that is not an end-of-sequence iterator holds a *zero-length match* if `match[0].matched == true` and `match[0].first == match[0].second`.

[Note 1: For example, this can occur when the part of the regular expression that matched consists only of an assertion (such as '^', '\$', '\b', '\B'). — end note]

### 30.12.1.2 Constructors

[re.register.cnstr]

```
regex_iterator();
```

- <sup>1</sup> *Effects:* Constructs an end-of-sequence iterator.

```
regex_iterator(BidirectionalIterator a, BidirectionalIterator b,
 const regex_type& re,
 regex_constants::match_flag_type m = regex_constants::match_default);
```

- <sup>2</sup> *Effects:* Initializes `begin` and `end` to `a` and `b`, respectively, sets `pregex` to `addressof(re)`, sets `flags` to `m`, then calls `regex_search(begin, end, match, *pregex, flags)`. If this call returns `false` the constructor sets `*this` to the end-of-sequence iterator.

### 30.12.1.3 Comparisons

[re.register.comp]

```
bool operator==(const regex_iterator& right) const;
```

- <sup>1</sup> *Returns:* `true` if `*this` and `right` are both end-of-sequence iterators or if the following conditions all hold:

- (1.1) — `begin == right.begin`,
- (1.2) — `end == right.end`,
- (1.3) — `pregex == right.pregex`,
- (1.4) — `flags == right.flags`, and
- (1.5) — `match[0] == right.match[0]`;

otherwise `false`.

### 30.12.1.4 Indirection

[re.register.deref]

```
const value_type& operator*() const;
```

- <sup>1</sup> *Returns:* `match`.

```
const value_type* operator->() const;
```

- <sup>2</sup> *Returns:* `addressof(match)`.

**30.12.1.5 Increment**

[re.register.incr]

```
regex_iterator& operator++();
```

<sup>1</sup> *Effects:* Constructs a local variable `start` of type `BidirectionalIterator` and initializes it with the value of `match[0].second`.

<sup>2</sup> If the iterator holds a zero-length match and `start == end` the operator sets `*this` to the end-of-sequence iterator and returns `*this`.

<sup>3</sup> Otherwise, if the iterator holds a zero-length match, the operator calls:

```
 regex_search(start, end, match, *pregex,
 flags | regex_constants::match_not_null | regex_constants::match_continuous)
```

If the call returns `true` the operator returns `*this`. Otherwise the operator increments `start` and continues as if the most recent match was not a zero-length match.

<sup>4</sup> If the most recent match was not a zero-length match, the operator sets `flags` to `flags | regex_constants::match_prev_avail` and calls `regex_search(start, end, match, *pregex, flags)`. If the call returns `false` the iterator sets `*this` to the end-of-sequence iterator. The iterator then returns `*this`.

<sup>5</sup> In all cases in which the call to `regex_search` returns `true`, `match.prefix().first` shall be equal to the previous value of `match[0].second`, and for each index `i` in the half-open range `[0, match.size()` for which `match[i].matched` is `true`, `match.position(i)` shall return `distance(begin, match[i].first)`.

<sup>6</sup> [Note 1: This means that `match.position(i)` gives the offset from the beginning of the target sequence, which is often not the same as the offset from the sequence passed in the call to `regex_search`. — end note]

<sup>7</sup> It is unspecified how the implementation makes these adjustments.

<sup>8</sup> [Note 2: This means that a compiler can call an implementation-specific search function, in which case a program-defined specialization of `regex_search` will not be called. — end note]

```
regex_iterator operator++(int);
```

<sup>9</sup> *Effects:* As if by:

```
 regex_iterator tmp = *this;
 ++(*this);
 return tmp;
```

**30.12.2 Class template regex\_token\_iterator**

[re.tokiter]

**30.12.2.1 General**

[re.tokiter.general]

<sup>1</sup> The class template `regex_token_iterator` is an iterator adaptor; that is to say it represents a new view of an existing iterator sequence, by enumerating all the occurrences of a regular expression within that sequence, and presenting one or more sub-expressions for each match found. Each position enumerated by the iterator is a `sub_match` class template instance that represents what matched a particular sub-expression within the regular expression.

<sup>2</sup> When class `regex_token_iterator` is used to enumerate a single sub-expression with index -1 the iterator performs field splitting: that is to say it enumerates one sub-expression for each section of the character container sequence that does not match the regular expression specified.

<sup>3</sup> After it is constructed, the iterator finds and stores a value `regex_iterator<BidirectionalIterator>` `position` and sets the internal count `N` to zero. It also maintains a sequence `subs` which contains a list of the sub-expressions which will be enumerated. Every time `operator++` is used the count `N` is incremented; if `N` exceeds or equals `subs.size()`, then the iterator increments member `position` and sets `N` to zero.

<sup>4</sup> If the end of sequence is reached (`position` is equal to the end of sequence iterator), the iterator becomes equal to the end-of-sequence iterator value, unless the sub-expression being enumerated has index -1, in which case the iterator enumerates one last sub-expression that contains all the characters from the end of the last regular expression match to the end of the input sequence being enumerated, provided that this would not be an empty sub-expression.

<sup>5</sup> The default constructor constructs an end-of-sequence iterator object, which is the only legitimate iterator to be used for the end condition. The result of `operator*` on an end-of-sequence iterator is not defined. For any other iterator value a `const sub_match<BidirectionalIterator>&` is returned. The result of

`operator->` on an end-of-sequence iterator is not defined. For any other iterator value a `const sub_match<BidirectionalIterator>*` is returned.

- 6 It is impossible to store things into `regex_token_iterators`. Two end-of-sequence iterators are always equal. An end-of-sequence iterator is not equal to a non-end-of-sequence iterator. Two non-end-of-sequence iterators are equal when they are constructed from the same arguments.

```
namespace std {
 template<class BidirectionalIterator,
 class charT = typename iterator_traits<BidirectionalIterator>::value_type,
 class traits = regex_traits<charT>>
 class regex_token_iterator {
public:
 using regex_type = basic_regex<charT, traits>;
 using iterator_category = forward_iterator_tag;
 using value_type = sub_match<BidirectionalIterator>;
 using difference_type = ptrdiff_t;
 using pointer = const value_type*;
 using reference = const value_type&;

 regex_token_iterator();
 regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
 const regex_type& re,
 int submatch = 0,

 template<size_t N>
 regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
 const regex_type&& re,
 const int (&submatches)[N],
 regex_constants::match_flag_type m =
 regex_constants::match_default) = delete;
 regex_token_iterator(const regex_token_iterator&);
 regex_token_iterator& operator=(const regex_token_iterator&);
```

```

 bool operator==(const regex_token_iterator&) const;
 const value_type& operator*() const;
 const value_type* operator->() const;
 regex_token_iterator& operator++();
 regex_token_iterator operator++(int);

private:
 using position_iterator =
 regex_iterator<BidirectionalIterator, charT, traits>; // exposition only
 position_iterator position; // exposition only
 const value_type* result; // exposition only
 value_type suffix; // exposition only
 size_t N; // exposition only
 vector<int> subs; // exposition only
};

}
}

```

- <sup>7</sup> A *suffix iterator* is a `regex_token_iterator` object that points to a final sequence of characters at the end of the target sequence. In a suffix iterator the member `result` holds a pointer to the data member `suffix`, the value of the member `suffix.match` is `true`, `suffix.first` points to the beginning of the final sequence, and `suffix.second` points to the end of the final sequence.
- <sup>8</sup> [Note 1: For a suffix iterator, data member `suffix.first` is the same as the end of the last match found, and `suffix.second` is the same as the end of the target sequence. —end note]
- <sup>9</sup> The *current match* is `(*position).prefix()` if `subs[N] == -1`, or `(*position)[subs[N]]` for any other value of `subs[N]`.

### 30.12.2.2 Constructors

[re.tokiter.cnstr]

```
regex_token_iterator();
```

- <sup>1</sup> *Effects:* Constructs the end-of-sequence iterator.

```

regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
 const regex_type& re,
 int submatch = 0,
 regex_constants::match_flag_type m = regex_constants::match_default);

regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
 const regex_type& re,
 const vector<int>& submatches,
 regex_constants::match_flag_type m = regex_constants::match_default);

regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
 const regex_type& re,
 initializer_list<int> submatches,
 regex_constants::match_flag_type m = regex_constants::match_default);

template<size_t N>
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
 const regex_type& re,
 const int (&submatches)[N],
 regex_constants::match_flag_type m = regex_constants::match_default);

```

- <sup>2</sup> *Preconditions:* Each of the initialization values of `submatches` is  $\geq -1$ .

- <sup>3</sup> *Effects:* The first constructor initializes the member `subs` to hold the single value `submatch`. The second, third, and fourth constructors initialize the member `subs` to hold a copy of the sequence of integer values pointed to by the iterator range `[begin(submatches), end(submatches))`.

- <sup>4</sup> Each constructor then sets `N` to 0, and `position` to `position_iterator(a, b, re, m)`. If `position` is not an end-of-sequence iterator the constructor sets `result` to the address of the current match. Otherwise if any of the values stored in `subs` is equal to -1 the constructor sets `*this` to a suffix iterator that points to the range `[a, b)`, otherwise the constructor sets `*this` to an end-of-sequence iterator.

**30.12.2.3 Comparisons**

[re.tokiter.comp]

```
bool operator==(const regex_token_iterator& right) const;
```

- 1     *Returns:* true if \*this and right are both end-of-sequence iterators, or if \*this and right are both suffix iterators and suffix == right.suffix; otherwise returns false if \*this or right is an end-of-sequence iterator or a suffix iterator. Otherwise returns true if position == right.position, N == right.N, and subs == right.subs. Otherwise returns false.

**30.12.2.4 Indirection**

[re.tokiter.deref]

```
const value_type& operator*() const;
```

- 1     *Returns:* \*result.

```
const value_type* operator->() const;
```

- 2     *Returns:* result.

**30.12.2.5 Increment**

[re.tokiter.incr]

```
regex_token_iterator& operator++();
```

- 1     *Effects:* Constructs a local variable prev of type position\_iterator, initialized with the value of position.
- 2     If \*this is a suffix iterator, sets \*this to an end-of-sequence iterator.
- 3     Otherwise, if N + 1 < subs.size(), increments N and sets result to the address of the current match.
- 4     Otherwise, sets N to 0 and increments position. If position is not an end-of-sequence iterator the operator sets result to the address of the current match.
- 5     Otherwise, if any of the values stored in subs is equal to -1 and prev->suffix().length() is not 0 the operator sets \*this to a suffix iterator that points to the range [prev->suffix().first, prev->suffix().second].
- 6     Otherwise, sets \*this to an end-of-sequence iterator.

- 7     *Returns:* \*this

```
regex_token_iterator& operator++(int);
```

- 8     *Effects:* Constructs a copy tmp of \*this, then calls ++(\*this).

- 9     *Returns:* tmp.

**30.13 Modified ECMAScript regular expression grammar**

[re.grammar]

- 1     The regular expression grammar recognized by basic\_regex objects constructed with the ECMAScript flag is that specified by ECMA-262, except as specified below.
- 2     Objects of type specialization of basic\_regex store within themselves a default-constructed instance of their traits template parameter, henceforth referred to as traits\_inst. This traits\_inst object is used to support localization of the regular expression; basic\_regex member functions shall not call any locale dependent C or C++ API, including the formatted string input functions. Instead they shall call the appropriate traits member function to achieve the required effect.
- 3     The following productions within the ECMAScript grammar are modified as follows:

*ClassAtom* ::

- 
- ClassAtomNoDash*
- ClassAtomExClass*
- ClassAtomCollatingElement*
- ClassAtomEquivalence*

*IdentityEscape* ::

*SourceCharacter* but not c

- 4     The following new productions are then added:

*ClassAtomExClass* ::

  [: *ClassName* :]

```

ClassAtomCollatingElement ::

 [. ClassName .]

ClassAtomEquivalence ::

 [= ClassName =]

ClassName ::

 ClassNameCharacter

ClassNameCharacter ClassName

ClassNameCharacter ::

 SourceCharacter but not one of . or = or :

```

- 5 The productions *ClassAtomExClass*, *ClassAtomCollatingElement* and *ClassAtomEquivalence* provide functionality equivalent to that of the same features in regular expressions in POSIX.
- 6 The regular expression grammar may be modified by any `regex_constants::syntax_option_type` flags specified when constructing an object of type specialization of `basic_regex` according to the rules in [Table 136](#).
- 7 A *ClassName* production, when used in *ClassAtomExClass*, is not valid if `traits_inst.lookup_classname` returns zero for that name. The names recognized as valid *ClassNames* are determined by the type of the traits class, but at least the following names shall be recognized: `alnum`, `alpha`, `blank`, `cntrl`, `digit`, `graph`, `lower`, `print`, `punct`, `space`, `upper`, `xdigit`, `d`, `s`, `w`. In addition the following expressions shall be equivalent:
  - `\d` and `[:digit:]`
  - `\D` and `[^[:digit:]]`
  - `\s` and `[:space:]`
  - `\S` and `[^[:space:]]`
  - `\w` and `_[:alnum:]`
  - `\W` and `[^_[:alnum:]]`
- 8 A *ClassName* production when used in a *ClassAtomCollatingElement* production is not valid if the value returned by `traits_inst.lookup_collatename` for that name is an empty string.
- 9 The results from multiple calls to `traits_inst.lookup_classname` can be bitwise OR'ed together and subsequently passed to `traits_inst.isctype`.
- 10 A *ClassName* production when used in a *ClassAtomEquivalence* production is not valid if the value returned by `traits_inst.lookup_collatename` for that name is an empty string or if the value returned by `traits_inst.transform_primary` for the result of the call to `traits_inst.lookup_collatename` is an empty string.
- 11 When the sequence of characters being transformed to a finite state machine contains an invalid class name the translator shall throw an exception object of type `regex_error`.
- 12 If the *CV* of a *UnicodeEscapeSequence* is greater than the largest value that can be held in an object of type `charT` the translator shall throw an exception object of type `regex_error`.
 

[*Note 1*: This means that values of the form "uxxxx" that do not fit in a character are invalid. — *end note*]
- 13 Where the regular expression grammar requires the conversion of a sequence of characters to an integral value, this is accomplished by calling `traits_inst.value`.
- 14 The behavior of the internal finite state machine representation when used to match a sequence of characters is as described in ECMA-262. The behavior is modified according to any `match_flag_type` flags ([30.5.3](#)) specified when using the regular expression object in one of the regular expression algorithms ([30.11](#)). The behavior is also localized by interaction with the traits class template parameter as follows:
  - (14.1) — During matching of a regular expression finite state machine against a sequence of characters, two characters `c` and `d` are compared using the following rules:
    - (14.1.1) — if `(flags() & regex_constants::icase)` the two characters are equal if `traits_inst.translate_nocase(c) == traits_inst.translate_nocase(d);`

- (14.1.2) — otherwise, if `flags() & regex_constants::collate` the two characters are equal if `traits_inst.translate(c) == traits_inst.translate(d)`;
- (14.1.3) — otherwise, the two characters are equal if `c == d`.
- (14.2) — During matching of a regular expression finite state machine against a sequence of characters, comparison of a collating element range `c1-c2` against a character `c` is conducted as follows: if `flags() & regex_constants::collate` is `false` then the character `c` is matched if `c1 <= c && c <= c2`, otherwise `c` is matched in accordance with the following algorithm:
- ```

string_type str1 = string_type(1,
    flags() & icase ?
        traits_inst.translate_nocase(c1) : traits_inst.translate(c1));
string_type str2 = string_type(1,
    flags() & icase ?
        traits_inst.translate_nocase(c2) : traits_inst.translate(c2));
string_type str = string_type(1,
    flags() & icase ?
        traits_inst.translate_nocase(c) : traits_inst.translate(c));
return traits_inst.transform(str1.begin(), str1.end())
    <= traits_inst.transform(str.begin(), str.end())
    && traits_inst.transform(str.begin(), str.end())
    <= traits_inst.transform(str2.begin(), str2.end());

```
- (14.3) — During matching of a regular expression finite state machine against a sequence of characters, testing whether a collating element is a member of a primary equivalence class is conducted by first converting the collating element and the equivalence class to sort keys using `traits::transform_primary`, and then comparing the sort keys for equality.
- (14.4) — During matching of a regular expression finite state machine against a sequence of characters, a character `c` is a member of a character class designated by an iterator range `[first, last)` if `traits_inst.isctype(c, traits_inst.lookup_classname(first, last, flags() & icase))` is `true`.

31 Atomic operations library

[atomics]

31.1 General

[atomics.general]

- ¹ This Clause describes components for fine-grained atomic access. This access is provided via operations on atomic objects.
- 2 The following subclauses describe atomics requirements and components for types and operations, as summarized in [Table 143](#).

Table 143: Atomics library summary [tab:atomics.summary]

Subclause	Header
31.3	Type aliases
31.4	<atomic>
31.5	Order and consistency
31.6	Lock-free property
31.7	Waiting and notifying
31.8	Class template <code>atomic_ref</code>
31.9	Class template <code>atomic</code>
31.10	Non-member functions
31.11	Flag type and operations
	Fences

31.2 Header <atomic> synopsis

[atomics.syn]

```

extern "C" void atomic_signal_fence(memory_order) noexcept;
}

```

31.3 Type aliases

[atomics.alias]

- ¹ The type aliases `atomic_intN_t`, `atomic_uintN_t`, `atomic_intptr_t`, and `atomic_uintptr_t` are defined if and only if `intN_t`, `uintN_t`, `intptr_t`, and `uintptr_t` are defined, respectively.
- 2 The type aliases `atomic_signed_lock_free` and `atomic_unsigned_lock_free` name specializations of `atomic` whose template arguments are integral types, respectively signed and unsigned, and whose `is_always_lock_free` property is true.

[Note 1: These aliases are optional in freestanding implementations (16.4.2.4). — end note]

Implementations should choose for these aliases the integral specializations of `atomic` for which the atomic waiting and notifying operations (31.6) are most efficient.

31.4 Order and consistency

[atomics.order]

```

namespace std {
    enum class memory_order : unspecified {
        relaxed, consume, acquire, release, acq_rel, seq_cst
    };
    inline constexpr memory_order memory_order_relaxed = memory_order::relaxed;
    inline constexpr memory_order memory_order_consume = memory_order::consume;
    inline constexpr memory_order memory_order_acquire = memory_order::acquire;
    inline constexpr memory_order memory_order_release = memory_order::release;
    inline constexpr memory_order memory_order_acq_rel = memory_order::acq_rel;
    inline constexpr memory_order memory_order_seq_cst = memory_order::seq_cst;
}

```

- ¹ The enumeration `memory_order` specifies the detailed regular (non-atomic) memory synchronization order as defined in 6.9.2 and may provide for operation ordering. Its enumerated values and their meanings are as follows:
 - (1.1) — `memory_order::relaxed`: no operation orders memory.
 - (1.2) — `memory_order::release`, `memory_order::acq_rel`, and `memory_order::seq_cst`: a store operation performs a release operation on the affected memory location.
 - (1.3) — `memory_order::consume`: a load operation performs a consume operation on the affected memory location.

[*Note 1:* Prefer `memory_order::acquire`, which provides stronger guarantees than `memory_order::consume`. Implementations have found it infeasible to provide performance better than that of `memory_order::acquire`. Specification revisions are under consideration. — *end note*]

- (1.4) — `memory_order::acquire`, `memory_order::acq_rel`, and `memory_order::seq_cst`: a load operation performs an acquire operation on the affected memory location.

[*Note 2:* Atomic operations specifying `memory_order::relaxed` are relaxed with respect to memory ordering. Implementations must still guarantee that any given atomic access to a particular atomic object be indivisible with respect to all other atomic accesses to that object. — *end note*]

- 2 An atomic operation *A* that performs a release operation on an atomic object *M* synchronizes with an atomic operation *B* that performs an acquire operation on *M* and takes its value from any side effect in the release sequence headed by *A*.
- 3 An atomic operation *A* on some atomic object *M* is *coherence-ordered before* another atomic operation *B* on *M* if
 - (3.1) — *A* is a modification, and *B* reads the value stored by *A*, or
 - (3.2) — *A* precedes *B* in the modification order of *M*, or
 - (3.3) — *A* and *B* are not the same atomic read-modify-write operation, and there exists an atomic modification *X* of *M* such that *A* reads the value stored by *X* and *X* precedes *B* in the modification order of *M*, or
 - (3.4) — there exists an atomic modification *X* of *M* such that *A* is coherence-ordered before *X* and *X* is coherence-ordered before *B*.
- 4 There is a single total order *S* on all `memory_order::seq_cst` operations, including fences, that satisfies the following constraints. First, if *A* and *B* are `memory_order::seq_cst` operations and *A* strongly happens before *B*, then *A* precedes *B* in *S*. Second, for every pair of atomic operations *A* and *B* on an object *M*, where *A* is coherence-ordered before *B*, the following four conditions are required to be satisfied by *S*:
 - (4.1) — if *A* and *B* are both `memory_order::seq_cst` operations, then *A* precedes *B* in *S*; and
 - (4.2) — if *A* is a `memory_order::seq_cst` operation and *B* happens before a `memory_order::seq_cst` fence *Y*, then *A* precedes *Y* in *S*; and
 - (4.3) — if a `memory_order::seq_cst` fence *X* happens before *A* and *B* is a `memory_order::seq_cst` operation, then *X* precedes *B* in *S*; and
 - (4.4) — if a `memory_order::seq_cst` fence *X* happens before *A* and *B* happens before a `memory_order::seq_cst` fence *Y*, then *X* precedes *Y* in *S*.
- 5 [*Note 3:* This definition ensures that *S* is consistent with the modification order of any atomic object *M*. It also ensures that a `memory_order::seq_cst` load *A* of *M* gets its value either from the last modification of *M* that precedes *A* in *S* or from some non-`memory_order::seq_cst` modification of *M* that does not happen before any modification of *M* that precedes *A* in *S*. — *end note*]
- 6 [*Note 4:* We do not require that *S* be consistent with “happens before” (6.9.2.2). This allows more efficient implementation of `memory_order::acquire` and `memory_order::release` on some machine architectures. It can produce surprising results when these are mixed with `memory_order::seq_cst` accesses. — *end note*]
- 7 [*Note 5:* `memory_order::seq_cst` ensures sequential consistency only for a program that is free of data races and uses exclusively `memory_order::seq_cst` atomic operations. Any use of weaker ordering will invalidate this guarantee unless extreme care is used. In many cases, `memory_order::seq_cst` atomic operations are reorderable with respect to other atomic operations performed by the same thread. — *end note*]
- 8 Implementations should ensure that no “out-of-thin-air” values are computed that circularly depend on their own computation.

[*Note 6:* For example, with *x* and *y* initially zero,

```
// Thread 1:  
r1 = y.load(memory_order::relaxed);  
x.store(r1, memory_order::relaxed);  
  
// Thread 2:  
r2 = x.load(memory_order::relaxed);  
y.store(r2, memory_order::relaxed);
```

this recommendation discourages producing `r1 == r2 == 42`, since the store of 42 to *y* is only possible if the store to *x* stores 42, which circularly depends on the store to *y* storing 42. Note that without this restriction, such an execution is possible. — *end note*]

- ⁹ [Note 7: The recommendation similarly disallows `r1 == r2 == 42` in the following example, with `x` and `y` again initially zero:

```
// Thread 1:  
r1 = x.load(memory_order::relaxed);  
if (r1 == 42) y.store(42, memory_order::relaxed);  
  
// Thread 2:  
r2 = y.load(memory_order::relaxed);  
if (r2 == 42) x.store(42, memory_order::relaxed);  
— end note]
```

- ¹⁰ Atomic read-modify-write operations shall always read the last value (in the modification order) written before the write associated with the read-modify-write operation.

- ¹¹ Implementations should make atomic stores visible to atomic loads within a reasonable amount of time.

```
template<class T>  
T kill_dependency(T y) noexcept;
```

- ¹² *Effects*: The argument does not carry a dependency to the return value (6.9.2).

- ¹³ *Returns*: `y`.

31.5 Lock-free property

[**atomics.lockfree**]

```
#define ATOMIC_BOOL_LOCK_FREE unspecified  
#define ATOMIC_CHAR_LOCK_FREE unspecified  
#define ATOMIC_CHAR8_T_LOCK_FREE unspecified  
#define ATOMIC_CHAR16_T_LOCK_FREE unspecified  
#define ATOMIC_CHAR32_T_LOCK_FREE unspecified  
#define ATOMIC_WCHAR_T_LOCK_FREE unspecified  
#define ATOMIC_SHORT_LOCK_FREE unspecified  
#define ATOMIC_INT_LOCK_FREE unspecified  
#define ATOMIC_LONG_LOCK_FREE unspecified  
#define ATOMIC_LLONG_LOCK_FREE unspecified  
#define ATOMIC_POINTER_LOCK_FREE unspecified
```

- ¹ The `ATOMIC_..._LOCK_FREE` macros indicate the lock-free property of the corresponding atomic types, with the signed and unsigned variants grouped together. The properties also apply to the corresponding (partial) specializations of the `atomic` template. A value of 0 indicates that the types are never lock-free. A value of 1 indicates that the types are sometimes lock-free. A value of 2 indicates that the types are always lock-free.

- ² At least one signed integral specialization of the `atomic` template, along with the specialization for the corresponding unsigned type (6.8.2), is always lock-free.

[Note 1: This requirement is optional in freestanding implementations (16.4.2.4). — end note]

- ³ The function `atomic_is_lock_free` (31.8.2) indicates whether the object is lock-free. In any given program execution, the result of the lock-free query shall be consistent for all pointers of the same type.

- ⁴ Atomic operations that are not lock-free are considered to potentially block (6.9.2.3).

- ⁵ *Recommended practice*: Operations that are lock-free should also be address-free³²⁸. The implementation of these operations should not depend on any per-process state.

[Note 2: This restriction enables communication by memory that is mapped into a process more than once and by memory that is shared between two processes. — end note]

31.6 Waiting and notifying

[**atomics.wait**]

- ¹ *Atomic waiting operations* and *atomic notifying operations* provide a mechanism to wait for the value of an atomic object to change more efficiently than can be achieved with polling. An atomic waiting operation may block until it is unblocked by an atomic notifying operation, according to each function's effects.

[Note 1: Programs are not guaranteed to observe transient atomic values, an issue known as the A-B-A problem, resulting in continued blocking if a condition is only temporarily met. — end note]

- ² [Note 2: The following functions are atomic waiting operations:

- (2.1) — `atomic<T>::wait`,

³²⁸ That is, atomic operations on the same memory location via two different addresses will communicate atomically.

- (2.2) — `atomic_flag::wait`,
 - (2.3) — `atomic_wait` and `atomic_wait_explicit`,
 - (2.4) — `atomic_flag_wait` and `atomic_flag_wait_explicit`, and
 - (2.5) — `atomic_ref<T>::wait`.
- *end note*]

³ [Note 3: The following functions are atomic notifying operations:

- (3.1) — `atomic<T>::notify_one` and `atomic<T>::notify_all`,
 - (3.2) — `atomic_flag::notify_one` and `atomic_flag::notify_all`,
 - (3.3) — `atomic_notify_one` and `atomic_notify_all`,
 - (3.4) — `atomic_flag_notify_one` and `atomic_flag_notify_all`, and
 - (3.5) — `atomic_ref<T>::notify_one` and `atomic_ref<T>::notify_all`.
- *end note*]

⁴ A call to an atomic waiting operation on an atomic object M is *eligible to be unblocked* by a call to an atomic notifying operation on M if there exist side effects X and Y on M such that:

- (4.1) — the atomic waiting operation has blocked after observing the result of X,
- (4.2) — X precedes Y in the modification order of M, and
- (4.3) — Y happens before the call to the atomic notifying operation.

31.7 Class template `atomic_ref`

[`atomics.ref.generic`]

31.7.1 General

[`atomics.ref.generic.general`]

```
namespace std {
    template<class T> struct atomic_ref {
        private:
            T* ptr;           // exposition only
        public:
            using value_type = T;
            static constexpr size_t required_alignment = implementation-defined;

            static constexpr bool is_always_lock_free = implementation-defined;
            bool is_lock_free() const noexcept;

            explicit atomic_ref(T&);
            atomic_ref(const atomic_ref&) noexcept;
            atomic_ref& operator=(const atomic_ref&) = delete;

            void store(T, memory_order = memory_order::seq_cst) const noexcept;
            T operator=(T) const noexcept;
            T load(memory_order = memory_order::seq_cst) const noexcept;
            operator T() const noexcept;

            T exchange(T, memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_weak(T&, T,
                                       memory_order, memory_order) const noexcept;
            bool compare_exchange_strong(T&, T,
                                         memory_order, memory_order) const noexcept;
            bool compare_exchange_weak(T&, T,
                                       memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_strong(T&, T,
                                         memory_order = memory_order::seq_cst) const noexcept;

            void wait(T, memory_order = memory_order::seq_cst) const noexcept;
            void notify_one() const noexcept;
            void notify_all() const noexcept;
    };
}
```

- ¹ An `atomic_ref` object applies atomic operations (31.1) to the object referenced by `*ptr` such that, for the lifetime (6.7.3) of the `atomic_ref` object, the object referenced by `*ptr` is an atomic object (6.9.2.2).
- ² The program is ill-formed if `is_trivially_copyable_v<T>` is false.
- ³ The lifetime (6.7.3) of an object referenced by `*ptr` shall exceed the lifetime of all `atomic_refs` that reference the object. While any `atomic_ref` instances exist that reference the `*ptr` object, all accesses to that object shall exclusively occur through those `atomic_ref` instances. No subobject of the object referenced by `atomic_ref` shall be concurrently referenced by any other `atomic_ref` object.
- ⁴ Atomic operations applied to an object through a referencing `atomic_ref` are atomic with respect to atomic operations applied through any other `atomic_ref` referencing the same object.

[*Note 1*: Atomic operations or the `atomic_ref` constructor can acquire a shared resource, such as a lock associated with the referenced object, to enable atomic operations to be applied to the referenced object. — *end note*]

31.7.2 Operations

[`atomics.ref.ops`]

```
static constexpr size_t required_alignment;
```

- ¹ The alignment required for an object to be referenced by an atomic reference, which is at least `alignof(T)`.
- ² [*Note 1*: Hardware can require an object referenced by an `atomic_ref` to have stricter alignment (6.7.6) than other objects of type `T`. Further, whether operations on an `atomic_ref` are lock-free can depend on the alignment of the referenced object. For example, it is possible that the hardware supports lock-free atomic operations on a `std::complex<double>` object only if the object is aligned to `2*alignof(double)`. — *end note*]

```
static constexpr bool is_always_lock_free;
```

- ³ The static data member `is_always_lock_free` is `true` if the `atomic_ref` type's operations are always lock-free, and `false` otherwise.

```
bool is_lock_free() const noexcept;
```

- ⁴ *Returns*: `true` if operations on all objects of the type `atomic_ref<T>` are lock-free, `false` otherwise.

```
atomic_ref(T& obj);
```

- ⁵ *Preconditions*: The referenced object is aligned to `required_alignment`.

- ⁶ *Postconditions*: `*this` references `obj`.

- ⁷ *Throws*: Nothing.

```
atomic_ref(const atomic_ref& ref) noexcept;
```

- ⁸ *Postconditions*: `*this` references the object referenced by `ref`.

```
void store(T desired, memory_order order = memory_order::seq_cst) const noexcept;
```

- ⁹ *Preconditions*: The `order` argument is neither `memory_order::consume`, `memory_order::acquire`, nor `memory_order::acq_rel`.

- ¹⁰ *Effects*: Atomically replaces the value referenced by `*ptr` with the value of `desired`. Memory is affected according to the value of `order`.

```
T operator=(T desired) const noexcept;
```

- ¹¹ *Effects*: Equivalent to:

```
    store(desired);
    return desired;
```

```
T load(memory_order order = memory_order::seq_cst) const noexcept;
```

- ¹² *Preconditions*: The `order` argument is neither `memory_order::release` nor `memory_order::acq_rel`.

- ¹³ *Effects*: Memory is affected according to the value of `order`.

- ¹⁴ *Returns*: Atomically returns the value referenced by `*ptr`.

```
operator T() const noexcept;
```

- ¹⁵ *Effects*: Equivalent to: `return load();`

T exchange(T desired, memory_order order = memory_order::seq_cst) const noexcept;

16 *Effects:* Atomically replaces the value referenced by *ptr with desired. Memory is affected according to the value of order. This operation is an atomic read-modify-write operation (6.9.2).

17 *Returns:* Atomically returns the value referenced by *ptr immediately before the effects.

```
bool compare_exchange_weak(T& expected, T desired,
                           memory_order success, memory_order failure) const noexcept;
```

```
bool compare_exchange_strong(T& expected, T desired,
                             memory_order success, memory_order failure) const noexcept;
```

```
bool compare_exchange_weak(T& expected, T desired,
                           memory_order order = memory_order::seq_cst) const noexcept;
```

```
bool compare_exchange_strong(T& expected, T desired,
                            memory_order order = memory_order::seq_cst) const noexcept;
```

18 *Preconditions:* The failure argument is neither memory_order::release nor memory_order::acq_rel.

19 *Effects:* Retrieves the value in expected. It then atomically compares the value representation of the value referenced by *ptr for equality with that previously retrieved from expected, and if true, replaces the value referenced by *ptr with that in desired. If and only if the comparison is true, memory is affected according to the value of success, and if the comparison is false, memory is affected according to the value of failure. When only one memory_order argument is supplied, the value of success is order, and the value of failure is order except that a value of memory_order::acq_rel shall be replaced by the value memory_order::acquire and a value of memory_order::release shall be replaced by the value memory_order::relaxed. If and only if the comparison is false then, after the atomic operation, the value in expected is replaced by the value read from the value referenced by *ptr during the atomic comparison. If the operation returns true, these operations are atomic read-modify-write operations (6.9.2.2) on the value referenced by *ptr. Otherwise, these operations are atomic load operations on that memory.

20 *Returns:* The result of the comparison.

21 *Remarks:* A weak compare-and-exchange operation may fail spuriously. That is, even when the contents of memory referred to by expected and ptr are equal, it may return false and store back to expected the same memory contents that were originally there.

[Note 2: This spurious failure enables implementation of compare-and-exchange on a broader class of machines, e.g., load-locked store-conditional machines. A consequence of spurious failure is that nearly all uses of weak compare-and-exchange will be in a loop. When a compare-and-exchange is in a loop, the weak version will yield better performance on some platforms. When a weak compare-and-exchange would require a loop and a strong one would not, the strong one is preferable. —end note]

```
void wait(T old, memory_order order = memory_order::seq_cst) const noexcept;
```

22 *Preconditions:* order is neither memory_order::release nor memory_order::acq_rel.

23 *Effects:* Repeatedly performs the following steps, in order:

(23.1) — Evaluates load(order) and compares its value representation for equality against that of old.

(23.2) — If they compare unequal, returns.

(23.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

24 *Remarks:* This function is an atomic waiting operation (31.6) on atomic object *ptr.

```
void notify_one() const noexcept;
```

25 *Effects:* Unblocks the execution of at least one atomic waiting operation on *ptr that is eligible to be unblocked (31.6) by this call, if any such atomic waiting operations exist.

26 *Remarks:* This function is an atomic notifying operation (31.6) on atomic object *ptr.

void notify_all() const noexcept;

27 *Effects:* Unblocks the execution of all atomic waiting operations on *ptr that are eligible to be unblocked (31.6) by this call.

28 *Remarks:* This function is an atomic notifying operation (31.6) on atomic object *ptr.

31.7.3 Specializations for integral types

[atomics.ref.int]

- ¹ There are specializations of the `atomic_ref` class template for the integral types `char`, `signed char`, `unsigned char`, `short`, `unsigned short`, `int`, `unsigned int`, `long`, `unsigned long`, `long long`, `unsigned long long`, `char8_t`, `char16_t`, `char32_t`, `wchar_t`, and any other types needed by the typedefs in the header `<cstdint>` (17.4.2). For each such type `integral`, the specialization `atomic_ref<integral>` provides additional atomic operations appropriate to integral types.

[Note 1: The specialization `atomic_ref<bool>` uses the primary template (31.7). — end note]

```
namespace std {
    template<> struct atomic_ref<integral> {
private:
    integral* ptr;           // exposition only
public:
    using value_type = integral;
    using difference_type = value_type;
    static constexpr size_t required_alignment = implementation-defined;

    static constexpr bool is_always_lock_free = implementation-defined;
    bool is_lock_free() const noexcept;

    explicit atomic_ref(integral&);
    atomic_ref(const atomic_ref&) noexcept;
    atomic_ref& operator=(const atomic_ref&) = delete;

    void store(integral, memory_order = memory_order::seq_cst) const noexcept;
    integral operator=(integral) const noexcept;
    integral load(memory_order = memory_order::seq_cst) const noexcept;
    operator integral() const noexcept;

    integral exchange(integral,
                      memory_order = memory_order::seq_cst) const noexcept;
    bool compare_exchange_weak(integral&, integral,
                               memory_order, memory_order) const noexcept;
    bool compare_exchange_strong(integral&, integral,
                               memory_order, memory_order) const noexcept;
    bool compare_exchange_weak(integral&, integral,
                               memory_order = memory_order::seq_cst) const noexcept;
    bool compare_exchange_strong(integral&, integral,
                               memory_order = memory_order::seq_cst) const noexcept;

    integral fetch_add(integral,
                      memory_order = memory_order::seq_cst) const noexcept;
    integral fetch_sub(integral,
                      memory_order = memory_order::seq_cst) const noexcept;
    integral fetch_and(integral,
                      memory_order = memory_order::seq_cst) const noexcept;
    integral fetch_or(integral,
                      memory_order = memory_order::seq_cst) const noexcept;
    integral fetch_xor(integral,
                      memory_order = memory_order::seq_cst) const noexcept;

    integral operator++(int) const noexcept;
    integral operator--(int) const noexcept;
    integral operator++() const noexcept;
    integral operator--() const noexcept;
    integral operator+=(integral) const noexcept;
    integral operator-=(integral) const noexcept;
```

```

integral operator&=(integral) const noexcept;
integral operator|=(integral) const noexcept;
integral operator^=(integral) const noexcept;

void wait(integral, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() const noexcept;
void notify_all() const noexcept;
};

}

```

- ² Descriptions are provided below only for members that differ from the primary template.
- ³ The following operations perform arithmetic computations. The key, operator, and computation correspondence is identified in [Table 144](#).

integral fetch_key(integral operand, memory_order order = memory_order::seq_cst) const noexcept;

- ⁴ *Effects:* Atomically replaces the value referenced by **ptr* with the result of the computation applied to the value referenced by **ptr* and the given operand. Memory is affected according to the value of *order*. These operations are atomic read-modify-write operations ([6.9.2.2](#)).

- ⁵ *Returns:* Atomically, the value referenced by **ptr* immediately before the effects.

- ⁶ *Remarks:* For signed integer types, the result is as if the object value and parameters were converted to their corresponding unsigned types, the computation performed on those types, and the result converted back to the signed type.

[*Note 2:* There are no undefined results arising from the computation. — *end note*]

integral operator op=(integral operand) const noexcept;

- ⁷ *Effects:* Equivalent to: `return fetch_key(operand) op operand;`

31.7.4 Specializations for floating-point types

[[atomics.ref.float](#)]

- ¹ There are specializations of the `atomic_ref` class template for the floating-point types `float`, `double`, and `long double`. For each such type *floating-point*, the specialization `atomic_ref<floating-point>` provides additional atomic operations appropriate to floating-point types.

```

namespace std {
    template<> struct atomic_ref<floating-point> {
        private:
            floating-point* ptr; // exposition only
        public:
            using value_type = floating-point;
            using difference_type = value_type;
            static constexpr size_t required_alignment = implementation-defined;

            static constexpr bool is_always_lock_free = implementation-defined;
            bool is_lock_free() const noexcept;

            explicit atomic_ref(floating-point&);
            atomic_ref(const atomic_ref&) noexcept;
            atomic_ref& operator=(const atomic_ref&) = delete;

            void store(floating-point, memory_order = memory_order::seq_cst) const noexcept;
            floating-point operator=(floating-point) const noexcept;
            floating-point load(memory_order = memory_order::seq_cst) const noexcept;
            operator floating-point() const noexcept;

            floating-point exchange(floating-point,
                                   memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_weak(floating-point&, floating-point,
                                       memory_order, memory_order) const noexcept;
            bool compare_exchange_strong(floating-point&, floating-point,
                                         memory_order, memory_order) const noexcept;
            bool compare_exchange_weak(floating-point&, floating-point,
                                       memory_order = memory_order::seq_cst) const noexcept;
    };
}

```

```

bool compare_exchange_strong(floating-point&, floating-point,
                             memory_order = memory_order::seq_cst) const noexcept;

floating-point fetch_add(floating-point,
                         memory_order = memory_order::seq_cst) const noexcept;
floating-point fetch_sub(floating-point,
                         memory_order = memory_order::seq_cst) const noexcept;

floating-point operator+=(floating-point) const noexcept;
floating-point operator-=(floating-point) const noexcept;

void wait(floating-point, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() const noexcept;
void notify_all() const noexcept;
};

}

```

² Descriptions are provided below only for members that differ from the primary template.

³ The following operations perform arithmetic computations. The key, operator, and computation correspondence are identified in [Table 144](#).

```

floating-point fetch_key(floating-point operand,
                         memory_order order = memory_order::seq_cst) const noexcept;

```

⁴ *Effects*: Atomically replaces the value referenced by `*ptr` with the result of the computation applied to the value referenced by `*ptr` and the given operand. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations ([6.9.2.2](#)).

⁵ *Returns*: Atomically, the value referenced by `*ptr` immediately before the effects.

⁶ *Remarks*: If the result is not a representable value for its type ([7.1](#)), the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on `floating-point` should conform to the `std::numeric_limits<floating-point>` traits associated with the floating-point type ([17.3.3](#)). The floating-point environment ([26.3](#)) for atomic arithmetic operations on `floating-point` may be different than the calling thread's floating-point environment.

```

floating-point operator op=(floating-point operand) const noexcept;

```

⁷ *Effects*: Equivalent to: `return fetch_key(operand) op operand;`

31.7.5 Partial specialization for pointers

[atomics.ref.pointer]

```

namespace std {
    template<class T> struct atomic_ref<T*> {
        private:
            T** ptr;           // exposition only
        public:
            using value_type = T*;
            using difference_type = ptrdiff_t;
            static constexpr size_t required_alignment = implementation-defined;

            static constexpr bool is_always_lock_free = implementation-defined;
            bool is_lock_free() const noexcept;

            explicit atomic_ref(T*&);

            atomic_ref(const atomic_ref&) noexcept;
            atomic_ref& operator=(const atomic_ref&) = delete;

            void store(T*, memory_order = memory_order::seq_cst) const noexcept;
            T* operator=(T*) const noexcept;
            T* load(memory_order = memory_order::seq_cst) const noexcept;
            operator T*() const noexcept;

            T* exchange(T*, memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_weak(T*&, T*,
                                      memory_order, memory_order) const noexcept;
    };
}

```

```

    bool compare_exchange_strong(T*&, T*,
                                memory_order, memory_order) const noexcept;
    bool compare_exchange_weak(T*&, T*,
                               memory_order = memory_order::seq_cst) const noexcept;
    bool compare_exchange_strong(T*&, T*,
                                memory_order = memory_order::seq_cst) const noexcept;

    T* fetch_add(difference_type, memory_order = memory_order::seq_cst) const noexcept;
    T* fetch_sub(difference_type, memory_order = memory_order::seq_cst) const noexcept;

    T* operator++(int) const noexcept;
    T* operator--(int) const noexcept;
    T* operator++() const noexcept;
    T* operator--() const noexcept;
    T* operator+=(difference_type) const noexcept;
    T* operator-=(difference_type) const noexcept;

    void wait(T*, memory_order = memory_order::seq_cst) const noexcept;
    void notify_one() const noexcept;
    void notify_all() const noexcept;
};

}

```

- ¹ Descriptions are provided below only for members that differ from the primary template.
- ² The following operations perform arithmetic computations. The key, operator, and computation correspondence is identified in [Table 145](#).

T* `fetch_key(difference_type operand, memory_order order = memory_order::seq_cst)` const noexcept;

³ *Mandates:* T is a complete object type.

⁴ *Effects:* Atomically replaces the value referenced by `*ptr` with the result of the computation applied to the value referenced by `*ptr` and the given operand. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations ([6.9.2.2](#)).

⁵ *Returns:* Atomically, the value referenced by `*ptr` immediately before the effects.

⁶ *Remarks:* The result may be an undefined address, but the operations otherwise have no undefined behavior.

T* `operator op=(difference_type operand) const noexcept;`

⁷ *Effects:* Equivalent to: `return fetch_key(operand) op operand;`

31.7.6 Member operators common to integers and pointers to objects [atomics.ref.memop]

value_type `operator++(int) const noexcept;`

¹ *Effects:* Equivalent to: `return fetch_add(1);`

value_type `operator--(int) const noexcept;`

² *Effects:* Equivalent to: `return fetch_sub(1);`

value_type `operator++() const noexcept;`

³ *Effects:* Equivalent to: `return fetch_add(1) + 1;`

value_type `operator--() const noexcept;`

⁴ *Effects:* Equivalent to: `return fetch_sub(1) - 1;`

31.8 Class template atomic

[atomics.types.generic]

31.8.1 General

[atomics.types.generic.general]

```

namespace std {
    template<class T> struct atomic {
        using value_type = T;

```

```

static constexpr bool is_always_lock_free = implementation-defined;
bool is_lock_free() const volatile noexcept;
bool is_lock_free() const noexcept;

// 31.8.2, operations on atomic types
constexpr atomic() noexcept(is_nothrow_default_constructible_v<T>);
constexpr atomic(T) noexcept;
atomic(const atomic&) = delete;
atomic& operator=(const atomic&) = delete;
atomic& operator=(const atomic&) volatile = delete;

T load(memory_order = memory_order::seq_cst) const volatile noexcept;
T load(memory_order = memory_order::seq_cst) const noexcept;
operator T() const volatile noexcept;
operator T() const noexcept;
void store(T, memory_order = memory_order::seq_cst) volatile noexcept;
void store(T, memory_order = memory_order::seq_cst) noexcept;
T operator=(T) volatile noexcept;
T operator=(T) noexcept;

T exchange(T, memory_order = memory_order::seq_cst) volatile noexcept;
T exchange(T, memory_order = memory_order::seq_cst) noexcept;
bool compare_exchange_weak(T&, T, memory_order, memory_order) volatile noexcept;
bool compare_exchange_weak(T&, T, memory_order, memory_order) noexcept;
bool compare_exchange_strong(T&, T, memory_order, memory_order) volatile noexcept;
bool compare_exchange_strong(T&, T, memory_order, memory_order) noexcept;
bool compare_exchange_weak(T&, T, memory_order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_weak(T&, T, memory_order = memory_order::seq_cst) noexcept;
bool compare_exchange_strong(T&, T, memory_order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(T&, T, memory_order = memory_order::seq_cst) noexcept;

void wait(T, memory_order = memory_order::seq_cst) const volatile noexcept;
void wait(T, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() volatile noexcept;
void notify_one() noexcept;
void notify_all() volatile noexcept;
void notify_all() noexcept;
};

}

```

¹ The template argument for T shall meet the *Cpp17CopyConstructible* and *Cpp17CopyAssignable* requirements. The program is ill-formed if any of

- (1.1) — *is_trivially_copyable_v*<T>,
- (1.2) — *is_copy_constructible_v*<T>,
- (1.3) — *is_move_constructible_v*<T>,
- (1.4) — *is_copy_assignable_v*<T>, or
- (1.5) — *is_move_assignable_v*<T>

is false.

[*Note 1*: Type arguments that are not also statically initializable can be difficult to use. — *end note*]

² The specialization *atomic*<bool> is a standard-layout struct.

³ [*Note 2*: The representation of an atomic specialization need not have the same size and alignment requirement as its corresponding argument type. — *end note*]

31.8.2 Operations on atomic types

[**atomics.types.operations**]

constexpr atomic() noexcept(*is_nothrow_default_constructible_v*<T>);

¹ *Mandates*: *is_default_constructible_v*<T> is true.

² *Effects*: Initializes the atomic object with the value of T(). Initialization is not an atomic operation (6.9.2).

```
constexpr atomic(T desired) noexcept;
```

3 *Effects:* Initializes the object with the value `desired`. Initialization is not an atomic operation (6.9.2).

[*Note 1:* It is possible to have an access to an atomic object `A` race with its construction, for example by communicating the address of the just-constructed object `A` to another thread via `memory_order::relaxed` operations on a suitable atomic pointer variable, and then immediately accessing `A` in the receiving thread. This results in undefined behavior. — *end note*]

```
static constexpr bool is_always_lock_free = implementation-defined;
```

4 The `static` data member `is_always_lock_free` is `true` if the atomic type's operations are always lock-free, and `false` otherwise.

[*Note 2:* The value of `is_always_lock_free` is consistent with the value of the corresponding `ATOMIC_..._LOCK_FREE` macro, if defined. — *end note*]

```
bool is_lock_free() const volatile noexcept;
bool is_lock_free() const noexcept;
```

5 *Returns:* `true` if the object's operations are lock-free, `false` otherwise.

[*Note 3:* The return value of the `is_lock_free` member function is consistent with the value of `is_always_lock_free` for the same type. — *end note*]

```
void store(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
void store(T desired, memory_order order = memory_order::seq_cst) noexcept;
```

6 *Preconditions:* The `order` argument is neither `memory_order::consume`, `memory_order::acquire`, nor `memory_order::acq_rel`.

7 *Constraints:* For the `volatile` overload of this function, `is_always_lock_free` is `true`.

8 *Effects:* Atomically replaces the value pointed to by `this` with the value of `desired`. Memory is affected according to the value of `order`.

```
T operator=(T desired) volatile noexcept;
T operator=(T desired) noexcept;
```

9 *Constraints:* For the `volatile` overload of this function, `is_always_lock_free` is `true`.

10 *Effects:* Equivalent to `store(desired)`.

11 *Returns:* `desired`.

```
T load(memory_order order = memory_order::seq_cst) const volatile noexcept;
T load(memory_order order = memory_order::seq_cst) const noexcept;
```

12 *Preconditions:* The `order` argument is neither `memory_order::release` nor `memory_order::acq_rel`.

13 *Constraints:* For the `volatile` overload of this function, `is_always_lock_free` is `true`.

14 *Effects:* Memory is affected according to the value of `order`.

15 *Returns:* Atomically returns the value pointed to by `this`.

```
operator T() const volatile noexcept;
operator T() const noexcept;
```

16 *Constraints:* For the `volatile` overload of this function, `is_always_lock_free` is `true`.

17 *Effects:* Equivalent to: `return load();`

```
T exchange(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
T exchange(T desired, memory_order order = memory_order::seq_cst) noexcept;
```

18 *Constraints:* For the `volatile` overload of this function, `is_always_lock_free` is `true`.

19 *Effects:* Atomically replaces the value pointed to by `this` with `desired`. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations (6.9.2).

20 *Returns:* Atomically returns the value pointed to by `this` immediately before the effects.

```
bool compare_exchange_weak(T& expected, T desired,
                           memory_order success, memory_order failure) volatile noexcept;
```

```

bool compare_exchange_weak(T& expected, T desired,
                           memory_order success, memory_order failure) noexcept;
bool compare_exchange_strong(T& expected, T desired,
                             memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
                            memory_order success, memory_order failure) noexcept;
bool compare_exchange_weak(T& expected, T desired,
                           memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,
                           memory_order order = memory_order::seq_cst) noexcept;
bool compare_exchange_strong(T& expected, T desired,
                            memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
                            memory_order order = memory_order::seq_cst) noexcept;

```

21 *Preconditions:* The `failure` argument is neither `memory_order::release` nor `memory_order::acq_rel`.

22 *Constraints:* For the `volatile` overload of this function, `is_always_lock_free` is `true`.

23 *Effects:* Retrieves the value in `expected`. It then atomically compares the value representation of the value pointed to by `this` for equality with that previously retrieved from `expected`, and if true, replaces the value pointed to by `this` with that in `desired`. If and only if the comparison is `true`, memory is affected according to the value of `success`, and if the comparison is false, memory is affected according to the value of `failure`. When only one `memory_order` argument is supplied, the value of `success` is `order`, and the value of `failure` is `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`. If and only if the comparison is false then, after the atomic operation, the value in `expected` is replaced by the value pointed to by `this` during the atomic comparison. If the operation returns `true`, these operations are atomic read-modify-write operations (6.9.2) on the memory pointed to by `this`. Otherwise, these operations are atomic load operations on that memory.

24 *Returns:* The result of the comparison.

25 *[Note 4:* For example, the effect of `compare_exchange_strong` on objects without padding bits (6.8) is

```

if (memcmp(this, &expected, sizeof(*this)) == 0)
    memcpy(this, &desired, sizeof(*this));
else
    memcpy(&expected, this, sizeof(*this));
— end note]

```

[Example 1: The expected use of the compare-and-exchange operations is as follows. The compare-and-exchange operations will update `expected` when another iteration of the loop is needed.

```

expected = current.load();
do {
    desired = function(expected);
} while (!current.compare_exchange_weak(expected, desired));
— end example]

```

[Example 2: Because the expected value is updated only on failure, code releasing the memory containing the `expected` value on success will work. For example, list head insertion will act atomically and would not introduce a data race in the following code:

```

do {
    p->next = head;                                     // make new list node point to the current head
} while (!head.compare_exchange_weak(p->next, p)); // try to insert
— end example]

```

26 Implementations should ensure that weak compare-and-exchange operations do not consistently return `false` unless either the atomic object has value different from `expected` or there are concurrent modifications to the atomic object.

27 *Remarks:* A weak compare-and-exchange operation may fail spuriously. That is, even when the contents of memory referred to by `expected` and `this` are equal, it may return `false` and store back to `expected` the same memory contents that were originally there.

[*Note 5:* This spurious failure enables implementation of compare-and-exchange on a broader class of machines, e.g., load-locked store-conditional machines. A consequence of spurious failure is that nearly all uses of weak compare-and-exchange will be in a loop. When a compare-and-exchange is in a loop, the weak version will yield better performance on some platforms. When a weak compare-and-exchange would require a loop and a strong one would not, the strong one is preferable. — *end note*]

28 [*Note 6:* Under cases where the `memcpy` and `memcmp` semantics of the compare-and-exchange operations apply, the comparisons can fail for values that compare equal with `operator==` if the value representation has trap bits or alternate representations of the same value. Notably, on implementations conforming to ISO/IEC/IEEE 60559, floating-point `-0.0` and `+0.0` will not compare equal with `memcmp` but will compare equal with `operator==`, and NaNs with the same payload will compare equal with `memcmp` but will not compare equal with `operator==`. — *end note*]

[*Note 7:* Because compare-and-exchange acts on an object's value representation, padding bits that never participate in the object's value representation are ignored. As a consequence, the following code is guaranteed to avoid spurious failure:

```
struct padded {
    char clank = 0x42;
    // Padding here.
    unsigned biff = 0xC0DEFEFE;
};

atomic<padded> pad = {};
```

```
bool zap() {
    padded expected, desired{0, 0};
    return pad.compare_exchange_strong(expected, desired);
}
```

— *end note*]

[*Note 8:* For a union with bits that participate in the value representation of some members but not others, it is possible for compare-and-exchange to always fail. This is because such padding bits have an indeterminate value when they do not participate in the value representation of the active member. As a consequence, the following code is not guaranteed to ever succeed:

```
union pony {
    double celestia = 0.;
    short luna;      // padded
};

atomic<pony> princesses = {};
```

```
bool party(pony desired) {
    pony expected;
    return princesses.compare_exchange_strong(expected, desired);
}
```

— *end note*]

```
void wait(T old, memory_order order = memory_order::seq_cst) const volatile noexcept;
void wait(T old, memory_order order = memory_order::seq_cst) const noexcept;
```

29 *Preconditions:* `order` is neither `memory_order::release` nor `memory_order::acq_rel`.

30 *Effects:* Repeatedly performs the following steps, in order:

- (30.1) — Evaluates `load(order)` and compares its value representation for equality against that of `old`.
- (30.2) — If they compare unequal, returns.
- (30.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

31 *Remarks:* This function is an atomic waiting operation (31.6).

```
void notify_one() volatile noexcept;
void notify_one() noexcept;
```

32 *Effects:* Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (31.6) by this call, if any such atomic waiting operations exist.

33 *Remarks:* This function is an atomic notifying operation (31.6).

```
void notify_all() volatile noexcept;
void notify_all() noexcept;
```

34 *Effects:* Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (31.6) by this call.

35 *Remarks:* This function is an atomic notifying operation (31.6).

31.8.3 Specializations for integers

[**atomics.types.int**]

- 1 There are specializations of the atomic class template for the integral types `char`, `signed char`, `unsigned char`, `short`, `unsigned short`, `int`, `unsigned int`, `long`, `unsigned long`, `long long`, `unsigned long long`, `char8_t`, `char16_t`, `char32_t`, `wchar_t`, and any other types needed by the typedefs in the header `<cstdint>` (17.4.2). For each such type `integral`, the specialization `atomic<integral>` provides additional atomic operations appropriate to integral types.

[*Note 1:* The specialization `atomic<bool>` uses the primary template (31.8). — *end note*]

```
namespace std {
    template<> struct atomic<integral> {

```

- ² The atomic integral specializations are standard-layout structs. They each have a trivial destructor.
- ³ Descriptions are provided below only for members that differ from the primary template.
- ⁴ The following operations perform arithmetic computations. The key, operator, and computation correspondence is:

Table 144: Atomic arithmetic computations [tab:atomic.types.int.comp]

key	Op	Computation	key	Op	Computation
add	+	addition	sub	-	subtraction
or		bitwise inclusive or	xor	~	bitwise exclusive or
and	&	bitwise and			

T fetch_key(T operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T fetch_key(T operand, memory_order order = memory_order::seq_cst) noexcept;

- ⁵ *Constraints*: For the `volatile` overload of this function, `is_always_lock_free` is true.
- ⁶ *Effects*: Atomically replaces the value pointed to by `this` with the result of the computation applied to the value pointed to by `this` and the given `operand`. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations (6.9.2).
- ⁷ *Returns*: Atomically, the value pointed to by `this` immediately before the effects.
- ⁸ *Remarks*: For signed integer types, the result is as if the object value and parameters were converted to their corresponding unsigned types, the computation performed on those types, and the result converted back to the signed type.

[Note 2: There are no undefined results arising from the computation. — end note]

```
T operator op=(T operand) volatile noexcept;
T operator op=(T operand) noexcept;
```

9 *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.

10 *Effects:* Equivalent to: `return fetch_key(operand) op operand;`

31.8.4 Specializations for floating-point types

[`atomics.types.float`]

- 1 There are specializations of the `atomic` class template for the floating-point types `float`, `double`, and `long double`. For each such type *floating-point*, the specialization `atomic<floating-point>` provides additional atomic operations appropriate to floating-point types.

```
namespace std {
    template<> struct atomic<floating-point> {
        using value_type = floating-point;
        using difference_type = value_type;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const volatile noexcept;
        bool is_lock_free() const noexcept;

        constexpr atomic() noexcept;
        constexpr atomic(floating-point) noexcept;
        atomic(const atomic&) = delete;
        atomic& operator=(const atomic&) = delete;
        atomic& operator=(const atomic&) volatile = delete;

        void store(floating-point, memory_order = memory_order::seq_cst) volatile noexcept;
        void store(floating-point, memory_order = memory_order::seq_cst) noexcept;
        floating-point operator=(floating-point) volatile noexcept;
        floating-point operator=(floating-point) noexcept;
        floating-point load(memory_order = memory_order::seq_cst) volatile noexcept;
        floating-point load(memory_order = memory_order::seq_cst) noexcept;
        operator floating-point() volatile noexcept;
        operator floating-point() noexcept;

        floating-point exchange(floating-point,
                               memory_order = memory_order::seq_cst) volatile noexcept;
        floating-point exchange(floating-point,
                               memory_order = memory_order::seq_cst) noexcept;
        bool compare_exchange_weak(floating-point&, floating-point,
                               memory_order, memory_order) volatile noexcept;
        bool compare_exchange_weak(floating-point&, floating-point,
                               memory_order, memory_order) noexcept;
        bool compare_exchange_strong(floating-point&, floating-point,
                               memory_order, memory_order) volatile noexcept;
        bool compare_exchange_strong(floating-point&, floating-point,
                               memory_order, memory_order) noexcept;
        bool compare_exchange_weak(floating-point&, floating-point,
                               memory_order = memory_order::seq_cst) volatile noexcept;
        bool compare_exchange_weak(floating-point&, floating-point,
                               memory_order = memory_order::seq_cst) noexcept;
        bool compare_exchange_strong(floating-point&, floating-point,
                               memory_order = memory_order::seq_cst) volatile noexcept;
        bool compare_exchange_strong(floating-point&, floating-point,
                               memory_order = memory_order::seq_cst) noexcept;

        floating-point fetch_add(floating-point,
                               memory_order = memory_order::seq_cst) volatile noexcept;
        floating-point fetch_add(floating-point,
                               memory_order = memory_order::seq_cst) noexcept;
        floating-point fetch_sub(floating-point,
                               memory_order = memory_order::seq_cst) volatile noexcept;
        floating-point fetch_sub(floating-point,
                               memory_order = memory_order::seq_cst) noexcept;
```

```

floating-point operator+=(floating-point) volatile noexcept;
floating-point operator+=(floating-point) noexcept;
floating-point operator-=(floating-point) volatile noexcept;
floating-point operator-=(floating-point) noexcept;

void wait(floating-point, memory_order = memory_order::seq_cst) const volatile noexcept;
void wait(floating-point, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() volatile noexcept;
void notify_one() noexcept;
void notify_all() volatile noexcept;
void notify_all() noexcept;
};

}

```

- ² The atomic floating-point specializations are standard-layout structs. They each have a trivial destructor.
- ³ Descriptions are provided below only for members that differ from the primary template.
- ⁴ The following operations perform arithmetic addition and subtraction computations. The key, operator, and computation correspondence are identified in [Table 144](#).

T fetch_key(T operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T fetch_key(T operand, memory_order order = memory_order::seq_cst) noexcept;

- ⁵ *Constraints*: For the volatile overload of this function, `is_always_lock_free` is true.
- ⁶ *Effects*: Atomically replaces the value pointed to by `this` with the result of the computation applied to the value pointed to by `this` and the given `operand`. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations ([6.9.2](#)).
- ⁷ *Returns*: Atomically, the value pointed to by `this` immediately before the effects.
- ⁸ *Remarks*: If the result is not a representable value for its type ([7.1](#)) the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on `floating-point` should conform to the `std::numeric_limits<floating-point>` traits associated with the floating-point type ([17.3.3](#)). The floating-point environment ([26.3](#)) for atomic arithmetic operations on `floating-point` may be different than the calling thread's floating-point environment.

T operator op=(T operand) volatile noexcept;
T operator op=(T operand) noexcept;

- ⁹ *Constraints*: For the volatile overload of this function, `is_always_lock_free` is true.
- ¹⁰ *Effects*: Equivalent to: `return fetch_key(operand) op operand;`
- ¹¹ *Remarks*: If the result is not a representable value for its type ([7.1](#)) the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on `floating-point` should conform to the `std::numeric_limits<floating-point>` traits associated with the floating-point type ([17.3.3](#)). The floating-point environment ([26.3](#)) for atomic arithmetic operations on `floating-point` may be different than the calling thread's floating-point environment.

31.8.5 Partial specialization for pointers

[`atomics.types.pointer`]

```

namespace std {
    template<class T> struct atomic<T*> {
        using value_type = T*;
        using difference_type = ptrdiff_t;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const volatile noexcept;
        bool is_lock_free() const noexcept;

        constexpr atomic() noexcept;
        constexpr atomic(T*) noexcept;
        atomic(const atomic&) = delete;
        atomic& operator=(const atomic&) = delete;
        atomic& operator=(const atomic&) volatile = delete;
    };
}
```

```

void store(T*, memory_order = memory_order::seq_cst) volatile noexcept;
void store(T*, memory_order = memory_order::seq_cst) noexcept;
T* operator=(T*) volatile noexcept;
T* operator=(T*) noexcept;
T* load(memory_order = memory_order::seq_cst) const volatile noexcept;
T* load(memory_order = memory_order::seq_cst) const noexcept;
operator T*() const volatile noexcept;
operator T*() const noexcept;

T* exchange(T*, memory_order = memory_order::seq_cst) volatile noexcept;
T* exchange(T*, memory_order = memory_order::seq_cst) noexcept;
bool compare_exchange_weak(T*&, T*, memory_order, memory_order) volatile noexcept;
bool compare_exchange_weak(T*&, T*, memory_order, memory_order) noexcept;
bool compare_exchange_strong(T*&, T*, memory_order, memory_order) volatile noexcept;
bool compare_exchange_strong(T*&, T*, memory_order, memory_order) noexcept;
bool compare_exchange_weak(T*&, T*,
                           memory_order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_weak(T*&, T*,
                           memory_order = memory_order::seq_cst) noexcept;
bool compare_exchange_strong(T*&, T*,
                            memory_order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(T*&, T*,
                            memory_order = memory_order::seq_cst) noexcept;

T* fetch_add(ptrdiff_t, memory_order = memory_order::seq_cst) volatile noexcept;
T* fetch_add(ptrdiff_t, memory_order = memory_order::seq_cst) noexcept;
T* fetch_sub(ptrdiff_t, memory_order = memory_order::seq_cst) volatile noexcept;
T* fetch_sub(ptrdiff_t, memory_order = memory_order::seq_cst) noexcept;

T* operator++(int) volatile noexcept;
T* operator++(int) noexcept;
T* operator--(int) volatile noexcept;
T* operator--(int) noexcept;
T* operator++() volatile noexcept;
T* operator++() noexcept;
T* operator--() volatile noexcept;
T* operator--() noexcept;
T* operator+=(ptrdiff_t) volatile noexcept;
T* operator+=(ptrdiff_t) noexcept;
T* operator-=(ptrdiff_t) volatile noexcept;
T* operator-=(ptrdiff_t) noexcept;

void wait(T*, memory_order = memory_order::seq_cst) const volatile noexcept;
void wait(T*, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() volatile noexcept;
void notify_one() noexcept;
void notify_all() volatile noexcept;
void notify_all() noexcept;
};

}

```

- ¹ There is a partial specialization of the `atomic` class template for pointers. Specializations of this partial specialization are standard-layout structs. They each have a trivial destructor.
- ² Descriptions are provided below only for members that differ from the primary template.
- ³ The following operations perform pointer arithmetic. The key, operator, and computation correspondence is:

Table 145: Atomic pointer computations [tab:atomic.types.pointer.comp]

key	Op	Computation	key	Op	Computation
add	+	addition	sub	-	subtraction

```
T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) noexcept;
```

4 *Constraints*: For the volatile overload of this function, `is_always_lock_free` is true.

5 *Mandates*: `T` is a complete object type.

[*Note 1*: Pointer arithmetic on `void*` or function pointers is ill-formed. — *end note*]

6 *Effects*: Atomically replaces the value pointed to by `this` with the result of the computation applied to the value pointed to by `this` and the given `operand`. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations (6.9.2).

7 *Returns*: Atomically, the value pointed to by `this` immediately before the effects.

8 *Remarks*: The result may be an undefined address, but the operations otherwise have no undefined behavior.

```
T* operator op=(ptrdiff_t operand) volatile noexcept;
T* operator op=(ptrdiff_t operand) noexcept;
```

9 *Constraints*: For the volatile overload of this function, `is_always_lock_free` is true.

10 *Effects*: Equivalent to: `return fetch_key(operand) op operand;`

31.8.6 Member operators common to integers and pointers to objects [atomics.types.memop]

```
value_type operator++(int) volatile noexcept;
value_type operator++(int) noexcept;
```

1 *Constraints*: For the volatile overload of this function, `is_always_lock_free` is true.

2 *Effects*: Equivalent to: `return fetch_add(1);`

```
value_type operator--(int) volatile noexcept;
value_type operator--(int) noexcept;
```

3 *Constraints*: For the volatile overload of this function, `is_always_lock_free` is true.

4 *Effects*: Equivalent to: `return fetch_sub(1);`

```
value_type operator++() volatile noexcept;
value_type operator++() noexcept;
```

5 *Constraints*: For the volatile overload of this function, `is_always_lock_free` is true.

6 *Effects*: Equivalent to: `return fetch_add(1) + 1;`

```
value_type operator--() volatile noexcept;
value_type operator--() noexcept;
```

7 *Constraints*: For the volatile overload of this function, `is_always_lock_free` is true.

8 *Effects*: Equivalent to: `return fetch_sub(1) - 1;`

31.8.7 Partial specializations for smart pointers

[util.smartptr.atomic]

31.8.7.1 General

[util.smartptr.atomic.general]

1 The library provides partial specializations of the `atomic` template for shared-ownership smart pointers (20.11). The behavior of all operations is as specified in 31.8, unless specified otherwise. The template parameter `T` of these partial specializations may be an incomplete type.

2 All changes to an atomic smart pointer in 31.8.7, and all associated `use_count` increments, are guaranteed to be performed atomically. Associated `use_count` decrements are sequenced after the atomic operation, but are not required to be part of it. Any associated deletion and deallocation are sequenced after the atomic update step and are not part of the atomic operation.

[*Note 1*: If the atomic operation uses locks, locks acquired by the implementation will be held when any `use_count` adjustments are performed, and will not be held when any destruction or deallocation resulting from this is performed. — *end note*]

³ [Example 1:

```
template<typename T> class atomic_list {
    struct node {
        T t;
        shared_ptr<node> next;
    };
    atomic<shared_ptr<node>> head;

public:
    auto find(T t) const {
        auto p = head.load();
        while (p && p->t != t)
            p = p->next;

        return shared_ptr<node>(move(p));
    }

    void push_front(T t) {
        auto p = make_shared<node>();
        p->t = t;
        p->next = head;
        while (!head.compare_exchange_weak(p->next, p)) {}
    }
};

— end example]
```

31.8.7.2 Partial specialization for shared_ptr

[util.smartptr.atomic.shared]

```
namespace std {
    template<class T> struct atomic<shared_ptr<T>> {
        using value_type = shared_ptr<T>;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const noexcept;

        constexpr atomic() noexcept;
        atomic(shared_ptr<T> desired) noexcept;
        atomic(const atomic&) = delete;
        void operator=(const atomic&) = delete;

        shared_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
        operator shared_ptr<T>() const noexcept;
        void store(shared_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
        void operator=(shared_ptr<T> desired) noexcept;

        shared_ptr<T> exchange(shared_ptr<T> desired,
                               memory_order order = memory_order::seq_cst) noexcept;
        bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
                                  memory_order success, memory_order failure) noexcept;
        bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
                                    memory_order success, memory_order failure) noexcept;
        bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
                                  memory_order order = memory_order::seq_cst) noexcept;
        bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
                                    memory_order order = memory_order::seq_cst) noexcept;

        void wait(shared_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
        void notify_one() noexcept;
        void notify_all() noexcept;

private:
    shared_ptr<T> p; // exposition only
};
```

```
constexpr atomic() noexcept;
```

1 *Effects:* Initializes p{}.

```
atomic(shared_ptr<T> desired) noexcept;
```

2 *Effects:* Initializes the object with the value desired. Initialization is not an atomic operation (6.9.2).

[*Note 1:* It is possible to have an access to an atomic object A race with its construction, for example, by communicating the address of the just-constructed object A to another thread via `memory_order::relaxed` operations on a suitable atomic pointer variable, and then immediately accessing A in the receiving thread. This results in undefined behavior. — *end note*]

```
void store(shared_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
```

3 *Preconditions:* order is neither `memory_order::consume`, `memory_order::acquire`, nor `memory_order::acq_rel`.

4 *Effects:* Atomically replaces the value pointed to by `this` with the value of desired as if by `p.swap(desired)`. Memory is affected according to the value of order.

```
void operator=(shared_ptr<T> desired) noexcept;
```

5 *Effects:* Equivalent to `store(desired)`.

```
shared_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
```

6 *Preconditions:* order is neither `memory_order::release` nor `memory_order::acq_rel`.

7 *Effects:* Memory is affected according to the value of order.

8 *Returns:* Atomically returns p.

```
operator shared_ptr<T>() const noexcept;
```

9 *Effects:* Equivalent to: `return load()`;

```
shared_ptr<T> exchange(shared_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
```

10 *Effects:* Atomically replaces p with desired as if by `p.swap(desired)`. Memory is affected according to the value of order. This is an atomic read-modify-write operation (6.9.2).

11 *Returns:* Atomically returns the value of p immediately before the effects.

```
bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
                           memory_order success, memory_order failure) noexcept;
```

```
bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
                           memory_order success, memory_order failure) noexcept;
```

12 *Preconditions:* failure is neither `memory_order::release` nor `memory_order::acq_rel`.

13 *Effects:* If p is equivalent to expected, assigns desired to p and has synchronization semantics corresponding to the value of success, otherwise assigns p to expected and has synchronization semantics corresponding to the value of failure.

14 *Returns:* true if p was equivalent to expected, false otherwise.

15 *Remarks:* Two `shared_ptr` objects are equivalent if they store the same pointer value and either share ownership or are both empty. The weak form may fail spuriously. See 31.8.2.

16 If the operation returns true, expected is not accessed after the atomic update and the operation is an atomic read-modify-write operation (6.9.2) on the memory pointed to by this. Otherwise, the operation is an atomic load operation on that memory, and expected is updated with the existing value read from the atomic object in the attempted atomic update. The `use_count` update corresponding to the write to expected is part of the atomic operation. The write to expected itself is not required to be part of the atomic operation.

```
bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
                           memory_order order = memory_order::seq_cst) noexcept;
```

17 *Effects:* Equivalent to:

```
    return compare_exchange_weak(expected, desired, order, fail_order);
```

where `fail_order` is the same as `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`.

```
bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
                             memory_order order = memory_order::seq_cst) noexcept;
```

18 *Effects:* Equivalent to:

```
    return compare_exchange_strong(expected, desired, order, fail_order);
```

where `fail_order` is the same as `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`.

```
void wait(shared_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
```

19 *Preconditions:* `order` is neither `memory_order::release` nor `memory_order::acq_rel`.

20 *Effects:* Repeatedly performs the following steps, in order:

(20.1) — Evaluates `load(order)` and compares it to `old`.

(20.2) — If the two are not equivalent, returns.

(20.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

21 *Remarks:* Two `shared_ptr` objects are equivalent if they store the same pointer and either share ownership or are both empty. This function is an atomic waiting operation (31.6).

```
void notify_one() noexcept;
```

22 *Effects:* Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (31.6) by this call, if any such atomic waiting operations exist.

23 *Remarks:* This function is an atomic notifying operation (31.6).

```
void notify_all() noexcept;
```

24 *Effects:* Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (31.6) by this call.

25 *Remarks:* This function is an atomic notifying operation (31.6).

31.8.7.3 Partial specialization for `weak_ptr`

[util.smartptr.atomic.weak]

```
namespace std {
    template<class T> struct atomic<weak_ptr<T>> {
        using value_type = weak_ptr<T>;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const noexcept;

        constexpr atomic() noexcept;
        atomic(weak_ptr<T> desired) noexcept;
        atomic(const atomic&) = delete;
        void operator=(const atomic&) = delete;

        weak_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
        operator weak_ptr<T>() const noexcept;
        void store(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
        void operator=(weak_ptr<T> desired) noexcept;

        weak_ptr<T> exchange(weak_ptr<T> desired,
                            memory_order order = memory_order::seq_cst) noexcept;
        bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
                                  memory_order success, memory_order failure) noexcept;
        bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
                                    memory_order success, memory_order failure) noexcept;
        bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
                                  memory_order order = memory_order::seq_cst) noexcept;
```

```

    bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
                                memory_order order = memory_order::seq_cst) noexcept;

    void wait(weak_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
    void notify_one() noexcept;
    void notify_all() noexcept;

```

```

private:
    weak_ptr<T> p;           // exposition only
};

}

constexpr atomic() noexcept;

```

1 *Effects:* Initializes p{}.

```
atomic(weak_ptr<T> desired) noexcept;
```

2 *Effects:* Initializes the object with the value **desired**. Initialization is not an atomic operation (6.9.2).

[*Note 1:* It is possible to have an access to an atomic object **A** race with its construction, for example, by communicating the address of the just-constructed object **A** to another thread via **memory_order::relaxed** operations on a suitable atomic pointer variable, and then immediately accessing **A** in the receiving thread. This results in undefined behavior. — *end note*]

```
void store(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
```

3 *Preconditions:* **order** is neither **memory_order::consume**, **memory_order::acquire**, nor **memory_order::acq_rel**.

4 *Effects:* Atomically replaces the value pointed to by **this** with the value of **desired** as if by **p.swap(desired)**. Memory is affected according to the value of **order**.

```
void operator=(weak_ptr<T> desired) noexcept;
```

5 *Effects:* Equivalent to **store(desired)**.

```
weak_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
```

6 *Preconditions:* **order** is neither **memory_order::release** nor **memory_order::acq_rel**.

7 *Effects:* Memory is affected according to the value of **order**.

8 *Returns:* Atomically returns **p**.

```
operator weak_ptr<T>() const noexcept;
```

9 *Effects:* Equivalent to: **return load()**;

```
weak_ptr<T> exchange(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
```

10 *Effects:* Atomically replaces **p** with **desired** as if by **p.swap(desired)**. Memory is affected according to the value of **order**. This is an atomic read-modify-write operation (6.9.2).

11 *Returns:* Atomically returns the value of **p** immediately before the effects.

```

bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
                           memory_order success, memory_order failure) noexcept;
bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
                            memory_order success, memory_order failure) noexcept;

```

12 *Preconditions:* **failure** is neither **memory_order::release** nor **memory_order::acq_rel**.

13 *Effects:* If **p** is equivalent to **expected**, assigns **desired** to **p** and has synchronization semantics corresponding to the value of **success**, otherwise assigns **p** to **expected** and has synchronization semantics corresponding to the value of **failure**.

14 *Returns:* **true** if **p** was equivalent to **expected**, **false** otherwise.

15 *Remarks:* Two **weak_ptr** objects are equivalent if they store the same pointer value and either share ownership or are both empty. The weak form may fail spuriously. See 31.8.2.

16 If the operation returns **true**, **expected** is not accessed after the atomic update and the operation is an atomic read-modify-write operation (6.9.2) on the memory pointed to by **this**. Otherwise, the

operation is an atomic load operation on that memory, and `expected` is updated with the existing value read from the atomic object in the attempted atomic update. The `use_count` update corresponding to the write to `expected` is part of the atomic operation. The write to `expected` itself is not required to be part of the atomic operation.

```
bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
                           memory_order order = memory_order::seq_cst) noexcept;
```

17 *Effects:* Equivalent to:

```
    return compare_exchange_weak(expected, desired, order, fail_order);
```

where `fail_order` is the same as `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`.

```
bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
                             memory_order order = memory_order::seq_cst) noexcept;
```

18 *Effects:* Equivalent to:

```
    return compare_exchange_strong(expected, desired, order, fail_order);
```

where `fail_order` is the same as `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`.

```
void wait(weak_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
```

19 *Preconditions:* `order` is neither `memory_order::release` nor `memory_order::acq_rel`.

20 *Effects:* Repeatedly performs the following steps, in order:

(20.1) — Evaluates `load(order)` and compares it to `old`.

(20.2) — If the two are not equivalent, returns.

(20.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

21 *Remarks:* Two `weak_ptr` objects are equivalent if they store the same pointer and either share ownership or are both empty. This function is an atomic waiting operation (31.6).

```
void notify_one() noexcept;
```

22 *Effects:* Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (31.6) by this call, if any such atomic waiting operations exist.

23 *Remarks:* This function is an atomic notifying operation (31.6).

```
void notify_all() noexcept;
```

24 *Effects:* Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (31.6) by this call.

25 *Remarks:* This function is an atomic notifying operation (31.6).

31.9 Non-member functions

[**atomics.nonmembers**]

¹ A non-member function template whose name matches the pattern `atomic_f` or the pattern `atomic_f_-explicit` invokes the member function `f`, with the value of the first parameter as the object expression and the values of the remaining parameters (if any) as the arguments of the member function call, in order. An argument for a parameter of type `atomic<T>::value_type*` is dereferenced when passed to the member function call. If no such member function exists, the program is ill-formed.

² [Note 1: The non-member functions enable programmers to write code that can be compiled as either C or C++, for example in a shared header file. — end note]

31.10 Flag type and operations

[**atomics.flag**]

```
namespace std {
    struct atomic_flag {
        constexpr atomic_flag() noexcept;
        atomic_flag(const atomic_flag&) = delete;
        atomic_flag& operator=(const atomic_flag&) = delete;
```

```

atomic_flag& operator=(const atomic_flag&) volatile = delete;

bool test(memory_order = memory_order::seq_cst) const volatile noexcept;
bool test(memory_order = memory_order::seq_cst) const noexcept;
bool test_and_set(memory_order = memory_order::seq_cst) volatile noexcept;
bool test_and_set(memory_order = memory_order::seq_cst) noexcept;
void clear(memory_order = memory_order::seq_cst) volatile noexcept;
void clear(memory_order = memory_order::seq_cst) noexcept;

void wait(bool, memory_order = memory_order::seq_cst) const volatile noexcept;
void wait(bool, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() volatile noexcept;
void notify_one() noexcept;
void notify_all() volatile noexcept;
void notify_all() noexcept;
};

}

```

- 1 The `atomic_flag` type provides the classic test-and-set functionality. It has two states, set and clear.
- 2 Operations on an object of type `atomic_flag` shall be lock-free. The operations should also be address-free.
- 3 The `atomic_flag` type is a standard-layout struct. It has a trivial destructor.

`constexpr atomic_flag::atomic_flag() noexcept;`

- 4 *Effects:* Initializes `*this` to the clear state.

```

bool atomic_flag_test(const volatile atomic_flag* object) noexcept;
bool atomic_flag_test(const atomic_flag* object) noexcept;
bool atomic_flag_test_explicit(const volatile atomic_flag* object,
                               memory_order order) noexcept;
bool atomic_flag_test_explicit(const atomic_flag* object,
                               memory_order order) noexcept;
bool atomic_flag::test(memory_order order = memory_order::seq_cst) const volatile noexcept;
bool atomic_flag::test(memory_order order = memory_order::seq_cst) const noexcept;

```

- 5 For `atomic_flag_test`, let `order` be `memory_order::seq_cst`.

Preconditions: `order` is neither `memory_order::release` nor `memory_order::acq_rel`.

Effects: Memory is affected according to the value of `order`.

Returns: Atomically returns the value pointed to by `object` or `this`.

```

bool atomic_flag_test_and_set(volatile atomic_flag* object) noexcept;
bool atomic_flag_test_and_set(atomic_flag* object) noexcept;
bool atomic_flag_test_and_set_explicit(volatile atomic_flag* object, memory_order order) noexcept;
bool atomic_flag_test_and_set_explicit(atomic_flag* object, memory_order order) noexcept;
bool atomic_flag::test_and_set(memory_order order = memory_order::seq_cst) volatile noexcept;
bool atomic_flag::test_and_set(memory_order order = memory_order::seq_cst) noexcept;

```

- 9 *Effects:* Atomically sets the value pointed to by `object` or by `this` to true. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations (6.9.2).

Returns: Atomically, the value of the object immediately before the effects.

```

void atomic_flag_clear(volatile atomic_flag* object) noexcept;
void atomic_flag_clear(atomic_flag* object) noexcept;
void atomic_flag_clear_explicit(volatile atomic_flag* object, memory_order order) noexcept;
void atomic_flag_clear_explicit(atomic_flag* object, memory_order order) noexcept;
void atomic_flag::clear(memory_order order = memory_order::seq_cst) volatile noexcept;
void atomic_flag::clear(memory_order order = memory_order::seq_cst) noexcept;

```

- 11 *Preconditions:* The `order` argument is neither `memory_order::consume`, `memory_order::acquire`, nor `memory_order::acq_rel`.

Effects: Atomically sets the value pointed to by `object` or by `this` to false. Memory is affected according to the value of `order`.

```
void atomic_flag_wait(const volatile atomic_flag* object, bool old) noexcept;
void atomic_flag_wait(const atomic_flag* object, bool old) noexcept;
void atomic_flag_wait_explicit(const volatile atomic_flag* object,
                               bool old, memory_order order) noexcept;
void atomic_flag_wait_explicit(const atomic_flag* object,
                               bool old, memory_order order) noexcept;
void atomic_flag::wait(bool old, memory_order order =
                      memory_order::seq_cst) const volatile noexcept;
void atomic_flag::wait(bool old, memory_order order =
                      memory_order::seq_cst) const noexcept;
```

13 For `atomic_flag_wait`, let `order` be `memory_order::seq_cst`. Let `flag` be `object` for the non-member functions and `this` for the member functions.

14 *Preconditions:* `order` is neither `memory_order::release` nor `memory_order::acq_rel`.

15 *Effects:* Repeatedly performs the following steps, in order:

(15.1) — Evaluates `flag->test(order) != old`.

(15.2) — If the result of that evaluation is `true`, returns.

(15.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

16 *Remarks:* This function is an atomic waiting operation (31.6).

```
void atomic_flag_notify_one(volatile atomic_flag* object) noexcept;
void atomic_flag_notify_one(atomic_flag* object) noexcept;
void atomic_flag::notify_one() volatile noexcept;
void atomic_flag::notify_one() noexcept;
```

17 *Effects:* Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (31.6) by this call, if any such atomic waiting operations exist.

18 *Remarks:* This function is an atomic notifying operation (31.6).

```
void atomic_flag_notify_all(volatile atomic_flag* object) noexcept;
void atomic_flag_notify_all(atomic_flag* object) noexcept;
void atomic_flag::notify_all() volatile noexcept;
void atomic_flag::notify_all() noexcept;
```

19 *Effects:* Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (31.6) by this call.

20 *Remarks:* This function is an atomic notifying operation (31.6).

31.11 Fences

[atomics.fences]

- 1 This subclause introduces synchronization primitives called *fences*. Fences can have acquire semantics, release semantics, or both. A fence with acquire semantics is called an *acquire fence*. A fence with release semantics is called a *release fence*.
- 2 A release fence *A* synchronizes with an acquire fence *B* if there exist atomic operations *X* and *Y*, both operating on some atomic object *M*, such that *A* is sequenced before *X*, *X* modifies *M*, *Y* is sequenced before *B*, and *Y* reads the value written by *X* or a value written by any side effect in the hypothetical release sequence *X* would head if it were a release operation.
- 3 A release fence *A* synchronizes with an atomic operation *B* that performs an acquire operation on an atomic object *M* if there exists an atomic operation *X* such that *A* is sequenced before *X*, *X* modifies *M*, and *B* reads the value written by *X* or a value written by any side effect in the hypothetical release sequence *X* would head if it were a release operation.
- 4 An atomic operation *A* that is a release operation on an atomic object *M* synchronizes with an acquire fence *B* if there exists some atomic operation *X* on *M* such that *X* is sequenced before *B* and reads the value written by *A* or a value written by any side effect in the release sequence headed by *A*.

```
extern "C" void atomic_thread_fence(memory_order order) noexcept;
```

5 *Effects:* Depending on the value of `order`, this operation:

(5.1) — has no effects, if `order == memory_order::relaxed`;

(5.2) — is an acquire fence, if `order == memory_order::acquire` or `order == memory_order::consume`;

- (5.3) — is a release fence, if `order == memory_order::release`;
- (5.4) — is both an acquire fence and a release fence, if `order == memory_order::acq_rel`;
- (5.5) — is a sequentially consistent acquire and release fence, if `order == memory_order::seq_cst`.

```
extern "C" void atomic_signal_fence(memory_order order) noexcept;
```

6 *Effects:* Equivalent to `atomic_thread_fence(order)`, except that the resulting ordering constraints are established only between a thread and a signal handler executed in the same thread.

7 *[Note 1: `atomic_signal_fence` can be used to specify the order in which actions performed by the thread become visible to the signal handler. Compiler optimizations and reorderings of loads and stores are inhibited in the same way as with `atomic_thread_fence`, but the hardware fence instructions that `atomic_thread_fence` would have inserted are not emitted. — end note]*

32 Thread support library [thread]

32.1 General

[thread.general]

- ¹ The following subclauses describe components to create and manage threads (6.9.2), perform mutual exclusion, and communicate conditions and values between threads, as summarized in [Table 146](#).

Table 146: Thread support library summary [tab:thread.summary]

Subclause	Header
32.2 Requirements	
32.3 Stop tokens	<code><stop_token></code>
32.4 Threads	<code><thread></code>
32.5 Mutual exclusion	<code><mutex>, <shared_mutex></code>
32.6 Condition variables	<code><condition_variable></code>
32.7 Semaphores	<code><semaphore></code>
32.8 Coordination types	<code><latch> <barrier></code>
32.9 Futures	<code><future></code>

32.2 Requirements

[thread.req]

32.2.1 Template parameter names

[thread.req.paramname]

- ¹ Throughout this Clause, the names of template parameters are used to express type requirements. If a template parameter is named `Predicate`, `operator()` applied to the template argument shall return a value that is convertible to `bool`. If a template parameter is named `Clock`, the corresponding template argument shall be a type `C` for which `is_clock_v<C>` is `true`; otherwise the program is ill-formed.

32.2.2 Exceptions

[thread.req.exception]

- ¹ Some functions described in this Clause are specified to throw exceptions of type `system_error` (19.5.8). Such exceptions are thrown if any of the function's error conditions is detected or a call to an operating system or other underlying API results in an error that prevents the library function from meeting its specifications. Failure to allocate storage is reported as described in [16.4.6.13](#).

[*Example 1*: Consider a function in this Clause that is specified to throw exceptions of type `system_error` and specifies error conditions that include `operation_not_permitted` for a thread that does not have the privilege to perform the operation. Assume that, during the execution of this function, an `errno` of `EPERM` is reported by a POSIX API call used by the implementation. Since POSIX specifies an `errno` of `EPERM` when “the caller does not have the privilege to perform the operation”, the implementation maps `EPERM` to an `error_condition` of `operation_not_permitted` (19.5) and an exception of type `system_error` is thrown. — *end example*]

- ² The `error_code` reported by such an exception's `code()` member function compares equal to one of the conditions specified in the function's error condition element.

32.2.3 Native handles

[thread.req.native]

- ¹ Several classes described in this Clause have members `native_handle_type` and `native_handle`. The presence of these members and their semantics is implementation-defined.

[*Note 1*: These members allow implementations to provide access to implementation details. Their names are specified to facilitate portable compile-time detection. Actual use of these members is inherently non-portable. — *end note*]

32.2.4 Timing specifications

[thread.req.timing]

- ¹ Several functions described in this Clause take an argument to specify a timeout. These timeouts are specified as either a `duration` or a `time_point` type as specified in [Clause 27](#).
- ² Implementations necessarily have some delay in returning from a timeout. Any overhead in interrupt response, function return, and scheduling induces a “quality of implementation” delay, expressed as duration D_i . Ideally, this delay would be zero. Further, any contention for processor and memory resources induces a “quality of

management” delay, expressed as duration D_m . The delay durations may vary from timeout to timeout, but in all cases shorter is better.

- 3 The functions whose names end in `_for` take an argument that specifies a duration. These functions produce relative timeouts. Implementations should use a steady clock to measure time for these functions.³²⁹ Given a duration argument D_t , the real-time duration of the timeout is $D_t + D_i + D_m$.
- 4 The functions whose names end in `_until` take an argument that specifies a time point. These functions produce absolute timeouts. Implementations should use the clock specified in the time point to measure time for these functions. Given a clock time point argument C_t , the clock time point of the return from timeout should be $C_t + D_i + D_m$ when the clock is not adjusted during the timeout. If the clock is adjusted to the time C_a during the timeout, the behavior should be as follows:
 - (4.1) — if $C_a > C_t$, the waiting function should wake as soon as possible, i.e., $C_a + D_i + D_m$, since the timeout is already satisfied. This specification may result in the total duration of the wait decreasing when measured against a steady clock.
 - (4.2) — if $C_a \leq C_t$, the waiting function should not time out until `Clock::now()` returns a time $C_n \geq C_t$, i.e., waking at $C_t + D_i + D_m$.

[*Note 1*: When the clock is adjusted backwards, this specification can result in the total duration of the wait increasing when measured against a steady clock. When the clock is adjusted forwards, this specification can result in the total duration of the wait decreasing when measured against a steady clock. — *end note*]

An implementation returns from such a timeout at any point from the time specified above to the time it would return from a steady-clock relative timeout on the difference between C_t and the time point of the call to the `_until` function.

Recommended practice: Implementations should decrease the duration of the wait when the clock is adjusted forwards.

- 5 [*Note 2*: If the clock is not synchronized with a steady clock, e.g., a CPU time clock, it is possible that these timeouts do not provide useful functionality. — *end note*]
- 6 The resolution of timing provided by an implementation depends on both operating system and hardware. The finest resolution provided by an implementation is called the *native resolution*.
- 7 Implementation-provided clocks that are used for these functions meet the *Cpp17TrivialClock* requirements (27.3).
- 8 A function that takes an argument which specifies a timeout will throw if, during its execution, a clock, time point, or time duration throws an exception. Such exceptions are referred to as *timeout-related exceptions*.
[*Note 3*: Instantiations of clock, time point and duration types supplied by the implementation as specified in 27.7 do not throw exceptions. — *end note*]

32.2.5 Requirements for *Cpp17Lockable* types

[`thread.req.lockable`]

32.2.5.1 In general

[`thread.req.lockable.general`]

- 1 An *execution agent* is an entity such as a thread that may perform work in parallel with other execution agents.

[*Note 1*: Implementations or users can introduce other kinds of agents such as processes or thread-pool tasks. — *end note*]

The calling agent is determined by context, e.g., the calling thread that contains the call, and so on.

- 2 [*Note 2*: Some lockable objects are “agent oblivious” in that they work for any execution agent model because they do not determine or store the agent’s ID (e.g., an ordinary spin lock). — *end note*]
- 3 The standard library templates `unique_lock` (32.5.4), `shared_lock` (32.5.5), `scoped_lock` (32.5.5.3), `lock_guard` (32.5.5.2), `lock`, `try_lock` (32.5.6), and `condition_variable_any` (32.6.5) all operate on user-supplied lockable objects. The *Cpp17BasicLockable* requirements, the *Cpp17Lockable* requirements, and the *Cpp17TimedLockable* requirements list the requirements imposed by these library types in order to acquire or release ownership of a `lock` by a given execution agent.

[*Note 3*: The nature of any lock ownership and any synchronization it entails are not part of these requirements. — *end note*]

³²⁹) Implementations for which standard time units are meaningful will typically have a steady clock within their hardware implementation.

32.2.5.2 Cpp17BasicLockable requirements

[thread.req.lockable.basic]

- ¹ A type L meets the *Cpp17BasicLockable* requirements if the following expressions are well-formed and have the specified semantics (*m* denotes a value of type L).

m.lock()

- ² *Effects:* Blocks until a lock can be acquired for the current execution agent. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

m.unlock()

- ³ *Preconditions:* The current execution agent holds a lock on *m*.

- ⁴ *Effects:* Releases a lock on *m* held by the current execution agent.

- ⁵ *Throws:* Nothing.

32.2.5.3 Cpp17Lockable requirements

[thread.req.lockable.req]

- ¹ A type L meets the *Cpp17Lockable* requirements if it meets the *Cpp17BasicLockable* requirements and the following expressions are well-formed and have the specified semantics (*m* denotes a value of type L).

m.try_lock()

- ² *Effects:* Attempts to acquire a lock for the current execution agent without blocking. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

- ³ *Return type:* `bool`.

- ⁴ *Returns:* `true` if the lock was acquired, `false` otherwise.

32.2.5.4 Cpp17TimedLockable requirements

[thread.req.lockable.timed]

- ¹ A type L meets the *Cpp17TimedLockable* requirements if it meets the *Cpp17Lockable* requirements and the following expressions are well-formed and have the specified semantics (*m* denotes a value of type L, *rel_time* denotes a value of an instantiation of *duration* (27.5), and *abs_time* denotes a value of an instantiation of *time_point* (27.6)).

m.try_lock_for(rel_time)

- ² *Effects:* Attempts to acquire a lock for the current execution agent within the relative timeout (32.2.4) specified by *rel_time*. The function will not return within the timeout specified by *rel_time* unless it has obtained a lock on *m* for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

- ³ *Return type:* `bool`.

- ⁴ *Returns:* `true` if the lock was acquired, `false` otherwise.

m.try_lock_until(abs_time)

- ⁵ *Effects:* Attempts to acquire a lock for the current execution agent before the absolute timeout (32.2.4) specified by *abs_time*. The function will not return before the timeout specified by *abs_time* unless it has obtained a lock on *m* for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

- ⁶ *Return type:* `bool`.

- ⁷ *Returns:* `true` if the lock was acquired, `false` otherwise.

32.3 Stop tokens

[thread.stoptoken]

32.3.1 Introduction

[thread.stoptoken.intro]

- ¹ Subclause 32.3 describes components that can be used to asynchronously request that an operation stops execution in a timely manner, typically because the result is no longer required. Such a request is called a *stop request*.

- ² *stop_source*, *stop_token*, and *stop_callback* implement semantics of shared ownership of a *stop state*. Any *stop_source*, *stop_token*, or *stop_callback* that shares ownership of the same stop state is an *associated stop_source*, *stop_token*, or *stop_callback*, respectively. The last remaining owner of the stop state automatically releases the resources associated with the stop state.

- ³ A `stop_token` can be passed to an operation which can either
- (3.1) — actively poll the token to check if there has been a stop request, or
 - (3.2) — register a callback using the `stop_callback` class template which will be called in the event that a stop request is made.

A stop request made via a `stop_source` will be visible to all associated `stop_token` and `stop_source` objects. Once a stop request has been made it cannot be withdrawn (a subsequent stop request has no effect).

- ⁴ Callbacks registered via a `stop_callback` object are called when a stop request is first made by any associated `stop_source` object.
- ⁵ Calls to the functions `request_stop`, `stop_requested`, and `stop_possible` do not introduce data races. A call to `request_stop` that returns `true` synchronizes with a call to `stop_requested` on an associated `stop_token` or `stop_source` object that returns `true`. Registration of a callback synchronizes with the invocation of that callback.

32.3.2 Header <stop_token> synopsis

[`thread.stoptoken.syn`]

```
namespace std {
    // 32.3.3, class stop_token
    class stop_token;

    // 32.3.4, class stop_source
    class stop_source;

    // no-shared-stop-state indicator
    struct nostopstate_t {
        explicit nostopstate_t() = default;
    };
    inline constexpr nostopstate_t nostopstate{};

    // 32.3.5, class stop_callback
    template<class Callback>
    class stop_callback;
}
```

32.3.3 Class `stop_token`

[`stoptoken`]

32.3.3.1 General

[`stoptoken.general`]

- ¹ The class `stop_token` provides an interface for querying whether a stop request has been made (`stop_requested`) or can ever be made (`stop_possible`) using an associated `stop_source` object (32.3.4). A `stop_token` can also be passed to a `stop_callback` (32.3.5) constructor to register a callback to be called when a stop request has been made from an associated `stop_source`.

```
namespace std {
    class stop_token {
    public:
        // 32.3.3.2, constructors, copy, and assignment
        stop_token() noexcept;

        stop_token(const stop_token&) noexcept;
        stop_token(stop_token&&) noexcept;
        stop_token& operator=(const stop_token&) noexcept;
        stop_token& operator=(stop_token&&) noexcept;
        ~stop_token();
        void swap(stop_token&) noexcept;

        // 32.3.3.3, stop handling
        [[nodiscard]] bool stop_requested() const noexcept;
        [[nodiscard]] bool stop_possible() const noexcept;

        [[nodiscard]] friend bool operator==(const stop_token& lhs, const stop_token& rhs) noexcept;
        friend void swap(stop_token& lhs, stop_token& rhs) noexcept;
    };
}
```

32.3.3.2 Constructors, copy, and assignment[**stoptoken.cons**]

```
stop_token() noexcept;
```

1 *Postconditions:* `stop_possible()` is `false` and `stop_requested()` is `false`.
 [Note 1: Because the created `stop_token` object can never receive a stop request, no resources are allocated for
 a stop state. —*end note*]

`stop_token(const stop_token& rhs) noexcept;`

2 *Postconditions:* `*this == rhs` is `true`.
 [Note 2: `*this` and `rhs` share the ownership of the same stop state, if any. —*end note*]

`stop_token(stop_token&& rhs) noexcept;`

3 *Postconditions:* `*this` contains the value of `rhs` prior to the start of construction and `rhs.stop_-`
 `possible()` is `false`.

`~stop_token();`

4 *Effects:* Releases ownership of the stop state, if any.

`stop_token& operator=(const stop_token& rhs) noexcept;`

5 *Effects:* Equivalent to: `stop_token(rhs).swap(*this)`.
 Returns: `*this`.

`stop_token& operator=(stop_token&& rhs) noexcept;`

7 *Effects:* Equivalent to: `stop_token(std::move(rhs)).swap(*this)`.
 Returns: `*this`.

`void swap(stop_token& rhs) noexcept;`

9 *Effects:* Exchanges the values of `*this` and `rhs`.

32.3.3.3 Members[**stoptoken.mem**]

```
[[nodiscard]] bool stop_requested() const noexcept;
```

1 *Returns:* `true` if `*this` has ownership of a stop state that has received a stop request; otherwise, `false`.

`[[nodiscard]] bool stop_possible() const noexcept;`

2 *Returns:* `false` if:
 (2.1) — `*this` does not have ownership of a stop state, or
 (2.2) — a stop request was not made and there are no associated `stop_source` objects;
 otherwise, `true`.

32.3.3.4 Non-member functions[**stoptoken.nonmembers**]

```
[[nodiscard]] bool operator==(const stop_token& lhs, const stop_token& rhs) noexcept;
```

1 *Returns:* `true` if `lhs` and `rhs` have ownership of the same stop state or if both `lhs` and `rhs` do not
 have ownership of a stop state; otherwise `false`.

`friend void swap(stop_token& x, stop_token& y) noexcept;`

2 *Effects:* Equivalent to: `x.swap(y)`.

32.3.4 Class `stop_source`[**stopsource**]**32.3.4.1 General**[**stopsource.general**]

¹ The class `stop_source` implements the semantics of making a stop request. A stop request made on a `stop_source` object is visible to all associated `stop_source` and `stop_token` ([32.3.3](#)) objects. Once a stop request has been made it cannot be withdrawn (a subsequent stop request has no effect).

```

namespace std {
    // no-shared-stop-state indicator
    struct nostopstate_t {
        explicit nostopstate_t() = default;
    };
    inline constexpr nostopstate_t nostopstate{};

    class stop_source {
    public:
        // 32.3.4.2, constructors, copy, and assignment
        stop_source();
        explicit stop_source(nostopstate_t) noexcept;

        stop_source(const stop_source&) noexcept;
        stop_source(stop_source&&) noexcept;
        stop_source& operator=(const stop_source&) noexcept;
        stop_source& operator=(stop_source&&) noexcept;
        ~stop_source();
        void swap(stop_source&) noexcept;

        // 32.3.4.3, stop handling
        [[nodiscard]] stop_token get_token() const noexcept;
        [[nodiscard]] bool stop_possible() const noexcept;
        [[nodiscard]] bool stop_requested() const noexcept;
        bool request_stop() noexcept;

        [[nodiscard]] friend bool
            operator==(const stop_source& lhs, const stop_source& rhs) noexcept;
        friend void swap(stop_source& lhs, stop_source& rhs) noexcept;
    };
}

```

32.3.4.2 Constructors, copy, and assignment

[stopsource.cons]

```
stop_source();
```

Effects: Initialises `*this` to have ownership of a new stop state.

Postconditions: `stop_possible()` is `true` and `stop_requested()` is `false`.

Throws: `bad_alloc` if memory cannot be allocated for the stop state.

```
explicit stop_source(nostopstate_t) noexcept;
```

Postconditions: `stop_possible()` is `false` and `stop_requested()` is `false`.

[*Note 1:* No resources are allocated for the state. — *end note*]

```
stop_source(const stop_source& rhs) noexcept;
```

Postconditions: `*this == rhs` is `true`.

[*Note 2:* `*this` and `rhs` share the ownership of the same stop state, if any. — *end note*]

```
stop_source(stop_source&& rhs) noexcept;
```

Postconditions: `*this` contains the value of `rhs` prior to the start of construction and `rhs.stop_possible()` is `false`.

```
~stop_source();
```

Effects: Releases ownership of the stop state, if any.

```
stop_source& operator=(const stop_source& rhs) noexcept;
```

Effects: Equivalent to: `stop_source(rhs).swap(*this)`.

Returns: `*this`.

```
stop_source& operator=(stop_source&& rhs) noexcept;
```

Effects: Equivalent to: `stop_source(std::move(rhs)).swap(*this)`.

11 >Returns: `*this`.
 void swap(`stop_source& rhs`) noexcept;
 12 Effects: Exchanges the values of `*this` and `rhs`.

32.3.4.3 Members

[stopsource.mem]

`[[nodiscard]] stop_token get_token() const noexcept;`
 1 >Returns: `stop_token()` if `stop_possible()` is `false`; otherwise a new associated `stop_token` object.
`[[nodiscard]] bool stop_possible() const noexcept;`
 2 >Returns: `true` if `*this` has ownership of a stop state; otherwise, `false`.
`[[nodiscard]] bool stop_requested() const noexcept;`
 3 >Returns: `true` if `*this` has ownership of a stop state that has received a stop request; otherwise, `false`.
`bool request_stop() noexcept;`
 4 Effects: If `*this` does not have ownership of a stop state, returns `false`. Otherwise, atomically determines whether the owned stop state has received a stop request, and if not, makes a stop request. The determination and making of the stop request are an atomic read-modify-write operation (6.9.2.2). If the request was made, the callbacks registered by associated `stop_callback` objects are synchronously called. If an invocation of a callback exits via an exception then `terminate` is called (14.6.2).
[Note 1: A stop request includes notifying all condition variables of type `condition_variable_any` temporarily registered during an interruptible wait (32.6.5.3). — end note]
 5 Postconditions: `stop_possible()` is `false` or `stop_requested()` is `true`.
 6 >Returns: `true` if this call made a stop request; otherwise `false`.

32.3.4.4 Non-member functions

[stopsource.nonmembers]

`[[nodiscard]] friend bool operator==(const stop_source& lhs, const stop_source& rhs) noexcept;`
 1 >Returns: `true` if `lhs` and `rhs` have ownership of the same stop state or if both `lhs` and `rhs` do not have ownership of a stop state; otherwise `false`.
`friend void swap(stop_source& x, stop_source& y) noexcept;`
 2 Effects: Equivalent to: `x.swap(y)`.

32.3.5 Class template `stop_callback`

[stopcallback]

32.3.5.1 General

[stopcallback.general]

```
1       namespace std {
  template<class Callback>
  class stop_callback {
  public:
    using callback_type = Callback;

    // 32.3.5.2, constructors and destructor
    template<class C>
    explicit stop_callback(const stop_token& st, C&& cb)
      noexcept(is_nothrow_constructible_v<Callback, C>);

    template<class C>
    explicit stop_callback(stop_token&& st, C&& cb)
      noexcept(is_nothrow_constructible_v<Callback, C>);
    ~stop_callback();

    stop_callback(const stop_callback&) = delete;
    stop_callback(stop_callback&&) = delete;
    stop_callback& operator=(const stop_callback&) = delete;
    stop_callback& operator=(stop_callback&&) = delete;
```

```

private:
    Callback callback;      // exposition only
};

template<class Callback>
stop_callback(stop_token, Callback) -> stop_callback<Callback>;
}

```

- ² *Mandates*: `stop_callback` is instantiated with an argument for the template parameter `Callback` that satisfies both `invocable` and `destructible`.
- ³ *Preconditions*: `stop_callback` is instantiated with an argument for the template parameter `Callback` that models both `invocable` and `destructible`.

32.3.5.2 Constructors and destructor

[stopcallback.cons]

```

template<class C>
explicit stop_callback(const stop_token& st, C&& cb)
    noexcept(is_nothrow_constructible_v<Callback, C>);

template<class C>
explicit stop_callback(stop_token&& st, C&& cb)
    noexcept(is_nothrow_constructible_v<Callback, C>);

```

- ¹ *Constraints*: `Callback` and `C` satisfy `constructible_from<Callback, C>`.
- ² *Preconditions*: `Callback` and `C` model `constructible_from<Callback, C>`.
- ³ *Effects*: Initializes `callback` with `std::forward<C>(cb)`. If `st.stop_requested()` is `true`, then `std::forward<Callback>(callback)()` is evaluated in the current thread before the constructor returns. Otherwise, if `st` has ownership of a stop state, acquires shared ownership of that stop state and registers the callback with that stop state such that `std::forward<Callback>(callback)()` is evaluated by the first call to `request_stop()` on an associated `stop_source`.
- ⁴ *Remarks*: If evaluating `std::forward<Callback>(callback)()` exits via an exception, then `terminate` is called (14.6.2).
- ⁵ *Throws*: Any exception thrown by the initialization of `callback`.

```
~stop_callback();
```

- ⁶ *Effects*: Unregisters the callback from the owned stop state, if any. The destructor does not block waiting for the execution of another callback registered by an associated `stop_callback`. If `callback` is concurrently executing on another thread, then the return from the invocation of `callback` strongly happens before (6.9.2.2) `callback` is destroyed. If `callback` is executing on the current thread, then the destructor does not block (3.7) waiting for the return from the invocation of `callback`. Releases ownership of the stop state, if any.

32.4 Threads

[thread.threads]

32.4.1 General

[thread.threads.general]

- ¹ 32.4 describes components that can be used to create and manage threads.

[Note 1: These threads are intended to map one-to-one with operating system threads. — end note]

32.4.2 Header <thread> synopsis

[thread.syn]

```

#include <compare>           // see 17.11.1

namespace std {
    class thread;

    void swap(thread& x, thread& y) noexcept;

    // 32.4.4 class jthread
    class jthread;

    namespace this_thread {
        thread::id get_id() noexcept;
    }
}
```

```

    void yield() noexcept;
    template<class Clock, class Duration>
        void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);
    template<class Rep, class Period>
        void sleep_for(const chrono::duration<Rep, Period>& rel_time);
    }
}

```

32.4.3 Class **thread**

32.4.3.1 General

[**thread.thread.class**]

[**thread.thread.class.general**]

- ¹ The class **thread** provides a mechanism to create a new thread of execution, to join with a thread (i.e., wait for a thread to complete), and to perform other operations that manage and query the state of a thread. A **thread** object uniquely represents a particular thread of execution. That representation may be transferred to other **thread** objects in such a way that no two **thread** objects simultaneously represent the same thread of execution. A thread of execution is *detached* when no **thread** object represents that thread. Objects of class **thread** can be in a state that does not represent a thread of execution.

[*Note 1*: A **thread** object does not represent a thread of execution after default construction, after being moved from, or after a successful call to **detach** or **join**. — *end note*]

```

namespace std {
    class thread {
    public:
        // types
        class id;
        using native_handle_type = implementation-defined;           // see 32.2.3

        // construct/copy/destroy
        thread() noexcept;
        template<class F, class... Args> explicit thread(F&& f, Args&&... args);
        ~thread();
        thread(const thread&) = delete;
        thread(thread&&) noexcept;
        thread& operator=(const thread&) = delete;
        thread& operator=(thread&&) noexcept;

        // members
        void swap(thread&) noexcept;
        bool joinable() const noexcept;
        void join();
        void detach();
        id get_id() const noexcept;
        native_handle_type native_handle();                                // see 32.2.3

        // static members
        static unsigned int hardware_concurrency() noexcept;
    };
}

```

32.4.3.2 Class **thread::id**

[**thread.thread.id**]

```

namespace std {
    class thread::id {
    public:
        id() noexcept;
    };

    bool operator==(thread::id x, thread::id y) noexcept;
    strong_ordering operator<=(thread::id x, thread::id y) noexcept;

    template<class charT, class traits>
        basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& out, thread::id id);
}

```

```
// hash support
template<class T> struct hash;
template<> struct hash<thread::id>;
}
```

- 1 An object of type `thread::id` provides a unique identifier for each thread of execution and a single distinct value for all `thread` objects that do not represent a thread of execution (32.4.3). Each thread of execution has an associated `thread::id` object that is not equal to the `thread::id` object of any other thread of execution and that is not equal to the `thread::id` object of any `thread` object that does not represent threads of execution.

- 2 `thread::id` is a trivially copyable class (11.2). The library may reuse the value of a `thread::id` of a terminated thread that can no longer be joined.

- 3 [Note 1: Relational operators allow `thread::id` objects to be used as keys in associative containers. —end note]

`id() noexcept;`

- 4 *Postconditions*: The constructed object does not represent a thread of execution.

`bool operator==(thread::id x, thread::id y) noexcept;`

- 5 *Returns*: `true` only if `x` and `y` represent the same thread of execution or neither `x` nor `y` represents a thread of execution.

`strong_ordering operator<=(thread::id x, thread::id y) noexcept;`

- 6 Let $P(x, y)$ be an unspecified total ordering over `thread::id` as described in 25.8.

- 7 *Returns*: `strong_ordering::less` if $P(x, y)$ is true. Otherwise, `strong_ordering::greater` if $P(y, x)$ is true. Otherwise, `strong_ordering::equal`.

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<< (basic_ostream<charT, traits>& out, thread::id id);
```

- 8 *Effects*: Inserts an unspecified text representation of `id` into `out`. For two objects of type `thread::id` `x` and `y`, if `x == y` the `thread::id` objects have the same text representation and if `x != y` the `thread::id` objects have distinct text representations.

- 9 *Returns*: `out`.

`template<> struct hash<thread::id>;`

- 10 The specialization is enabled (20.14.19).

32.4.3.3 Constructors

[`thread.thread.constr`]

`thread() noexcept;`

- 1 *Effects*: The object does not represent a thread of execution.

- 2 *Postconditions*: `get_id() == id()`.

`template<class F, class... Args> explicit thread(F&& f, Args&&... args);`

- 3 *Constraints*: `remove_cvref_t<F>` is not the same type as `thread`.

- 4 *Mandates*: The following are all `true`:

- (4.1) — `is_constructible_v<decay_t<F>, F>`,
- (4.2) — `(is_constructible_v<decay_t<Args>, Args> && ...)`,
- (4.3) — `is_move_constructible_v<decay_t<F>>`,
- (4.4) — `(is_move_constructible_v<decay_t<Args>> && ...)`, and
- (4.5) — `is_invocable_v<decay_t<F>, decay_t<Args>...>`.

- 5 *Preconditions*: `decay_t<F>` and each type in `decay_t<Args>` meet the `Cpp17MoveConstructible` requirements.

- 6 *Effects*: The new thread of execution executes

`invoke(decay-copy(std::forward<F>(f)), decay-copy(std::forward<Args>(args))...)`

with the calls to *decay-copy* being evaluated in the constructing thread. Any return value from this invocation is ignored.

[*Note 1*: This implies that any exceptions not thrown from the invocation of the copy of `f` will be thrown in the constructing thread, not the new thread. — *end note*]

If the invocation of `invoke` terminates with an uncaught exception, `terminate` is called.

7 *Synchronization*: The completion of the invocation of the constructor synchronizes with the beginning of the invocation of the copy of `f`.

8 *Postconditions*: `get_id() != id()`. `*this` represents the newly started thread.

9 *Throws*: `system_error` if unable to start the new thread.

10 *Error conditions*:

- (10.1) — `resource_unavailable_try_again` — the system lacked the necessary resources to create another thread, or the system-imposed limit on the number of threads in a process would be exceeded.

```
thread(thread&& x) noexcept;
```

11 *Postconditions*: `x.get_id() == id()` and `get_id()` returns the value of `x.get_id()` prior to the start of construction.

32.4.3.4 Destructor

[`thread.thread.destr`]

```
~thread();
```

1 *Effects*: If `joinable()`, calls `terminate()`. Otherwise, has no effects.

[*Note 1*: Either implicitly detaching or joining a `joinable()` thread in its destructor can result in difficult to debug correctness (for detach) or performance (for join) bugs encountered only when an exception is thrown. These bugs can be avoided by ensuring that the destructor is never executed while the thread is still joinable. — *end note*]

32.4.3.5 Assignment

[`thread.thread.assign`]

```
thread& operator=(thread&& x) noexcept;
```

1 *Effects*: If `joinable()`, calls `terminate()`. Otherwise, assigns the state of `x` to `*this` and sets `x` to a default constructed state.

2 *Postconditions*: `x.get_id() == id()` and `get_id()` returns the value of `x.get_id()` prior to the assignment.

3 *Returns*: `*this`.

32.4.3.6 Members

[`thread.thread.member`]

```
void swap(thread& x) noexcept;
```

1 *Effects*: Swaps the state of `*this` and `x`.

```
bool joinable() const noexcept;
```

2 *Returns*: `get_id() != id()`.

```
void join();
```

3 *Effects*: Blocks until the thread represented by `*this` has completed.

4 *Synchronization*: The completion of the thread represented by `*this` synchronizes with (6.9.2) the corresponding successful `join()` return.

[*Note 1*: Operations on `*this` are not synchronized. — *end note*]

5 *Postconditions*: The thread represented by `*this` has completed. `get_id() == id()`.

6 *Throws*: `system_error` when an exception is required (32.2.2).

7 *Error conditions*:

- (7.1) — `resource_deadlock_would_occur` — if deadlock is detected or `get_id() == this_thread::get_id()`.

- (7.2) — `no_such_process` — if the thread is not valid.

(7.3) — `invalid_argument` — if the thread is not joinable.

```
void detach();
```

8 *Effects:* The thread represented by `*this` continues execution without the calling thread blocking. When `detach()` returns, `*this` no longer represents the possibly continuing thread of execution. When the thread previously represented by `*this` ends execution, the implementation releases any owned resources.

9 *Postconditions:* `get_id() == id()`.

10 *Throws:* `system_error` when an exception is required (32.2.2).

11 *Error conditions:*

(11.1) — `no_such_process` — if the thread is not valid.

(11.2) — `invalid_argument` — if the thread is not joinable.

```
id get_id() const noexcept;
```

12 *Returns:* A default constructed `id` object if `*this` does not represent a thread, otherwise `this_thread::get_id()` for the thread of execution represented by `*this`.

32.4.3.7 Static members

[`thread.thread.static`]

```
unsigned hardware_concurrency() noexcept;
```

1 *Returns:* The number of hardware thread contexts.

[*Note 1:* This value should only be considered to be a hint. — *end note*]

If this value is not computable or well-defined, an implementation should return 0.

32.4.3.8 Specialized algorithms

[`thread.thread.algorithm`]

```
void swap(thread& x, thread& y) noexcept;
```

1 *Effects:* As if by `x.swap(y)`.

32.4.4 Class `jthread`

[`thread.jthread.class`]

32.4.4.1 General

[`thread.jthread.class.general`]

1 The class `jthread` provides a mechanism to create a new thread of execution. The functionality is the same as for class `thread` (32.4.3) with the additional abilities to provide a `stop_token` (32.3) to the new thread of execution, make stop requests, and automatically join.

```
namespace std {
    class jthread {
    public:
        // types
        using id = thread::id;
        using native_handle_type = thread::native_handle_type;

        // 32.4.4.2, constructors, move, and assignment
        jthread() noexcept;
        template<class F, class... Args> explicit jthread(F&& f, Args&&... args);
        ~jthread();
        jthread(const jthread&) = delete;
        jthread(jthread&&) noexcept;
        jthread& operator=(const jthread&) = delete;
        jthread& operator=(jthread&&) noexcept;

        // 32.4.4.3, members
        void swap(jthread&) noexcept;
        [[nodiscard]] bool joinable() const noexcept;
        void join();
        void detach();
        [[nodiscard]] id get_id() const noexcept;
        [[nodiscard]] native_handle_type native_handle(); // see 32.2.3
    };
}
```

```

// 32.4.4.4, stop token handling
[[nodiscard]] stop_source get_stop_source() noexcept;
[[nodiscard]] stop_token get_stop_token() const noexcept;
bool request_stop() noexcept;

// 32.4.4.5, specialized algorithms
friend void swap(jthread& lhs, jthread& rhs) noexcept;

// 32.4.4.6, static members
[[nodiscard]] static unsigned int hardware_concurrency() noexcept;

private:
    stop_source ssource;           // exposition only
};

}

```

32.4.4.2 Constructors, move, and assignment

[thread.jthread.cons]

jthread() noexcept;

1 *Effects*: Constructs a jthread object that does not represent a thread of execution.

2 *Postconditions*: `get_id() == id()` is true and `ssource.stop_possible()` is false.

template<class F, class... Args> explicit jthread(F&& f, Args&&... args);

3 *Constraints*: `remove_cvref_t<F>` is not the same type as `jthread`.

4 *Mandates*: The following are all true:

- (4.1) — `is_constructible_v<decay_t<F>, F>`,
- (4.2) — `(is_constructible_v<decay_t<Args>, Args> && ...)`,
- (4.3) — `is_move_constructible_v<decay_t<F>>`,
- (4.4) — `(is_move_constructible_v<decay_t<Args>> && ...)`, and
- (4.5) — `is_invocable_v<decay_t<F>, decay_t<Args>...> ||`
`is_invocable_v<decay_t<F>, stop_token, decay_t<Args>...>.`

5 *Preconditions*: `decay_t<F>` and each type in `decay_t<Args>` meet the Cpp17MoveConstructible requirements.

6 *Effects*: Initializes `ssource`. The new thread of execution executes

```
invoke(decay-copy(std::forward<F>(f)), get_stop_token(),
      decay-copy(std::forward<Args>(args))...)

```

if that expression is well-formed, otherwise

```
invoke(decay-copy(std::forward<F>(f)), decay-copy(std::forward<Args>(args))...)

```

with the calls to `decay-copy` being evaluated in the constructing thread. Any return value from this invocation is ignored.

[Note 1: This implies that any exceptions not thrown from the invocation of the copy of `f` will be thrown in the constructing thread, not the new thread. — end note]

If the `invoke` expression exits via an exception, `terminate` is called.

7 *Synchronization*: The completion of the invocation of the constructor synchronizes with the beginning of the invocation of the copy of `f`.

8 *Postconditions*: `get_id() != id()` is true and `ssource.stop_possible()` is true and `*this` represents the newly started thread.

[Note 2: The calling thread can make a stop request only once, because it cannot replace this stop token. — end note]

9 *Throws*: `system_error` if unable to start the new thread.

10 *Error conditions*:

- (10.1) — `resource_unavailable_try_again` — the system lacked the necessary resources to create another thread, or the system-imposed limit on the number of threads in a process would be exceeded.

```
jthread(jthread&& x) noexcept;
11  Postconditions: x.get_id() == id() and get_id() returns the value of x.get_id() prior to the start of construction. ssource has the value of x.ssource prior to the start of construction and x.ssource.stop_possible() is false.

~jthread();
12  Effects: If joinable() is true, calls request_stop() and then join().
    [Note 3: Operations on *this are not synchronized. — end note]

jthread& operator=(jthread&& x) noexcept;
13  Effects: If joinable() is true, calls request_stop() and then join(). Assigns the state of x to *this and sets x to a default constructed state.

14  Postconditions: x.get_id() == id() and get_id() returns the value of x.get_id() prior to the assignment. ssource has the value of x.ssource prior to the assignment and x.ssource.stop_possible() is false.

15  Returns: *this.
```

32.4.4.3 Members[[thread.jthread.mem](#)]

```
void swap(jthread& x) noexcept;
1  Effects: Exchanges the values of *this and x.

[[nodiscard]] bool joinable() const noexcept;
2  Returns: get_id() != id().

void join();
3  Effects: Blocks until the thread represented by *this has completed.

4  Synchronization: The completion of the thread represented by *this synchronizes with (6.9.2) the corresponding successful join() return.

    [Note 1: Operations on *this are not synchronized. — end note]

5  Postconditions: The thread represented by *this has completed. get_id() == id().

6  Throws: system\_error when an exception is required (32.2.2).

7  Error conditions:

(7.1)  — resource\_deadlock\_would\_occur — if deadlock is detected or get_id() == this\_thread::get\_id\(\).
(7.2)  — no\_such\_process — if the thread is not valid.
(7.3)  — invalid\_argument — if the thread is not joinable.

void detach();
8  Effects: The thread represented by *this continues execution without the calling thread blocking. When detach() returns, *this no longer represents the possibly continuing thread of execution. When the thread previously represented by *this ends execution, the implementation releases any owned resources.

9  Postconditions: get_id() == id().

10  Throws: system\_error when an exception is required (32.2.2).

11  Error conditions:

(11.1)  — no\_such\_process — if the thread is not valid.
(11.2)  — invalid\_argument — if the thread is not joinable.

id get_id() const noexcept;
12  Returns: A default constructed id object if *this does not represent a thread, otherwise this\_thread::get\_id\(\) for the thread of execution represented by *this.
```

32.4.4.4 Stop token handling

[thread.jthread.stop]

```
[[nodiscard]] stop_source get_stop_source() noexcept;
1   Effects: Equivalent to: return ssource;
[[nodiscard]] stop_token get_stop_token() const noexcept;
2   Effects: Equivalent to: return ssource.get_token();
bool request_stop() noexcept;
3   Effects: Equivalent to: return ssource.request_stop();
```

32.4.4.5 Specialized algorithms

[thread.jthread.special]

```
friend void swap(jthread& x, jthread& y) noexcept;
1   Effects: Equivalent to: x.swap(y).
```

32.4.4.6 Static members

[thread.jthread.static]

```
[[nodiscard]] static unsigned int hardware_concurrency() noexcept;
1   Returns: thread::hardware_concurrency().
```

32.4.5 Namespace this_thread

[thread.thread.this]

```
namespace std::this_thread {
    thread::id get_id() noexcept;

    void yield() noexcept;
    template<class Clock, class Duration>
        void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);
    template<class Rep, class Period>
        void sleep_for(const chrono::duration<Rep, Period>& rel_time);
}
```

```
thread::id this_thread::get_id() noexcept;
```

1 Returns: An object of type `thread::id` that uniquely identifies the current thread of execution. No other thread of execution has this id and this thread of execution always has this id. The object returned does not compare equal to a default constructed `thread::id`.

```
void this_thread::yield() noexcept;
```

2 Effects: Offers the implementation the opportunity to reschedule.

3 Synchronization: None.

```
template<class Clock, class Duration>
    void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);
```

4 Effects: Blocks the calling thread for the absolute timeout (32.2.4) specified by `abs_time`.

5 Synchronization: None.

6 Throws: Timeout-related exceptions (32.2.4).

```
template<class Rep, class Period>
    void sleep_for(const chrono::duration<Rep, Period>& rel_time);
```

7 Effects: Blocks the calling thread for the relative timeout (32.2.4) specified by `rel_time`.

8 Synchronization: None.

9 Throws: Timeout-related exceptions (32.2.4).

32.5 Mutual exclusion

[thread.mutex]

32.5.1 General

[thread.mutex.general]

1 Subclause 32.5 provides mechanisms for mutual exclusion: mutexes, locks, and call once. These mechanisms ease the production of race-free programs (6.9.2).

32.5.2 Header <mutex> synopsis

[mutex.syn]

```

namespace std {
    class mutex;
    class recursive_mutex;
    class timed_mutex;
    class recursive_timed_mutex;

    struct defer_lock_t { explicit defer_lock_t() = default; };
    struct try_to_lock_t { explicit try_to_lock_t() = default; };
    struct adopt_lock_t { explicit adopt_lock_t() = default; };

    inline constexpr defer_lock_t  defer_lock { };
    inline constexpr try_to_lock_t try_to_lock { };
    inline constexpr adopt_lock_t  adopt_lock { };

    template<class Mutex> class lock_guard;
    template<class... MutexTypes> class scoped_lock;
    template<class Mutex> class unique_lock;

    template<class Mutex>
        void swap(unique_lock<Mutex>& x, unique_lock<Mutex>& y) noexcept;

    template<class L1, class L2, class... L3> int try_lock(L1&, L2&, L3&...);
    template<class L1, class L2, class... L3> void lock(L1&, L2&, L3&...);

    struct once_flag;

    template<class Callable, class... Args>
        void call_once(once_flag& flag, Callable&& func, Args&&... args);
}
```

32.5.3 Header <shared_mutex> synopsis

[shared.mutex.syn]

```

namespace std {
    class shared_mutex;
    class shared_timed_mutex;
    template<class Mutex> class shared_lock;
    template<class Mutex>
        void swap(shared_lock<Mutex>& x, shared_lock<Mutex>& y) noexcept;
}
```

32.5.4 Mutex requirements

[thread.mutex.requirements]

32.5.4.1 In general

[thread.mutex.requirements.general]

- 1 A mutex object facilitates protection against data races and allows safe synchronization of data between execution agents (32.2.5). An execution agent *owns* a mutex from the time it successfully calls one of the lock functions until it calls unlock. Mutexes can be either recursive or non-recursive, and can grant simultaneous ownership to one or many execution agents. Both recursive and non-recursive mutexes are supplied.

32.5.4.2 Mutex types

[thread.mutex.requirements.mutex]

32.5.4.2.1 General

[thread.mutex.requirements.mutex.general]

- 1 The *mutex types* are the standard library types `mutex`, `recursive_mutex`, `timed_mutex`, `recursive_timed_mutex`, `shared_mutex`, and `shared_timed_mutex`. They meet the requirements set out in 32.5.4.2. In this description, \mathbf{m} denotes an object of a mutex type.
- 2 The mutex types meet the *Cpp17Lockable* requirements (32.2.5.3).
- 3 The mutex types meet *Cpp17DefaultConstructible* and *Cpp17Destructible*. If initialization of an object of a mutex type fails, an exception of type `system_error` is thrown. The mutex types are neither copyable nor movable.
- 4 The error conditions for error codes, if any, reported by member functions of the mutex types are as follows:
 - (4.1) — `resource_unavailable_try_again` — if any native handle type manipulated is not available.
 - (4.2) — `operation_not_permitted` — if the thread does not have the privilege to perform the operation.

(4.3) — `invalid_argument` — if any native handle type manipulated as part of mutex construction is incorrect.

5 The implementation provides lock and unlock operations, as described below. For purposes of determining the existence of a data race, these behave as atomic operations (6.9.2). The lock and unlock operations on a single mutex appears to occur in a single total order.

[*Note 1*: This can be viewed as the modification order (6.9.2) of the mutex. — *end note*]

[*Note 2*: Construction and destruction of an object of a mutex type need not be thread-safe; other synchronization can be used to ensure that mutex objects are initialized and visible to other threads. — *end note*]

6 The expression `m.lock()` is well-formed and has the following semantics:

7 *Preconditions*: If `m` is of type `mutex`, `timed_mutex`, `shared_mutex`, or `shared_timed_mutex`, the calling thread does not own the mutex.

8 *Effects*: Blocks the calling thread until ownership of the mutex can be obtained for the calling thread.

9 *Postconditions*: The calling thread owns the mutex.

10 *Return type*: `void`.

11 *Synchronization*: Prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

12 *Throws*: `system_error` when an exception is required (32.2.2).

13 *Error conditions*:

(13.1) — `operation_not_permitted` — if the thread does not have the privilege to perform the operation.

(13.2) — `resource_deadlock_would_occur` — if the implementation detects that a deadlock would occur.

14 The expression `m.try_lock()` is well-formed and has the following semantics:

15 *Preconditions*: If `m` is of type `mutex`, `timed_mutex`, `shared_mutex`, or `shared_timed_mutex`, the calling thread does not own the mutex.

16 *Effects*: Attempts to obtain ownership of the mutex for the calling thread without blocking. If ownership is not obtained, there is no effect and `try_lock()` immediately returns. An implementation may fail to obtain the lock even if it is not held by any other thread.

[*Note 3*: This spurious failure is normally uncommon, but allows interesting implementations based on a simple compare and exchange (Clause 31). — *end note*]

An implementation should ensure that `try_lock()` does not consistently return `false` in the absence of contending mutex acquisitions.

17 *Return type*: `bool`.

18 *Returns*: `true` if ownership of the mutex was obtained for the calling thread, otherwise `false`.

19 *Synchronization*: If `try_lock()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

[*Note 4*: Since `lock()` does not synchronize with a failed subsequent `try_lock()`, the visibility rules are weak enough that little would be known about the state after a failure, even in the absence of spurious failures. — *end note*]

20 *Throws*: Nothing.

21 The expression `m.unlock()` is well-formed and has the following semantics:

22 *Preconditions*: The calling thread owns the mutex.

23 *Effects*: Releases the calling thread's ownership of the mutex.

24 *Return type*: `void`.

25 *Synchronization*: This operation synchronizes with (6.9.2) subsequent lock operations that obtain ownership on the same object.

26 *Throws*: Nothing.

32.5.4.2.2 Class mutex

[`thread.mutex.class`]

```
namespace std {
    class mutex {
        public:
            constexpr mutex() noexcept;
```

```

~mutex();

mutex(const mutex&) = delete;
mutex& operator=(const mutex&) = delete;

void lock();
bool try_lock();
void unlock();

using native_handle_type = implementation-defined;           // see 32.2.3
native_handle_type native_handle();                            // see 32.2.3
};

}

```

- ¹ The class **mutex** provides a non-recursive mutex with exclusive ownership semantics. If one thread owns a **mutex** object, attempts by another thread to acquire ownership of that object will fail (for **try_lock()**) or block (for **lock()**) until the owning thread has released ownership with a call to **unlock()**.
- ² [Note 1: After a thread A has called **unlock()**, releasing a mutex, it is possible for another thread B to lock the same mutex, observe that it is no longer in use, unlock it, and destroy it, before thread A appears to have returned from its unlock call. Implementations are required to handle such scenarios correctly, as long as thread A doesn't access the mutex after the unlock call returns. These cases typically occur when a reference-counted object contains a mutex that is used to protect the reference count. —end note]
- ³ The class **mutex** meets all of the mutex requirements (32.5.4). It is a standard-layout class (11.2).
- ⁴ [Note 2: A program can deadlock if the thread that owns a **mutex** object calls **lock()** on that object. If the implementation can detect the deadlock, a **resource_deadlock_would_occur** error condition can be observed. —end note]
- ⁵ The behavior of a program is undefined if it destroys a **mutex** object owned by any thread or a thread terminates while owning a **mutex** object.

32.5.4.2.3 Class recursive_mutex

[thread.mutex.recursive]

```

namespace std {
    class recursive_mutex {
    public:
        recursive_mutex();
        ~recursive_mutex();

        recursive_mutex(const recursive_mutex&) = delete;
        recursive_mutex& operator=(const recursive_mutex&) = delete;

        void lock();
        bool try_lock() noexcept;
        void unlock();

        using native_handle_type = implementation-defined;           // see 32.2.3
        native_handle_type native_handle();                            // see 32.2.3
    };
}

```

- ¹ The class **recursive_mutex** provides a recursive mutex with exclusive ownership semantics. If one thread owns a **recursive_mutex** object, attempts by another thread to acquire ownership of that object will fail (for **try_lock()**) or block (for **lock()**) until the first thread has completely released ownership.
- ² The class **recursive_mutex** meets all of the mutex requirements (32.5.4). It is a standard-layout class (11.2).
- ³ A thread that owns a **recursive_mutex** object may acquire additional levels of ownership by calling **lock()** or **try_lock()** on that object. It is unspecified how many levels of ownership may be acquired by a single thread. If a thread has already acquired the maximum level of ownership for a **recursive_mutex** object, additional calls to **try_lock()** fail, and additional calls to **lock()** throw an exception of type **system_error**. A thread shall call **unlock()** once for each level of ownership acquired by calls to **lock()** and **try_lock()**. Only when all levels of ownership have been released may ownership be acquired by another thread.
- ⁴ The behavior of a program is undefined if:
 - (4.1) — it destroys a **recursive_mutex** object owned by any thread or

(4.2) — a thread terminates while owning a `recursive_mutex` object.

32.5.4.3 Timed mutex types

[`thread.timedmutex.requirements`]

32.5.4.3.1 General

[`thread.timedmutex.requirements.general`]

- 1 The *timed mutex types* are the standard library types `timed_mutex`, `recursive_timed_mutex`, and `shared_timed_mutex`. They meet the requirements set out below. In this description, `m` denotes an object of a mutex type, `rel_time` denotes an object of an instantiation of `duration` (27.5), and `abs_time` denotes an object of an instantiation of `time_point` (27.6).
- 2 The timed mutex types meet the *Cpp17TimedLockable* requirements (32.2.5.4).
- 3 The expression `m.try_lock_for(rel_time)` is well-formed and has the following semantics:

Preconditions: If `m` is of type `timed_mutex` or `shared_timed_mutex`, the calling thread does not own the mutex.
Effects: The function attempts to obtain ownership of the mutex within the relative timeout (32.2.4) specified by `rel_time`. If the time specified by `rel_time` is less than or equal to `rel_time.zero()`, the function attempts to obtain ownership without blocking (as if by calling `try_lock()`). The function returns within the timeout specified by `rel_time` only if it has obtained ownership of the mutex object.

[*Note 1:* As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — *end note*]

Return type: `bool`.

Returns: `true` if ownership was obtained, otherwise `false`.

Synchronization: If `try_lock_for()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

Throws: Timeout-related exceptions (32.2.4).

- 10 The expression `m.try_lock_until(abs_time)` is well-formed and has the following semantics:

Preconditions: If `m` is of type `timed_mutex` or `shared_timed_mutex`, the calling thread does not own the mutex.

Effects: The function attempts to obtain ownership of the mutex. If `abs_time` has already passed, the function attempts to obtain ownership without blocking (as if by calling `try_lock()`). The function returns before the absolute timeout (32.2.4) specified by `abs_time` only if it has obtained ownership of the mutex object.

[*Note 2:* As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — *end note*]

Return type: `bool`.

Returns: `true` if ownership was obtained, otherwise `false`.

Synchronization: If `try_lock_until()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

- 16 *Throws:* Timeout-related exceptions (32.2.4).

32.5.4.3.2 Class `timed_mutex`

[`thread.timedmutex.class`]

```
namespace std {
    class timed_mutex {
        public:
            timed_mutex();
            ~timed_mutex();

            timed_mutex(const timed_mutex&) = delete;
            timed_mutex& operator=(const timed_mutex&) = delete;

            void lock();      // blocking
            bool try_lock();
            template<class Rep, class Period>
                bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
            template<class Clock, class Duration>
                bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
```

```

void unlock();

using native_handle_type = implementation-defined;           // see 32.2.3
native_handle_type native_handle();                           // see 32.2.3
};

}

```

- 1 The class `timed_mutex` provides a non-recursive mutex with exclusive ownership semantics. If one thread owns a `timed_mutex` object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`, `try_lock_for()`, and `try_lock_until()`) until the owning thread has released ownership with a call to `unlock()` or the call to `try_lock_for()` or `try_lock_until()` times out (having failed to obtain ownership).
- 2 The class `timed_mutex` meets all of the timed mutex requirements (32.5.4.3). It is a standard-layout class (11.2).
- 3 The behavior of a program is undefined if:
 - (3.1) — it destroys a `timed_mutex` object owned by any thread,
 - (3.2) — a thread that owns a `timed_mutex` object calls `lock()`, `try_lock()`, `try_lock_for()`, or `try_lock_until()` on that object, or
 - (3.3) — a thread terminates while owning a `timed_mutex` object.

32.5.4.3.3 Class recursive_timed_mutex

[thread.timedmutex.recursive]

```

namespace std {
    class recursive_timed_mutex {
public:
    recursive_timed_mutex();
    ~recursive_timed_mutex();

    recursive_timed_mutex(const recursive_timed_mutex&) = delete;
    recursive_timed_mutex& operator=(const recursive_timed_mutex&) = delete;

    void lock();          // blocking
    bool try_lock() noexcept;
    template<class Rep, class Period>
        bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
    template<class Clock, class Duration>
        bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
    void unlock();

    using native_handle_type = implementation-defined;           // see 32.2.3
    native_handle_type native_handle();                           // see 32.2.3
};

}

```

- 1 The class `recursive_timed_mutex` provides a recursive mutex with exclusive ownership semantics. If one thread owns a `recursive_timed_mutex` object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`, `try_lock_for()`, and `try_lock_until()`) until the owning thread has completely released ownership or the call to `try_lock_for()` or `try_lock_until()` times out (having failed to obtain ownership).
- 2 The class `recursive_timed_mutex` meets all of the timed mutex requirements (32.5.4.3). It is a standard-layout class (11.2).
- 3 A thread that owns a `recursive_timed_mutex` object may acquire additional levels of ownership by calling `lock()`, `try_lock()`, `try_lock_for()`, or `try_lock_until()` on that object. It is unspecified how many levels of ownership may be acquired by a single thread. If a thread has already acquired the maximum level of ownership for a `recursive_timed_mutex` object, additional calls to `try_lock()`, `try_lock_for()`, or `try_lock_until()` fail, and additional calls to `lock()` throw an exception of type `system_error`. A thread shall call `unlock()` once for each level of ownership acquired by calls to `lock()`, `try_lock()`, `try_lock_for()`, and `try_lock_until()`. Only when all levels of ownership have been released may ownership of the object be acquired by another thread.

- ⁴ The behavior of a program is undefined if:
- (4.1) — it destroys a `recursive_timed_mutex` object owned by any thread, or
 - (4.2) — a thread terminates while owning a `recursive_timed_mutex` object.
- 32.5.4.4 Shared mutex types** [thread.sharedmutex.requirements]
- 32.5.4.4.1 General** [thread.sharedmutex.requirements.general]
- ¹ The standard library types `shared_mutex` and `shared_timed_mutex` are *shared mutex types*. Shared mutex types meet the requirements of mutex types (32.5.4.2) and additionally meet the requirements set out below. In this description, `m` denotes an object of a shared mutex type.
 - ² In addition to the exclusive lock ownership mode specified in 32.5.4.2, shared mutex types provide a *shared lock* ownership mode. Multiple execution agents can simultaneously hold a shared lock ownership of a shared mutex type. But no execution agent holds a shared lock while another execution agent holds an exclusive lock on the same shared mutex type, and vice-versa. The maximum number of execution agents which can share a shared lock on a single shared mutex type is unspecified, but is at least 10000. If more than the maximum number of execution agents attempt to obtain a shared lock, the excess execution agents block until the number of shared locks are reduced below the maximum amount by other execution agents releasing their shared lock.
 - ³ The expression `m.lock_shared()` is well-formed and has the following semantics:
 - ⁴ *Preconditions*: The calling thread has no ownership of the mutex.
 - ⁵ *Effects*: Blocks the calling thread until shared ownership of the mutex can be obtained for the calling thread. If an exception is thrown then a shared lock has not been acquired for the current thread.
 - ⁶ *Postconditions*: The calling thread has a shared lock on the mutex.
 - ⁷ *Return type*: `void`.
 - ⁸ *Synchronization*: Prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.
 - ⁹ *Throws*: `system_error` when an exception is required (32.2.2).
 - ¹⁰ *Error conditions*:
 - `operation_not_permitted` — if the thread does not have the privilege to perform the operation.
 - `resource_deadlock_would_occur` — if the implementation detects that a deadlock would occur.
 - ¹¹ The expression `m.unlock_shared()` is well-formed and has the following semantics:
 - ¹² *Preconditions*: The calling thread holds a shared lock on the mutex.
 - ¹³ *Effects*: Releases a shared lock on the mutex held by the calling thread.
 - ¹⁴ *Return type*: `void`.
 - ¹⁵ *Synchronization*: This operation synchronizes with (6.9.2) subsequent `lock()` operations that obtain ownership on the same object.
 - ¹⁶ *Throws*: Nothing.
 - ¹⁷ The expression `m.try_lock_shared()` is well-formed and has the following semantics:
 - ¹⁸ *Preconditions*: The calling thread has no ownership of the mutex.
 - ¹⁹ *Effects*: Attempts to obtain shared ownership of the mutex for the calling thread without blocking. If shared ownership is not obtained, there is no effect and `try_lock_shared()` immediately returns. An implementation may fail to obtain the lock even if it is not held by any other thread.
 - ²⁰ *Return type*: `bool`.
 - ²¹ *Returns*: `true` if the shared ownership lock was acquired, `false` otherwise.
 - ²² *Synchronization*: If `try_lock_shared()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.
 - ²³ *Throws*: Nothing.

32.5.4.4.2 Class `shared_mutex`[`thread.sharedmutex.class`]

```

namespace std {
    class shared_mutex {
        public:
            shared_mutex();
            ~shared_mutex();

            shared_mutex(const shared_mutex&) = delete;
            shared_mutex& operator=(const shared_mutex&) = delete;

            // exclusive ownership
            void lock();                                // blocking
            bool try_lock();
            void unlock();

            // shared ownership
            void lock_shared();                         // blocking
            bool try_lock_shared();
            void unlock_shared();

            using native_handle_type = implementation-defined;      // see 32.2.3
            native_handle_type native_handle();           // see 32.2.3
    };
}

```

- ¹ The class `shared_mutex` provides a non-recursive mutex with shared ownership semantics.
- ² The class `shared_mutex` meets all of the shared mutex requirements (32.5.4.4). It is a standard-layout class (11.2).
- ³ The behavior of a program is undefined if:
 - (3.1) — it destroys a `shared_mutex` object owned by any thread,
 - (3.2) — a thread attempts to recursively gain any ownership of a `shared_mutex`, or
 - (3.3) — a thread terminates while possessing any ownership of a `shared_mutex`.
- ⁴ `shared_mutex` may be a synonym for `shared_timed_mutex`.

32.5.4.5 Shared timed mutex types

[`thread.sharedtimedmutex.requirements`]

32.5.4.5.1 General

[`thread.sharedtimedmutex.requirements.general`]

- ¹ The standard library type `shared_timed_mutex` is a *shared timed mutex type*. Shared timed mutex types meet the requirements of timed mutex types (32.5.4.3), shared mutex types (32.5.4.4), and additionally meet the requirements set out below. In this description, `m` denotes an object of a shared timed mutex type, `rel_time` denotes an object of an instantiation of duration (27.5), and `abs_time` denotes an object of an instantiation of `time_point` (27.6).
- ² The expression `m.try_lock_shared_for(rel_time)` is well-formed and has the following semantics:
 - ³ *Preconditions:* The calling thread has no ownership of the mutex.
 - ⁴ *Effects:* Attempts to obtain shared lock ownership for the calling thread within the relative timeout (32.2.4) specified by `rel_time`. If the time specified by `rel_time` is less than or equal to `rel_time.zero()`, the function attempts to obtain ownership without blocking (as if by calling `try_lock_shared()`). The function returns within the timeout specified by `rel_time` only if it has obtained shared ownership of the mutex object.

[*Note 1:* As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — *end note*]

If an exception is thrown then a shared lock has not been acquired for the current thread.

- ⁵ *Return type:* `bool`.

- ⁶ *Returns:* `true` if the shared lock was acquired, `false` otherwise.

- ⁷ *Synchronization:* If `try_lock_shared_for()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

8 *Throws:* Timeout-related exceptions (32.2.4).

9 The expression `m.try_lock_shared_until(abs_time)` is well-formed and has the following semantics:

10 *Preconditions:* The calling thread has no ownership of the mutex.

11 *Effects:* The function attempts to obtain shared ownership of the mutex. If `abs_time` has already passed, the function attempts to obtain shared ownership without blocking (as if by calling `try_lock_shared()`). The function returns before the absolute timeout (32.2.4) specified by `abs_time` only if it has obtained shared ownership of the mutex object.

[*Note 2:* As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — *end note*]

If an exception is thrown then a shared lock has not been acquired for the current thread.

12 *Return type:* `bool`.

13 *Returns:* `true` if the shared lock was acquired, `false` otherwise.

14 *Synchronization:* If `try_lock_shared_until()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

15 *Throws:* Timeout-related exceptions (32.2.4).

32.5.4.5.2 Class `shared_timed_mutex`

[`thread.sharedtimedmutex.class`]

```
namespace std {
    class shared_timed_mutex {
    public:
        shared_timed_mutex();
        ~shared_timed_mutex();

        shared_timed_mutex(const shared_timed_mutex&) = delete;
        shared_timed_mutex& operator=(const shared_timed_mutex&) = delete;

        // exclusive ownership
        void lock();           // blocking
        bool try_lock();
        template<class Rep, class Period>
            bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
        template<class Clock, class Duration>
            bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
        void unlock();

        // shared ownership
        void lock_shared();     // blocking
        bool try_lock_shared();
        template<class Rep, class Period>
            bool try_lock_shared_for(const chrono::duration<Rep, Period>& rel_time);
        template<class Clock, class Duration>
            bool try_lock_shared_until(const chrono::time_point<Clock, Duration>& abs_time);
        void unlock_shared();
    };
}
```

¹ The class `shared_timed_mutex` provides a non-recursive mutex with shared ownership semantics.

² The class `shared_timed_mutex` meets all of the shared timed mutex requirements (32.5.4.5). It is a standard-layout class (11.2).

³ The behavior of a program is undefined if:

- (3.1) — it destroys a `shared_timed_mutex` object owned by any thread,
- (3.2) — a thread attempts to recursively gain any ownership of a `shared_timed_mutex`, or
- (3.3) — a thread terminates while possessing any ownership of a `shared_timed_mutex`.

32.5.5 Locks

[**thread.lock**]

32.5.5.1 General

[**thread.lock.general**]

- ¹ A *lock* is an object that holds a reference to a lockable object and may unlock the lockable object during the lock's destruction (such as when leaving block scope). An execution agent may use a lock to aid in managing ownership of a lockable object in an exception safe manner. A lock is said to *own* a lockable object if it is currently managing the ownership of that lockable object for an execution agent. A lock does not manage the lifetime of the lockable object it references.

[*Note 1:* Locks are intended to ease the burden of unlocking the lockable object under both normal and exceptional circumstances. — *end note*]

- ² Some lock constructors take tag types which describe what should be done with the lockable object during the lock's construction.

```
namespace std {
    struct defer_lock_t { };      // do not acquire ownership of the mutex
    struct try_to_lock_t { };     // try to acquire ownership of the mutex
                                  // without blocking
    struct adopt_lock_t { };      // assume the calling thread has already
                                  // obtained mutex ownership and manage it

    inline constexpr defer_lock_t  defer_lock { };
    inline constexpr try_to_lock_t try_to_lock { };
    inline constexpr adopt_lock_t  adopt_lock { };
}
```

32.5.5.2 Class template lock_guard

[**thread.lock.guard**]

```
namespace std {
    template<class Mutex>
    class lock_guard {
    public:
        using mutex_type = Mutex;

        explicit lock_guard(mutex_type& m);
        lock_guard(mutex_type& m, adopt_lock_t);
        ~lock_guard();

        lock_guard(const lock_guard&) = delete;
        lock_guard& operator=(const lock_guard&) = delete;

    private:
        mutex_type& pm;           // exposition only
    };
}
```

- ¹ An object of type `lock_guard` controls the ownership of a lockable object within a scope. A `lock_guard` object maintains ownership of a lockable object throughout the `lock_guard` object's lifetime (6.7.3). The behavior of a program is undefined if the lockable object referenced by `pm` does not exist for the entire lifetime of the `lock_guard` object. The supplied `Mutex` type shall meet the *Cpp17BasicLockable* requirements (32.2.5.2).

`explicit lock_guard(mutex_type& m);`

- ² *Preconditions:* If `mutex_type` is not a recursive mutex, the calling thread does not own the mutex `m`.

- ³ *Effects:* Initializes `pm` with `m`. Calls `m.lock()`.

`lock_guard(mutex_type& m, adopt_lock_t);`

- ⁴ *Preconditions:* The calling thread owns the mutex `m`.

- ⁵ *Effects:* Initializes `pm` with `m`.

- ⁶ *Throws:* Nothing.

`~lock_guard();`

- ⁷ *Effects:* As if by `pm.unlock()`.

32.5.5.3 Class template scoped_lock

[thread.lock.scoped]

```
namespace std {
    template<class... MutexTypes>
    class scoped_lock {
        public:
            using mutex_type = Mutex; // If MutexTypes... consists of the single type Mutex

            explicit scoped_lock(MutexTypes&... m);
            explicit scoped_lock(adopt_lock_t, MutexTypes&... m);
            ~scoped_lock();

            scoped_lock(const scoped_lock&) = delete;
            scoped_lock& operator=(const scoped_lock&) = delete;

        private:
            tuple<MutexTypes&...> pm; // exposition only
    };
}
```

- ¹ An object of type `scoped_lock` controls the ownership of lockable objects within a scope. A `scoped_lock` object maintains ownership of lockable objects throughout the `scoped_lock` object's lifetime (6.7.3). The behavior of a program is undefined if the lockable objects referenced by `pm` do not exist for the entire lifetime of the `scoped_lock` object. When `sizeof...(MutexTypes)` is 1, the supplied `Mutex` type shall meet the *Cpp17BasicLockable* requirements (32.2.5.2). Otherwise, each of the mutex types shall meet the *Cpp17Lockable* requirements (32.2.5.3).

`explicit scoped_lock(MutexTypes&... m);`

- ² *Preconditions*: If a `MutexTypes` type is not a recursive mutex, the calling thread does not own the corresponding mutex element of `m`.

- ³ *Effects*: Initializes `pm` with `tie(m...)`. Then if `sizeof...(MutexTypes)` is 0, no effects. Otherwise if `sizeof...(MutexTypes)` is 1, then `m.lock()`. Otherwise, `lock(m...)`.

`explicit scoped_lock(adopt_lock_t, MutexTypes&... m);`

- ⁴ *Preconditions*: The calling thread owns all the mutexes in `m`.

- ⁵ *Effects*: Initializes `pm` with `tie(m...)`.

- ⁶ *Throws*: Nothing.

`~scoped_lock();`

- ⁷ *Effects*: For all `i` in `[0, sizeof...(MutexTypes)]`, `get<i>(pm).unlock()`.

32.5.5.4 Class template unique_lock

[thread.lock.unique]

32.5.5.4.1 General

[thread.lock.unique.general]

```
namespace std {
    template<class Mutex>
    class unique_lock {
        public:
            using mutex_type = Mutex;

            // 32.5.5.4.2, construct/copy/destroy
            unique_lock() noexcept;
            explicit unique_lock(mutex_type& m);
            unique_lock(mutex_type& m, defer_lock_t) noexcept;
            unique_lock(mutex_type& m, try_to_lock_t);
            unique_lock(mutex_type& m, adopt_lock_t);

            template<class Clock, class Duration>
                unique_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
            template<class Rep, class Period>
                unique_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
            ~unique_lock();
    };
}
```

```

unique_lock(const unique_lock&) = delete;
unique_lock& operator=(const unique_lock&) = delete;

unique_lock(unique_lock&& u) noexcept;
unique_lock& operator=(unique_lock&& u);

// 32.5.5.4.3, locking
void lock();
bool try_lock();

template<class Rep, class Period>
bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
template<class Clock, class Duration>
bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);

void unlock();

// 32.5.5.4.4, modifiers
void swap(unique_lock& u) noexcept;
mutex_type* release() noexcept;

// 32.5.5.4.5, observers
bool owns_lock() const noexcept;
explicit operator bool () const noexcept;
mutex_type* mutex() const noexcept;

private:
    mutex_type* pm;           // exposition only
    bool owns;                // exposition only
};

template<class Mutex>
void swap(unique_lock<Mutex>& x, unique_lock<Mutex>& y) noexcept;
}

```

- ¹ An object of type `unique_lock` controls the ownership of a lockable object within a scope. Ownership of the lockable object may be acquired at construction or after construction, and may be transferred, after acquisition, to another `unique_lock` object. Objects of type `unique_lock` are not copyable but are movable. The behavior of a program is undefined if the contained pointer `pm` is not null and the lockable object pointed to by `pm` does not exist for the entire remaining lifetime (6.7.3) of the `unique_lock` object. The supplied `Mutex` type shall meet the *Cpp17BasicLockable* requirements (32.2.5.2).
- ² [Note 1: `unique_lock<Mutex>` meets the *Cpp17BasicLockable* requirements. If `Mutex` meets the *Cpp17Lockable* requirements (32.2.5.3), `unique_lock<Mutex>` also meets the *Cpp17Lockable* requirements; if `Mutex` meets the *Cpp17TimedLockable* requirements (32.2.5.4), `unique_lock<Mutex>` also meets the *Cpp17TimedLockable* requirements.
— end note]

32.5.5.4.2 Constructors, destructor, and assignment

[**thread.lock.unique.cons**]

`unique_lock() noexcept;`

¹ *Postconditions:* `pm == 0` and `owns == false`.

`explicit unique_lock(mutex_type& m);`

² *Preconditions:* If `mutex_type` is not a recursive mutex the calling thread does not own the mutex.

³ *Effects:* Calls `m.lock()`.

⁴ *Postconditions:* `pm == addressof(m)` and `owns == true`.

`unique_lock(mutex_type& m, defer_lock_t) noexcept;`

⁵ *Postconditions:* `pm == addressof(m)` and `owns == false`.

`unique_lock(mutex_type& m, try_to_lock_t);`

⁶ *Preconditions:* The supplied `Mutex` type meets the *Cpp17Lockable* requirements (32.2.5.3). If `mutex_type` is not a recursive mutex the calling thread does not own the mutex.

7 *Effects:* Calls `m.try_lock()`.

8 *Postconditions:* `pm == addressof(m)` and `owns == res`, where `res` is the value returned by the call to `m.try_lock()`.

```
unique_lock(mutex_type& m, adopt_lock_t);
```

9 *Preconditions:* The calling thread owns the mutex.

10 *Postconditions:* `pm == addressof(m)` and `owns == true`.

11 *Throws:* Nothing.

```
template<class Clock, class Duration>
unique_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
```

12 *Preconditions:* If `mutex_type` is not a recursive mutex the calling thread does not own the mutex. The supplied `Mutex` type meets the *Cpp17TimedLockable* requirements (32.2.5.4).

13 *Effects:* Calls `m.try_lock_until(abs_time)`.

14 *Postconditions:* `pm == addressof(m)` and `owns == res`, where `res` is the value returned by the call to `m.try_lock_until(abs_time)`.

```
template<class Rep, class Period>
unique_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
```

15 *Preconditions:* If `mutex_type` is not a recursive mutex the calling thread does not own the mutex. The supplied `Mutex` type meets the *Cpp17TimedLockable* requirements (32.2.5.4).

16 *Effects:* Calls `m.try_lock_for(rel_time)`.

17 *Postconditions:* `pm == addressof(m)` and `owns == res`, where `res` is the value returned by the call to `m.try_lock_for(rel_time)`.

```
unique_lock(unique_lock&& u) noexcept;
```

18 *Postconditions:* `pm == u_p.pm` and `owns == u_p.owns` (where `u_p` is the state of `u` just prior to this construction), `u.pm == 0` and `u.owns == false`.

```
unique_lock& operator=(unique_lock&& u);
```

19 *Effects:* If `owns` calls `pm->unlock()`.

20 *Postconditions:* `pm == u_p.pm` and `owns == u_p.owns` (where `u_p` is the state of `u` just prior to this construction), `u.pm == 0` and `u.owns == false`.

21 [*Note 1:* With a recursive mutex it is possible for both `*this` and `u` to own the same mutex before the assignment. In this case, `*this` will own the mutex after the assignment and `u` will not. — *end note*]

22 *Throws:* Nothing.

```
~unique_lock();
```

23 *Effects:* If `owns` calls `pm->unlock()`.

32.5.5.4.3 Locking**[thread.lock.unique.locking]**`void lock();`

1 *Effects:* As if by `pm->lock()`.

2 *Postconditions:* `owns == true`.

3 *Throws:* Any exception thrown by `pm->lock()`. `system_error` when an exception is required (32.2.2).

4 *Error conditions:*

(4.1) — `operation_not_permitted` — if `pm` is `nullptr`.

(4.2) — `resource_deadlock_would_occur` — if on entry `owns` is `true`.

`bool try_lock();`

5 *Preconditions:* The supplied `Mutex` meets the *Cpp17Lockable* requirements (32.2.5.3).

6 *Effects:* As if by `pm->try_lock()`.

7 *Returns*: The value returned by the call to `try_lock()`.

8 *Postconditions*: `owns == res`, where `res` is the value returned by the call to `try_lock()`.

9 *Throws*: Any exception thrown by `pm->try_lock()`. `system_error` when an exception is required (32.2.2).

10 *Error conditions*:

(10.1) — `operation_not_permitted` — if `pm` is `nullptr`.

(10.2) — `resource_deadlock_would_occur` — if on entry `owns` is `true`.

```
template<class Clock, class Duration>
bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
```

11 *Preconditions*: The supplied `Mutex` type meets the *Cpp17TimedLockable* requirements (32.2.5.4).

12 *Effects*: As if by `pm->try_lock_until(abs_time)`.

13 *Returns*: The value returned by the call to `try_lock_until(abs_time)`.

14 *Postconditions*: `owns == res`, where `res` is the value returned by the call to `try_lock_until(abs_time)`.

15 *Throws*: Any exception thrown by `pm->try_lock_until()`. `system_error` when an exception is required (32.2.2).

16 *Error conditions*:

(16.1) — `operation_not_permitted` — if `pm` is `nullptr`.

(16.2) — `resource_deadlock_would_occur` — if on entry `owns` is `true`.

```
template<class Rep, class Period>
bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
```

17 *Preconditions*: The supplied `Mutex` type meets the *Cpp17TimedLockable* requirements (32.2.5.4).

18 *Effects*: As if by `pm->try_lock_for(rel_time)`.

19 *Returns*: The value returned by the call to `try_lock_for(rel_time)`.

20 *Postconditions*: `owns == res`, where `res` is the value returned by the call to `try_lock_for(rel_time)`.

21 *Throws*: Any exception thrown by `pm->try_lock_for()`. `system_error` when an exception is required (32.2.2).

22 *Error conditions*:

(22.1) — `operation_not_permitted` — if `pm` is `nullptr`.

(22.2) — `resource_deadlock_would_occur` — if on entry `owns` is `true`.

```
void unlock();
```

23 *Effects*: As if by `pm->unlock()`.

24 *Postconditions*: `owns == false`.

25 *Throws*: `system_error` when an exception is required (32.2.2).

26 *Error conditions*:

(26.1) — `operation_not_permitted` — if on entry `owns` is `false`.

32.5.5.4.4 Modifiers

[thread.lock.unique.mod]

```
void swap(unique_lock& u) noexcept;
```

1 *Effects*: Swaps the data members of `*this` and `u`.

```
mutex_type* release() noexcept;
```

2 *Returns*: The previous value of `pm`.

3 *Postconditions*: `pm == 0` and `owns == false`.

```
template<class Mutex>
void swap(unique_lock<Mutex>& x, unique_lock<Mutex>& y) noexcept;
```

4 *Effects:* As if by `x.swap(y)`.

32.5.5.4.5 Observers

[`thread.lock.unique.obs`]

```
bool owns_lock() const noexcept;
```

1 *Returns:* `owns`.

```
explicit operator bool() const noexcept;
```

2 *Returns:* `owns`.

```
mutex_type *mutex() const noexcept;
```

3 *Returns:* `pm`.

32.5.5.5 Class template shared_lock

[`thread.lock.shared`]

32.5.5.5.1 General

[`thread.lock.shared.general`]

```
namespace std {
    template<class Mutex>
    class shared_lock {
        public:
            using mutex_type = Mutex;

            // 32.5.5.2, construct/copy/destroy
            shared_lock() noexcept;
            explicit shared_lock(mutex_type& m);           // blocking
            shared_lock(mutex_type& m, defer_lock_t) noexcept;
            shared_lock(mutex_type& m, try_to_lock_t);
            shared_lock(mutex_type& m, adopt_lock_t);
            template<class Clock, class Duration>
                shared_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
            template<class Rep, class Period>
                shared_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
            ~shared_lock();

            shared_lock(const shared_lock&) = delete;
            shared_lock& operator=(const shared_lock&) = delete;

            shared_lock(shared_lock&& u) noexcept;
            shared_lock& operator=(shared_lock&& u) noexcept;

            // 32.5.5.3, locking
            void lock();                                     // blocking
            bool try_lock();
            template<class Rep, class Period>
                bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
            template<class Clock, class Duration>
                bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
            void unlock();

            // 32.5.5.4, modifiers
            void swap(shared_lock& u) noexcept;
            mutex_type* release() noexcept;

            // 32.5.5.5, observers
            bool owns_lock() const noexcept;
            explicit operator bool () const noexcept;
            mutex_type* mutex() const noexcept;

        private:
            mutex_type* pm;                                // exposition only
            bool owns;                                    // exposition only
    };
}
```

```
template<class Mutex>
    void swap(shared_lock<Mutex>& x, shared_lock<Mutex>& y) noexcept;
}
```

- ¹ An object of type `shared_lock` controls the shared ownership of a lockable object within a scope. Shared ownership of the lockable object may be acquired at construction or after construction, and may be transferred, after acquisition, to another `shared_lock` object. Objects of type `shared_lock` are not copyable but are movable. The behavior of a program is undefined if the contained pointer `pm` is not null and the lockable object pointed to by `pm` does not exist for the entire remaining lifetime (6.7.3) of the `shared_lock` object. The supplied `Mutex` type shall meet the shared mutex requirements (32.5.4.5).

- ² [Note 1: `shared_lock<Mutex>` meets the *Cpp17TimedLockable* requirements (32.2.5.4). — end note]

32.5.5.2 Constructors, destructor, and assignment

[**thread.lock.shared.cons**]

```
shared_lock() noexcept;
```

- ¹ *Postconditions*: `pm == nullptr` and `owns == false`.

```
explicit shared_lock(mutex_type& m);
```

- ² *Preconditions*: The calling thread does not own the mutex for any ownership mode.

- ³ *Effects*: Calls `m.lock_shared()`.

- ⁴ *Postconditions*: `pm == addressof(m)` and `owns == true`.

```
shared_lock(mutex_type& m, defer_lock_t) noexcept;
```

- ⁵ *Postconditions*: `pm == addressof(m)` and `owns == false`.

```
shared_lock(mutex_type& m, try_to_lock_t);
```

- ⁶ *Preconditions*: The calling thread does not own the mutex for any ownership mode.

- ⁷ *Effects*: Calls `m.try_lock_shared()`.

- ⁸ *Postconditions*: `pm == addressof(m)` and `owns == res` where `res` is the value returned by the call to `m.try_lock_shared()`.

```
shared_lock(mutex_type& m, adopt_lock_t);
```

- ⁹ *Preconditions*: The calling thread has shared ownership of the mutex.

- ¹⁰ *Postconditions*: `pm == addressof(m)` and `owns == true`.

```
template<class Clock, class Duration>
```

```
    shared_lock(mutex_type& m,
               const chrono::time_point<Clock, Duration>& abs_time);
```

- ¹¹ *Preconditions*: The calling thread does not own the mutex for any ownership mode.

- ¹² *Effects*: Calls `m.try_lock_shared_until(abs_time)`.

- ¹³ *Postconditions*: `pm == addressof(m)` and `owns == res` where `res` is the value returned by the call to `m.try_lock_shared_until(abs_time)`.

```
template<class Rep, class Period>
```

```
    shared_lock(mutex_type& m,
               const chrono::duration<Rep, Period>& rel_time);
```

- ¹⁴ *Preconditions*: The calling thread does not own the mutex for any ownership mode.

- ¹⁵ *Effects*: Calls `m.try_lock_shared_for(rel_time)`.

- ¹⁶ *Postconditions*: `pm == addressof(m)` and `owns == res` where `res` is the value returned by the call to `m.try_lock_shared_for(rel_time)`.

```
~shared_lock();
```

- ¹⁷ *Effects*: If `owns` calls `pm->unlock_shared()`.

```
shared_lock(shared_lock&& s1) noexcept;
```

- ¹⁸ *Postconditions*: `pm == s1_pm` and `owns == s1_owns` (where `s1_pm` is the state of `s1` just prior to this construction), `s1_pm == nullptr` and `s1_owns == false`.

`shared_lock& operator=(shared_lock&& sl) noexcept;`

19 *Effects:* If `owns` calls `pm->unlock_shared()`.

20 *Postconditions:* `pm == sl_p.pm` and `owns == sl_p.owns` (where `sl_p` is the state of `sl` just prior to this assignment), `sl.pm == nullptr` and `sl.owns == false`.

32.5.5.3 Locking

[`thread.lock.shared.locking`]

`void lock();`

1 *Effects:* As if by `pm->lock_shared()`.

2 *Postconditions:* `owns == true`.

3 *Throws:* Any exception thrown by `pm->lock_shared()`. `system_error` when an exception is required ([32.2.2](#)).

4 *Error conditions:*

(4.1) — `operation_not_permitted` — if `pm` is `nullptr`.

(4.2) — `resource_deadlock_would_occur` — if on entry `owns` is `true`.

`bool try_lock();`

5 *Effects:* As if by `pm->try_lock_shared()`.

6 *Returns:* The value returned by the call to `pm->try_lock_shared()`.

7 *Postconditions:* `owns == res`, where `res` is the value returned by the call to `pm->try_lock_shared()`.

8 *Throws:* Any exception thrown by `pm->try_lock_shared()`. `system_error` when an exception is required ([32.2.2](#)).

9 *Error conditions:*

(9.1) — `operation_not_permitted` — if `pm` is `nullptr`.

(9.2) — `resource_deadlock_would_occur` — if on entry `owns` is `true`.

`template<class Clock, class Duration>`

`bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);`

10 *Effects:* As if by `pm->try_lock_shared_until(abs_time)`.

11 *Returns:* The value returned by the call to `pm->try_lock_shared_until(abs_time)`.

12 *Postconditions:* `owns == res`, where `res` is the value returned by the call to `pm->try_lock_shared_until(abs_time)`.

13 *Throws:* Any exception thrown by `pm->try_lock_shared_until(abs_time)`. `system_error` when an exception is required ([32.2.2](#)).

14 *Error conditions:*

(14.1) — `operation_not_permitted` — if `pm` is `nullptr`.

(14.2) — `resource_deadlock_would_occur` — if on entry `owns` is `true`.

`template<class Rep, class Period>`

`bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);`

15 *Effects:* As if by `pm->try_lock_shared_for(rel_time)`.

16 *Returns:* The value returned by the call to `pm->try_lock_shared_for(rel_time)`.

17 *Postconditions:* `owns == res`, where `res` is the value returned by the call to `pm->try_lock_shared_for(rel_time)`.

18 *Throws:* Any exception thrown by `pm->try_lock_shared_for(rel_time)`. `system_error` when an exception is required ([32.2.2](#)).

19 *Error conditions:*

(19.1) — `operation_not_permitted` — if `pm` is `nullptr`.

(19.2) — `resource_deadlock_would_occur` — if on entry `owns` is `true`.

```
void unlock();
```

20 *Effects:* As if by `pm->unlock_shared()`.

21 *Postconditions:* `owns == false`.

22 *Throws:* `system_error` when an exception is required ([32.2.2](#)).

23 *Error conditions:*

(23.1) — `operation_not_permitted` — if on entry `owns` is `false`.

32.5.5.4 Modifiers[`thread.lock.shared.mod`]

```
void swap(shared_lock& sl) noexcept;
```

1 *Effects:* Swaps the data members of `*this` and `sl`.

```
mutex_type* release() noexcept;
```

2 *Returns:* The previous value of `pm`.

3 *Postconditions:* `pm == nullptr` and `owns == false`.

```
template<class Mutex>
```

```
    void swap(shared_lock<Mutex>& x, shared_lock<Mutex>& y) noexcept;
```

4 *Effects:* As if by `x.swap(y)`.

32.5.5.5 Observers[`thread.lock.shared.obs`]

```
bool owns_lock() const noexcept;
```

1 *Returns:* `owns`.

```
explicit operator bool() const noexcept;
```

2 *Returns:* `owns`.

```
mutex_type* mutex() const noexcept;
```

3 *Returns:* `pm`.

32.5.6 Generic locking algorithms[`thread.lock.algorithm`]

```
template<class L1, class L2, class... L3> int try_lock(L1&, L2&, L3&...);
```

1 *Preconditions:* Each template parameter type meets the `Cpp17Lockable` requirements.

[*Note 1:* The `unique_lock` class template meets these requirements when suitably instantiated. — *end note*]

2 *Effects:* Calls `try_lock()` for each argument in order beginning with the first until all arguments have been processed or a call to `try_lock()` fails, either by returning `false` or by throwing an exception. If a call to `try_lock()` fails, `unlock()` is called for all prior arguments with no further calls to `try_lock()`.

3 *Returns:* `-1` if all calls to `try_lock()` returned `true`, otherwise a zero-based index value that indicates the argument for which `try_lock()` returned `false`.

```
template<class L1, class L2, class... L3> void lock(L1&, L2&, L3&...);
```

4 *Preconditions:* Each template parameter type meets the `Cpp17Lockable` requirements.

[*Note 2:* The `unique_lock` class template meets these requirements when suitably instantiated. — *end note*]

5 *Effects:* All arguments are locked via a sequence of calls to `lock()`, `try_lock()`, or `unlock()` on each argument. The sequence of calls does not result in deadlock, but is otherwise unspecified.

[*Note 3:* A deadlock avoidance algorithm such as try-and-back-off can be used, but the specific algorithm is not specified to avoid over-constraining implementations. — *end note*]

If a call to `lock()` or `try_lock()` throws an exception, `unlock()` is called for any argument that had been locked by a call to `lock()` or `try_lock()`.

32.5.7 Call once[**thread.once**]**32.5.7.1 Struct once_flag**[**thread.once.onceflag**]

```
namespace std {
    struct once_flag {
        constexpr once_flag() noexcept;

        once_flag(const once_flag&) = delete;
        once_flag& operator=(const once_flag&) = delete;
    };
}
```

- ¹ The class `once_flag` is an opaque data structure that `call_once` uses to initialize data without causing a data race or deadlock.

```
constexpr once_flag() noexcept;
```

- ² *Synchronization*: The construction of a `once_flag` object is not synchronized.

- ³ *Postconditions*: The object's internal state is set to indicate to an invocation of `call_once` with the object as its initial argument that no function has been called.

32.5.7.2 Function call_once[**thread.once.callonce**]

```
template<class Callable, class... Args>
void call_once(once_flag& flag, Callable&& func, Args&&... args);
```

- ¹ *Mandates*: `is_invocable_v<Callable, Args...>` is true.

- ² *Effects*: An execution of `call_once` that does not call its `func` is a *passive* execution. An execution of `call_once` that calls its `func` is an *active* execution. An active execution calls `INVOKE(std::forward<Callable>(func), std::forward<Args>(args)...)`. If such a call to `func` throws an exception the execution is *exceptional*, otherwise it is *returning*. An exceptional execution propagates the exception to the caller of `call_once`. Among all executions of `call_once` for any given `once_flag`: at most one is a returning execution; if there is a returning execution, it is the last active execution; and there are passive executions only if there is a returning execution.

[*Note 1*: Passive executions allow other threads to reliably observe the results produced by the earlier returning execution. — *end note*]

- ³ *Synchronization*: For any given `once_flag`: all active executions occur in a total order; completion of an active execution synchronizes with (6.9.2) the start of the next one in this total order; and the returning execution synchronizes with the return from all passive executions.

- ⁴ *Throws*: `system_error` when an exception is required (32.2.2), or any exception thrown by `func`.

- ⁵ [*Example 1*:

```
// global flag, regular function
void init();
std::once_flag flag;

void f() {
    std::call_once(flag, init);
}

// function static flag, function object
struct initializer {
    void operator()();
};

void g() {
    static std::once_flag flag2;
    std::call_once(flag2, initializer());
}

// object flag, member function
class information {
    std::once_flag verified;
```

```

    void verifier();
public:
    void verify() { std::call_once(verified, &information::verifier, *this); }
};

— end example]

```

32.6 Condition variables

[**thread.condition**]

32.6.1 General

[**thread.condition.general**]

- ¹ Condition variables provide synchronization primitives used to block a thread until notified by some other thread that some condition is met or until a system time is reached. Class `condition_variable` provides a condition variable that can only wait on an object of type `unique_lock<mutex>`, allowing the implementation to be more efficient. Class `condition_variable_any` provides a general condition variable that can wait on objects of user-supplied lock types.
- ² Condition variables permit concurrent invocation of the `wait`, `wait_for`, `wait_until`, `notify_one` and `notify_all` member functions.
- ³ The executions of `notify_one` and `notify_all` are atomic. The executions of `wait`, `wait_for`, and `wait_until` are performed in three atomic parts:
 1. the release of the mutex and entry into the waiting state;
 2. the unblocking of the wait; and
 3. the reacquisition of the lock.
- ⁴ The implementation behaves as if all executions of `notify_one`, `notify_all`, and each part of the `wait`, `wait_for`, and `wait_until` executions are executed in a single unspecified total order consistent with the "happens before" order.
- ⁵ Condition variable construction and destruction need not be synchronized.

32.6.2 Header <condition_variable> synopsis

[**condition.variable.syn**]

```

namespace std {
    class condition_variable;
    class condition_variable_any;

    void notify_all_at_thread_exit(condition_variable& cond, unique_lock<mutex> lk);

    enum class cv_status { no_timeout, timeout };
}

```

32.6.3 Non-member functions

[**thread.condition.nonmember**]

```
void notify_all_at_thread_exit(condition_variable& cond, unique_lock<mutex> lk);
```

- ¹ *Preconditions:* `lk` is locked by the calling thread and either
 - (1.1) — no other thread is waiting on `cond`, or
 - (1.2) — `lk.mutex()` returns the same value for each of the lock arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.
- ² *Effects:* Transfers ownership of the lock associated with `lk` into internal storage and schedules `cond` to be notified when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed. This notification is equivalent to:

```
lk.unlock();
cond.notify_all();
```

³ *Synchronization:* The implied `lk.unlock()` call is sequenced after the destruction of all objects with thread storage duration associated with the current thread.

⁴ [Note 1: The supplied lock is held until the thread exits, which can cause deadlock due to lock ordering issues.
— end note]

⁵ [Note 2: It is the user's responsibility to ensure that waiting threads do not erroneously assume that the thread has finished if they experience spurious wakeups. This typically requires that the condition being waited for is satisfied while holding the lock on `lk`, and that this lock is not released and reacquired prior to calling `notify_all_at_thread_exit`. — end note]

32.6.4 Class condition_variable

[thread.condition.condvar]

```

namespace std {
    class condition_variable {
        public:
            condition_variable();
            ~condition_variable();

            condition_variable(const condition_variable&) = delete;
            condition_variable& operator=(const condition_variable&) = delete;

            void notify_one() noexcept;
            void notify_all() noexcept;
            void wait(unique_lock<mutex>& lock);
            template<class Predicate>
                void wait(unique_lock<mutex>& lock, Predicate pred);
            template<class Clock, class Duration>
                cv_status wait_until(unique_lock<mutex>& lock,
                                    const chrono::time_point<Clock, Duration>& abs_time);
            template<class Clock, class Duration, class Predicate>
                bool wait_until(unique_lock<mutex>& lock,
                               const chrono::time_point<Clock, Duration>& abs_time,
                               Predicate pred);
            template<class Rep, class Period>
                cv_status wait_for(unique_lock<mutex>& lock,
                                   const chrono::duration<Rep, Period>& rel_time);
            template<class Rep, class Period, class Predicate>
                bool wait_for(unique_lock<mutex>& lock,
                              const chrono::duration<Rep, Period>& rel_time,
                              Predicate pred);

            using native_handle_type = implementation-defined;           // see 32.2.3
            native_handle_type native_handle();                          // see 32.2.3
        };
    }
}

```

¹ The class `condition_variable` is a standard-layout class (11.2).

`condition_variable();`

² *Throws:* `system_error` when an exception is required (32.2.2).

³ *Error conditions:*

(3.1) — `resource_unavailable_try_again` — if some non-memory resource limitation prevents initialization.

`~condition_variable();`

⁴ *Preconditions:* There is no thread blocked on `*this`.

[*Note 1:* That is, all threads have been notified; they can subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. Undefined behavior ensues if a thread waits on `*this` once the destructor has been started, especially when the waiting threads are calling the wait functions in a loop or using the overloads of `wait`, `wait_for`, or `wait_until` that take a predicate. — *end note*]

`void notify_one() noexcept;`

⁵ *Effects:* If any threads are blocked waiting for `*this`, unblocks one of those threads.

`void notify_all() noexcept;`

⁶ *Effects:* Unblocks all threads that are blocked waiting for `*this`.

`void wait(unique_lock<mutex>& lock);`

⁷ *Preconditions:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread, and either
(7.1) — no other thread is waiting on this `condition_variable` object or

(7.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

8 *Effects:*

- (8.1) — Atomically calls `lock.unlock()` and blocks on `*this`.
- (8.2) — When unblocked, calls `lock.lock()` (possibly blocking on the lock), then returns.
- (8.3) — The function will unblock when signaled by a call to `notify_one()` or a call to `notify_all()`, or spuriously.

9 *Remarks:* If the function fails to meet the postcondition, `terminate()` is called (14.6.2).

[*Note 2:* This can happen if the re-locking of the mutex throws an exception. — *end note*]

10 *Postconditions:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.

11 *Throws:* Nothing.

```
template<class Predicate>
void wait(unique_lock<mutex>& lock, Predicate pred);
```

12 *Preconditions:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread, and either

(12.1) — no other thread is waiting on this `condition_variable` object or

(12.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

13 *Effects:* Equivalent to:

```
while (!pred())
    wait(lock);
```

14 *Remarks:* If the function fails to meet the postcondition, `terminate()` is called (14.6.2).

[*Note 3:* This can happen if the re-locking of the mutex throws an exception. — *end note*]

15 *Postconditions:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.

16 *Throws:* Any exception thrown by `pred`.

```
template<class Clock, class Duration>
cv_status wait_until(unique_lock<mutex>& lock,
                     const chrono::time_point<Clock, Duration>& abs_time);
```

17 *Preconditions:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread, and either

(17.1) — no other thread is waiting on this `condition_variable` object or

(17.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

18 *Effects:*

- (18.1) — Atomically calls `lock.unlock()` and blocks on `*this`.
- (18.2) — When unblocked, calls `lock.lock()` (possibly blocking on the lock), then returns.
- (18.3) — The function will unblock when signaled by a call to `notify_one()`, a call to `notify_all()`, expiration of the absolute timeout (32.2.4) specified by `abs_time`, or spuriously.
- (18.4) — If the function exits via an exception, `lock.lock()` is called prior to exiting the function.

19 *Remarks:* If the function fails to meet the postcondition, `terminate()` is called (14.6.2).

[*Note 4:* This can happen if the re-locking of the mutex throws an exception. — *end note*]

20 *Postconditions:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.

21 *Returns:* `cv_status::timeout` if the absolute timeout (32.2.4) specified by `abs_time` expired, otherwise `cv_status::no_timeout`.

22 *Throws:* Timeout-related exceptions (32.2.4).

```

template<class Rep, class Period>
cv_status wait_for(unique_lock<mutex>& lock,
                  const chrono::duration<Rep, Period>& rel_time);

23   Preconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread, and either
(23.1)   — no other thread is waiting on this condition_variable object or
(23.2)   — lock.mutex() returns the same value for each of the lock arguments supplied by all concurrently
         waiting (via wait, wait_for, or wait_until) threads.

24   Effects: Equivalent to:
        return wait_until(lock, chrono::steady_clock::now() + rel_time);

25   Returns: cv_status::timeout if the relative timeout (32.2.4) specified by rel_time expired, otherwise
         cv_status::no_timeout.

26   Remarks: If the function fails to meet the postcondition, terminate() is called (14.6.2).
[Note 5: This can happen if the re-locking of the mutex throws an exception. — end note]

27   Postconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread.

28   Throws: Timeout-related exceptions (32.2.4).

```

```

template<class Clock, class Duration, class Predicate>
bool wait_until(unique_lock<mutex>& lock,
                const chrono::time_point<Clock, Duration>& abs_time,
                Predicate pred);

29   Preconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread, and either
(29.1)   — no other thread is waiting on this condition_variable object or
(29.2)   — lock.mutex() returns the same value for each of the lock arguments supplied by all concurrently
         waiting (via wait, wait_for, or wait_until) threads.

30   Effects: Equivalent to:
        while (!pred())
            if (wait_until(lock, abs_time) == cv_status::timeout)
                return pred();
        return true;

31   Remarks: If the function fails to meet the postcondition, terminate() is called (14.6.2).
[Note 6: This can happen if the re-locking of the mutex throws an exception. — end note]

32   Postconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread.

33   [Note 7: The returned value indicates whether the predicate evaluated to true regardless of whether the timeout
         was triggered. — end note]

34   Throws: Timeout-related exceptions (32.2.4) or any exception thrown by pred.

```

```

template<class Rep, class Period, class Predicate>
bool wait_for(unique_lock<mutex>& lock,
              const chrono::duration<Rep, Period>& rel_time,
              Predicate pred);

35   Preconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread, and either
(35.1)   — no other thread is waiting on this condition_variable object or
(35.2)   — lock.mutex() returns the same value for each of the lock arguments supplied by all concurrently
         waiting (via wait, wait_for, or wait_until) threads.

36   Effects: Equivalent to:
        return wait_until(lock, chrono::steady_clock::now() + rel_time, std::move(pred));

37   [Note 8: There is no blocking if pred() is initially true, even if the timeout has already expired. — end note]

38   Remarks: If the function fails to meet the postcondition, terminate() is called (14.6.2).
[Note 9: This can happen if the re-locking of the mutex throws an exception. — end note]

39   Postconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread.

```

40 [Note 10: The returned value indicates whether the predicate evaluates to `true` regardless of whether the timeout was triggered. —end note]

41 *Throws:* Timeout-related exceptions (32.2.4) or any exception thrown by `pred`.

32.6.5 Class `condition_variable_any`

[`thread.condition.condvarany`]

32.6.5.1 General

[`thread.condition.condvarany.general`]

¹ A Lock type shall meet the *Cpp17BasicLockable* requirements (32.2.5.2).

[Note 1: All of the standard mutex types meet this requirement. If a Lock type other than one of the standard mutex types or a `unique_lock` wrapper for a standard mutex type is used with `condition_variable_any`, any necessary synchronization is assumed to be in place with respect to the predicate associated with the `condition_variable_any` instance. —end note]

```
namespace std {
    class condition_variable_any {
    public:
        condition_variable_any();
        ~condition_variable_any();

        condition_variable_any(const condition_variable_any&) = delete;
        condition_variable_any& operator=(const condition_variable_any&) = delete;

        void notify_one() noexcept;
        void notify_all() noexcept;

        // 32.6.5.2, noninterruptible waits
        template<class Lock>
        void wait(Lock& lock);
        template<class Lock, class Predicate>
        void wait(Lock& lock, Predicate pred);

        template<class Lock, class Clock, class Duration>
        cv_status wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time);
        template<class Lock, class Clock, class Duration, class Predicate>
        bool wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time,
                        Predicate pred);
        template<class Lock, class Rep, class Period>
        cv_status wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time);
        template<class Lock, class Rep, class Period, class Predicate>
        bool wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time, Predicate pred);

        // 32.6.5.3, interruptible waits
        template<class Lock, class Predicate>
        bool wait(Lock& lock, stop_token stoken, Predicate pred);
        template<class Lock, class Clock, class Duration, class Predicate>
        bool wait_until(Lock& lock, stop_token stoken,
                        const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);
        template<class Lock, class Rep, class Period, class Predicate>
        bool wait_for(Lock& lock, stop_token stoken,
                      const chrono::duration<Rep, Period>& rel_time, Predicate pred);
    };
}
```

`condition_variable_any();`

² *Throws:* `bad_alloc` or `system_error` when an exception is required (32.2.2).

³ *Error conditions:*

- (3.1) — `resource_unavailable_try_again` — if some non-memory resource limitation prevents initialization.
- (3.2) — `operation_not_permitted` — if the thread does not have the privilege to perform the operation.

```
~condition_variable_any();
```

4 *Preconditions:* There is no thread blocked on `*this`.

[*Note 2:* That is, all threads have been notified; they can subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. Undefined behavior ensues if a thread waits on `*this` once the destructor has been started, especially when the waiting threads are calling the wait functions in a loop or using the overloads of `wait`, `wait_for`, or `wait_until` that take a predicate. — *end note*]

```
void notify_one() noexcept;
```

5 *Effects:* If any threads are blocked waiting for `*this`, unblocks one of those threads.

```
void notify_all() noexcept;
```

6 *Effects:* Unblocks all threads that are blocked waiting for `*this`.

32.6.5.2 Noninterruptible waits

[`thread.condvarany.wait`]

```
template<class Lock>
void wait(Lock& lock);
```

1 *Effects:*

- (1.1) — Atomically calls `lock.unlock()` and blocks on `*this`.
- (1.2) — When unblocked, calls `lock.lock()` (possibly blocking on the lock) and returns.
- (1.3) — The function will unblock when signaled by a call to `notify_one()`, a call to `notify_all()`, or spuriously.

2 *Remarks:* If the function fails to meet the postcondition, `terminate()` is called ([14.6.2](#)).

[*Note 1:* This can happen if the re-locking of the mutex throws an exception. — *end note*]

3 *Postconditions:* `lock` is locked by the calling thread.

4 *Throws:* Nothing.

```
template<class Lock, class Predicate>
void wait(Lock& lock, Predicate pred);
```

5 *Effects:* Equivalent to:

```
while (!pred())
    wait(lock);
```

```
template<class Lock, class Clock, class Duration>
cv_status wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time);
```

6 *Effects:*

- (6.1) — Atomically calls `lock.unlock()` and blocks on `*this`.
- (6.2) — When unblocked, calls `lock.lock()` (possibly blocking on the lock) and returns.
- (6.3) — The function will unblock when signaled by a call to `notify_one()`, a call to `notify_all()`, expiration of the absolute timeout ([32.2.4](#)) specified by `abs_time`, or spuriously.
- (6.4) — If the function exits via an exception, `lock.lock()` is called prior to exiting the function.

7 *Remarks:* If the function fails to meet the postcondition, `terminate()` is called ([14.6.2](#)).

[*Note 2:* This can happen if the re-locking of the mutex throws an exception. — *end note*]

8 *Postconditions:* `lock` is locked by the calling thread.

9 *Returns:* `cv_status::timeout` if the absolute timeout ([32.2.4](#)) specified by `abs_time` expired, otherwise `cv_status::no_timeout`.

10 *Throws:* Timeout-related exceptions ([32.2.4](#)).

```
template<class Lock, class Rep, class Period>
cv_status wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time);
```

11 *Effects:* Equivalent to:

```
return wait_until(lock, chrono::steady_clock::now() + rel_time);
```

- 12 *Returns:* `cv_status::timeout` if the relative timeout (32.2.4) specified by `rel_time` expired, otherwise `cv_status::no_timeout`.
- 13 *Remarks:* If the function fails to meet the postcondition, `terminate()` is called (14.6.2).
- [Note 3: This can happen if the re-locking of the mutex throws an exception. — end note]
- 14 *Postconditions:* `lock` is locked by the calling thread.
- 15 *Throws:* Timeout-related exceptions (32.2.4).

```
template<class Lock, class Clock, class Duration, class Predicate>
bool wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);
```

- 16 *Effects:* Equivalent to:

```
while (!pred())
    if (wait_until(lock, abs_time) == cv_status::timeout)
        return pred();
    return true;
```

- 17 [Note 4: There is no blocking if `pred()` is initially `true`, or if the timeout has already expired. — end note]

- 18 [Note 5: The returned value indicates whether the predicate evaluates to `true` regardless of whether the timeout was triggered. — end note]

```
template<class Lock, class Rep, class Period, class Predicate>
bool wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time, Predicate pred);
```

- 19 *Effects:* Equivalent to:

```
return wait_until(lock, chrono::steady_clock::now() + rel_time, std::move(pred));
```

32.6.5.3 Interruptible waits

[thread.condvarany.intwait]

- 1 The following wait functions will be notified when there is a stop request on the passed `stop_token`. In that case the functions return immediately, returning `false` if the predicate evaluates to `false`.

```
template<class Lock, class Predicate>
bool wait(Lock& lock, stop_token stoken, Predicate pred);
```

- 2 *Effects:* Registers for the duration of this call `*this` to get notified on a stop request on `stoken` during this call and then equivalent to:

```
while (!stoken.stop_requested()) {
    if (pred())
        return true;
    wait(lock);
}
```

- 3 [Note 1: The returned value indicates whether the predicate evaluated to `true` regardless of whether there was a stop request. — end note]

- 4 *Postconditions:* `lock` is locked by the calling thread.

- 5 *Remarks:* If the function fails to meet the postcondition, `terminate` is called (14.6.2).

- [Note 2: This can happen if the re-locking of the mutex throws an exception. — end note]

- 6 *Throws:* Any exception thrown by `pred`.

```
template<class Lock, class Clock, class Duration, class Predicate>
bool wait_until(Lock& lock, stop_token stoken,
                const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);
```

- 7 *Effects:* Registers for the duration of this call `*this` to get notified on a stop request on `stoken` during this call and then equivalent to:

```
while (!stoken.stop_requested()) {
    if (pred())
        return true;
    if (wait_until(lock, abs_time) == cv_status::timeout)
        return pred();
}
```

- 8 [Note 3: There is no blocking if `pred()` is initially `true`, `stoken.stop_requested()` was already `true` or the
time-out has already expired. —end note]
- 9 [Note 4: The returned value indicates whether the predicate evaluated to `true` regardless of whether the time-out
was triggered or a stop request was made. —end note]
- 10 *Postconditions:* `lock` is locked by the calling thread.
- 11 *Remarks:* If the function fails to meet the postcondition, `terminate` is called (14.6.2).
- 12 [Note 5: This can happen if the re-locking of the mutex throws an exception. —end note]
- 13 *Throws:* Time-out-related exceptions (32.2.4), or any exception thrown by `pred`.

```
template<class Lock, class Rep, class Period, class Predicate>
bool wait_for(Lock& lock, stop_token stoken,
              const chrono::duration<Rep, Period>& rel_time, Predicate pred);
```

Effects: Equivalent to:

```
return wait_until(lock, std::move(stoken), chrono::steady_clock::now() + rel_time,
                  std::move(pred));
```

32.7 Semaphore

[thread.sema]

32.7.1 General

[thread.sema.general]

- 1 Semaphores are lightweight synchronization primitives used to constrain concurrent access to a shared resource. They are widely used to implement other synchronization primitives and, whenever both are applicable, can be more efficient than condition variables.
- 2 A counting semaphore is a semaphore object that models a non-negative resource count. A binary semaphore is a semaphore object that has only two states. A binary semaphore should be more efficient than the default implementation of a counting semaphore with a unit resource count.

32.7.2 Header <semaphore> synopsis

[semaphore.syn]

```
namespace std {
    template<ptrdiff_t least_max_value = implementation-defined>
        class counting_semaphore;

    using binary_semaphore = counting_semaphore<1>;
}
```

32.7.3 Class template counting_semaphore

[thread.sema.cnt]

```
namespace std {
    template<ptrdiff_t least_max_value = implementation-defined>
        class counting_semaphore {
    public:
        static constexpr ptrdiff_t max() noexcept;

        constexpr explicit counting_semaphore(ptrdiff_t desired);
        ~counting_semaphore();

        counting_semaphore(const counting_semaphore&) = delete;
        counting_semaphore& operator=(const counting_semaphore&) = delete;

        void release(ptrdiff_t update = 1);
        void acquire();
        bool try_acquire() noexcept;
        template<class Rep, class Period>
            bool try_acquire_for(const chrono::duration<Rep, Period>& rel_time);
        template<class Clock, class Duration>
            bool try_acquire_until(const chrono::time_point<Clock, Duration>& abs_time);

    private:
        ptrdiff_t counter;           // exposition only
    };
}
```

¹ Class template `counting_semaphore` maintains an internal counter that is initialized when the semaphore is created. The counter is decremented when a thread acquires the semaphore, and is incremented when a thread releases the semaphore. If a thread tries to acquire the semaphore when the counter is zero, the thread will block until another thread increments the counter by releasing the semaphore.

² `least_max_value` shall be non-negative; otherwise the program is ill-formed.

³ Concurrent invocations of the member functions of `counting_semaphore`, other than its destructor, do not introduce data races.

```
static constexpr ptrdiff_t max() noexcept;
```

⁴ *Returns*: The maximum value of `counter`. This value is greater than or equal to `least_max_value`.

```
constexpr explicit counting_semaphore(ptrdiff_t desired);
```

⁵ *Preconditions*: `desired >= 0` is true, and `desired <= max()` is true.

⁶ *Effects*: Initializes `counter` with `desired`.

⁷ *Throws*: Nothing.

```
void release(ptrdiff_t update = 1);
```

⁸ *Preconditions*: `update >= 0` is true, and `update <= max() - counter` is true.

⁹ *Effects*: Atomically execute `counter += update`. Then, unblocks any threads that are waiting for `counter` to be greater than zero.

¹⁰ *Synchronization*: Strongly happens before invocations of `try_acquire` that observe the result of the effects.

¹¹ *Throws*: `system_error` when an exception is required (32.2.2).

¹² *Error conditions*: Any of the error conditions allowed for mutex types (32.5.4.2).

```
bool try_acquire() noexcept;
```

¹³ *Effects*: Attempts to atomically decrement `counter` if it is positive, without blocking. If `counter` is not decremented, there is no effect and `try_acquire` immediately returns. An implementation may fail to decrement `counter` even if it is positive.

[*Note 1*: This spurious failure is normally uncommon, but allows interesting implementations based on a simple compare and exchange (Clause 31). —end note]

An implementation should ensure that `try_acquire` does not consistently return `false` in the absence of contending semaphore operations.

¹⁴ *Returns*: `true` if `counter` was decremented, otherwise `false`.

```
void acquire();
```

¹⁵ *Effects*: Repeatedly performs the following steps, in order:

- Evaluates `try_acquire`. If the result is `true`, returns.

(15.2)

- Blocks on `*this` until `counter` is greater than zero.

¹⁶ *Throws*: `system_error` when an exception is required (32.2.2).

¹⁷ *Error conditions*: Any of the error conditions allowed for mutex types (32.5.4.2).

```
template<class Rep, class Period>
  bool try_acquire_for(const chrono::duration<Rep, Period>& rel_time);
template<class Clock, class Duration>
  bool try_acquire_until(const chrono::time_point<Clock, Duration>& abs_time);
```

¹⁸ *Effects*: Repeatedly performs the following steps, in order:

- Evaluates `try_acquire()`. If the result is `true`, returns `true`.

(18.2)

- Blocks on `*this` until `counter` is greater than zero or until the timeout expires. If it is unblocked by the timeout expiring, returns `false`.

The timeout expires (32.2.4) when the current time is after `abs_time` (for `try_acquire_until`) or when at least `rel_time` has passed from the start of the function (for `try_acquire_for`).

- 19 *Throws:* Timeout-related exceptions (32.2.4), or `system_error` when a non-timeout-related exception
is required (32.2.2).
- 20 *Error conditions:* Any of the error conditions allowed for mutex types (32.5.4.2).

32.8 Coordination types

[**thread.coord**]

32.8.1 General

[**thread.coord.general**]

- ¹ Subclause 32.8 describes various concepts related to thread coordination, and defines the coordination types `latch` and `barrier`. These types facilitate concurrent computation performed by a number of threads.

32.8.2 Latches

[**thread.latch**]

32.8.2.1 General

[**thread.latch.general**]

- ¹ A `latch` is a thread coordination mechanism that allows any number of threads to block until an expected number of threads arrive at the latch (via the `count_down` function). The expected count is set when the latch is created. An individual latch is a single-use object; once the expected count has been reached, the latch cannot be reused.

32.8.2.2 Header <latch> synopsis

[**latch.syn**]

```
namespace std {
    class latch;
}
```

32.8.2.3 Class latch

[**thread.latch.class**]

```
namespace std {
    class latch {
        public:
            static constexpr ptrdiff_t max() noexcept;

            constexpr explicit latch(ptrdiff_t expected);
            ~latch();

            latch(const latch&) = delete;
            latch& operator=(const latch&) = delete;

            void count_down(ptrdiff_t update = 1);
            bool try_wait() const noexcept;
            void wait() const;
            void arrive_and_wait(ptrdiff_t update = 1);

        private:
            ptrdiff_t counter; // exposition only
        };
}
```

- ¹ A `latch` maintains an internal counter that is initialized when the latch is created. Threads can block on the `latch` object, waiting for counter to be decremented to zero.
- ² Concurrent invocations of the member functions of `latch`, other than its destructor, do not introduce data races.

`static constexpr ptrdiff_t max() noexcept;`

- ³ *Returns:* The maximum value of `counter` that the implementation supports.

`constexpr explicit latch(ptrdiff_t expected);`

- ⁴ *Preconditions:* `expected >= 0` is true and `expected <= max()` is true.

- ⁵ *Effects:* Initializes `counter` with `expected`.

- ⁶ *Throws:* Nothing.

```

void count_down(ptrdiff_t update = 1);
7   Preconditions: update >= 0 is true, and update <= counter is true.
8   Effects: Atomically decrements counter by update. If counter is equal to zero, unblocks all threads
     blocked on *this.
9   Synchronization: Strongly happens before the returns from all calls that are unblocked.
10  Throws: system_error when an exception is required (32.2.2).
11  Error conditions: Any of the error conditions allowed for mutex types (32.5.4.2).

bool try_wait() const noexcept;
12 Returns: With very low probability false. Otherwise counter == 0.

void wait() const;
13 Effects: If counter equals zero, returns immediately. Otherwise, blocks on *this until a call to
     count_down that decrements counter to zero.
14 Throws: system_error when an exception is required (32.2.2).
15 Error conditions: Any of the error conditions allowed for mutex types (32.5.4.2).

void arrive_and_wait(ptrdiff_t update = 1);
16 Effects: Equivalent to:
     count_down(update);
     wait();

```

32.8.3 Barriers

[thread.barrier]

32.8.3.1 General

[thread.barrier.general]

- ¹ A barrier is a thread coordination mechanism whose lifetime consists of a sequence of barrier phases, where each phase allows at most an expected number of threads to block until the expected number of threads arrive at the barrier.

[Note 1: A barrier is useful for managing repeated tasks that are handled by multiple threads. —end note]

32.8.3.2 Header <barrier> synopsis

[barrier.syn]

```

namespace std {
    template<class CompletionFunction = see below>
        class barrier;
}

```

32.8.3.3 Class template barrier

[thread.barrier.class]

```

namespace std {
    template<class CompletionFunction = see below>
        class barrier {
    public:
        using arrival_token = see below;

        static constexpr ptrdiff_t max() noexcept;

        constexpr explicit barrier(ptrdiff_t expected,
                                  CompletionFunction f = CompletionFunction());
        ~barrier();

        barrier(const barrier&) = delete;
        barrier& operator=(const barrier&) = delete;

        [[nodiscard]] arrival_token arrive(ptrdiff_t update = 1);
        void wait(arrival_token&& arrival) const;

        void arrive_and_wait();
        void arrive_and_drop();

```

```

private:
    CompletionFunction completion;      // exposition only
};

}

```

- 1 Each *barrier phase* consists of the following steps:
 - (1.1) — The expected count is decremented by each call to `arrive` or `arrive_and_drop`.
 - (1.2) — When the expected count reaches zero, the phase completion step is run. For the specialization with the default value of the `CompletionFunction` template parameter, the completion step is run as part of the call to `arrive` or `arrive_and_drop` that caused the expected count to reach zero. For other specializations, the completion step is run on one of the threads that arrived at the barrier during the phase.
 - (1.3) — When the completion step finishes, the expected count is reset to what was specified by the `expected` argument to the constructor, possibly adjusted by calls to `arrive_and_drop`, and the next phase starts.
- 2 Each phase defines a *phase synchronization point*. Threads that arrive at the barrier during the phase can block on the phase synchronization point by calling `wait`, and will remain blocked until the phase completion step is run.
- 3 The *phase completion step* that is executed at the end of each phase has the following effects:
 - (3.1) — Invokes the completion function, equivalent to `completion()`.
 - (3.2) — Unblocks all threads that are blocked on the phase synchronization point.

The end of the completion step strongly happens before the returns from all calls that were unblocked by the completion step. For specializations that do not have the default value of the `CompletionFunction` template parameter, the behavior is undefined if any of the barrier object's member functions other than `wait` are called while the completion step is in progress.

- 4 Concurrent invocations of the member functions of `barrier`, other than its destructor, do not introduce data races. The member functions `arrive` and `arrive_and_drop` execute atomically.
- 5 `CompletionFunction` shall meet the *Cpp17MoveConstructible* ([Table 28](#)) and *Cpp17Destructible* ([Table 32](#)) requirements. `is_nothrow_invocable_v<CompletionFunction&>` shall be `true`.
- 6 The default value of the `CompletionFunction` template parameter is an unspecified type, such that, in addition to satisfying the requirements of `CompletionFunction`, it meets the *Cpp17DefaultConstructible* requirements ([Table 27](#)) and `completion()` has no effects.
- 7 `barrier::arrival_token` is an unspecified type, such that it meets the *Cpp17MoveConstructible* ([Table 28](#)), *Cpp17MoveAssignable* ([Table 30](#)), and *Cpp17Destructible* ([Table 32](#)) requirements.

`static constexpr ptrdiff_t max() noexcept;`

- 8 *Returns*: The maximum expected count that the implementation supports.

`constexpr explicit barrier(ptrdiff_t expected,
 CompletionFunction f = CompletionFunction());`

- 9 *Preconditions*: `expected >= 0` is `true` and `expected <= max()` is `true`.

- 10 *Effects*: Sets both the initial expected count for each barrier phase and the current expected count for the first phase to `expected`. Initializes `completion` with `std::move(f)`. Starts the first phase.

[*Note 1*: If `expected` is 0 this object can only be destroyed. — *end note*]

- 11 *Throws*: Any exception thrown by `CompletionFunction`'s move constructor.

`[[nodiscard]] arrival_token arrive(ptrdiff_t update = 1);`

- 12 *Preconditions*: `update > 0` is `true`, and `update` is less than or equal to the expected count for the current barrier phase.

- 13 *Effects*: Constructs an object of type `arrival_token` that is associated with the phase synchronization point for the current phase. Then, decrements the expected count by `update`.

- 14 *Synchronization*: The call to `arrive` strongly happens before the start of the phase completion step for the current phase.

- 15 *Returns*: The constructed `arrival_token` object.

16 *Throws:* `system_error` when an exception is required (32.2.2).

17 *Error conditions:* Any of the error conditions allowed for mutex types (32.5.4.2).

18 *[Note 2:* This call can cause the completion step for the current phase to start. — end note]

```
void wait(arrival_token&& arrival) const;
```

19 *Preconditions:* `arrival` is associated with the phase synchronization point for the current phase or the immediately preceding phase of the same barrier object.

20 *Effects:* Blocks at the synchronization point associated with `std::move(arrival)` until the phase completion step of the synchronization point's phase is run.

[Note 3: If `arrival` is associated with the synchronization point for a previous phase, the call returns immediately. — end note]

21 *Throws:* `system_error` when an exception is required (32.2.2).

22 *Error conditions:* Any of the error conditions allowed for mutex types (32.5.4.2).

```
void arrive_and_wait();
```

23 *Effects:* Equivalent to: `wait(arrive())`.

```
void arrive_and_drop();
```

24 *Preconditions:* The expected count for the current barrier phase is greater than zero.

25 *Effects:* Decrements the initial expected count for all subsequent phases by one. Then decrements the expected count for the current phase by one.

26 *Synchronization:* The call to `arrive_and_drop` strongly happens before the start of the phase completion step for the current phase.

27 *Throws:* `system_error` when an exception is required (32.2.2).

28 *Error conditions:* Any of the error conditions allowed for mutex types (32.5.4.2).

29 *[Note 4:* This call can cause the completion step for the current phase to start. — end note]

32.9 Futures

[futures]

32.9.1 Overview

[futures.overview]

¹ 32.9 describes components that a C++ program can use to retrieve in one thread the result (value or exception) from a function that has run in the same thread or another thread.

[Note 1: These components are not restricted to multi-threaded programs but can be useful in single-threaded programs as well. — end note]

32.9.2 Header <future> synopsis

[future.syn]

```
namespace std {
    enum class future_errc {
        broken.promise = implementation-defined,
        future.already_retrieved = implementation-defined,
        promise.already_satisfied = implementation-defined,
        no.state = implementation-defined
    };

    enum class launch : unspecified {
        async = unspecified,
        deferred = unspecified,
        implementation-defined
    };

    enum class future_status {
        ready,
        timeout,
        deferred
    };
}
```

```

template<> struct is_error_code_enum<future_errc> : public true_type { };
error_code make_error_code(future_errc e) noexcept;
error_condition make_error_condition(future_errc e) noexcept;

const error_category& future_category() noexcept;

class future_error;

template<class R> class promise;
template<class R> class promise<R&>;
template<> class promise<void>;

template<class R>
void swap(promise<R>& x, promise<R>& y) noexcept;

template<class R, class Alloc>
struct uses_allocator<promise<R>, Alloc>;

template<class R> class future;
template<class R> class future<R&>;
template<> class future<void>;

template<class R> class shared_future;
template<class R> class shared_future<R&>;
template<> class shared_future<void>;

template<class> class packaged_task; // not defined
template<class R, class... ArgTypes>
class packaged_task<R(ArgTypes...)>;

template<class R, class... ArgTypes>
void swap(packaged_task<R(ArgTypes...)>&, packaged_task<R(ArgTypes...)>&) noexcept;

template<class F, class... Args>
[[nodiscard]] future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
async(F&& f, Args&&... args);
template<class F, class... Args>
[[nodiscard]] future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
async(launch policy, F&& f, Args&&... args);
}

```

¹ The enum type `launch` is a bitmask type (16.3.3.3.4) with elements `launch::async` and `launch::deferred`.

[Note 1: Implementations can provide bitmasks to specify restrictions on task interaction by functions launched by `async()` applicable to a corresponding subset of available launch policies. Implementations can extend the behavior of the first overload of `async()` by adding their extensions to the launch policy under the “as if” rule. —end note]

² The enum values of `future_errc` are distinct and not zero.

32.9.3 Error handling

[**futures.errors**]

```

const error_category& future_category() noexcept;

1   Returns: A reference to an object of a type derived from class error_category.
2   The object's default_error_condition and equivalent virtual functions shall behave as specified for
      the class error_category. The object's name virtual function returns a pointer to the string "future".

error_code make_error_code(future_errc e) noexcept;
3   Returns: error_code(static_cast<int>(e), future_category()).
error_condition make_error_condition(future_errc e) noexcept;
4   Returns: error_condition(static_cast<int>(e), future_category()).

```

32.9.4 Class future_error**[futures.future.error]**

```
namespace std {
    class future_error : public logic_error {
        public:
            explicit future_error(future_errc e);

            const error_code& code() const noexcept;
            const char* what() const noexcept;

        private:
            error_code ec_;           // exposition only
    };
}
```

```
explicit future_error(future_errc e);

1   Effects: Initializes ec_ with make_error_code(e).

2   Returns: ec_.

3   Returns: An NTBS incorporating code().message().
```

32.9.5 Shared state**[futures.state]**

- 1 Many of the classes introduced in subclause 32.9 use some state to communicate results. This *shared state* consists of some state information and some (possibly not yet evaluated) *result*, which can be a (possibly void) value or an exception.

[Note 1: Futures, promises, and tasks defined in this Clause reference such shared state. —end note]

- 2 [Note 2: The result can be any kind of object including a function to compute that result, as used by `async` when `policy` is `launch::deferred`. —end note]

- 3 An *asynchronous return object* is an object that reads results from a shared state. A *waiting function* of an asynchronous return object is one that potentially blocks to wait for the shared state to be made ready. If a waiting function can return before the state is made ready because of a timeout (32.2.5), then it is a *timed waiting function*, otherwise it is a *non-timed waiting function*.

- 4 An *asynchronous provider* is an object that provides a result to a shared state. The result of a shared state is set by respective functions on the asynchronous provider.

[Note 3: Such as promises or tasks. —end note]

The means of setting the result of a shared state is specified in the description of those classes and functions that create such a state object.

- 5 When an asynchronous return object or an asynchronous provider is said to release its shared state, it means:

- (5.1) — if the return object or provider holds the last reference to its shared state, the shared state is destroyed; and
- (5.2) — the return object or provider gives up its reference to its shared state; and
- (5.3) — these actions will not block for the shared state to become ready, except that it may block if all of the following are true: the shared state was created by a call to `std::async`, the shared state is not yet ready, and this was the last reference to the shared state.

- 6 When an asynchronous provider is said to make its shared state ready, it means:

- (6.1) — first, the provider marks its shared state as ready; and
- (6.2) — second, the provider unblocks any execution agents waiting for its shared state to become ready.

- 7 When an asynchronous provider is said to abandon its shared state, it means:

- (7.1) — first, if that state is not ready, the provider
- (7.1.1) — stores an exception object of type `future_error` with an error condition of `broken_promise` within its shared state; and then

- (7.1.2) — makes its shared state ready;
- (7.2) — second, the provider releases its shared state.
- 8 A shared state is *ready* only if it holds a value or an exception ready for retrieval. Waiting for a shared state to become ready may invoke code to compute the result on the waiting thread if so specified in the description of the class or function that creates the state object.
- 9 Calls to functions that successfully set the stored result of a shared state synchronize with (6.9.2) calls to functions successfully detecting the ready state resulting from that setting. The storage of the result (whether normal or exceptional) into the shared state synchronizes with (6.9.2) the successful return from a call to a waiting function on the shared state.
- 10 Some functions (e.g., `promise::set_value_at_thread_exit`) delay making the shared state ready until the calling thread exits. The destruction of each of that thread's objects with thread storage duration (6.7.5.3) is sequenced before making that shared state ready.
- 11 Access to the result of the same shared state may conflict (6.9.2).

[*Note 4*: This explicitly specifies that the result of the shared state is visible in the objects that reference this state in the sense of data race avoidance (16.4.6.10). For example, concurrent accesses through references returned by `shared_future::get()` (32.9.8) must either use read-only operations or provide additional synchronization. — *end note*]

32.9.6 Class template promise

[**futures.promise**]

```
namespace std {
    template<class R>
    class promise {
        public:
            promise();
            template<class Allocator>
            promise(allocator_arg_t, const Allocator& a);
            promise(promise&& rhs) noexcept;
            promise(const promise&) = delete;
            ~promise();

            // assignment
            promise& operator=(promise&& rhs) noexcept;
            promise& operator=(const promise&) = delete;
            void swap(promise& other) noexcept;

            // retrieving the result
            future<R> get_future();

            // setting the result
            void set_value(see below);
            void set_exception(exception_ptr p);

            // setting the result with deferred notification
            void set_value_at_thread_exit(see below);
            void set_exception_at_thread_exit(exception_ptr p);
    };

    template<class R>
    void swap(promise<R>& x, promise<R>& y) noexcept;

    template<class R, class Alloc>
    struct uses_allocator<promise<R>, Alloc>;
}
```

- 1 The implementation provides the template `promise` and two specializations, `promise<R&>` and `promise<void>`. These differ only in the argument type of the member functions `set_value` and `set_value_at_thread_exit`, as set out in their descriptions, below.
- 2 The `set_value`, `set_exception`, `set_value_at_thread_exit`, and `set_exception_at_thread_exit` member functions behave as though they acquire a single mutex associated with the `promise` object while updating the `promise` object.

```
template<class R, class Alloc>
```

```
    struct uses_allocator<promise<R>, Alloc>
        : true_type { };
```

3 *Preconditions:* Alloc meets the Cpp17Allocator requirements ([Table 36](#)).

```
promise();
```

```
template<class Allocator>
```

```
    promise(allocator_arg_t, const Allocator& a);
```

4 *Effects:* Creates a shared state. The second constructor uses the allocator a to allocate memory for the shared state.

```
promise(promise&& rhs) noexcept;
```

5 *Effects:* Transfers ownership of the shared state of rhs (if any) to the newly-constructed object.

6 *Postconditions:* rhs has no shared state.

```
~promise();
```

7 *Effects:* Abandons any shared state ([32.9.5](#)).

```
promise& operator=(promise&& rhs) noexcept;
```

8 *Effects:* Abandons any shared state ([32.9.5](#)) and then as if `promise(std::move(rhs)).swap(*this)`.

9 *Returns:* *this.

```
void swap(promise& other) noexcept;
```

10 *Effects:* Exchanges the shared state of *this and other.

11 *Postconditions:* *this has the shared state (if any) that other had prior to the call to swap. other has the shared state (if any) that *this had prior to the call to swap.

```
future<R> get_future();
```

12 *Returns:* A future<R> object with the same shared state as *this.

13 *Synchronization:* Calls to this function do not introduce data races ([6.9.2](#)) with calls to set_value, set_exception, set_value_at_thread_exit, or set_exception_at_thread_exit.

[*Note 1:* Such calls need not synchronize with each other. —end note]

14 *Throws:* future_error if *this has no shared state or if get_future has already been called on a promise with the same shared state as *this.

15 *Error conditions:*

(15.1) — future_already_retrieved if get_future has already been called on a promise with the same shared state as *this.

(15.2) — no_state if *this has no shared state.

```
void promise::set_value(const R& r);
```

```
void promise::set_value(R&& r);
```

```
void promise<R&>::set_value(R& r);
```

```
void promise<void>::set_value();
```

16 *Effects:* Atomically stores the value r in the shared state and makes that state ready ([32.9.5](#)).

17 *Throws:*

(17.1) — future_error if its shared state already has a stored value or exception, or

(17.2) — for the first version, any exception thrown by the constructor selected to copy an object of R, or

(17.3) — for the second version, any exception thrown by the constructor selected to move an object of R.

18 *Error conditions:*

(18.1) — promise_already_satisfied if its shared state already has a stored value or exception.

(18.2) — no_state if *this has no shared state.

```

void set_exception(exception_ptr p);
19  Preconditions: p is not null.
20  Effects: Atomically stores the exception pointer p in the shared state and makes that state ready (32.9.5).
21  Throws: future_error if its shared state already has a stored value or exception.
22  Error conditions:
(22.1) — promise_already_satisfied if its shared state already has a stored value or exception.
(22.2) — no_state if *this has no shared state.

void promise::set_value_at_thread_exit(const R& r);
void promise::set_value_at_thread_exit(R&& r);
void promise<R>::set_value_at_thread_exit(R& r);
void promise<void>::set_value_at_thread_exit();

23  Effects: Stores the value r in the shared state without making that state ready immediately. Schedules that state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.
24  Throws:
(24.1) — future_error if its shared state already has a stored value or exception, or
(24.2) — for the first version, any exception thrown by the constructor selected to copy an object of R, or
(24.3) — for the second version, any exception thrown by the constructor selected to move an object of R.
25  Error conditions:
(25.1) — promise_already_satisfied if its shared state already has a stored value or exception.
(25.2) — no_state if *this has no shared state.

void set_exception_at_thread_exit(exception_ptr p);
26  Preconditions: p is not null.
27  Effects: Stores the exception pointer p in the shared state without making that state ready immediately. Schedules that state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.
28  Throws: future_error if an error condition occurs.
29  Error conditions:
(29.1) — promise_already_satisfied if its shared state already has a stored value or exception.
(29.2) — no_state if *this has no shared state.

template<class R>
void swap(promise<R>& x, promise<R>& y) noexcept;
30  Effects: As if by x.swap(y).

```

32.9.7 Class template future

[futures.unique.future]

- ¹ The class template future defines a type for asynchronous return objects which do not share their shared state with other asynchronous return objects. A default-constructed future object has no shared state. A future object with shared state can be created by functions on asynchronous providers (32.9.5) or by the move constructor and shares its shared state with the original asynchronous provider. The result (value or exception) of a future object can be set by calling a respective function on an object that shares the same shared state.
- ² [Note 1: Member functions of future do not synchronize with themselves or with member functions of shared_future. — end note]
- ³ The effect of calling any member function other than the destructor, the move-assignment operator, share, or valid on a future object for which valid() == false is undefined.

[Note 2: It is valid to move from a future object for which valid() == false. — end note]

Recommended practice: Implementations should detect this case and throw an object of type future_error with an error condition of future_errc::no_state.

```

namespace std {
    template<class R>
    class future {
        public:
            future() noexcept;
            future(future&&) noexcept;
            future(const future&) = delete;
            ~future();
            future& operator=(const future&) = delete;
            future& operator=(future&&) noexcept;
            shared_future<R> share() noexcept;

            // retrieving the value
            see below get();

            // functions to check state
            bool valid() const noexcept;

            void wait() const;
            template<class Rep, class Period>
                future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
            template<class Clock, class Duration>
                future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
    };
}

```

- ⁴ The implementation provides the template **future** and two specializations, **future<R&>** and **future<void>**. These differ only in the return type and return value of the member function **get**, as set out in its description, below.

future() noexcept;

- ⁵ *Effects:* The object does not refer to a shared state.

- ⁶ *Postconditions:* **valid() == false**.

future(future&& rhs) noexcept;

- ⁷ *Effects:* Move constructs a **future** object that refers to the shared state that was originally referred to by **rhs** (if any).

- ⁸ *Postconditions:*

- (8.1) — **valid()** returns the same value as **rhs.valid()** prior to the constructor invocation.

- (8.2) — **rhs.valid() == false**.

~future();

- ⁹ *Effects:*

- (9.1) — Releases any shared state ([32.9.5](#));

- (9.2) — destroys ***this**.

future& operator=(future&& rhs) noexcept;

- ¹⁰ *Effects:*

- (10.1) — Releases any shared state ([32.9.5](#)).

- (10.2) — move assigns the contents of **rhs** to ***this**.

- ¹¹ *Postconditions:*

- (11.1) — **valid()** returns the same value as **rhs.valid()** prior to the assignment.

- (11.2) — **rhs.valid() == false**.

shared_future<R> share() noexcept;

- ¹² *Returns:* **shared_future<R>(std::move(*this))**.

- ¹³ *Postconditions:* **valid() == false**.

```
R future::get();
R& future<R&>::get();
void future<void>::get();
```

14 [Note 3: As described above, the template and its two required specializations differ only in the return type and return value of the member function `get`. — end note]

15 *Effects:*

- (15.1) — `wait()`s until the shared state is ready, then retrieves the value stored in the shared state;
- (15.2) — releases any shared state ([32.9.5](#)).

16 *Returns:*

- (16.1) — `future::get()` returns the value `v` stored in the object's shared state as `std::move(v)`.
- (16.2) — `future<R&>::get()` returns the reference stored as value in the object's shared state.
- (16.3) — `future<void>::get()` returns nothing.

17 *Throws:* The stored exception, if an exception was stored in the shared state.

18 *Postconditions:* `valid() == false`.

```
bool valid() const noexcept;
```

19 *Returns:* `true` only if `*this` refers to a shared state.

```
void wait() const;
```

20 *Effects:* Blocks until the shared state is ready.

```
template<class Rep, class Period>
future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
```

21 *Effects:* None if the shared state contains a deferred function ([32.9.9](#)), otherwise blocks until the shared state is ready or until the relative timeout ([32.2.4](#)) specified by `rel_time` has expired.

22 *Returns:*

- (22.1) — `future_status::deferred` if the shared state contains a deferred function.
- (22.2) — `future_status::ready` if the shared state is ready.
- (22.3) — `future_status::timeout` if the function is returning because the relative timeout ([32.2.4](#)) specified by `rel_time` has expired.

23 *Throws:* timeout-related exceptions ([32.2.4](#)).

```
template<class Clock, class Duration>
future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
```

24 *Effects:* None if the shared state contains a deferred function ([32.9.9](#)), otherwise blocks until the shared state is ready or until the absolute timeout ([32.2.4](#)) specified by `abs_time` has expired.

25 *Returns:*

- (25.1) — `future_status::deferred` if the shared state contains a deferred function.
- (25.2) — `future_status::ready` if the shared state is ready.
- (25.3) — `future_status::timeout` if the function is returning because the absolute timeout ([32.2.4](#)) specified by `abs_time` has expired.

26 *Throws:* timeout-related exceptions ([32.2.4](#)).

32.9.8 Class template `shared_future`

[`futures.shared.future`]

¹ The class template `shared_future` defines a type for asynchronous return objects which may share their shared state with other asynchronous return objects. A default-constructed `shared_future` object has no shared state. A `shared_future` object with shared state can be created by conversion from a `future` object and shares its shared state with the original asynchronous provider ([32.9.5](#)) of the shared state. The result (value or exception) of a `shared_future` object can be set by calling a respective function on an object that shares the same shared state.

² [Note 1: Member functions of `shared_future` do not synchronize with themselves, but they synchronize with the shared state. — end note]

- ³ The effect of calling any member function other than the destructor, the move-assignment operator, the copy-assignment operator, or `valid()` on a `shared_future` object for which `valid() == false` is undefined.
 [Note 2: It is valid to copy or move from a `shared_future` object for which `valid()` is `false`. — end note]

Recommended practice: Implementations should detect this case and throw an object of type `future_error` with an error condition of `future_errc::no_state`.

```
namespace std {
    template<class R>
    class shared_future {
        public:
            shared_future() noexcept;
            shared_future(const shared_future& rhs) noexcept;
            shared_future(future<R>&&) noexcept;
            shared_future(shared_future&& rhs) noexcept;
            ~shared_future();
            shared_future& operator=(const shared_future& rhs) noexcept;
            shared_future& operator=(shared_future&& rhs) noexcept;

            // retrieving the value
            see below get() const;

            // functions to check state
            bool valid() const noexcept;

            void wait() const;
            template<class Rep, class Period>
                future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
            template<class Clock, class Duration>
                future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
    };
}
```

- ⁴ The implementation provides the template `shared_future` and two specializations, `shared_future<R&>` and `shared_future<void>`. These differ only in the return type and return value of the member function `get`, as set out in its description, below.

`shared_future() noexcept;`

5 *Effects:* The object does not refer to a shared state.

6 *Postconditions:* `valid() == false`.

`shared_future(const shared_future& rhs) noexcept;`

7 *Effects:* The object refers to the same shared state as `rhs` (if any).

8 *Postconditions:* `valid()` returns the same value as `rhs.valid()`.

`shared_future(future<R>&& rhs) noexcept;`

`shared_future(shared_future&& rhs) noexcept;`

9 *Effects:* Move constructs a `shared_future` object that refers to the shared state that was originally referred to by `rhs` (if any).

10 *Postconditions:*

(10.1) — `valid()` returns the same value as `rhs.valid()` returned prior to the constructor invocation.

(10.2) — `rhs.valid() == false`.

`~shared_future();`

11 *Effects:*

(11.1) — Releases any shared state ([32.9.5](#));

(11.2) — destroys `*this`.

```

shared_future& operator=(shared_future&& rhs) noexcept;
12   Effects:
(12.1)   — Releases any shared state (32.9.5);
(12.2)   — move assigns the contents of rhs to *this.

13   Postconditions:
(13.1)   — valid() returns the same value as rhs.valid() returned prior to the assignment.
(13.2)   — rhs.valid() == false.

shared_future& operator=(const shared_future& rhs) noexcept;
14   Effects:
(14.1)   — Releases any shared state (32.9.5);
(14.2)   — assigns the contents of rhs to *this.

  [Note 3: As a result, *this refers to the same shared state as rhs (if any). — end note]

15   Postconditions: valid() == rhs.valid().

const R& shared_future::get() const;
R& shared_future<R&>::get() const;
void shared_future<void>::get() const;
16   [Note 4: As described above, the template and its two required specializations differ only in the return type
and return value of the member function get. — end note]

17   [Note 5: Access to a value object stored in the shared state is unsynchronized, so it is possible for operations on
R to introduce a data race (6.9.2). — end note]

18   Effects: wait()s until the shared state is ready, then retrieves the value stored in the shared state.

19   Returns:
(19.1)   — shared_future::get() returns a const reference to the value stored in the object's shared state.

  [Note 6: Access through that reference after the shared state has been destroyed produces undefined
behavior; this can be avoided by not storing the reference in any storage with a greater lifetime than the
shared_future object that returned the reference. — end note]

(19.2)   — shared_future<R&>::get() returns the reference stored as value in the object's shared state.
(19.3)   — shared_future<void>::get() returns nothing.

20   Throws: The stored exception, if an exception was stored in the shared state.

bool valid() const noexcept;
21   Returns: true only if *this refers to a shared state.

void wait() const;
22   Effects: Blocks until the shared state is ready.

template<class Rep, class Period>
future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
23   Effects: None if the shared state contains a deferred function (32.9.9), otherwise blocks until the shared
state is ready or until the relative timeout (32.2.4) specified by rel_time has expired.

24   Returns:
(24.1)   — future_status::deferred if the shared state contains a deferred function.
(24.2)   — future_status::ready if the shared state is ready.
(24.3)   — future_status::timeout if the function is returning because the relative timeout (32.2.4) specified
by rel_time has expired.

25   Throws: timeout-related exceptions (32.2.4).

```

```

template<class Clock, class Duration>
future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
26   Effects: None if the shared state contains a deferred function (32.9.9), otherwise blocks until the shared
   state is ready or until the absolute timeout (32.2.4) specified by abs_time has expired.
27   Returns:
(27.1)   — future_status::deferred if the shared state contains a deferred function.
(27.2)   — future_status::ready if the shared state is ready.
(27.3)   — future_status::timeout if the function is returning because the absolute timeout (32.2.4)
   specified by abs_time has expired.
28   Throws: timeout-related exceptions (32.2.4).

```

32.9.9 Function template `async`

[**futures.async**]

- ¹ The function template `async` provides a mechanism to launch a function potentially in a new thread and provides the result of the function in a `future` object with which it shares a shared state.

```

template<class F, class... Args>
[[nodiscard]] future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
  async(F&& f, Args&&... args);
template<class F, class... Args>
[[nodiscard]] future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
  async(launch policy, F&& f, Args&&... args);

```

2 *Mandates:* The following are all `true`:

- (2.1) — `is_constructible_v<decay_t<F>, F>`,
- (2.2) — `(is_constructible_v<decay_t<Args>, Args> &&...)`,
- (2.3) — `is_move_constructible_v<decay_t<F>>`,
- (2.4) — `(is_move_constructible_v<decay_t<Args>> &&...)`, and
- (2.5) — `is_invocable_v<decay_t<F>, decay_t<Args>...>`.

3 *Preconditions:* `decay_t<F>` and each type in `decay_t<Args>` meet the *Cpp17MoveConstructible* requirements.

4 *Effects:* The first function behaves the same as a call to the second function with a `policy` argument of `launch::async` | `launch::deferred` and the same arguments for `F` and `Args`. The second function creates a shared state that is associated with the returned `future` object. The further behavior of the second function depends on the `policy` argument as follows (if more than one of these conditions applies, the implementation may choose any of the corresponding policies):

- (4.1) — If `launch::async` is set in `policy`, calls `invoke(decay-copy(std::forward<F>(f)), decay-copy(std::forward<Args>(args))...)` (20.14.4, 32.4.3.3) as if in a new thread of execution represented by a `thread` object with the calls to `decay-copy` being evaluated in the thread that called `async`. Any return value is stored as the result in the shared state. Any exception propagated from the execution of `invoke(decay-copy(std::forward<F>(f)), decay-copy(std::forward<Args>(args))...)` is stored as the exceptional result in the shared state. The `thread` object is stored in the shared state and affects the behavior of any asynchronous return objects that reference that state.
- (4.2) — If `launch::deferred` is set in `policy`, stores `decay-copy(std::forward<F>(f))` and `decay-copy(std::forward<Args>(args))...` in the shared state. These copies of `f` and `args` constitute a *deferred function*. Invocation of the deferred function evaluates `invoke(std::move(g), std::move(xyz))` where `g` is the stored value of `decay-copy(std::forward<F>(f))` and `xyz` is the stored copy of `decay-copy(std::forward<Args>(args))....` Any return value is stored as the result in the shared state. Any exception propagated from the execution of the deferred function is stored as the exceptional result in the shared state. The shared state is not made ready until the function has completed. The first call to a non-timed waiting function (32.9.5) on an asynchronous return object referring to this shared state invokes the deferred function in the thread that called the waiting function. Once evaluation of `invoke(std::move(g), std::move(xyz))` begins, the function is no longer considered deferred.

Recommended practice: If this policy is specified together with other policies, such as when using a `policy` value of `launch::async` | `launch::deferred`, implementations should defer invocation or the selection of the policy when no more concurrency can be effectively exploited.

- (4.3) — If no value is set in the launch policy, or a value is set that is neither specified in this document nor by the implementation, the behavior is undefined.

5 *Returns:* An object of type `future<invoke_result_t<decay_t<F>, decay_t<Args>...>>` that refers to the shared state created by this call to `async`.

[*Note 1:* If a future obtained from `async` is moved outside the local scope, the future's destructor can block for the shared state to become ready. — *end note*]

6 *Synchronization:* The following apply regardless of the provided `policy` argument:

- (6.1) — The invocation of `async` synchronizes with (6.9.2) the invocation of `f`.

[*Note 2:* This statement applies even when the corresponding `future` object is moved to another thread. — *end note*]

- (6.2) — The completion of the function `f` is sequenced before (6.9.2) the shared state is made ready.

[*Note 3:* It is possible for `f` not to be called at all, in which case its completion never happens. — *end note*]

If the implementation chooses the `launch::async` policy,

- (6.3) — a call to a waiting function on an asynchronous return object that shares the shared state created by this `async` call shall block until the associated thread has completed, as if joined, or else time out (32.4.3.6);

- (6.4) — the associated thread completion synchronizes with (6.9.2) the return from the first function that successfully detects the ready status of the shared state or with the return from the last function that releases the shared state, whichever happens first.

7 *Throws:* `system_error` if `policy == launch::async` and the implementation is unable to start a new thread, or `std::bad_alloc` if memory for the internal data structures cannot be allocated.

8 *Error conditions:*

- (8.1) — `resource_unavailable_try_again` — if `policy == launch::async` and the system is unable to start a new thread.

9 [Example 1:

```
int work1(int value);
int work2(int value);
int work(int value) {
    auto handle = std::async([=]{ return work2(value); });
    int tmp = work1(value);
    return tmp + handle.get();    // #1
}
```

[*Note 4:* It is possible for line #1 not to result in concurrency because the `async` call uses the default policy, which can use `launch::deferred`, in which case it is possible that the lambda is not invoked until the `get()` call; in that case, `work1` and `work2` are called on the same thread and there is no concurrency. — *end note*]

— *end example*]

32.9.10 Class template `packaged_task`

[`futures.task`]

32.9.10.1 General

[`futures.task.general`]

- The class template `packaged_task` defines a type for wrapping a function or callable object so that the return value of the function or callable object is stored in a future when it is invoked.
- When the `packaged_task` object is invoked, its stored task is invoked and the result (whether normal or exceptional) stored in the shared state. Any futures that share the shared state will then be able to access the stored result.

```
namespace std {
    template<class> class packaged_task; // not defined
```

```

template<class R, class... ArgTypes>
class packaged_task<R(ArgTypes...)> {
public:
    // construction and destruction
    packaged_task() noexcept;
    template<class F>
    explicit packaged_task(F&& f);
    ~packaged_task();

    // no copy
    packaged_task(const packaged_task&) = delete;
    packaged_task& operator=(const packaged_task&) = delete;

    // move support
    packaged_task(packaged_task&& rhs) noexcept;
    packaged_task& operator=(packaged_task&& rhs) noexcept;
    void swap(packaged_task& other) noexcept;

    bool valid() const noexcept;

    // result retrieval
    future<R> get_future();

    // execution
    void operator()(ArgTypes... );
    void make_ready_at_thread_exit(ArgTypes...);

    void reset();
};

template<class R, class... ArgTypes>
void swap(packaged_task<R(ArgTypes...)>& x, packaged_task<R(ArgTypes...)>& y) noexcept;
}

```

32.9.10.2 Member functions

[[futures.task.members](#)]

`packaged_task() noexcept;`

1 *Effects:* The object has no shared state and no stored task.

`template<class F>`
 `packaged_task(F&& f);`

2 *Constraints:* `remove_cvref_t<F>` is not the same type as `packaged_task<R(ArgTypes...)>`.

3 *Mandates:* `is_invocable_r_v<R, F&, ArgTypes...>` is true.

4 *Preconditions:* Invoking a copy of `f` behaves the same as invoking `f`.

5 *Effects:* Constructs a new `packaged_task` object with a shared state and initializes the object's stored task with `std::forward<F>(f)`.

6 *Throws:* Any exceptions thrown by the copy or move constructor of `f`, or `bad_alloc` if memory for the internal data structures cannot be allocated.

`packaged_task(packaged_task&& rhs) noexcept;`

7 *Effects:* Transfers ownership of `rhs`'s shared state to `*this`, leaving `rhs` with no shared state. Moves the stored task from `rhs` to `*this`.

8 *Postconditions:* `rhs` has no shared state.

`packaged_task& operator=(packaged_task&& rhs) noexcept;`

9 *Effects:*

— Releases any shared state ([32.9.5](#));

(9.2) — calls `packaged_task(std::move(rhs)).swap(*this)`.

```

~packaged_task();

10   Effects: Abandons any shared state (32.9.5).

void swap(packaged_task& other) noexcept;
11   Effects: Exchanges the shared states and stored tasks of *this and other.

12   Postconditions: *this has the same shared state and stored task (if any) as other prior to the call to swap. other has the same shared state and stored task (if any) as *this prior to the call to swap.

bool valid() const noexcept;
13   Returns: true only if *this has a shared state.

future<R> get_future();
14   Returns: A future object that shares the same shared state as *this.

15   Synchronization: Calls to this function do not introduce data races (6.9.2) with calls to operator() or make_ready_at_thread_exit.

[Note 1: Such calls need not synchronize with each other. —end note]

16   Throws: A future_error object if an error occurs.

17   Error conditions:

(17.1)   — future_already_retrieved if get_future has already been called on a packaged_task object with the same shared state as *this.

(17.2)   — no_state if *this has no shared state.

void operator()(ArgTypes... args);
18   Effects: As if by INVOKE<R>(f, t1, t2, ..., tN) (20.14.4), where f is the stored task of *this and t1, t2, ..., tN are the values in args.... If the task returns normally, the return value is stored as the asynchronous result in the shared state of *this, otherwise the exception thrown by the task is stored. The shared state of *this is made ready, and any threads blocked in a function waiting for the shared state of *this to become ready are unblocked.

19   Throws: A future_error exception object if there is no shared state or the stored task has already been invoked.

20   Error conditions:

(20.1)   — promise_already_satisfied if the stored task has already been invoked.

(20.2)   — no_state if *this has no shared state.

void make_ready_at_thread_exit(ArgTypes... args);
21   Effects: As if by INVOKE<R>(f, t1, t2, ..., tN) (20.14.4), where f is the stored task and t1, t2, ..., tN are the values in args.... If the task returns normally, the return value is stored as the asynchronous result in the shared state of *this, otherwise the exception thrown by the task is stored. In either case, this is done without making that state ready (32.9.5) immediately. Schedules the shared state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.

22   Throws: future_error if an error condition occurs.

23   Error conditions:

(23.1)   — promise_already_satisfied if the stored task has already been invoked.

(23.2)   — no_state if *this has no shared state.

void reset();
24   Effects: As if *this = packaged_task(std::move(f)), where f is the task stored in *this.

[Note 2: This constructs a new shared state for *this. The old state is abandoned (32.9.5). —end note]

25   Throws:

(25.1)   — bad_alloc if memory for the new shared state cannot be allocated.

(25.2)   — any exception thrown by the move constructor of the task stored in the shared state.

```

(25.3) — `future_error` with an error condition of `no_state` if `*this` has no shared state.

32.9.10.3 Globals

[`futures.task.nonmembers`]

```
template<class R, class... ArgTypes>
void swap(packaged_task<R(ArgTypes...)>& x, packaged_task<R(ArgTypes...)>& y) noexcept;
```

1 *Effects:* As if by `x.swap(y)`.

Annex A (informative) Grammar summary [gram]

A.1 General

[gram.general]

- ¹ This summary of C++ grammar is intended to be an aid to comprehension. It is not an exact statement of the language. In particular, the grammar described here accepts a superset of valid C++ constructs. Disambiguation rules (8.9, 9.2, 11.8) are applied to distinguish expressions from declarations. Further, access control, ambiguity, and type rules are used to weed out syntactically valid but meaningless constructs.

A.2 Keywords

[gram.key]

- ¹ New context-dependent keywords are introduced into a program by `typedef` (9.2.4), `namespace` (9.8.2), `class` (Clause 11), `enumeration` (9.7.1), and `template` (Clause 13) declarations.

```

typedef-name:
    identifier
    simple-template-id

namespace-name:
    identifier
    namespace-alias

namespace-alias:
    identifier

class-name:
    identifier
    simple-template-id

enum-name:
    identifier

template-name:
    identifier
  
```

A.3 Lexical conventions

[gram.lex]

```

hex-quad:
    hexadecimal-digit hexadecimal-digit hexadecimal-digit hexadecimal-digit

universal-character-name:
    \u hex-quad
    \U hex-quad hex-quad

Annex B (normative) Implementation quantities [implimits]

- ¹ Because computers are finite, C++ implementations are inevitably limited in the size of the programs they can successfully process. Every implementation shall document those limitations where known. This documentation may cite fixed limits where they exist, say how to compute variable limits as a function of available resources, or say that fixed limits do not exist or are unknown.
- ² The limits may constrain quantities that include those described below or others. The bracketed number following each quantity is recommended as the minimum for that quantity. However, these quantities are only guidelines and do not determine compliance.
- (2.1) — Nesting levels of compound statements (8.4), iteration control structures (8.6), and selection control structures (8.5) [256].
 - (2.2) — Nesting levels of conditional inclusion (15.2) [256].
 - (2.3) — Pointer (9.3.4.2), array (9.3.4.5), and function (9.3.4.6) declarators (in any combination) modifying a class, arithmetic, or incomplete type in a declaration [256].
 - (2.4) — Nesting levels of parenthesized expressions (7.5.3) within a full-expression [256].
 - (2.5) — Number of characters in an internal identifier (5.10) or macro name (15.6) [1 024].
 - (2.6) — Number of characters in an external identifier (5.10, 6.6) [1 024].
 - (2.7) — External identifiers (6.6) in one translation unit [65 536].
 - (2.8) — Identifiers with block scope declared in one block (6.4.3) [1 024].
 - (2.9) — Structured bindings (9.6) introduced in one declaration [256].
 - (2.10) — Macro identifiers (15.6) simultaneously defined in one translation unit [65 536].
 - (2.11) — Parameters in one function definition (9.5.1) [256].
 - (2.12) — Arguments in one function call (7.6.1.3) [256].
 - (2.13) — Parameters in one macro definition (15.6) [256].
 - (2.14) — Arguments in one macro invocation (15.6) [256].
 - (2.15) — Characters in one logical source line (5.2) [65 536].
 - (2.16) — Characters in a *string-literal* (5.13.5) (after concatenation (5.2)) [65 536].
 - (2.17) — Size of an object (6.7.2) [262 144].
 - (2.18) — Nesting levels for #include files (15.3) [256].
 - (2.19) — Case labels for a switch statement (8.5.3) (excluding those for any nested switch statements) [16 384].
 - (2.20) — Non-static data members (including inherited ones) in a single class (11.4) [16 384].
 - (2.21) — Lambda-captures in one lambda-expression (7.5.5.3) [256].
 - (2.22) — Enumeration constants in a single enumeration (9.7.1) [4 096].
 - (2.23) — Levels of nested class definitions (11.4.11) in a single member-specification [256].
 - (2.24) — Functions registered by atexit() (17.5) [32].
 - (2.25) — Functions registered by at_quick_exit() (17.5) [32].
 - (2.26) — Direct and indirect base classes (11.7) [16 384].
 - (2.27) — Direct base classes for a single class (11.7) [1 024].
 - (2.28) — Class members declared in a single member-specification (including member functions) (11.4) [4 096].
 - (2.29) — Final overriding virtual functions in a class, accessible or not (11.7.3) [16 384].
 - (2.30) — Direct and indirect virtual bases of a class (11.7.2) [1 024].

- (2.31) — Static data members of a class (11.4.9.3) [1 024].
- (2.32) — Friend declarations in a class (11.9.4) [4 096].
- (2.33) — Access control declarations in a class (11.9.2) [4 096].
- (2.34) — Member initializers in a constructor definition (11.10.3) [6 144].
- (2.35) — *initializer-clauses* in one *braced-init-list* (9.4) [16 384].
- (2.36) — Scope qualifications of one identifier (7.5.4.3) [256].
- (2.37) — Nested *linkage-specifications* (9.11) [1 024].
- (2.38) — Recursive constexpr function invocations (9.2.6) [512].
- (2.39) — Full-expressions evaluated within a core constant expression (7.7) [1 048 576].
- (2.40) — Template parameters in a template declaration (13.2) [1 024].
- (2.41) — Recursively nested template instantiations (13.9.2), including substitution during template argument deduction (13.10.3) [1 024].
- (2.42) — Handlers per try block (14.4) [256].
- (2.43) — Number of placeholders (20.14.15.5) [10].

Annex C (informative)

Compatibility

[diff]

C.1 C++ and ISO C++ 2017

[diff.cpp17]

C.1.1 General

[diff.cpp17.general]

- ¹ Subclause C.1 lists the differences between C++ and ISO C++ 2017 (ISO/IEC 14882:2017, *Programming Languages — C++*), by the chapters of this document.

C.1.2 Clause 5: lexical conventions

[diff.cpp17.lex]

- ¹ **Affected subclauses:** 5.4, 10.1, 10.3, 15.1, 15.4, and 15.5

Change: New identifiers with special meaning.

Rationale: Required for new features.

Effect on original feature: Logical lines beginning with `module` or `import` may be interpreted differently in this revision of C++.

[Example 1:

```
class module {};
module m1;           // was variable declaration; now module-declaration
module *m2;          // variable declaration

class import {};
import j1;            // was variable declaration; now module-import-declaration
::import j2;          // variable declaration
— end example]
```

- ² **Affected subclause:** 5.8

Change: *header-name* tokens are formed in more contexts.

Rationale: Required for new features.

Effect on original feature: When the identifier `import` is followed by a < character, a *header-name* token may be formed.

[Example 2:

```
template<typename> class import {};
import<int> f();           // ill-formed; previously well-formed
::import<int> g();          // OK
— end example]
```

- ³ **Affected subclause:** 5.11

Change: New keywords.

Rationale: Required for new features.

- (3.1) — The `char8_t` keyword is added to differentiate the types of ordinary and UTF-8 literals (5.13.5).
- (3.2) — The `concept` keyword is added to enable the definition of concepts (13.7.9).
- (3.3) — The `consteval` keyword is added to declare immediate functions (9.2.6).
- (3.4) — The `constinit` keyword is added to prevent unintended dynamic initialization (9.2.7).
- (3.5) — The `co_await`, `co_yield`, and `co_return` keywords are added to enable the definition of coroutines (9.5.4).
- (3.6) — The `requires` keyword is added to introduce constraints through a *requires-clause* (13.1) or a *requires-expression* (7.5.7).

Effect on original feature: Valid C++ 2017 code using `char8_t`, `concept`, `consteval`, `constinit`, `co_await`, `co_yield`, `co_return`, or `requires` as an identifier is not valid in this revision of C++.

⁴ **Affected subclause:** 5.12**Change:** New operator `<=`.**Rationale:** Necessary for new functionality.**Effect on original feature:** Valid C++ 2017 code that contains a `<=` token immediately followed by a `>` token may be ill-formed or have different semantics in this revision of C++:

```
namespace N {
    struct X {};
    bool operator<=(X, X);
    template<bool(X, X)> struct Y {};
    Y<operator<=> y;           // ill-formed; previously well-formed
}
```

⁵ **Affected subclause:** 5.13**Change:** Type of UTF-8 string and character literals.**Rationale:** Required for new features. The changed types enable function overloading, template specialization, and type deduction to distinguish ordinary and UTF-8 string and character literals.**Effect on original feature:** Valid C++ 2017 code that depends on UTF-8 string literals having type “array of `const char`” and UTF-8 character literals having type “`char`” is not valid in this revision of C++.

```
const auto *u8s = u8"text";      // u8s previously deduced as const char*; now deduced as const char8_t*
const char *ps = u8s;           // ill-formed; previously well-formed

auto u8c = u8'c';              // u8c previously deduced as char; now deduced as char8_t
char *pc = &u8c;                // ill-formed; previously well-formed

std::string s = u8"text";       // ill-formed; previously well-formed

void f(const char *s);
f(u8"text");                  // ill-formed; previously well-formed

template<typename> struct ct;
template<> struct ct<char> {
    using type = char;
};
ct<decltype(u8'c')>::type x;  // ill-formed; previously well-formed.
```

C.1.3 Clause 6: basics

[diff.cpp17.basic]

¹ **Affected subclause:** 6.7.3**Change:** A pseudo-destructor call ends the lifetime of the object to which it is applied.**Rationale:** Increase consistency of the language model.**Effect on original feature:** Valid ISO C++ 2017 code may be ill-formed or have undefined behavior in this revision of C++.

[Example 1:

```
int f() {
    int a = 123;
    using T = int;
    a.~T();
    return a;           // undefined behavior; previously returned 123
}
```

— end example]

² **Affected subclause:** 6.9.2.2**Change:** Except for the initial release operation, a release sequence consists solely of atomic read-modify-write operations.**Rationale:** Removal of rarely used and confusing feature.**Effect on original feature:** If a `memory_order_release` atomic store is followed by a `memory_order_relaxed` store to the same variable by the same thread, then reading the latter value with a `memory_order_acquire` load no longer provides any “happens before” guarantees, even in the absence of intervening stores by another thread.

C.1.4 Clause 7: expressions

[diff.cpp17.expr]

1 **Affected subclause:** 7.5.5.3**Change:** Implicit lambda capture may capture additional entities.**Rationale:** Rule simplification, necessary to resolve interactions with constexpr if.**Effect on original feature:** Lambdas with a *capture-default* may capture local entities that were not captured in C++ 2017 if those entities are only referenced in contexts that do not result in an odr-use.**C.1.5 Clause 9: declarations**

[diff.cpp17.dcl.dcl]

1 **Affected subclause:** 9.2.4**Change:** Unnamed classes with a typedef name for linkage purposes can contain only C-compatible constructs.**Rationale:** Necessary for implementability.**Effect on original feature:** Valid C++ 2017 code may be ill-formed in this revision of C++.

```
typedef struct {
    void f() {}           // ill-formed; previously well-formed
} S;
```

2 **Affected subclause:** 9.3.4.7**Change:** A function cannot have different default arguments in different translation units.**Rationale:** Required for modules support.**Effect on original feature:** Valid C++ 2017 code may be ill-formed in this revision of C++, with no diagnostic required.

```
// Translation unit 1
int f(int a = 42);
int g() { return f(); }

// Translation unit 2
int f(int a = 76) { return a; }           // ill-formed, no diagnostic required; previously well-formed
int g();
int main() { return g(); }                 // used to return 42
```

3 **Affected subclause:** 9.4.2**Change:** A class that has user-declared constructors is never an aggregate.**Rationale:** Remove potentially error-prone aggregate initialization which may apply notwithstanding the declared constructors of a class.**Effect on original feature:** Valid C++ 2017 code that aggregate-initializes a type with a user-declared constructor may be ill-formed or have different semantics in this revision of C++.

```
struct A {                         // not an aggregate; previously an aggregate
    A() = delete;
};

struct B {                         // not an aggregate; previously an aggregate
    B() = default;
    int i = 0;
};

struct C {                         // not an aggregate; previously an aggregate
    C(C&&) = default;
    int a, b;
};

A a{};                            // ill-formed; previously well-formed
B b = {1};                         // ill-formed; previously well-formed
auto* c = new C{2, 3};             // ill-formed; previously well-formed

struct Y;

struct X {
    operator Y();
};
```

```

struct Y {                                // not an aggregate; previously an aggregate
    Y(const Y&) = default;
    X x;
};

Y y{X{}};                          // copy constructor call; previously aggregate-initialization

```

4 Affected subclause: 9.4.5**Change:** Boolean conversion from a pointer or pointer-to-member type is now a narrowing conversion.**Rationale:** Catches bugs.**Effect on original feature:** Valid C++ 2017 code may fail to compile in this revision of C++. For example:

```
bool y[] = { "bc" };      // ill-formed; previously well-formed
```

C.1.6 Clause 11: classes

[diff.cpp17.class]

1 Affected subclauses: 11.4.5 and 11.4.8.3**Change:** The class name can no longer be used parenthesized immediately after an **explicit decl-specifier** in a constructor declaration. The **conversion-function-id** can no longer be used parenthesized immediately after an **explicit decl-specifier** in a conversion function declaration.**Rationale:** Necessary for new functionality.**Effect on original feature:** Valid C++ 2017 code may fail to compile in this revision of C++. For example:

```

struct S {
    explicit (S)(const S&);      // ill-formed; previously well-formed
    explicit (operator int)();    // ill-formed; previously well-formed
    explicit(true) (S)(int);     // OK
};

```

2 Affected subclauses: 11.4.5 and 11.4.7**Change:** A **simple-template-id** is no longer valid as the **declarator-id** of a constructor or destructor.**Rationale:** Remove potentially error-prone option for redundancy.**Effect on original feature:** Valid C++ 2017 code may fail to compile in this revision of C++. For example:

```

template<class T>
struct A {
    A<T>();           // error: simple-template-id not allowed for constructor
    A(int);           // OK, injected-class-name used
    ~A<T>();          // error: simple-template-id not allowed for destructor
};

```

3 Affected subclause: 11.10.6**Change:** A function returning an implicitly movable entity may invoke a constructor taking an rvalue reference to a type different from that of the returned expression. Function and catch-clause parameters can be thrown using move constructors.**Rationale:** Side effect of making it easier to write more efficient code that takes advantage of moves.**Effect on original feature:** Valid C++ 2017 code may fail to compile or have different semantics in this revision of C++. For example:

```

struct base {
    base();
    base(base const &);

private:
    base(base &&);

};

struct derived : base {};

base f(base b) {
    throw b;                      // error: base(base &&) is private
    derived d;
    return d;                      // error: base(base &&) is private
}

struct S {
    S(const char *s) : m(s) { }
    S(const S&) = default;
}

```

```

S(S&& other) : m(other.m) { other.m = nullptr; }
const char * m;
};

S consume(S&& s) { return s; }

void g() {
    S s("text");
    consume(static_cast<S&&>(s));
    char c = *s.m;           // undefined behavior; previously ok
}

```

C.1.7 Clause 12: overloading

[diff.cpp17.over]

- ¹
- Affected subclause: 12.4.2.3

Change: Equality and inequality expressions can now find reversed and rewritten candidates.

Rationale: Improve consistency of equality with three-way comparison and make it easier to write the full complement of equality operations.

Effect on original feature: Equality and inequality expressions between two objects of different types, where one is convertible to the other, can invoke a different operator. Equality and inequality expressions between two objects of the same type can become ambiguous.

```

struct A {
    operator int() const;
};

bool operator==(A, int);           // #1
// #2 is built-in candidate: bool operator==(int, int);
// #3 is built-in candidate: bool operator!=(int, int);

int check(A x, A y) {
    return (x == y) +             // ill-formed; previously well-formed
           (10 == x) +           // calls #1, previously selected #2
           (10 != x);          // calls #1, previously selected #3
}

```

C.1.8 Clause 13: templates

[diff.cpp17.temp]

- ¹
- Affected subclause: 13.3

Change: An *unqualified-id* that is followed by a < and for which name lookup finds nothing or finds a function will be treated as a *template-name* in order to potentially cause argument dependent lookup to be performed.

Rationale: It was problematic to call a function template with an explicit template argument list via argument dependent lookup because of the need to have a template with the same name visible via normal lookup.

Effect on original feature: Previously valid code that uses a function name as the left operand of a < operator would become ill-formed.

```

struct A {};
bool operator<(void (*fp)(), A);
void f() {}
int main() {
    A a;
    f < a;      // ill-formed; previously well-formed
    (f) < a;   // still well formed
}

```

C.1.9 Clause 14: exception handling

[diff.cpp17.except]

- ¹
- Affected subclause: 14.5

Change: Remove throw() exception specification.

Rationale: Removal of obsolete feature that has been replaced by noexcept.

Effect on original feature: A valid C++ 2017 function declaration, member function declaration, function pointer declaration, or function reference declaration that uses throw() for its exception specification will be

rejected as ill-formed in this revision of C++. It should simply be replaced with `noexcept` for no change of meaning since C++ 2017.

[*Note 1:* There is no way to write a function declaration that is non-throwing in this revision of C++ and is also non-throwing in C++ 2003 except by using the preprocessor to generate a different token sequence in each case. — *end note*]

C.1.10 Clause 16: library introduction

[diff.cpp17.library]

- ¹ **Affected subclause:** [16.4.2.3](#)

Change: New headers.

Rationale: New functionality.

Effect on original feature: The following C++ headers are new: `<barrier>` ([32.8.3.2](#)), `<bit>` ([26.5.2](#)), `<charconv>` ([20.19.1](#)), `<compare>` ([17.11.1](#)), `<concepts>` ([18.3](#)), `<coroutine>` ([17.12.2](#)), `<format>` ([20.20.1](#)), `<latch>` ([32.8.2.2](#)), `<numbers>` ([26.9.1](#)), `<ranges>` ([24.2](#)), `<semaphore>` ([32.7.2](#)), `<source_location>` ([17.8.1](#)), `` ([22.7.2](#)), `<stop_token>` ([32.3.2](#)), `<syncstream>` ([29.10.1](#)), and `<version>` ([17.3.1](#)). Valid C++ 2017 code that `#includes` headers with these names may be invalid in this revision of C++.

- ² **Affected subclause:** [16.4.2.3](#)

Change: Remove vacuous C++ header files.

Rationale: The empty headers implied a false requirement to achieve C compatibility with the C++ headers.

Effect on original feature: A valid C++ 2017 program that `#includes` any of the following headers may fail to compile: `<ccomplex>`, `<ciso646>`, `<cstdalign>`, `<cstdbool>`, and `<ctgmath>`. To retain the same behavior:

- (2.1) — a `#include` of `<ccomplex>` can be replaced by a `#include` of `<complex>` ([26.4.2](#)),
- (2.2) — a `#include` of `<ctgmath>` can be replaced by a `#include` of `<cmath>` ([26.8.1](#)) and a `#include` of `<complex>`, and
- (2.3) — a `#include` of `<ciso646>`, `<cstdalign>`, or `<cstdbool>` can simply be removed.

C.1.11 Clause 22: containers library

[diff.cpp17.containers]

- ¹ **Affected subclauses:** [22.3.9](#) and [22.3.10](#)

Change: Return types of `remove`, `remove_if`, and `unique` changed from `void` to `container::size_type`.

Rationale: Improve efficiency and convenience of finding number of removed elements.

Effect on original feature: Code that depends on the return types can have different semantics in this revision of C++. Translation units compiled against this version of C++ may be incompatible with translation units compiled against C++ 2017, either failing to link or having undefined behavior.

C.1.12 Clause 23: iterators library

[diff.cpp17.iterators]

- ¹ **Affected subclause:** [23.3.2.3](#)

Change: The specialization of `iterator_traits` for `void*` and for function pointer types no longer contains any nested typedefs.

Rationale: Corrects an issue misidentifying pointer types that are not incrementable as iterator types.

Effect on original feature: A valid C++ 2017 program that relies on the presence of the typedefs may fail to compile, or have different behavior.

C.1.13 Clause 25: algorithms library

[diff.cpp17.alg.reqs]

- ¹ **Affected subclause:** [25.2](#)

Change: The number and order of deducible template parameters for algorithm declarations is now unspecified, instead of being as-declared.

Rationale: Increase implementor freedom and allow some function templates to be implemented as function objects with templated call operators.

Effect on original feature: A valid C++ 2017 program that passes explicit template arguments to algorithms not explicitly specified to allow such in this version of C++ may fail to compile or have undefined behavior.

C.1.14 Clause 29: input/output library

[diff.cpp17.input.output]

1 Affected subclause: 29.7.4.3.3**Change:** Character array extraction only takes array types.**Rationale:** Increase safety via preventing buffer overflow at compile time.**Effect on original feature:** Valid C++ 2017 code may fail to compile in this revision of C++:

```
auto p = new char[100];
char q[100];
std::cin >> std::setw(20) >> p;           // ill-formed; previously well-formed
std::cin >> std::setw(20) >> q;           // OK
```

2 Affected subclause: 29.7.5.3.4**Change:** Overload resolution for ostream inserters used with UTF-8 literals.**Rationale:** Required for new features.**Effect on original feature:** Valid C++ 2017 code that passes UTF-8 literals to `basic_ostream<char, ...>::operator<<` or `basic_ostream<wchar_t, ...>::operator<<` is now ill-formed.

```
std::cout << u8"text";                  // previously called operator<<(const char*) and printed a string;
                                              // now ill-formed
std::cout << u8'X';                   // previously called operator<<(char) and printed a character;
                                              // now ill-formed
```

3 Affected subclause: 29.7.5.3.4**Change:** Overload resolution for ostream inserters used with `wchar_t`, `char16_t`, or `char32_t` types.**Rationale:** Removal of surprising behavior.**Effect on original feature:** Valid C++ 2017 code that passes `wchar_t`, `char16_t`, or `char32_t` characters or strings to `basic_ostream<char, ...>::operator<<` or that passes `char16_t` or `char32_t` characters or strings to `basic_ostream<wchar_t, ...>::operator<<` is now ill-formed.

```
std::cout << u"text";                  // previously formatted the string as a pointer value;
                                              // now ill-formed
std::cout << u'X';                   // previously formatted the character as an integer value;
                                              // now ill-formed
```

4 Affected subclause: 29.11.6**Change:** Return type of filesystem path format observer member functions.**Rationale:** Required for new features.**Effect on original feature:** Valid C++ 2017 code that depends on the `u8string()` and `generic_u8string()` member functions of `std::filesystem::path` returning `std::string` is not valid in this revision of C++.

```
std::filesystem::path p;
std::string s1 = p.u8string();          // ill-formed; previously well-formed
std::string s2 = p.generic_u8string();  // ill-formed; previously well-formed
```

C.1.15 Annex D: compatibility features

[diff.cpp17.depr]

1 Change: Remove `uncaught_exception`.**Rationale:** The function did not have a clear specification when multiple exceptions were active, and has been superseded by `uncaught_exceptions`.**Effect on original feature:** A valid C++ 2017 program that calls `std::uncaught_exception` may fail to compile. It can be revised to use `std::uncaught_exceptions` instead, for clear and portable semantics.**2 Change:** Remove support for adaptable function API.**Rationale:** The deprecated support relied on a limited convention that cannot be extended to support the general case or new language features. It has been superseded by direct language support with `decltype`, and by the `std::bind` and `std::not_fn` function templates.**Effect on original feature:** A valid C++ 2017 program that relies on the presence of `result_type`, `argument_type`, `first_argument_type`, or `second_argument_type` in a standard library class may fail to compile. A valid C++ 2017 program that calls `not1` or `not2`, or uses the class templates `unary_negate` or `binary_negate`, may fail to compile.

³ **Change:** Remove redundant members from `std::allocator`.

Rationale: `std::allocator` was overspecified, encouraging direct usage in user containers rather than relying on `std::allocator_traits`, leading to poor containers.

Effect on original feature: A valid C++ 2017 program that directly makes use of the `pointer`, `const_pointer`, `reference`, `const_reference`, `rebind`, `address`, `construct`, `destroy`, or `max_size` members of `std::allocator`, or that directly calls `allocate` with an additional hint argument, may fail to compile.

⁴ **Change:** Remove `raw_storage_iterator`.

Rationale: The iterator encouraged use of potentially-throwing algorithms, but did not return the number of elements successfully constructed, which need to be destroyed in order to avoid leaks.

Effect on original feature: A valid C++ 2017 program that uses this iterator class may fail to compile.

⁵ **Change:** Remove temporary buffers API.

Rationale: The temporary buffer facility was intended to provide an efficient optimization for small memory requests, but there is little evidence this was achieved in practice, while requiring the user to provide their own exception-safe wrappers to guard use of the facility in many cases.

Effect on original feature: A valid C++ 2017 program that calls `get_temporary_buffer` or `return_temporary_buffer` may fail to compile.

⁶ **Change:** Remove `shared_ptr::unique`.

Rationale: The result of a call to this member function is not reliable in the presence of multiple threads and weak pointers. The member function `use_count` is similarly unreliable, but has a clearer contract in such cases, and remains available for well defined use in single-threaded cases.

Effect on original feature: A valid C++ 2017 program that calls `unique` on a `shared_ptr` object may fail to compile.

⁷ **Affected subclause:** D.14

Change: Remove deprecated type traits.

Rationale: The traits had unreliable or awkward interfaces. The `is_literal_type` trait provided no way to detect which subset of constructors and member functions of a type were declared `constexpr`. The `result_of` trait had a surprising syntax that would not report the result of a regular function type. It has been superseded by the `invoke_result` trait.

Effect on original feature: A valid C++ 2017 program that relies on the `is_literal_type` or `result_of` type traits, on the `is_literal_type_v` variable template, or on the `result_of_t` alias template may fail to compile.

C.2 C++ and ISO C++ 2014

[diff.cpp14]

C.2.1 General

[diff.cpp14.general]

¹ Subclause C.2 lists the differences between C++ and ISO C++ 2014 (ISO/IEC 14882:2014, *Programming Languages — C++*), in addition to those listed above, by the chapters of this document.

C.2.2 Clause 5: lexical conventions

[diff.cpp14.lex]

¹ **Affected subclause:** 5.2

Change: Removal of trigraph support as a required feature.

Rationale: Prevents accidental uses of trigraphs in non-raw string literals and comments.

Effect on original feature: Valid C++ 2014 code that uses trigraphs may not be valid or may have different semantics in this revision of C++. Implementations may choose to translate trigraphs as specified in C++ 2014 if they appear outside of a raw string literal, as part of the implementation-defined mapping from physical source file characters to the basic source character set.

² **Affected subclause:** 5.9

Change: `pp-number` can contain `p sign` and `P sign`.

Rationale: Necessary to enable *hexadecimal-floating-point-literals*.

Effect on original feature: Valid C++ 2014 code may fail to compile or produce different results in this revision of C++. Specifically, character sequences like `0p+0` and `0e1_p+0` are three separate tokens each in C++ 2014, but one single token in this revision of C++. For example:

```
#define F(a) b ## a
int b0p = F(0p+0); // ill-formed; equivalent to "int b0p = b0p + 0;" in C++ 2014
```

C.2.3 Clause 7: expressions

[diff.cpp14.expr]

1 **Affected subclauses:** 7.6.1.6 and 7.6.2.3**Change:** Remove increment operator with `bool` operand.**Rationale:** Obsolete feature with occasionally surprising semantics.**Effect on original feature:** A valid C++ 2014 expression utilizing the increment operator on a `bool` lvalue is ill-formed in this revision of C++. Note that this can occur when the lvalue has a type given by a template parameter.2 **Affected subclauses:** 7.6.2.8 and 7.6.2.9**Change:** Dynamic allocation mechanism for over-aligned types.**Rationale:** Simplify use of over-aligned types.**Effect on original feature:** In C++ 2014 code that uses a *new-expression* to allocate an object with an over-aligned class type, where that class has no allocation functions of its own, `::operator new(std::size_t)` is used to allocate the memory. In this revision of C++, `::operator new(std::size_t, std::align_val_t)` is used instead.**C.2.4 Clause 9: declarations**

[diff.cpp14.dcl.dcl]

1 **Affected subclause:** 9.2.2**Change:** Removal of `register storage-class-specifier`.**Rationale:** Enable repurposing of deprecated keyword in future revisions of C++.**Effect on original feature:** A valid C++ 2014 declaration utilizing the `register storage-class-specifier` is ill-formed in this revision of C++. The specifier can simply be removed to retain the original meaning.2 **Affected subclause:** 9.2.9.6**Change:** `auto` deduction from *braced-init-list*.**Rationale:** More intuitive deduction behavior.**Effect on original feature:** Valid C++ 2014 code may fail to compile or may change meaning in this revision of C++. For example:

```
auto x1{1};           // was std::initializer_list<int>, now int
auto x2{1, 2};        // was std::initializer_list<int>, now ill-formed
```

3 **Affected subclause:** 9.3.4.6**Change:** Make exception specifications be part of the type system.**Rationale:** Improve type-safety.**Effect on original feature:** Valid C++ 2014 code may fail to compile or change meaning in this revision of C++. For example:

```
void g1() noexcept;
void g2();
template<class T> int f(T *, T *);
int x = f(g1, g2);           // ill-formed; previously well-formed
```

4 **Affected subclause:** 9.4.2**Change:** Definition of an aggregate is extended to apply to user-defined types with base classes.**Rationale:** To increase convenience of aggregate initialization.**Effect on original feature:** Valid C++ 2014 code may fail to compile or produce different results in this revision of C++; initialization from an empty initializer list will perform aggregate initialization instead of invoking a default constructor for the affected types. For example:

```
struct derived;
struct base {
    friend struct derived;
private:
    base();
};
struct derived : base {};

derived d1{};           // error; the code was well-formed in C++ 2014
derived d2;             // still OK
```

C.2.5 Clause 11: classes

[diff.cpp14.class]

¹ **Affected subclause:** [11.10.4](#)**Change:** Inheriting a constructor no longer injects a constructor into the derived class.**Rationale:** Better interaction with other language features.**Effect on original feature:** Valid C++ 2014 code that uses inheriting constructors may not be valid or may have different semantics. A *using-declaration* that names a constructor now makes the corresponding base class constructors visible to initializations of the derived class rather than declaring additional derived class constructors.

```
struct A {
    template<typename T> A(T, typename T::type = 0);
    A(int);
};

struct B : A {
    using A::A;
    B(int);
};

B b(42L);           // now calls B(int), used to call B<long>(long),
                    // which called A(int) due to substitution failure
                    // in A<long>(long).
```

C.2.6 Clause 13: templates

[diff.cpp14.temp]

¹ **Affected subclause:** [13.10.3.6](#)**Change:** Allowance to deduce from the type of a non-type template argument.**Rationale:** In combination with the ability to declare non-type template arguments with placeholder types, allows partial specializations to decompose from the type deduced for the non-type template argument.**Effect on original feature:** Valid C++ 2014 code may fail to compile or produce different results in this revision of C++. For example:

```
template <int N> struct A;
template <typename T, T N> int foo(A<N> *) = delete;
void foo(void *);
void bar(A<0> *p) {
    foo(p);           // ill-formed; previously well-formed
}
```

C.2.7 Clause 14: exception handling

[diff.cpp14.except]

¹ **Affected subclause:** [14.5](#)**Change:** Remove dynamic exception specifications.**Rationale:** Dynamic exception specifications were a deprecated feature that was complex and brittle in use. They interacted badly with the type system, which became a more significant issue in this revision of C++ where (non-dynamic) exception specifications are part of the function type.**Effect on original feature:** A valid C++ 2014 function declaration, member function declaration, function pointer declaration, or function reference declaration, if it has a potentially throwing dynamic exception specification, is rejected as ill-formed in this revision of C++. Violating a non-throwing dynamic exception specification calls `terminate` rather than `unexpected` and it is unspecified whether stack unwinding is performed prior to such a call.**C.2.8 Clause 16: library introduction**

[diff.cpp14.library]

¹ **Affected subclause:** [16.4.2.3](#)**Change:** New headers.**Rationale:** New functionality.**Effect on original feature:** The following C++ headers are new: `<any>` ([20.8.2](#)), `<charconv>` ([20.19.1](#)), `<execution>` ([20.18.2](#)), `<filesystem>` ([29.11.4](#)), `<memory_resource>` ([20.12.1](#)), `<optional>` ([20.6.2](#)), `<string_view>` ([21.4.2](#)), and `<variant>` ([20.7.2](#)). Valid C++ 2014 code that `#includes` headers with these names may be invalid in this revision of C++.² **Affected subclause:** [16.4.5.2.3](#)**Change:** New reserved namespaces.**Rationale:** Reserve namespaces for future revisions of the standard library that can otherwise be incompatible with existing programs.

Effect on original feature: The global namespaces `std` followed by an arbitrary sequence of *digits* (5.10) are reserved for future standardization. Valid C++ 2014 code that uses such a top-level namespace, e.g., `std2`, may be invalid in this revision of C++.

C.2.9 Clause 20: general utilities library

[diff.cpp14.utilities]

¹ **Affected subclause:** 20.14.17

Change: Constructors taking allocators removed.

Rationale: No implementation consensus.

Effect on original feature: Valid C++ 2014 code may fail to compile or may change meaning in this revision of C++. Specifically, constructing a `std::function` with an allocator is ill-formed and uses-allocator construction will not pass an allocator to `std::function` constructors in this revision of C++.

² **Affected subclause:** 20.11.3

Change: Different constraint on conversions from `unique_ptr`.

Rationale: Adding array support to `shared_ptr`, via the syntax `shared_ptr<T[]>` and `shared_ptr<T[N]>`.

Effect on original feature: Valid C++ 2014 code may fail to compile or may change meaning in this revision of C++. For example:

```
#include <memory>
std::unique_ptr<int[]> arr(new int[1]);
std::shared_ptr<int> ptr(std::move(arr)); // error: int(*)[] is not compatible with int*
```

C.2.10 Clause 21: strings library

[diff.cpp14.string]

¹ **Affected subclause:** 21.3.3

Change: Non-const `.data()` member added.

Rationale: The lack of a non-const `.data()` differed from the similar member of `std::vector`. This change regularizes behavior.

Effect on original feature: Overloaded functions which have differing code paths for `char*` and `const char*` arguments will execute differently when called with a non-const string's `.data()` member in this revision of C++.

```
int f(char *) = delete;
int f(const char *);
string s;
int x = f(s.data()); // ill-formed; previously well-formed
```

C.2.11 Clause 22: containers library

[diff.cpp14.containers]

¹ **Affected subclause:** 22.2.6

Change: Requirements change:

Rationale: Increase portability, clarification of associative container requirements.

Effect on original feature: Valid C++ 2014 code that attempts to use associative containers having a comparison object with non-const function call operator may fail to compile in this revision of C++:

```
#include <set>

struct compare
{
    bool operator()(int a, int b)
    {
        return a < b;
    }
};

int main() {
    const std::set<int, compare> s;
    s.find(0);
}
```

C.2.12 Annex D: compatibility features

[diff.cpp14.depr]

¹ **Change:** The class templates `auto_ptr`, `unary_function`, and `binary_function`, the function templates `random_shuffle`, and the function templates (and their return types) `ptr_fun`, `mem_fun`, `mem_fun_ref`, `bind1st`, and `bind2nd` are not defined.

Rationale: Superseded by new features.

Effect on original feature: Valid C++ 2014 code that uses these class templates and function templates may fail to compile in this revision of C++.

- ² **Change:** Remove old iostreams members [depr.ios.members].

Rationale: Redundant feature for compatibility with pre-standard code has served its time.

Effect on original feature: A valid C++ 2014 program using these identifiers may be ill-formed in this revision of C++.

C.3 C++ and ISO C++ 2011

[diff.cpp11]

C.3.1 General

[diff.cpp11.general]

- ¹ Subclause C.3 lists the differences between C++ and ISO C++ 2011 (ISO/IEC 14882:2011, *Programming Languages — C++*), in addition to those listed above, by the chapters of this document.

C.3.2 Clause 5: lexical conventions

[diff.cpp11.lex]

- ¹ **Affected subclause:** 5.9

Change: *pp-number* can contain one or more single quotes.

Rationale: Necessary to enable single quotes as digit separators.

Effect on original feature: Valid C++ 2011 code may fail to compile or may change meaning in this revision of C++. For example, the following code is valid both in C++ 2011 and in this revision of C++, but the macro invocation produces different outcomes because the single quotes delimit a *character-literal* in C++ 2011, whereas they are digit separators in this revision of C++:

```
#define M(x, ...) __VA_ARGS__
int x[2] = { M(1'2,3'4, 5) };
// int x[2] = { 5 }; — C++ 2011
// int x[2] = { 3'4, 5 }; — this revision of C++
```

C.3.3 Clause 6: basics

[diff.cpp11.basic]

- ¹ **Affected subclause:** 6.7.5.5.3

Change: New usual (non-placement) deallocator.

Rationale: Required for sized deallocation.

Effect on original feature: Valid C++ 2011 code can declare a global placement allocation function and deallocation function as follows:

```
void* operator new(std::size_t, std::size_t);
void operator delete(void*, std::size_t) noexcept;
```

In this revision of C++, however, the declaration of `operator delete` can match a predefined usual (non-placement) `operator delete` (6.7.5.5). If so, the program is ill-formed, as it was for class member allocation functions and deallocation functions (7.6.2.8).

C.3.4 Clause 7: expressions

[diff.cpp11.expr]

- ¹ **Affected subclause:** 7.6.16

Change: A conditional expression with a throw expression as its second or third operand keeps the type and value category of the other operand.

Rationale: Formerly mandated conversions (lvalue-to-rvalue (7.3.2), array-to-pointer (7.3.3), and function-to-pointer (7.3.4) standard conversions), especially the creation of the temporary due to lvalue-to-rvalue conversion, were considered gratuitous and surprising.

Effect on original feature: Valid C++ 2011 code that relies on the conversions may behave differently in this revision of C++:

```
struct S {
    int x = 1;
    void mf() { x = 2; }
};
int f(bool cond) {
    S s;
    (cond ? s : throw 0).mf();
    return s.x;
}
```

In C++ 2011, `f(true)` returns 1. In this revision of C++, it returns 2.

```
sizeof(true ? "" : throw 0)
```

In C++ 2011, the expression yields `sizeof(const char*)`. In this revision of C++, it yields `sizeof(const char[1])`.

C.3.5 Clause 9: declarations

[diff.cpp11.dcl.dcl]

- ¹ Affected subclause: 9.2.6

Change: `constexpr` non-static member functions are not implicitly `const` member functions.

Rationale: Necessary to allow `constexpr` member functions to mutate the object.

Effect on original feature: Valid C++ 2011 code may fail to compile in this revision of C++. For example, the following code is valid in C++ 2011 but invalid in this revision of C++ because it declares the same member function twice with different return types:

```
struct S {
    constexpr const int &f();
    int &f();
};
```

- ² Affected subclause: 9.4.2

Change: Classes with default member initializers can be aggregates.

Rationale: Necessary to allow default member initializers to be used by aggregate initialization.

Effect on original feature: Valid C++ 2011 code may fail to compile or may change meaning in this revision of C++. For example:

```
struct S {           // Aggregate in C++ 2014 onwards.
    int m = 1;
};

struct X {
    operator int();
    operator S();
};

X a{};
S b{a};           // uses copy constructor in C++ 2011,
                  // performs aggregate initialization in this revision of C++
```

C.3.6 Clause 16: library introduction

[diff.cpp11.library]

- ¹ Affected subclause: 16.4.2.3

Change: New header.

Rationale: New functionality.

Effect on original feature: The C++ header `<shared_mutex>` (32.5.3) is new. Valid C++ 2011 code that `#includes` a header with that name may be invalid in this revision of C++.

C.3.7 Clause 29: input/output library

[diff.cpp11.input.output]

- ¹ Affected subclause: 29.12

Change: `gets` is not defined.

Rationale: Use of `gets` is considered dangerous.

Effect on original feature: Valid C++ 2011 code that uses the `gets` function may fail to compile in this revision of C++.

C.4 C++ and ISO C++ 2003

[diff.cpp03]

C.4.1 General

[diff.cpp03.general]

- ¹ Subclause C.4 lists the differences between C++ and ISO C++ 2003 (ISO/IEC 14882:2003, *Programming Languages — C++*), in addition to those listed above, by the chapters of this document.

C.4.2 Clause 5: lexical conventions

[diff.cpp03.lex]

- ¹ Affected subclause: 5.4

Change: New kinds of *string-literals*.

Rationale: Required for new features.

Effect on original feature: Valid C++ 2003 code may fail to compile or produce different results in this

revision of C++. Specifically, macros named R, u8, u8R, u, uR, U, UR, or LR will not be expanded when adjacent to a *string-literal* but will be interpreted as part of the *string-literal*. For example:

```
#define u8 "abc"
const char* s = u8"def";           // Previously "abcdef", now "def"
```

2 Affected subclause: 5.4

Change: User-defined literal string support.

Rationale: Required for new features.

Effect on original feature: Valid C++ 2003 code may fail to compile or produce different results in this revision of C++. For example:

```
#define _x "there"
"hello"_x           // #1
```

Previously, #1 would have consisted of two separate preprocessing tokens and the macro `_x` would have been expanded. In this revision of C++, #1 consists of a single preprocessing token, so the macro is not expanded.

3 Affected subclause: 5.11

Change: New keywords.

Rationale: Required for new features.

Effect on original feature: Added to Table 5, the following identifiers are new keywords: `alignas`, `alignof`, `char16_t`, `char32_t`, `constexpr`, `decltype`, `noexcept`, `nullptr`, `static_assert`, and `thread_local`. Valid C++ 2003 code using these identifiers is invalid in this revision of C++.

4 Affected subclause: 5.13.2

Change: Type of integer literals.

Rationale: C99 compatibility.

Effect on original feature: Certain integer literals whose value is larger than the maximum representable value of type `long` can change from an unsigned integer type to `signed long long`.

C.4.3 Clause 7: expressions

[diff.cpp03.expr]

1 Affected subclause: 7.3.12

Change: Only literals are integer null pointer constants.

Rationale: Removing surprising interactions with templates and constant expressions.

Effect on original feature: Valid C++ 2003 code may fail to compile or produce different results in this revision of C++. For example:

```
void f(void *);      // #1
void f(...);         // #2
template<int N> void g() {
    f(0*N);          // calls #2; used to call #1
}
```

2 Affected subclause: 7.6.5

Change: Specify rounding for results of integer / and %.

Rationale: Increase portability, C99 compatibility.

Effect on original feature: Valid C++ 2003 code that uses integer division rounds the result toward 0 or toward negative infinity, whereas this revision of C++ always rounds the result toward 0.

3 Affected subclause: 7.6.14

Change: `&&` is valid in a *type-name*.

Rationale: Required for new features.

Effect on original feature: Valid C++ 2003 code may fail to compile or produce different results in this revision of C++. For example:

```
bool b1 = new int && false;           // previously false, now ill-formed
struct S { operator int(); };
bool b2 = &S::operator int && false;    // previously false, now ill-formed
```

C.4.4 Clause 9: declarations

[diff.cpp03.dcl.dcl]

1 Affected subclause: 9.2

Change: Remove `auto` as a storage class specifier.

Rationale: New feature.

Effect on original feature: Valid C++ 2003 code that uses the keyword `auto` as a storage class specifier

may be invalid in this revision of C++. In this revision of C++, `auto` indicates that the type of a variable is to be deduced from its initializer expression.

2 Affected subclause: [9.4.5](#)

Change: Narrowing restrictions in aggregate initializers.

Rationale: Catches bugs.

Effect on original feature: Valid C++ 2003 code may fail to compile in this revision of C++. For example, the following code is valid in C++ 2003 but invalid in this revision of C++ because `double` to `int` is a narrowing conversion:

```
int x[] = { 2.0 };
```

C.4.5 Clause 11: classes

[[diff.cpp03.class](#)]

1 Affected subclauses: [11.4.5.2](#), [11.4.7](#), [11.4.5.3](#), and [11.4.6](#)

Change: Implicitly-declared special member functions are defined as deleted when the implicit definition would have been ill-formed.

Rationale: Improves template argument deduction failure.

Effect on original feature: A valid C++ 2003 program that uses one of these special member functions in a context where the definition is not required (e.g., in an expression that is not potentially evaluated) becomes ill-formed.

2 Affected subclause: [11.4.7](#)

Change: User-declared destructors have an implicit exception specification.

Rationale: Clarification of destructor requirements.

Effect on original feature: Valid C++ 2003 code may execute differently in this revision of C++. In particular, destructors that throw exceptions will call `std::terminate` (without calling `std::unexpected`) if their exception specification is non-throwing.

C.4.6 Clause 13: templates

[[diff.cpp03.temp](#)]

1 Affected subclause: [13.2](#)

Change: Remove `export`.

Rationale: No implementation consensus.

Effect on original feature: A valid C++ 2003 declaration containing `export` is ill-formed in this revision of C++.

2 Affected subclause: [13.4](#)

Change: Remove whitespace requirement for nested closing template right angle brackets.

Rationale: Considered a persistent but minor annoyance. Template aliases representing non-class types would exacerbate whitespace issues.

Effect on original feature: Change to semantics of well-defined expression. A valid C++ 2003 expression containing a right angle bracket (“>”) followed immediately by another right angle bracket may now be treated as closing two templates. For example, the following code is valid in C++ 2003 because “>>” is a right-shift operator, but invalid in this revision of C++ because “>>” closes two templates.

```
template <class T> struct X { };
template <int N> struct Y { };
X< Y< 1 >> 2 > > x;
```

3 Affected subclause: [13.8.5.2](#)

Change: Allow dependent calls of functions with internal linkage.

Rationale: Overly constrained, simplify overload resolution rules.

Effect on original feature: A valid C++ 2003 program can get a different result than in this revision of C++.

C.4.7 Clause 16: library introduction

[[diff.cpp03.library](#)]

1 Affected: [Clause 16 – Clause 32](#)

Change: New reserved identifiers.

Rationale: Required by new features.

Effect on original feature: Valid C++ 2003 code that uses any identifiers added to the C++ standard library by later revisions of C++ may fail to compile or produce different results in this revision of C++. A comprehensive list of identifiers used by the C++ standard library can be found in the Index of Library Names in this document.

² Affected subclause: 16.4.2.3**Change:** New headers.**Rationale:** New functionality.

Effect on original feature: The following C++ headers are new: `<array>` (22.3.2), `<atomic>` (31.2), `<chrono>` (27.2), `<codecvt>` (D.21.2), `<condition_variable>` (32.6.2), `<forward_list>` (22.3.4), `<future>` (32.9.2), `<initializer_list>` (17.10.2), `<mutex>` (32.5.2), `<random>` (26.6.2), `<ratio>` (20.16.2), `<regex>` (30.4), `<scoped_allocator>` (20.13.1), `<system_error>` (19.5.2), `<thread>` (32.4.2), `<tuple>` (20.5.2), `<typeindex>` (20.17.1), `<type_traits>` (20.15.3), `<unordered_map>` (22.5.2), and `<unordered_set>` (22.5.3). In addition the following C compatibility headers are new: `<cfenv>` (26.3.1), `<cinttypes>` (29.12.2), `<cstdint>` (17.4.2), and `<cuchar>` (21.5.5). Valid C++ 2003 code that #includes headers with these names may be invalid in this revision of C++.

³ Affected subclause: 16.4.4.3**Effect on original feature:** Function `swap` moved to a different header**Rationale:** Remove dependency on `<algorithm>` (25.4) for `swap`.

Effect on original feature: Valid C++ 2003 code that has been compiled expecting `swap` to be in `<algorithm>` (25.4) may have to instead include `<utility>` (20.2.1).

⁴ Affected subclause: 16.4.5.2.2**Change:** New reserved namespace.**Rationale:** New functionality.

Effect on original feature: The global namespace `posix` is now reserved for standardization. Valid C++ 2003 code that uses a top-level namespace `posix` may be invalid in this revision of C++.

⁵ Affected subclause: 16.4.6.3**Change:** Additional restrictions on macro names.**Rationale:** Avoid hard to diagnose or non-portable constructs.

Effect on original feature: Names of attribute identifiers may not be used as macro names. Valid C++ 2003 code that defines `override`, `final`, `carries_dependency`, or `noreturn` as macros is invalid in this revision of C++.

C.4.8 Clause 17: language support library

[diff.cpp03.language.support]

¹ Affected subclause: 17.6.3.2**Change:** operator `new` may throw exceptions other than `std::bad_alloc`.**Rationale:** Consistent application of `noexcept`.

Effect on original feature: Valid C++ 2003 code that assumes that global operator `new` only throws `std::bad_alloc` may execute differently in this revision of C++. Valid C++ 2003 code that replaces the global replaceable operator `new` is ill-formed in this revision of C++, because the exception specification of `throw(std::bad_alloc)` was removed.

C.4.9 Clause 19: diagnostics library

[diff.cpp03.diagnostics]

¹ Affected subclause: 19.4**Change:** Thread-local error numbers.**Rationale:** Support for new thread facilities.

Effect on original feature: Valid but implementation-specific C++ 2003 code that relies on `errno` being the same across threads may change behavior in this revision of C++.

C.4.10 Clause 20: general utilities library

[diff.cpp03.utilities]

¹ Affected subclause: 20.10.5**Change:** Minimal support for garbage-collected regions.**Rationale:** Required by new feature.

Effect on original feature: Valid C++ 2003 code, compiled without traceable pointer support, that interacts with newer C++ code using regions declared reachable may have different runtime behavior.

² Affected subclauses: 20.14.6, 20.14.7, 20.14.8, 20.14.10, and 20.14.11**Change:** Standard function object types no longer derived from `std::unary_function` or `std::binary_function`.**Rationale:** Superseded by new feature; `unary_function` and `binary_function` are no longer defined.

Effect on original feature: Valid C++ 2003 code that depends on function object types being derived from `unary_function` or `binary_function` may fail to compile in this revision of C++.

C.4.11 Clause 21: strings library

[diff.cpp03.strings]

1 Affected subclause: 21.3**Change:** `basic_string` requirements no longer allow reference-counted strings.**Rationale:** Invalidation is subtly different with reference-counted strings. This change regularizes behavior.**Effect on original feature:** Valid C++ 2003 code may execute differently in this revision of C++.**2 Affected subclause: 21.3.3.2****Change:** Loosen `basic_string` validation rules.**Rationale:** Allow small-string optimization.**Effect on original feature:** Valid C++ 2003 code may execute differently in this revision of C++. Some `const` member functions, such as `data` and `c_str`, no longer invalidate iterators.**C.4.12 Clause 22: containers library**

[diff.cpp03.containers]

1 Affected subclause: 22.2**Change:** Complexity of `size()` member functions now constant.**Rationale:** Lack of specification of complexity of `size()` resulted in divergent implementations with inconsistent performance characteristics.**Effect on original feature:** Some container implementations that conform to C++ 2003 may not conform to the specified `size()` requirements in this revision of C++. Adjusting containers such as `std::list` to the stricter requirements may require incompatible changes.**2 Affected subclause: 22.2****Change:** Requirements change: relaxation.**Rationale:** Clarification.**Effect on original feature:** Valid C++ 2003 code that attempts to meet the specified container requirements may now be over-specified. Code that attempted to be portable across containers may need to be adjusted as follows:

- (2.1) — not all containers provide `size()`; use `empty()` instead of `size() == 0`;
- (2.2) — not all containers are empty after construction (`array`);
- (2.3) — not all containers have constant complexity for `swap()` (`array`).

3 Affected subclause: 22.2**Change:** Requirements change: default constructible.**Rationale:** Clarification of container requirements.**Effect on original feature:** Valid C++ 2003 code that attempts to explicitly instantiate a container using a user-defined type with no default constructor may fail to compile.**4 Affected subclauses: 22.2.3 and 22.2.6****Change:** Signature changes: from `void` return types.**Rationale:** Old signature threw away useful information that may be expensive to recalculate.**Effect on original feature:** The following member functions have changed:

- (4.1) — `erase(iterator)` for `set`, `multiset`, `map`, `multimap`
- (4.2) — `erase(begin, end)` for `set`, `multiset`, `map`, `multimap`
- (4.3) — `insert(pos, num, val)` for `vector`, `deque`, `list`, `forward_list`
- (4.4) — `insert(pos, beg, end)` for `vector`, `deque`, `list`, `forward_list`

Valid C++ 2003 code that relies on these functions returning `void` (e.g., code that creates a pointer to member function that points to one of these functions) will fail to compile with this revision of C++.**5 Affected subclauses: 22.2.3 and 22.2.6****Change:** Signature changes: from `iterator` to `const_iterator` parameters.**Rationale:** Overspecification.**Effect on original feature:** The signatures of the following member functions changed from taking an `iterator` to taking a `const_iterator`:

- (5.1) — `insert(iterator, val)` for `vector`, `deque`, `list`, `set`, `multiset`, `map`, `multimap`
- (5.2) — `insert(pos, beg, end)` for `vector`, `deque`, `list`, `forward_list`
- (5.3) — `erase(begin, end)` for `set`, `multiset`, `map`, `multimap`
- (5.4) — all forms of `list::splice`

- (5.5) — all forms of `list::merge`

Valid C++ 2003 code that uses these functions may fail to compile with this revision of C++.

6 Affected subclauses: [22.2.3](#) and [22.2.6](#)

Change: Signature changes: `resize`.

Rationale: Performance, compatibility with move semantics.

Effect on original feature: For `vector`, `deque`, and `list` the fill value passed to `resize` is now passed by reference instead of by value, and an additional overload of `resize` has been added. Valid C++ 2003 code that uses this function may fail to compile with this revision of C++.

C.4.13 Clause 25: algorithms library

[[diff.cpp03.algorithms](#)]

1 Affected subclause: [25.1](#)

Change: Result state of inputs after application of some algorithms.

Rationale: Required by new feature.

Effect on original feature: A valid C++ 2003 program may detect that an object with a valid but unspecified state has a different valid but unspecified state with this revision of C++. For example, `std::remove` and `std::remove_if` may leave the tail of the input sequence with a different set of values than previously.

C.4.14 Clause 26: numerics library

[[diff.cpp03.numerics](#)]

1 Affected subclause: [26.4](#)

Change: Specified representation of complex numbers.

Rationale: Compatibility with C99.

Effect on original feature: Valid C++ 2003 code that uses implementation-specific knowledge about the binary representation of the required template specializations of `std::complex` may not be compatible with this revision of C++.

C.4.15 Clause 29: input/output library

[[diff.cpp03.input.output](#)]

1 Affected subclauses: [29.7.4.2.4](#), [29.7.5.2.4](#), and [29.5.5.4](#)

Change: Specify use of `explicit` in existing boolean conversion functions.

Rationale: Clarify intentions, avoid workarounds.

Effect on original feature: Valid C++ 2003 code that relies on implicit boolean conversions will fail to compile with this revision of C++. Such conversions occur in the following conditions:

- (1.1) — passing a value to a function that takes an argument of type `bool`;
- (1.2) — using `operator==` to compare to `false` or `true`;
- (1.3) — returning a value from a function with a return type of `bool`;
- (1.4) — initializing members of type `bool` via aggregate initialization;
- (1.5) — initializing a `const bool&` which would bind to a temporary object.

2 Affected subclause: [29.5.3.2.1](#)

Change: Change base class of `std::ios_base::failure`.

Rationale: More detailed error messages.

Effect on original feature: `std::ios_base::failure` is no longer derived directly from `std::exception`, but is now derived from `std::system_error`, which in turn is derived from `std::runtime_error`. Valid C++ 2003 code that assumes that `std::ios_base::failure` is derived directly from `std::exception` may execute differently in this revision of C++.

3 Affected subclause: [29.5.3](#)

Change: Flag types in `std::ios_base` are now bitmasks with values defined as `constexpr` static members.

Rationale: Required for new features.

Effect on original feature: Valid C++ 2003 code that relies on `std::ios_base` flag types being represented as `std::bitset` or as an integer type may fail to compile with this revision of C++. For example:

```
#include <iostream>

int main() {
    int flag = std::ios_base::hex;
    std::cout.setf(flag);           // error: setf does not take argument of type int
}
```

C.5 C++ and ISO C

[diff.iso]

C.5.1 General

[diff.iso.general]

- ¹ Subclause C.5 lists the differences between C++ and ISO C, in addition to those listed above, by the chapters of this document.

C.5.2 Clause 5: lexical conventions

[diff.lex]

- ¹ **Affected subclause:** 5.11

Change: New Keywords

New keywords are added to C++; see 5.11.

Rationale: These keywords were added in order to implement the new semantics of C++.**Effect on original feature:** Change to semantics of well-defined feature. Any ISO C programs that used any of these keywords as identifiers are not valid C++ programs.**Difficulty of converting:** Syntactic transformation. Converting one specific program is easy. Converting a large collection of related programs takes more work.**How widely used:** Common.

- ² **Affected subclause:** 5.13.3

Change: Type of *character-literal* is changed from `int` to `char`.**Rationale:** This is needed for improved overloaded function argument type matching. For example:

```
int function( int i );
int function( char c );

function( 'x' );
```

It is preferable that this call match the second version of function rather than the first.

Effect on original feature: Change to semantics of well-defined feature. ISO C programs which depend on

```
sizeof('x') == sizeof(int)
```

will not work the same as C++ programs.

Difficulty of converting: Simple.**How widely used:** Programs which depend upon `sizeof('x')` are probably rare.

- ³ **Affected subclause:** 5.13.5

Change: String literals made `const`.The type of a *string-literal* is changed from “array of `char`” to “array of `const char`”. The type of a UTF-8 string literal is changed from “array of `char`” to “array of `const char8_t`”. The type of a UTF-16 string literal is changed from “array of *some-integer-type*” to “array of `const char16_t`”. The type of a UTF-32 string literal is changed from “array of *some-integer-type*” to “array of `const char32_t`”. The type of a wide string literal is changed from “array of `wchar_t`” to “array of `const wchar_t`”.**Rationale:** This avoids calling an inappropriate overloaded function, which would possibly attempt to modify its argument.**Effect on original feature:** Change to semantics of well-defined feature.**Difficulty of converting:** Syntactic transformation. The fix is to add a cast:

```
char* p = "abc";           // valid in C, invalid in C++
void f(char*) {
    char* p = (char*)"abc";   // OK: cast added
    f(p);
    f((char*)"def");        // OK: cast added
}
```

How widely used: Programs that have a legitimate reason to treat string literal objects as potentially modifiable memory are probably rare.**C.5.3 Clause 6: basics**

[diff.basic]

- ¹ **Affected subclause:** 6.2

Change: C++ does not have “tentative definitions” as in C.

E.g., at file scope,

```
int i;
int i;
```

is valid in C, invalid in C++. This makes it impossible to define mutually referential file-local objects with static storage duration, if initializers are restricted to the syntactic forms of C. For example,

```
struct X { int i; struct X* next; };

static struct X a;
static struct X b = { 0, &a };
static struct X a = { 1, &b };
```

Rationale: This avoids having different initialization rules for fundamental types and user-defined types.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. In C++, the initializer for one of a set of mutually-referential file-local objects with static storage duration must invoke a function call to achieve the initialization.

How widely used: Seldom.

2 Affected subclause: 6.4

Change: A `struct` is a scope in C++, not in C.

Rationale: Class scope is crucial to C++, and a `struct` is a class.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: C programs use `struct` extremely frequently, but the change is only noticeable when `struct`, enumeration, or enumerator names are referred to outside the `struct`. The latter is probably rare.

3 Affected subclause: 6.6 [also 9.2.9]

Change: A name of file scope that is explicitly declared `const`, and not explicitly declared `extern`, has internal linkage, while in C it would have external linkage.

Rationale: Because `const` objects may be used as values during translation in C++, this feature urges programmers to provide an explicit initializer for each `const` object. This feature allows the user to put `const` objects in source files that are included in more than one translation unit.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: Seldom.

4 Affected subclause: 6.9.3.1

Change: The `main` function cannot be called recursively and cannot have its address taken.

Rationale: The `main` function may require special actions.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Trivial: create an intermediary function such as `mymain(argc, argv)`.

How widely used: Seldom.

5 Affected subclause: 6.8

Change: C allows “compatible types” in several places, C++ does not.

For example, otherwise-identical `struct` types with different tag names are “compatible” in C but are distinctly different types in C++.

Rationale: Stricter type checking is essential for C++.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. The “typesafe linkage” mechanism will find many, but not all, of such problems. Those problems not found by typesafe linkage will continue to function properly, according to the “layout compatibility rules” of this document.

How widely used: Common.

C.5.4 Clause 7: expressions

[diff.expr]

1 Affected subclause: 7.3.12

Change: Converting `void*` to a pointer-to-object type requires casting.

```
char a[10];
void* b=a;
void foo() {
    char* c=b;
}
```

ISO C will accept this usage of pointer to void being assigned to a pointer to object type. C++ will not.

Rationale: C++ tries harder than C to enforce compile-time type safety.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Can be automated. Violations will be diagnosed by the C++ translator. The fix is to add a cast. For example:

```
char* c = (char*) b;
```

How widely used: This is fairly widely used but it is good programming practice to add the cast when assigning pointer-to-void to pointer-to-object. Some ISO C translators will give a warning if the cast is not used.

2 Affected subclause: 7.6.1.3

Change: Implicit declaration of functions is not allowed.

Rationale: The type-safe nature of C++.

Effect on original feature: Deletion of semantically well-defined feature. Note: the original feature was labeled as “obsolete” in ISO C.

Difficulty of converting: Syntactic transformation. Facilities for producing explicit function declarations are fairly widespread commercially.

How widely used: Common.

3 Affected subclauses: 7.6.1.6 and 7.6.2.3

Change: Decrement operator is not allowed with `bool` operand.

Rationale: Feature with surprising semantics.

Effect on original feature: A valid ISO C expression utilizing the decrement operator on a `bool` lvalue (for instance, via the C typedef in `<stdbool.h>` (D.10.5)) is ill-formed in C++.

4 Affected subclauses: 7.6.2.5 and 7.6.3

Change: In C++, types can only be defined in declarations, not in expressions.

In C, a `sizeof` expression or cast expression may define a new type. For example,

```
p = (void*)(struct x {int i;} *)0;
```

defines a new type, `struct x`.

Rationale: This prohibition helps to clarify the location of definitions in the source code.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Syntactic transformation.

How widely used: Seldom.

5 Affected subclauses: 7.6.16, 7.6.19, and 7.6.20

Change: The result of a conditional expression, an assignment expression, or a comma expression may be an lvalue.

Rationale: C++ is an object-oriented language, placing relatively more emphasis on lvalues. For example, function calls may yield lvalues.

Effect on original feature: Change to semantics of well-defined feature. Some C expressions that implicitly rely on lvalue-to-rvalue conversions will yield different results. For example,

```
char arr[100];
sizeof(0, arr)
```

yields 100 in C++ and `sizeof(char*)` in C.

Difficulty of converting: Programs must add explicit casts to the appropriate rvalue.

How widely used: Rare.

C.5.5 Clause 8: statements

[diff.stat]

1 Affected subclauses: 8.5.3 and 8.7.6

Change: It is now invalid to jump past a declaration with explicit or implicit initializer (except across entire block not entered).

Rationale: Constructors used in initializers may allocate resources which need to be de-allocated upon leaving the block. Allowing jump past initializers would require complicated runtime determination of allocation. Furthermore, any use of the uninitialized object can be a disaster. With this simple compile-time rule, C++ assures that if an initialized variable is in scope, then it has assuredly been initialized.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: Seldom.

2 Affected subclause: 8.7.4

Change: It is now invalid to return (explicitly or implicitly) from a function which is declared to return a value without actually returning a value.

Rationale: The caller and callee may assume fairly elaborate return-value mechanisms for the return of class objects. If some flow paths execute a return without specifying any value, the implementation must embody many more complications. Besides, promising to return a value of a given type, and then not returning such a value, has always been recognized to be a questionable practice, tolerated only because very-old C had no distinction between void functions and int functions.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. Add an appropriate return value to the source code, such as zero.

How widely used: Seldom. For several years, many existing C implementations have produced warnings in this case.

C.5.6 Clause 9: declarations

[diff.dcl]

¹ **Affected subclause:** 9.2.2

Change: In C++, the `static` or `extern` specifiers can only be applied to names of objects or functions. Using these specifiers with type declarations is illegal in C++. In C, these specifiers are ignored when used on type declarations.

Example:

```
static struct S {           // valid C, invalid in C++
    int i;
};
```

Rationale: Storage class specifiers don't have any meaning when associated with a type. In C++, class members can be declared with the `static` storage class specifier. Allowing storage class specifiers on type declarations can render the code confusing for users.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Syntactic transformation.

How widely used: Seldom.

² **Affected subclause:** 9.2.2

Change: In C++, `register` is not a storage class specifier.

Rationale: The storage class specifier had no effect in C++.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Syntactic transformation.

How widely used: Common.

³ **Affected subclause:** 9.2.4

Change: A C++ `typedef` name must be different from any class type name declared in the same scope (except if the `typedef` is a synonym of the class name with the same name). In C, a `typedef` name and a `struct` tag name declared in the same scope can have the same name (because they have different name spaces).

Example:

```
typedef struct name1 { /* ... */ } name1;           // valid C and C++
struct name { /* ... */ };
typedef int name;                                // valid C, invalid C++
```

Rationale: For ease of use, C++ doesn't require that a type name be prefixed with the keywords `class`, `struct` or `union` when used in object declarations or type casts.

Example:

```
class name { /* ... */ };
name i;                                         // i has type class name
```

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. One of the 2 types has to be renamed.

How widely used: Seldom.

⁴ **Affected subclause:** 9.2.9 [see also 6.6]

Change: Const objects must be initialized in C++ but can be left uninitialized in C.

Rationale: A const object cannot be assigned to so it must be initialized to hold a useful value.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: Seldom.

5 Affected subclause: 9.2.9**Change:** Banning implicit int.

In C++ a *decl-specifier-seq* must contain a *type-specifier*, unless it is followed by a declarator for a constructor, a destructor, or a conversion function. In the following example, the left-hand column presents valid C; the right-hand column presents equivalent C++:

<pre>void f(const parm); const n = 3; main() /* ... */</pre>	<pre>void f(const int parm); const int n = 3; int main() /* ... */</pre>
--	--

Rationale: In C++, implicit int creates several opportunities for ambiguity between expressions involving function-like casts and declarations. Explicit declaration is increasingly considered to be proper style. Liaison with WG14 (C) indicated support for (at least) deprecating implicit int in the next revision of C.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Syntactic transformation. Can be automated.

How widely used: Common.

6 Affected subclause: 9.2.9.6**Change:** The keyword auto cannot be used as a storage class specifier.

<pre>void f() { auto int x;</pre>	<i>// valid C, invalid C++</i>
---------------------------------------	--------------------------------

Rationale: Allowing the use of auto to deduce the type of a variable from its initializer results in undesired interpretations of auto as a storage class specifier in certain contexts.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Syntactic transformation.

How widely used: Rare.

7 Affected subclause: 9.3.4.6

Change: In C++, a function declared with an empty parameter list takes no arguments. In C, an empty parameter list means that the number and type of the function arguments are unknown.

Example:

<pre>int f();</pre>	<i>// means int f(void) in C++ // int f(unknown) in C</i>
---------------------	---

Rationale: This is to avoid erroneous function calls (i.e., function calls with the wrong number or type of arguments).

Effect on original feature: Change to semantics of well-defined feature. This feature was marked as “obsolete” in C.

Difficulty of converting: Syntactic transformation. The function declarations using C incomplete declaration style must be completed to become full prototype declarations. A program may need to be updated further if different calls to the same (non-prototype) function have different numbers of arguments or if the type of corresponding arguments differed.

How widely used: Common.

8 Affected subclause: 9.3.4.6 [see 7.6.2.5]

Change: In C++, types may not be defined in return or parameter types. In C, these type definitions are allowed.

Example:

<pre>void f(struct S { int a; } arg) {}</pre>	<i>// valid C, invalid C++ enum E { A, B, C } f() {}</i>	<i>// valid C, invalid C++</i>
---	--	--------------------------------

Rationale: When comparing types in different translation units, C++ relies on name equivalence when C relies on structural equivalence. Regarding parameter types: since the type defined in a parameter list would be in the scope of the function, the only legal calls in C++ would be from within the function itself.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. The type definitions must be moved to file scope, or in header files.

How widely used: Seldom. This style of type definition is seen as poor coding style.

9 Affected subclause: 9.5

Change: In C++, the syntax for function definition excludes the “old-style” C function. In C, “old-style” syntax is allowed, but deprecated as “obsolescent”.

Rationale: Prototypes are essential to type safety.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Syntactic transformation.

How widely used: Common in old programs, but already known to be obsolescent.

10 Affected subclause: 9.4.2

Change: In C++, designated initialization support is restricted compared to the corresponding functionality in C. In C++, designators for non-static data members must be specified in declaration order, designators for array elements and nested designators are not supported, and designated and non-designated initializers cannot be mixed in the same initializer list.

Example:

```
struct A { int x, y; };
struct B { struct A a; };
struct A a = {.y = 1, .x = 2}; // valid C, invalid C++
int arr[3] = {[1] = 5}; // valid C, invalid C++
struct B b = {.a.x = 0}; // valid C, invalid C++
struct A c = {.x = 1, 2}; // valid C, invalid C++
```

Rationale: In C++, members are destroyed in reverse construction order and the elements of an initializer list are evaluated in lexical order, so field initializers must be specified in order. Array designators conflict with *lambda-expression* syntax. Nested designators are seldom used.

Effect on original feature: Deletion of feature that is incompatible with C++.

Difficulty of converting: Syntactic transformation.

How widely used: Out-of-order initializers are common. The other features are seldom used.

11 Affected subclause: 9.4.3

Change: In C++, when initializing an array of character with a string, the number of characters in the string (including the terminating '\0') must not exceed the number of elements in the array. In C, an array can be initialized with a string even if the array is not large enough to contain the string-terminating '\0'.

Example:

```
char array[4] = "abcd"; // valid C, invalid C++
```

Rationale: When these non-terminated arrays are manipulated by standard string functions, there is potential for major catastrophe.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. The arrays must be declared one element bigger to contain the string terminating '\0'.

How widely used: Seldom. This style of array initialization is seen as poor coding style.

12 Affected subclause: 9.7.1

Change: C++ objects of enumeration type can only be assigned values of the same enumeration type. In C, objects of enumeration type can be assigned values of any integral type.

Example:

```
enum color { red, blue, green };
enum color c = 1; // valid C, invalid C++
```

Rationale: The type-safe nature of C++.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Syntactic transformation. (The type error produced by the assignment can be automatically corrected by applying an explicit cast.)

How widely used: Common.

13 Affected subclause: 9.7.1

Change: In C++, the type of an enumerator is its enumeration. In C, the type of an enumerator is `int`.

Example:

```
enum e { A };
```

```
sizeof(A) == sizeof(int)      // in C
sizeof(A) == sizeof(e)        // in C++
/* and sizeof(int) is not necessarily equal to sizeof(e) */
```

Rationale: In C++, an enumeration is a distinct type.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: Seldom. The only time this affects existing C code is when the size of an enumerator is taken. Taking the size of an enumerator is not a common C coding practice.

C.5.7 Clause 11: classes

[diff.class]

- 1 **Affected subclause:** 11.3 [see also 9.2.4]

Change: In C++, a class declaration introduces the class name into the scope where it is declared and hides any object, function or other declaration of that name in an enclosing scope. In C, an inner scope declaration of a struct tag name never hides the name of an object or function in an outer scope.

Example:

```
int x[99];
void f() {
    struct x { int a; };
    sizeof(x); /* size of the array in C */
    /* size of the struct in C++ */
}
```

Rationale: This is one of the few incompatibilities between C and C++ that can be attributed to the new C++ name space definition where a name can be declared as a type and as a non-type in a single scope causing the non-type name to hide the type name and requiring that the keywords `class`, `struct`, `union` or `enum` be used to refer to the type name. This new name space definition provides important notational conveniences to C++ programmers and helps making the use of the user-defined types as similar as possible to the use of fundamental types. The advantages of the new name space definition were judged to outweigh by far the incompatibility with C described above.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation. If the hidden name that needs to be accessed is at global scope, the `::` C++ operator can be used. If the hidden name is at block scope, either the type or the struct tag has to be renamed.

How widely used: Seldom.

- 2 **Affected subclause:** 11.4.5.3

Change: Copying volatile objects.

The implicitly-declared copy constructor and implicitly-declared copy assignment operator cannot make a copy of a volatile lvalue. For example, the following is valid in ISO C:

```
struct X { int i; };
volatile struct X x1 = {0};
struct X x2 = x1;           // invalid C++
struct X x3;
x3 = x1;                  // also invalid C++
```

Rationale: Several alternatives were debated at length. Changing the parameter to `volatile const X&` would greatly complicate the generation of efficient code for class objects. Discussion of providing two alternative signatures for these implicitly-defined operations raised unanswered concerns about creating ambiguities and complicating the rules that specify the formation of these operators according to the bases and members.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. If volatile semantics are required for the copy, a user-declared constructor or assignment must be provided. If non-volatile semantics are required, an explicit `const_cast` can be used.

How widely used: Seldom.

- 3 **Affected subclause:** 11.4.10

Change: Bit-fields of type plain `int` are signed.

Rationale: Leaving the choice of signedness to implementations can lead to inconsistent definitions of template specializations. For consistency, the implementation freedom was eliminated for non-dependent

types, too.

Effect on original feature: The choice is implementation-defined in C, but not so in C++.

Difficulty of converting: Syntactic transformation.

How widely used: Seldom.

⁴ **Affected subclause:** [11.4.11](#)

Change: In C++, the name of a nested class is local to its enclosing class. In C the name of the nested class belongs to the same scope as the name of the outermost enclosing class.

Example:

```
struct X {
    struct Y { /* ... */ } y;
};

struct Y yy;                                // valid C, invalid C++
```

Rationale: C++ classes have member functions which require that classes establish scopes. The C rule would leave classes as an incomplete scope mechanism which would prevent C++ programmers from maintaining locality within a class. A coherent set of scope rules for C++ based on the C rule would be very complicated and C++ programmers would be unable to predict reliably the meanings of nontrivial examples involving nested or local functions.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation. To make the struct type name visible in the scope of the enclosing struct, the struct tag can be declared in the scope of the enclosing struct, before the enclosing struct is defined. Example:

```
struct Y;                                     // struct Y and struct X are at the same scope
struct X {
    struct Y { /* ... */ } y;
};
```

All the definitions of C struct types enclosed in other struct definitions and accessed outside the scope of the enclosing struct can be exported to the scope of the enclosing struct. Note: this is a consequence of the difference in scope rules, which is documented in [6.4](#).

How widely used: Seldom.

⁵ **Affected subclause:** [11.4.12](#)

Change: In C++, a typedef name may not be redeclared in a class definition after being used in that definition.

Example:

```
typedef int I;
struct S {
    I i;
    int I;                                // valid C, invalid C++
};
```

Rationale: When classes become complicated, allowing such a redefinition after the type has been used can create confusion for C++ programmers as to what the meaning of I really is.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. Either the type or the struct member has to be renamed.

How widely used: Seldom.

C.5.8 Clause 15: preprocessing directives

[diff.cpp]

¹ **Affected subclause:** [15.11](#)

Change: Whether `__STDC__` is defined and if so, what its value is, are implementation-defined.

Rationale: C++ is not identical to ISO C. Mandating that `__STDC__` be defined would require that translators make an incorrect claim.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: Programs and headers that reference `__STDC__` are quite common.

C.6 C standard library

[diff.library]

C.6.1 General

[diff.library.general]

- ¹ Subclause C.6 summarizes the explicit changes in headers, definitions, declarations, or behavior between the C standard library in the C standard and the parts of the C++ standard library that were included from the C standard library.

C.6.2 Modifications to headers

[diff.mods.to.headers]

- ¹ For compatibility with the C standard library, the C++ standard library provides the C headers enumerated in D.10, but their use is deprecated in C++.
- ² There are no C++ headers for the C standard library's headers <stdatomic.h>, <stdnoreturn.h>, and <threads.h>, nor are these headers from the C standard library headers themselves part of C++.
- ³ The C headers <complex.h> and <tgmath.h> do not contain any of the content from the C standard library and instead merely include other headers from the C++ standard library.

C.6.3 Modifications to definitions

[diff.mods.to.definitions]

C.6.3.1 Types `char16_t` and `char32_t`

[diff.char16]

- ¹ The types `char16_t` and `char32_t` are distinct types rather than typedefs to existing integral types. The tokens `char16_t` and `char32_t` are keywords in C++ (5.11). They do not appear as macro or type names defined in <cuchar> (21.5.5).

C.6.3.2 Type `wchar_t`

[diff.wchar.t]

- ¹ The type `wchar_t` is a distinct type rather than a typedef to an existing integral type. The token `wchar_t` is a keyword in C++ (5.11). It does not appear as a macro or type name defined in any of <cstddef> (17.2.1), <cstdlib> (17.2.2), or <cwchar> (21.5.4).

C.6.3.3 Header <assert.h>

[diff.header.assert.h]

- ¹ The token `static_assert` is a keyword in C++. It does not appear as a macro name defined in <cassert> (19.3.2).

C.6.3.4 Header <iso646.h>

[diff.header.iso646.h]

- ¹ The tokens `and`, `and_eq`, `bitand`, `bitor`, `compl`, `not`, `not_eq`, `or`, `or_eq`, `xor`, and `xor_eq` are keywords in C++ (5.11), and are not introduced as macros by <iso646.h> (D.10.3).

C.6.3.5 Header <stdalign.h>

[diff.header.stdalign.h]

- ¹ The token `alignas` is a keyword in C++ (5.11), and is not introduced as a macro by <stdalign.h> (D.10.4).

C.6.3.6 Header <stdbool.h>

[diff.headerstdbool.h]

- ¹ The tokens `bool`, `true`, and `false` are keywords in C++ (5.11), and are not introduced as macros by <stdbool.h> (D.10.5).

C.6.3.7 Macro `NULL`

[diff.null]

- ¹ The macro `NULL`, defined in any of <clocale> (28.5.1), <cstddef> (17.2.1), <cstdio> (29.12.1), <cstdlib> (17.2.2), <cstring> (21.5.3), <ctime> (27.14), or <cwchar> (21.5.4), is an implementation-defined null pointer constant in C++ (17.2).

C.6.4 Modifications to declarations

[diff.mods.to.declarations]

- ¹ Header <cstring> (21.5.3): The following functions have different declarations:

- (1.1) — `strchr`
- (1.2) — `strpbrk`
- (1.3) — `strrchr`
- (1.4) — `strstr`
- (1.5) — `memchr`

Subclause 21.5.3 describes the changes.

- 2 Header <cwchar> (21.5.4): The following functions have different declarations:

- (2.1) — `wcschr`
- (2.2) — `wcspbrk`
- (2.3) — `wcsrchr`
- (2.4) — `wcsstr`
- (2.5) — `wmemchr`

Subclause 21.5.4 describes the changes.

- 3 Header <cstddef> (17.2.1) declares the name `nullptr_t` in addition to the names declared in <stddef.h> (D.10) in the C standard library.

C.6.5 Modifications to behavior

[diff.mods.to.behavior]

C.6.5.1 General

[diff.mods.to.behavior.general]

- 1 Header <cstdlib> (17.2.2): The following functions have different behavior:

- (1.1) — `atexit`
- (1.2) — `exit`
- (1.3) — `abort`

Subclause 17.5 describes the changes.

- 2 Header <csetjmp> (17.13.3): The following functions have different behavior:

- (2.1) — `longjmp`

Subclause 17.13.3 describes the changes.

C.6.5.2 Macro `offsetof(type, member-designator)`

[diff.offsetof]

- 1 The macro `offsetof`, defined in <cstddef> (17.2.1), accepts a restricted set of `type` arguments in C++. Subclause 17.2.4 describes the change.

C.6.5.3 Memory allocation functions

[diff.malloc]

- 1 The functions `aligned_alloc`, `calloc`, `malloc`, and `realloc` are restricted in C++. Subclause 20.10.12 describes the changes.

Annex D (normative) Compatibility features

[depr]

D.1 General

[depr.general]

- ¹ This Annex describes features of the C++ Standard that are specified for compatibility with existing implementations.
- ² These are deprecated features, where *deprecated* is defined as: Normative for the current revision of C++, but having been identified as a candidate for removal from future revisions. An implementation may declare library names and entities described in this Clause with the **deprecated** attribute (9.12.4).

D.2 Arithmetic conversion on enumerations

[depr.arith.conv.enum]

- ¹ The ability to apply the usual arithmetic conversions (7.4) on operands where one is of enumeration type and the other is of a different enumeration type or a floating-point type is deprecated.

[*Note 1*: Three-way comparisons (7.6.8) between such operands are ill-formed. — *end note*]

[*Example 1*:

```
enum E1 { e };
enum E2 { f };
bool b = e <= 3.7;           // deprecated
int k = f - e;              // deprecated
auto cmp = e <=> f;        // error
```

— *end example*]

D.3 Implicit capture of ***this** by reference

[depr.capture.this]

- ¹ For compatibility with prior revisions of C++, a *lambda-expression* with *capture-default* = (7.5.5.3) may implicitly capture ***this** by reference.

[*Example 1*:

```
struct X {
    int x;
    void foo(int n) {
        auto f = [=]() { x = n; };           // deprecated: x means this->x, not a copy thereof
        auto g = [=, this]() { x = n; };      // recommended replacement
    }
};
```

— *end example*]

D.4 Comma operator in subscript expressions

[depr.comma.subscript]

- ¹ A comma expression (7.6.20) appearing as the *expr-or-braced-init-list* of a subscripting expression (7.6.1.2) is deprecated.

[*Note 1*: A parenthesized comma expression is not deprecated. — *end note*]

[*Example 1*:

```
void f(int *a, int b, int c) {
    a[b,c];                      // deprecated
    a[(b,c)];                    // OK
}
```

— *end example*]

D.5 Array comparisons

[depr.array.comp]

- ¹ Equality and relational comparisons (7.6.10, 7.6.9) between two operands of array type are deprecated.

[*Note 1*: Three-way comparisons (7.6.8) between such operands are ill-formed. — *end note*]

[Example 1:

```
int arr1[5];
int arr2[5];
bool same = arr1 == arr2;           // deprecated, same as &arr1[0] == &arr2[0],
                                    // does not compare array contents
auto cmp = arr1 <= arr2;          // error
— end example]
```

D.6 Deprecated volatile types

[depr.volatile.type]

- ¹ Postfix ++ and -- expressions (7.6.1.6) and prefix ++ and -- expressions (7.6.2.3) of volatile-qualified arithmetic and pointer types are deprecated.

[Example 1:

```
volatile int velociraptor;
++velociraptor;                  // deprecated
— end example]
```

- ² Certain assignments where the left operand is a volatile-qualified non-class type are deprecated; see 7.6.19.

[Example 2:

```
int neck, tail;
volatile int brachiosaur;
brachiosaur = neck;              // OK
tail = brachiosaur;              // OK
tail = brachiosaur = neck;       // deprecated
brachiosaur += neck;             // deprecated
brachiosaur = brachiosaur + neck; // OK
— end example]
```

- ³ A function type (9.3.4.6) with a parameter with volatile-qualified type or with a volatile-qualified return type is deprecated.

[Example 3:

```
volatile struct amber jurassic();           // deprecated
void trex(volatile short left_arm, volatile short right_arm); // deprecated
void fly(volatile struct pterosaur* pteranodon);           // OK
— end example]
```

- ⁴ A structured binding (9.6) of a volatile-qualified type is deprecated.

[Example 4:

```
struct linhenykus { short forelimb; };
void park(linhenykus alvarezsauroid) {
    volatile auto [what_is_this] = alvarezsauroid;           // deprecated
    // ...
}
— end example]
```

D.7 Redeclaration of static constexpr data members

[depr.static.constexpr]

- ¹ For compatibility with prior revisions of C++, a `constexpr` static data member may be redundantly redeclared outside the class with no initializer. This usage is deprecated.

[Example 1:

```
struct A {
    static constexpr int n = 5;   // definition (declaration in C++ 2014)
};

constexpr int A::n;                // redundant declaration (definition in C++ 2014)
— end example]
```

D.8 Non-local use of TU-local entities

[depr.local]

- ¹ A declaration of a non-TU-local entity that is an exposure (6.6) is deprecated.

[*Note 1*: Such a declaration in an importable module unit is ill-formed. — *end note*]

[*Example 1*:

```
namespace {
    struct A {
        void f() {}
    };
}
A h(); // deprecated: not internal linkage
inline void g() {A().f();} // deprecated: inline and not internal linkage
— end example
```

D.9 Implicit declaration of copy functions

[depr.impldec]

- ¹ The implicit definition of a copy constructor (11.4.5.3) as defaulted is deprecated if the class has a user-declared copy assignment operator or a user-declared destructor (11.4.7). The implicit definition of a copy assignment operator (11.4.6) as defaulted is deprecated if the class has a user-declared copy constructor or a user-declared destructor.

D.10 C headers

[depr.c.headers]

D.10.1 General

[depr.c.headers.general]

- ¹ For compatibility with the C standard library, the C++ standard library provides the *C headers* shown in Table 147.

Table 147: C headers [tab:depr.c.headers]

<assert.h>	<inttypes.h>	<signal.h>	<stdio.h>	<wchar.h>
<complex.h>	<iso646.h>	<stdalign.h>	<stdlib.h>	<wctype.h>
<ctype.h>	<limits.h>	<stdarg.h>	<string.h>	
<errno.h>	<locale.h>	<stdbool.h>	<tgmath.h>	
<fenv.h>	<math.h>	<stddef.h>	<time.h>	
<float.h>	<setjmp.h>	<stdint.h>	<uchar.h>	

D.10.2 Header <complex.h> synopsis

[depr.complex.h.syn]

```
#include <complex>
```

- ¹ The header <complex.h> behaves as if it simply includes the header <complex> (26.4.2).

- ² [*Note 1*: Names introduced by <complex> in namespace std are not placed into the global namespace scope by <complex.h>. — *end note*]

D.10.3 Header <iso646.h> synopsis

[depr.iso646.h.syn]

- ¹ The C++ header <iso646.h> is empty.

[*Note 1*: and, and_eq, bitand, bitor, compl, not_eq, not, or, or_eq, xor, and xor_eq are keywords in C++ (5.11). — *end note*]

D.10.4 Header <stdalign.h> synopsis

[depr.stdalign.h.syn]

```
#define __alignas_is_defined 1
```

- ¹ The contents of the C++ header <stdalign.h> are the same as the C standard library header <stdalign.h>, with the following changes: The header <stdalign.h> does not define a macro named alignas.

SEE ALSO: ISO C 7.15

D.10.5 Header <stdbool.h> synopsis

[deprstdbool.h.syn]

```
#define __bool_true_false_are_defined 1
```

- ¹ The contents of the C++ header <stdbool.h> are the same as the C standard library header <stdbool.h>, with the following changes: The header <stdbool.h> does not define macros named `bool`, `true`, or `false`.

SEE ALSO: ISO C 7.18

D.10.6 Header <tgmath.h> synopsis

[deprtgmath.h.syn]

```
#include <cmath>
#include <complex>
```

- ¹ The header <tgmath.h> behaves as if it simply includes the headers <cmath> (26.8.1) and <complex> (26.4.2).
- ² [Note 1: The overloads provided in C by type-generic macros are already provided in <complex> and <cmath> by “sufficient” additional overloads. — end note]
- ³ [Note 2: Names introduced by <cmath> or <complex> in namespace `std` are not placed into the global namespace scope by <tgmath.h>. — end note]

D.10.7 Other C headers

[deprc.headers.other]

- ¹ Every C header other than <complex.h> (D.10.2), <iso646.h> (D.10.3), <stdalign.h> (D.10.4), <stdbool.h> (D.10.5), and <tgmath.h> (D.10.6), each of which has a name of the form <`cname.h`>, behaves as if each name placed in the standard library namespace by the corresponding <`cname`> header is placed within the global namespace scope, except for the functions described in 26.8.6, the declaration of `std::byte` (17.2.1), and the functions and function templates described in 17.2.5. It is unspecified whether these names are first declared or defined within namespace scope (6.4.6) of the namespace `std` and are then injected into the global namespace scope by explicit *using-declarations* (9.9).
- ² [Example 1: The header <cstdlib> assuredly provides its declarations and definitions within the namespace `std`. It may also provide these names within the global namespace. The header <stdlib.h> assuredly provides the same declarations and definitions within the global namespace, much as in the C Standard. It may also provide these names within the namespace `std`. — end example]

D.11 Requires paragraph

[depr.res.on.required]

- ¹ In addition to the elements specified in 16.3.2.4, descriptions of function semantics may also contain a *Requires:* element to denote the preconditions for calling a function.
- ² Violation of any preconditions specified in a function’s *Requires:* element results in undefined behavior unless the function’s *Throws:* element specifies throwing an exception when the precondition is violated.

D.12 Relational operators

[depr.relops]

- ¹ The header <utility> (20.2.1) has the following additions:

```
namespace std::rel_ops {
    template<class T> bool operator!=(const T&, const T&);
    template<class T> bool operator> (const T&, const T&);
    template<class T> bool operator<=(const T&, const T&);
    template<class T> bool operator>=(const T&, const T&);
}
```

- ² To avoid redundant definitions of `operator!=` out of `operator==` and operators `>`, `<=`, and `>=` out of `operator<`, the library provides the following:

```
template<class T> bool operator!=(const T& x, const T& y);
```

- ³ *Requires:* Type `T` is *Cpp17EqualityComparable* (Table 25).

- ⁴ *Returns:* `!(x == y)`.

```
template<class T> bool operator>(const T& x, const T& y);
```

- ⁵ *Requires:* Type `T` is *Cpp17LessThanComparable* (Table 26).

- ⁶ *Returns:* `y < x`.

```

template<class T> bool operator<=(const T& x, const T& y);
7   Requires: Type T is Cpp17LessThanComparable (Table 26).
8   Returns: !(y < x).

template<class T> bool operator>=(const T& x, const T& y);
9   Requires: Type T is Cpp17LessThanComparable (Table 26).
10  Returns: !(x < y).

```

D.13 char* streams

[depr.str.strstreams]

D.13.1 Header <strstream> synopsis

[depr.strstream.syn]

- ¹ The header <strstream> defines types that associate stream buffers with character array objects and assist reading and writing such objects.

```

namespace std {
    class strstreambuf;
    class istrstream;
    class ostrstream;
    class strstream;
}

```

D.13.2 Class strstreambuf

[depr.strstreambuf]

D.13.2.1 General

[depr.strstreambuf.general]

```

namespace std {
    class strstreambuf : public basic_streambuf<char> {
        public:
            strstreambuf() : strstreambuf(0) {}
            explicit strstreambuf(streamsize alsize_arg);
            strstreambuf(void* (*malloc_arg)(size_t), void (*free_arg)(void*));
            strstreambuf(char* gnex_arg, streamsize n, char* pbeg_arg = nullptr);
            strstreambuf(const char* gnex_arg, streamsize n);

            strstreambuf(signed char* gnex_arg, streamsize n,
                        signed char* pbeg_arg = nullptr);
            strstreambuf(const signed char* gnex_arg, streamsize n,
                        unsigned char* gnex_arg, streamsize n,
                        unsigned char* pbeg_arg = nullptr);
            strstreambuf(const unsigned char* gnex_arg, streamsize n);

            virtual ~strstreambuf();

            void freeze(bool freezefl = true);
            char* str();
            int pcount();

        protected:
            int_type overflow (int_type c = EOF) override;
            int_type pbackfail(int_type c = EOF) override;
            int_type underflow() override;
            pos_type seekoff(off_type off, ios_base::seekdir way,
                            ios_base::openmode which = ios_base::in | ios_base::out) override;
            pos_type seekpos(pos_type sp,
                            ios_base::openmode which = ios_base::in | ios_base::out) override;
            streambuf* setbuf(char* s, streamsize n) override;

        private:
            using strstate = T1; // exposition only
            static const strstate allocated; // exposition only
            static const strstate constant; // exposition only
            static const strstate dynamic; // exposition only
            static const strstate frozen; // exposition only
            strstate strmode; // exposition only
    };
}

```

```

    streamsize alsiz;
                // exposition only
    void* (*palloc)(size_t);
                // exposition only
    void (*pfree)(void*);
                // exposition only
};

}

}

```

- ¹ The class **strstreambuf** associates the input sequence, and possibly the output sequence, with an object of some *character array type*, whose elements store arbitrary values. The array object has several attributes.
- ² [Note 1: For the sake of exposition, these are represented as elements of a bitmask type (indicated here as T1) called **strstate**. The elements are:
 - (2.1) — **allocated**, set when a dynamic array object has been allocated, and hence will be freed by the destructor for the **strstreambuf** object;
 - (2.2) — **constant**, set when the array object has **const** elements, so the output sequence cannot be written;
 - (2.3) — **dynamic**, set when the array object is allocated (or reallocated) as necessary to hold a character sequence that can change in length;
 - (2.4) — **frozen**, set when the program has requested that the array object not be altered, reallocated, or freed.
— end note]
- ³ [Note 2: For the sake of exposition, the maintained data is presented here as:
 - (3.1) — **strstate strmode**, the attributes of the array object associated with the **strstreambuf** object;
 - (3.2) — **int alsiz**, the suggested minimum size for a dynamic array object;
 - (3.3) — **void* (*palloc)(size_t)**, points to the function to call to allocate a dynamic array object;
 - (3.4) — **void (*pfree)(void*)**, points to the function to call to free a dynamic array object.
— end note]
- ⁴ Each object of class **strstreambuf** has a *seekable area*, delimited by the pointers **seeklow** and **seekhigh**. If **gnext** is a null pointer, the seekable area is undefined. Otherwise, **seeklow** equals **gbeg** and **seekhigh** is either **pend**, if **pend** is not a null pointer, or **gend**.

D.13.2.2 **strstreambuf** constructors

[depr.strstreambuf.cons]

```
explicit strstreambuf(streamsize alsiz_arg);
```

- ¹ Effects: Initializes the base class with **streambuf()**. The postconditions of this function are indicated in [Table 148](#).

Table 148: **strstreambuf(streamsize)** effects [tab:depr.strstreambuf.cons.sz]

Element	Value
strmode	dynamic
alsiz	alsiz_arg
palloc	a null pointer
pfree	a null pointer

```
strstreambuf(void* (*palloc_arg)(size_t), void (*pfree_arg)(void*));
```

- ² Effects: Initializes the base class with **streambuf()**. The postconditions of this function are indicated in [Table 149](#).

Table 149: **strstreambuf(void* (*)(size_t), void (*)(void*))** effects [tab:depr.strstreambuf.cons.alloc]

Element	Value
strmode	dynamic
alsiz	an unspecified value
palloc	palloc_arg
pfree	pfree_arg

```
strstreambuf(char* gnext_arg, streamsize n, char* pbeg_arg = nullptr);
strstreambuf(signed char* gnext_arg, streamsize n,
            signed char* pbeg_arg = nullptr);
strstreambuf(unsigned char* gnext_arg, streamsize n,
             unsigned char* pbeg_arg = nullptr);
```

- 3 *Effects:* Initializes the base class with `streambuf()`. The postconditions of this function are indicated in [Table 150](#).

Table 150: `strstreambuf(charT*, streamsize, charT*)` effects [tab:depr.strstreambuf.cons.ptr]

Element	Value
<code>strmode</code>	0
<code>alsize</code>	an unspecified value
<code>palloc</code>	a null pointer
<code>pfree</code>	a null pointer

- 4 `gnext_arg` shall point to the first element of an array object whose number of elements `N` is determined as follows:

- (4.1) — If `n > 0`, `N` is `n`.
- (4.2) — If `n == 0`, `N` is `std::strlen(gnext_arg)`.
- (4.3) — If `n < 0`, `N` is `INT_MAX`.³³⁰

5 If `pbeg_arg` is a null pointer, the function executes:

```
setg(gnext_arg, gnext_arg, gnext_arg + N);
```

6 Otherwise, the function executes:

```
setg(gnext_arg, gnext_arg, pbeg_arg);
setp(pbeg_arg, pbeg_arg + N);
```

```
strstreambuf(const char* gnext_arg, streamsize n);
strstreambuf(const signed char* gnext_arg, streamsize n);
strstreambuf(const unsigned char* gnext_arg, streamsize n);
```

- 7 *Effects:* Behaves the same as `strstreambuf((char*)gnext_arg,n)`, except that the constructor also sets `constant` in `strmode`.

```
virtual ~strstreambuf();
```

- 8 *Effects:* Destroys an object of class `strstreambuf`. The function frees the dynamically allocated array object only if `(strmode & allocated) != 0` and `(strmode & frozen) == 0`. ([D.13.2.4](#) describes how a dynamically allocated array object is freed.)

D.13.2.3 Member functions

[depr.strstreambuf.members]

```
void freeze(bool freezefl = true);
```

- 1 *Effects:* If `strmode & dynamic` is nonzero, alters the freeze status of the dynamic array object as follows:

- (1.1) — If `freezefl` is `true`, the function sets `frozen` in `strmode`.
- (1.2) — Otherwise, it clears `frozen` in `strmode`.

```
char* str();
```

- 2 *Effects:* Calls `freeze()`, then returns the beginning pointer for the input sequence, `gbeg`.

- 3 *Remarks:* The return value can be a null pointer.

³³⁰) The function signature `strlen(const char*)` is declared in `<cstring>` ([21.5.3](#)). The macro `INT_MAX` is defined in `<climits>` ([17.3.6](#)).

```
int pcount() const;
```

- 4 *Effects:* If the next pointer for the output sequence, `pnext`, is a null pointer, returns zero. Otherwise, returns the current effective length of the array object as the next pointer minus the beginning pointer for the output sequence, `pnext - pbeg`.

D.13.2.4 `strstreambuf` overridden virtual functions

[depr.strstreambuf.virtuals]

```
int_type overflow(int_type c = EOF) override;
```

- 1 *Effects:* Appends the character designated by `c` to the output sequence, if possible, in one of two ways:
- (1.1) — If `c != EOF` and if either the output sequence has a write position available or the function makes a write position available (as described below), assigns `c` to `*pnext++`.
Returns `(unsigned char)c`.
- (1.2) — If `c == EOF`, there is no character to append.
Returns a value other than `EOF`.

2 Returns `EOF` to indicate failure.

3 *Remarks:* The function can alter the number of write positions available as a result of any call.

4 To make a write position available, the function reallocates (or initially allocates) an array object with a sufficient number of elements `n` to hold the current array object (if any), plus at least one additional write position. How many additional write positions are made available is otherwise unspecified. If `palloc` is not a null pointer, the function calls `(*palloc)(n)` to allocate the new dynamic array object. Otherwise, it evaluates the expression `new charT[n]`. In either case, if the allocation fails, the function returns `EOF`. Otherwise, it sets `allocated` in `strmode`.

5 To free a previously existing dynamic array object whose first element address is `p`: If `pfree` is not a null pointer, the function calls `(*pfree)(p)`. Otherwise, it evaluates the expression `delete[]p`.

6 If `(strmode & dynamic) == 0`, or if `(strmode & frozen) != 0`, the function cannot extend the array (reallocate it with greater length) to make a write position available.

7 *Recommended practice:* An implementation should consider `alsize` in making the decision how many additional write positions to make available.

```
int_type pbackfail(int_type c = EOF) override;
```

8 Puts back the character designated by `c` to the input sequence, if possible, in one of three ways:

- (8.1) — If `c != EOF`, if the input sequence has a putback position available, and if `(char)c == gnext[-1]`, assigns `gnext - 1` to `gnext`.
Returns `c`.
- (8.2) — If `c != EOF`, if the input sequence has a putback position available, and if `strmode & constant` is zero, assigns `c` to `--gnext`.
Returns `c`.
- (8.3) — If `c == EOF` and if the input sequence has a putback position available, assigns `gnext - 1` to `gnext`.
Returns a value other than `EOF`.

9 Returns `EOF` to indicate failure.

10 *Remarks:* If the function can succeed in more than one of these ways, it is unspecified which way is chosen. The function can alter the number of putback positions available as a result of any call.

```
int_type underflow() override;
```

11 *Effects:* Reads a character from the *input sequence*, if possible, without moving the stream position past it, as follows:

- (11.1) — If the input sequence has a read position available, the function signals success by returning `(unsigned char)*gnext`.

(11.2) — Otherwise, if the current write next pointer `pnext` is not a null pointer and is greater than the current read end pointer `gend`, makes a *read position* available by assigning to `gend` a value greater than `gnext` and no greater than `pnext`.

Returns `(unsigned char)*gnext`.

12 Returns EOF to indicate failure.

13 *Remarks:* The function can alter the number of read positions available as a result of any call.

`pos_type seekoff(off_type off, seekdir way, openmode which = in | out) override;`

14 *Effects:* Alters the stream position within one of the controlled sequences, if possible, as indicated in [Table 151](#).

Table 151: `seekoff` positioning [tab:depr.strstreambuf.seekoff.pos]

Conditions	Result
<code>(which & ios::in) != 0</code>	positions the input sequence
<code>(which & ios::out) != 0</code>	positions the output sequence
<code>(which & (ios::in ios::out)) == (ios::in ios::out)</code> and either <code>way == ios::beg</code> or <code>way == ios::end</code>	positions both the input and the output sequences
Otherwise	the positioning operation fails.

15 For a sequence to be positioned, if its next pointer is a null pointer, the positioning operation fails. Otherwise, the function determines `newoff` as indicated in [Table 152](#).

Table 152: `newoff` values [tab:depr.strstreambuf.seekoff.newoff]

Condition	<code>newoff</code> Value
<code>way == ios::beg</code>	0
<code>way == ios::cur</code>	the next pointer minus the beginning pointer (<code>xnext - xbeg</code>).
<code>way == ios::end</code>	<code>seekhigh</code> minus the beginning pointer (<code>seekhigh - xbeg</code>).

16 If $(\text{newoff} + \text{off}) < (\text{seeklow} - \text{xbeg})$ or $(\text{seekhigh} - \text{xbeg}) < (\text{newoff} + \text{off})$, the positioning operation fails. Otherwise, the function assigns `xbeg + newoff + off` to the next pointer `xnext`.

17 *Returns:* `pos_type(newoff)`, constructed from the resultant offset `newoff` (of type `off_type`), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is `pos_type(off_type(-1))`.

`pos_type seekpos(pos_type sp, ios_base::openmode which = ios_base::in | ios_base::out) override;`

18 *Effects:* Alters the stream position within one of the controlled sequences, if possible, to correspond to the stream position stored in `sp` (as described below).

(18.1) — If `(which & ios::in) != 0`, positions the input sequence.

(18.2) — If `(which & ios::out) != 0`, positions the output sequence.

(18.3) — If the function positions neither sequence, the positioning operation fails.

19 For a sequence to be positioned, if its next pointer is a null pointer, the positioning operation fails. Otherwise, the function determines `newoff` from `sp.offset()`:

(19.1) — If `newoff` is an invalid stream position, has a negative value, or has a value greater than $(\text{seekhigh} - \text{seeklow})$, the positioning operation fails

(19.2) — Otherwise, the function adds `newoff` to the beginning pointer `xbeg` and stores the result in the next pointer `xnext`.

20 *Returns:* `pos_type(newoff)`, constructed from the resultant offset `newoff` (of type `off_type`), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is `pos_type(off_type(-1))`.

```
streambuf<char>* setbuf(char* s, streamsize n) override;
```

21 *Effects:* Behavior is implementation-defined, except that `setbuf(0, 0)` has no effect.

D.13.3 Class `istrstream`

[depr.`istrstream`]

D.13.3.1 General

[depr.`istrstream.general`]

```
namespace std {
    class istrstream : public basic_istream<char> {
        public:
            explicit istrstream(const char* s);
            explicit istrstream(char* s);
            istrstream(const char* s, streamsize n);
            istrstream(char* s, streamsize n);
            virtual ~istrstream();

            strstreambuf* rdbuf() const;
            char* str();
        private:
            strstreambuf sb;           // exposition only
        };
}
```

1 The class `istrstream` supports the reading of objects of class `strstreambuf`. It supplies a `strstreambuf` object to control the associated array object. For the sake of exposition, the maintained data is presented here as:

(1.1) — `sb`, the `strstreambuf` object.

D.13.3.2 `istrstream` constructors

[depr.`istrstream.cons`]

```
explicit istrstream(const char* s);
explicit istrstream(char* s);
```

1 *Effects:* Initializes the base class with `istream(&sb)` and `sb` with `strstreambuf(s, 0)`. `s` shall designate the first element of an NTBS.

```
istrstream(const char* s, streamsize n);
istrstream(char* s, streamsize n);
```

2 *Effects:* Initializes the base class with `istream(&sb)` and `sb` with `strstreambuf(s, n)`. `s` shall designate the first element of an array whose length is `n` elements, and `n` shall be greater than zero.

D.13.3.3 Member functions

[depr.`istrstream.members`]

```
strstreambuf* rdbuf() const;
```

1 *Returns:* `const_cast<strstreambuf*>(&sb)`.

```
char* str();
```

2 *Returns:* `rdbuf()->str()`.

D.13.4 Class `ostrstream`

[depr.`ostrstream`]

D.13.4.1 General

[depr.`ostrstream.general`]

```
namespace std {
    class ostrstream : public basic_oostream<char> {
        public:
            ostrstream();
            ostrstream(char* s, int n, ios_base::openmode mode = ios_base::out);
            virtual ~ostrstream();

            strstreambuf* rdbuf() const;
            void freeze(bool freezefl = true);
            char* str();
            int pcount() const;
        private:
            strstreambuf sb;           // exposition only
    };
}
```

```
};  
}
```

- 1 The class `ostrstream` supports the writing of objects of class `strstreambuf`. It supplies a `strstreambuf` object to control the associated array object. For the sake of exposition, the maintained data is presented here as:

- (1.1) — `sb`, the `strstreambuf` object.

D.13.4.2 `ostrstream` constructors

[depr.`ostrstream.cons`]

```
ostrstream();
```

- 1 *Effects*: Initializes the base class with `ostream(&sb)` and `sb` with `strstreambuf()`.

```
ostrstream(char* s, int n, ios_base::openmode mode = ios_base::out);
```

- 2 *Effects*: Initializes the base class with `ostream(&sb)`, and `sb` with one of two constructors:

- (2.1) — If `(mode & app) == 0`, then `s` shall designate the first element of an array of `n` elements.

The constructor is `strstreambuf(s, n, s)`.

- (2.2) — If `(mode & app) != 0`, then `s` shall designate the first element of an array of `n` elements that contains an NTBS whose first element is designated by `s`. The constructor is `strstreambuf(s, n, s + std::strlen(s))`.³³¹

D.13.4.3 Member functions

[depr.`ostrstream.members`]

```
strstreambuf* rdbuf() const;
```

- 1 *Returns*: `(strstreambuf*)&sb`.

```
void freeze(bool freezefl = true);
```

- 2 *Effects*: Calls `rdbuf()->freeze(freezefl)`.

```
char* str();
```

- 3 *Returns*: `rdbuf()->str()`.

```
int pcount() const;
```

- 4 *Returns*: `rdbuf()->pcount()`.

D.13.5 Class `strstream`

[depr.`strstream`]

D.13.5.1 General

[depr.`strstream.general`]

```
namespace std {  
    class strstream  
        : public basic_iostream<char> {  
    public:  
        // types  
        using char_type = char;  
        using int_type = char_traits<char>::int_type;  
        using pos_type = char_traits<char>::pos_type;  
        using off_type = char_traits<char>::off_type;  
  
        // constructors/destructor  
        strstream();  
        strstream(char* s, int n,  
                 ios_base::openmode mode = ios_base::in|ios_base::out);  
        virtual ~strstream();  
  
        // members  
        strstreambuf* rdbuf() const;  
        void freeze(bool freezefl = true);  
        int pcount() const;  
        char* str();
```

³³¹ The function signature `strlen(const char*)` is declared in `<cstring>` (21.5.3).

```

private:
    strstreambuf sb;           // exposition only
};

}

```

- 1 The class `strstream` supports reading and writing from objects of class `strstreambuf`. It supplies a `strstreambuf` object to control the associated array object. For the sake of exposition, the maintained data is presented here as:

- (1.1) — `sb`, the `strstreambuf` object.

D.13.5.2 `strstream` constructors

[depr.strstream.cons]

```
strstream();
```

- 1 *Effects*: Initializes the base class with `iostream(&sb)`.

```
strstream(char* s, int n,
         ios_base::openmode mode = ios_base::in|ios_base::out);
```

- 2 *Effects*: Initializes the base class with `iostream(&sb)`, and `sb` with one of the two constructors:

- (2.1) — If `(mode & app) == 0`, then `s` shall designate the first element of an array of `n` elements. The constructor is `strstreambuf(s,n,s)`.
- (2.2) — If `(mode & app) != 0`, then `s` shall designate the first element of an array of `n` elements that contains an NTBS whose first element is designated by `s`. The constructor is `strstreambuf(s,n,s + std::strlen(s))`.

D.13.5.3 `strstream` destructor

[depr.strstream.dest]

```
virtual ~strstream();
```

- 1 *Effects*: Destroys an object of class `strstream`.

D.13.5.4 `strstream` operations

[depr.strstream.oper]

```
strstreambuf* rdbuf() const;
```

- 1 *Returns*: `const_cast<strstreambuf*>(&sb)`.

```
void freeze(bool freezefl = true);
```

- 2 *Effects*: Calls `rdbuf()>freeze(freezefl)`.

```
char* str();
```

- 3 *Returns*: `rdbuf()>str()`.

```
int pcount() const;
```

- 4 *Returns*: `rdbuf()>pcount()`.

D.14 Deprecated type traits

[depr.meta.types]

- 1 The header `<type_traits>` (20.15.3) has the following addition:

```

namespace std {
    template<class T> struct is_pod;
    template<class T> inline constexpr bool is_pod_v = is_pod<T>::value;
}

```

- 2 The behavior of a program that adds specializations for any of the templates defined in this subclause is undefined, unless explicitly permitted by the specification of the corresponding template.

```
template<class T> struct is_pod;
```

- 3 *Requires*: `remove_all_extents_t<T>` shall be a complete type or *cv void*.

- 4 `is_pod<T>` is a *Cpp17UnaryTypeTrait* (20.15.2) with a base characteristic of `true_type` if `T` is a POD type, and `false_type` otherwise. A POD class is a class that is both a trivial class and a standard-layout class, and has no non-static data members of type non-POD class (or array thereof). A POD type is a scalar type, a POD class, an array of such a type, or a *cv*-qualified version of one of these types.

- 5 [Note 1: It is unspecified whether a closure type (7.5.5.2) is a POD type. — *end note*]

D.15 Tuple

[depr.tuple]

- 1 The header `<tuple>` (20.5.2) has the following additions:

```
namespace std {
    template<class T> class tuple_size<volatile T>;
    template<class T> class tuple_size<const volatile T>;

    template<size_t I, class T> class tuple_element<I, volatile T>;
    template<size_t I, class T> class tuple_element<I, const volatile T>;
}

template<class T> class tuple_size<volatile T>;
template<class T> class tuple_size<const volatile T>;
```

- 2 Let `TS` denote `tuple_size<T>` of the cv-unqualified type `T`. If the expression `TS::value` is well-formed when treated as an unevaluated operand, then specializations of each of the two templates meet the *Cpp17TransformationTrait* requirements with a base characteristic of `integral_constant<size_t, TS::value>`. Otherwise, they have no member `value`.
- 3 Access checking is performed as if in a context unrelated to `TS` and `T`. Only the validity of the immediate context of the expression is considered.
- 4 In addition to being available via inclusion of the `<tuple>` (20.5.2) header, the two templates are available when any of the headers `<array>` (22.3.2), `<ranges>` (24.2), or `<utility>` (20.2.1) are included.

```
template<size_t I, class T> class tuple_element<I, volatile T>;
template<size_t I, class T> class tuple_element<I, const volatile T>;
```

- 5 Let `TE` denote `tuple_element_t<I, T>` of the cv-unqualified type `T`. Then specializations of each of the two templates meet the *Cpp17TransformationTrait* requirements with a member `typedef type` that names the following type:
- (5.1) — for the first specialization, `add_volatile_t<TE>`, and
- (5.2) — for the second specialization, `add_cv_t<TE>`.

- 6 In addition to being available via inclusion of the `<tuple>` (20.5.2) header, the two templates are available when any of the headers `<array>` (22.3.2), `<ranges>` (24.2), or `<utility>` (20.2.1) are included.

D.16 Variant

[depr.variant]

- 1 The header `<variant>` (20.7.2) has the following additions:

```
namespace std {
    template<class T> struct variant_size<volatile T>;
    template<class T> struct variant_size<const volatile T>;

    template<size_t I, class T> struct variant_alternative<I, volatile T>;
    template<size_t I, class T> struct variant_alternative<I, const volatile T>;
}

template<class T> class variant_size<volatile T>;
template<class T> class variant_size<const volatile T>;
```

- 2 Let `VS` denote `variant_size<T>` of the cv-unqualified type `T`. Then specializations of each of the two templates meet the *Cpp17UnaryTypeTrait* requirements with a base characteristic of `integral_constant<size_t, VS::value>`.
- ```
template<size_t I, class T> class variant_alternative<I, volatile T>;
template<size_t I, class T> class variant_alternative<I, const volatile T>;
```
- 3 Let `VA` denote `variant_alternative<I, T>` of the cv-unqualified type `T`. Then specializations of each of the two templates meet the *Cpp17TransformationTrait* requirements with a member `typedef type` that names the following type:
- (3.1) — for the first specialization, `add_volatile_t<VA::type>`, and
- (3.2) — for the second specialization, `add_cv_t<VA::type>`.

**D.17 Deprecated iterator class template**

[depr.iterator]

- <sup>1</sup> The header <iterator> (23.2) has the following addition:

```
namespace std {
 template<class Category, class T, class Distance = ptrdiff_t,
 class Pointer = T*, class Reference = T&>
 struct iterator {
 using iterator_category = Category;
 using value_type = T;
 using difference_type = Distance;
 using pointer = Pointer;
 using reference = Reference;
 };
}
```

- <sup>2</sup> The iterator template may be used as a base class to ease the definition of required types for new iterators.

<sup>3</sup> [Note 1: If the new iterator type is a class template, then these aliases will not be visible from within the iterator class's template definition, but only to callers of that class. — end note]

- <sup>4</sup> [Example 1: If a C++ program wants to define a bidirectional iterator for some data structure containing double and such that it works on a large memory model of the implementation, it can do so with:

```
class MyIterator :
 public iterator<bidirectional_iterator_tag, double, long, T*, T&> {
 // code implementing ++, etc.
};
```

— end example]

**D.18 Deprecated move\_iterator access**

[depr.move.iter.elem]

- <sup>1</sup> The following member is declared in addition to those members specified in 23.5.3.6:

```
namespace std {
 template<class Iterator>
 class move_iterator {
 public:
 constexpr pointer operator->() const;
 };
}

constexpr pointer operator->() const;
```

- <sup>2</sup> Returns: current.

**D.19 Deprecated shared\_ptr atomic access**

[depr.util.smartptr.shared.atomic]

- <sup>1</sup> The header <memory> (20.10.2) has the following additions:

```
namespace std {
 template<class T>
 bool atomic_is_lock_free(const shared_ptr<T>* p);

 template<class T>
 shared_ptr<T> atomic_load(const shared_ptr<T>* p);
 template<class T>
 shared_ptr<T> atomic_load_explicit(const shared_ptr<T>* p, memory_order mo);

 template<class T>
 void atomic_store(shared_ptr<T>* p, shared_ptr<T> r);
 template<class T>
 void atomic_store_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);

 template<class T>
 shared_ptr<T> atomic_exchange(shared_ptr<T>* p, shared_ptr<T> r);
 template<class T>
 shared_ptr<T> atomic_exchange_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);
```

```

template<class T>
 bool atomic_compare_exchange_weak(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);
template<class T>
 bool atomic_compare_exchange_strong(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);
template<class T>
 bool atomic_compare_exchange_weak_explicit(
 shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w,
 memory_order success, memory_order failure);
template<class T>
 bool atomic_compare_exchange_strong_explicit(
 shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w,
 memory_order success, memory_order failure);
}

```

2 Concurrent access to a `shared_ptr` object from multiple threads does not introduce a data race if the access is done exclusively via the functions in this subclause and the instance is passed as their first argument.

3 The meaning of the arguments of type `memory_order` is explained in [31.4](#).

```
template<class T> bool atomic_is_lock_free(const shared_ptr<T>* p);
```

4 *Requires:* `p` shall not be null.

5 *Returns:* `true` if atomic access to `*p` is lock-free, `false` otherwise.

6 *Throws:* Nothing.

```
template<class T> shared_ptr<T> atomic_load(const shared_ptr<T>* p);
```

7 *Requires:* `p` shall not be null.

8 *Returns:* `atomic_load_explicit(p, memory_order::seq_cst)`.

9 *Throws:* Nothing.

```
template<class T> shared_ptr<T> atomic_load_explicit(const shared_ptr<T>* p, memory_order mo);
```

10 *Requires:* `p` shall not be null.

11 *Requires:* `mo` shall not be `memory_order::release` or `memory_order::acq_rel`.

12 *Returns:* `*p`.

13 *Throws:* Nothing.

```
template<class T> void atomic_store(shared_ptr<T>* p, shared_ptr<T> r);
```

14 *Requires:* `p` shall not be null.

15 *Effects:* As if by `atomic_store_explicit(p, r, memory_order::seq_cst)`.

16 *Throws:* Nothing.

```
template<class T> void atomic_store_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);
```

17 *Requires:* `p` shall not be null.

18 *Requires:* `mo` shall not be `memory_order::acquire` or `memory_order::acq_rel`.

19 *Effects:* As if by `p->swap(r)`.

20 *Throws:* Nothing.

```
template<class T> shared_ptr<T> atomic_exchange(shared_ptr<T>* p, shared_ptr<T> r);
```

21 *Requires:* `p` shall not be null.

22 *Returns:* `atomic_exchange_explicit(p, r, memory_order::seq_cst)`.

23 *Throws:* Nothing.

```
template<class T>
 shared_ptr<T> atomic_exchange_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);
```

24 *Requires:* `p` shall not be null.

25 *Effects:* As if by `p->swap(r)`.

26       *Returns:* The previous value of `*p`.

27       *Throws:* Nothing.

```
template<class T>
 bool atomic_compare_exchange_weak(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);
```

28       *Requires:* `p` shall not be null and `v` shall not be null.

29       *Returns:*

```
 atomic_compare_exchange_weak_explicit(p, v, w, memory_order::seq_cst, memory_order::seq_cst)
```

30       *Throws:* Nothing.

```
template<class T>
 bool atomic_compare_exchange_strong(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);
```

31       *Returns:*

```
 atomic_compare_exchange_strong_explicit(p, v, w, memory_order::seq_cst,
 memory_order::seq_cst)
```

```
template<class T>
 bool atomic_compare_exchange_weak_explicit(
 shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w,
 memory_order success, memory_order failure);
template<class T>
 bool atomic_compare_exchange_strong_explicit(
 shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w,
 memory_order success, memory_order failure);
```

32       *Requires:* `p` shall not be null and `v` shall not be null. The `failure` argument shall not be `memory_order::release` nor `memory_order::acq_rel`.

33       *Effects:* If `*p` is equivalent to `*v`, assigns `w` to `*p` and has synchronization semantics corresponding to the value of `success`, otherwise assigns `*p` to `*v` and has synchronization semantics corresponding to the value of `failure`.

34       *Returns:* `true` if `*p` was equivalent to `*v`, `false` otherwise.

35       *Throws:* Nothing.

36       *Remarks:* Two `shared_ptr` objects are equivalent if they store the same pointer value and share ownership. The weak form may fail spuriously. See 31.8.2.

**D.20 Deprecated basic\_string capacity**

[depr.string.capacity]

- <sup>1</sup> The following member is declared in addition to those members specified in 21.3.3.5:

```
namespace std {
 template<class charT, class traits = char_traits<charT>,
 class Allocator = allocator<charT>>
 class basic_string {
 public:
 void reserve();
 };
}
```

`void reserve();`

- <sup>2</sup> *Effects:* After this call, `capacity()` has an unspecified value greater than or equal to `size()`.

[*Note 1:* This is a non-binding shrink to fit request. — *end note*]

**D.21 Deprecated standard code conversion facets**

[depr.locale.stdcvf]

**D.21.1 General**

[depr.locale.stdcvf.general]

- <sup>1</sup> The header `<codecvt>` provides code conversion facets for various character encodings.

**D.21.2 Header <codecvt> synopsis**

[depr.codecvt.syn]

```

namespace std {
 enum codecvt_mode {
 consume_header = 4,
 generate_header = 2,
 little_endian = 1
 };

 template<class Elem, unsigned long Maxcode = 0x10ffff, codecvt_mode Mode = (codecvt_mode)0>
 class codecvt_utf8 : public codecvt<Elem, char, mbstate_t> {
 public:
 explicit codecvt_utf8(size_t refs = 0);
 ~codecvt_utf8();
 };

 template<class Elem, unsigned long Maxcode = 0x10ffff, codecvt_mode Mode = (codecvt_mode)0>
 class codecvt_utf16 : public codecvt<Elem, char, mbstate_t> {
 public:
 explicit codecvt_utf16(size_t refs = 0);
 ~codecvt_utf16();
 };

 template<class Elem, unsigned long Maxcode = 0x10ffff, codecvt_mode Mode = (codecvt_mode)0>
 class codecvt_utf8_utf16 : public codecvt<Elem, char, mbstate_t> {
 public:
 explicit codecvt_utf8_utf16(size_t refs = 0);
 ~codecvt_utf8_utf16();
 };
}

```

**D.21.3 Requirements**

[depr.locale.stdcvt.req]

- <sup>1</sup> For each of the three code conversion facets `codecvt_utf8`, `codecvt_utf16`, and `codecvt_utf8_utf16`:
  - (1.1) — `Elem` is the wide-character type, such as `wchar_t`, `char16_t`, or `char32_t`.
  - (1.2) — `Maxcode` is the largest wide-character code that the facet will read or write without reporting a conversion error.
  - (1.3) — If (`Mode & consume_header`), the facet shall consume an initial header sequence, if present, when reading a multibyte sequence to determine the endianness of the subsequent multibyte sequence to be read.
  - (1.4) — If (`Mode & generate_header`), the facet shall generate an initial header sequence when writing a multibyte sequence to advertise the endianness of the subsequent multibyte sequence to be written.
  - (1.5) — If (`Mode & little_endian`), the facet shall generate a multibyte sequence in little-endian order, as opposed to the default big-endian order.
- 2 For the facet `codecvt_utf8`:
  - (2.1) — The facet shall convert between UTF-8 multibyte sequences and UCS-2 or UTF-32 (depending on the size of `Elem`) within the program.
  - (2.2) — Endianness shall not affect how multibyte sequences are read or written.
  - (2.3) — The multibyte sequences may be written as either a text or a binary file.
- 3 For the facet `codecvt_utf16`:
  - (3.1) — The facet shall convert between UTF-16 multibyte sequences and UCS-2 or UTF-32 (depending on the size of `Elem`) within the program.
  - (3.2) — Multibyte sequences shall be read or written according to the `Mode` flag, as set out above.
  - (3.3) — The multibyte sequences may be written only as a binary file. Attempting to write to a text file produces undefined behavior.

- <sup>4</sup> For the facet `codecvt_utf8_utf16`:
- (4.1) — The facet shall convert between UTF-8 multibyte sequences and UTF-16 (one or two 16-bit codes) within the program.
  - (4.2) — Endianness shall not affect how multibyte sequences are read or written.
  - (4.3) — The multibyte sequences may be written as either a text or a binary file.
- 5 The encoding forms UTF-8, UTF-16, and UTF-32 are specified in ISO/IEC 10646. The encoding form UCS-2 is specified in ISO/IEC 10646:2003.<sup>332</sup>

## D.22 Deprecated convenience conversion interfaces

[depr.conversions]

### D.22.1 General

[depr.conversions.general]

- <sup>1</sup> The header <locale> (28.2) has the following additions:

```
namespace std {
 template<class Codecvt, class Elem = wchar_t,
 class WideAlloc = allocator<Elem>,
 class ByteAlloc = allocator<char>>
 class wstring_convert;

 template<class Codecvt, class Elem = wchar_t,
 class Tr = char_traits<Elem>>
 class wbuffer_convert;
}
```

### D.22.2 Class template `wstring_convert`

[depr.conversions.string]

- <sup>1</sup> Class template `wstring_convert` performs conversions between a wide string and a byte string. It lets you specify a code conversion facet (like class template `codecvt`) to perform the conversions, without affecting any streams or locales.

[Example 1: If you want to use the code conversion facet `codecvt_utf8` to output to `cout` a UTF-8 multibyte sequence corresponding to a wide string, but you don't want to alter the locale for `cout`, you can write something like:

```
wstring_convert<std::codecvt_utf8<wchar_t>> myconv;
std::string mbstring = myconv.to_bytes(L"Hello\n");
std::cout << mbstring;
— end example]

namespace std {
 template<class Codecvt, class Elem = wchar_t,
 class WideAlloc = allocator<Elem>,
 class ByteAlloc = allocator<char>>
 class wstring_convert {
public:
 using byte_string = basic_string<char, char_traits<char>, ByteAlloc>;
 using wide_string = basic_string<Elem, char_traits<Elem>, WideAlloc>;
 using state_type = typename Codecvt::state_type;
 using int_type = typename wide_string::traits_type::int_type;

 wstring_convert() : wstring_convert(new Codecvt) {}
 explicit wstring_convert(Codecvt* pcvt);
 wstring_convert(Codecvt* pcvt, state_type state);
 explicit wstring_convert(const byte_string& byte_err,
 const wide_string& wide_err = wide_string());
 ~wstring_convert();

 wstring_convert(const wstring_convert&) = delete;
 wstring_convert& operator=(const wstring_convert&) = delete;

 wide_string from_bytes(char byte);
 wide_string from_bytes(const char* ptr);
 wide_string from_bytes(const byte_string& str);
 wide_string from_bytes(const char* first, const char* last);
```

<sup>332</sup> Cancelled and replaced by ISO/IEC 10646:2017.

```

 byte_string to_bytes(Elem wchar);
 byte_string to_bytes(const Elem* wptr);
 byte_string to_bytes(const wide_string& wstr);
 byte_string to_bytes(const Elem* first, const Elem* last);

 size_t converted() const noexcept;
 state_type state() const;

private:
 byte_string byte_err_string; // exposition only
 wide_string wide_err_string; // exposition only
 Codecvt* cvtptr; // exposition only
 state_type cvtstate; // exposition only
 size_t cvtcount; // exposition only
};

}

```

- <sup>2</sup> The class template describes an object that controls conversions between wide string objects of class `basic_string<Elem, char_traits<Elem>, WideAlloc>` and byte string objects of class `basic_string<char, char_traits<char>, ByteAlloc>`. The class template defines the types `wide_string` and `byte_string` as synonyms for these two types. Conversion between a sequence of `Elem` values (stored in a `wide_string` object) and multibyte sequences (stored in a `byte_string` object) is performed by an object of class `Codecv`, which meets the requirements of the standard code-conversion facet `codecvt<Elem, char, mbstate_t>`.

- <sup>3</sup> An object of this class template stores:

- (3.1) — `byte_err_string` — a byte string to display on errors
- (3.2) — `wide_err_string` — a wide string to display on errors
- (3.3) — `cvtptr` — a pointer to the allocated conversion object (which is freed when the `wstring_convert` object is destroyed)
- (3.4) — `cvtstate` — a conversion state object
- (3.5) — `cvtcount` — a conversion count

`using byte_string = basic_string<char, char_traits<char>, ByteAlloc>;`

- <sup>4</sup> The type shall be a synonym for `basic_string<char, char_traits<char>, ByteAlloc>`.

`size_t converted() const noexcept;`

- <sup>5</sup> *Returns:* `cvtcount`.

```

wide_string from_bytes(char byte);
wide_string from_bytes(const char* ptr);
wide_string from_bytes(const byte_string& str);
wide_string from_bytes(const char* first, const char* last);

```

- <sup>6</sup> *Effects:* The first member function shall convert the single-element sequence `byte` to a wide string. The second member function shall convert the null-terminated sequence beginning at `ptr` to a wide string. The third member function shall convert the sequence stored in `str` to a wide string. The fourth member function shall convert the sequence defined by the range `[first, last]` to a wide string.

- <sup>7</sup> In all cases:

- (7.1) — If the `cvtstate` object was not constructed with an explicit value, it shall be set to its default value (the initial conversion state) before the conversion begins. Otherwise it shall be left unchanged.
- (7.2) — The number of input elements successfully converted shall be stored in `cvtcount`.

- <sup>8</sup> *Returns:* If no conversion error occurs, the member function shall return the converted wide string. Otherwise, if the object was constructed with a wide-error string, the member function shall return the wide-error string. Otherwise, the member function throws an object of class `range_error`.

`using int_type = typename wide_string::traits_type::int_type;`

- <sup>9</sup> The type shall be a synonym for `wide_string::traits_type::int_type`.

```

state_type state() const;
10 Returns: cvtstate.

using state_type = typename Codecvt::state_type;
11 The type shall be a synonym for Codecvt::state_type.

byte_string to_bytes(Elem wchar);
byte_string to_bytes(const Elem* wptr);
byte_string to_bytes(const wide_string& wstr);
byte_string to_bytes(const Elem* first, const Elem* last);

12 Effects: The first member function shall convert the single-element sequence wchar to a byte string. The second member function shall convert the null-terminated sequence beginning at wptr to a byte string. The third member function shall convert the sequence stored in wstr to a byte string. The fourth member function shall convert the sequence defined by the range [first, last) to a byte string.

13 In all cases:
(13.1) — If the cvtstate object was not constructed with an explicit value, it shall be set to its default value (the initial conversion state) before the conversion begins. Otherwise it shall be left unchanged.
(13.2) — The number of input elements successfully converted shall be stored in cvtcount.

14 Returns: If no conversion error occurs, the member function shall return the converted byte string. Otherwise, if the object was constructed with a byte-error string, the member function shall return the byte-error string. Otherwise, the member function shall throw an object of class range_error.

using wide_string = basic_string<Elem, char_traits<Elem>, WideAlloc>;
15 The type shall be a synonym for basic_string<Elem, char_traits<Elem>, WideAlloc>.

explicit wstring_convert(Codecvt* pcvt);
wstring_convert(Codecvt* pcvt, state_type state);
explicit wstring_convert(const byte_string& byte_err,
 const wide_string& wide_err = wide_string());

16 Requires: For the first and second constructors, pcvt != nullptr.

17 Effects: The first constructor shall store pcvt in cvtptr and default values in cvtstate, byte_err_string, and wide_err_string. The second constructor shall store pcvt in cvtptr, state in cvtstate, and default values in byte_err_string and wide_err_string; moreover the stored state shall be retained between calls to from_bytes and to_bytes. The third constructor shall store new Codecvt in cvtptr, state_type() in cvtstate, byte_err in byte_err_string, and wide_err in wide_err_string.

~wstring_convert();

18 Effects: The destructor shall delete cvtptr.

```

**D.22.3 Class template wbuffer\_convert**

[depr.conversions.buffer]

- <sup>1</sup> Class template `wbuffer_convert` looks like a wide stream buffer, but performs all its I/O through an underlying byte stream buffer that you specify when you construct it. Like class template `wstring_convert`, it lets you specify a code conversion facet to perform the conversions, without affecting any streams or locales.

```

namespace std {
 template<class Codecvt, class Elem = wchar_t, class Tr = char_traits<Elem>>
 class wbuffer_convert : public basic_streambuf<Elem, Tr> {
 public:
 using state_type = typename Codecvt::state_type;

 wbuffer_convert() : wbuffer_convert(nullptr) {}
 explicit wbuffer_convert(streambuf* bytebuf,
 Codecvt* pcvt = new Codecvt,
 state_type state = state_type());
 ~wbuffer_convert();
}

```

```
wbuffer_convert(const wbuffer_convert&) = delete;
wbuffer_convert& operator=(const wbuffer_convert&) = delete;

streambuf* rdbuf() const;
streambuf* rdbuf(streambuf* bytebuf);

state_type state() const;

private:
 streambuf* bufptr; // exposition only
 Codecvt* cvtptr; // exposition only
 state_type cvtstate; // exposition only
};

}
```

- 2 The class template describes a stream buffer that controls the transmission of elements of type `Elem`, whose character traits are described by the class `Tr`, to and from a byte stream buffer of type `streambuf`. Conversion between a sequence of `Elem` values and multibyte sequences is performed by an object of class `Codecvt`, which shall meet the requirements of the standard code-conversion facet `codecvt<Elem, char, mbstate_t>`.

- 3 An object of this class template stores:

- (3.1) — `bufptr` — a pointer to its underlying byte stream buffer
- (3.2) — `cvtptr` — a pointer to the allocated conversion object (which is freed when the `wbuffer_convert` object is destroyed)
- (3.3) — `cvtstate` — a conversion state object

`state_type state() const;`

4 *Returns:* `cvtstate`.

`streambuf* rdbuf() const;`

5 *Returns:* `bufptr`.

`streambuf* rdbuf(streambuf* bytebuf);`

6 *Effects:* Stores `bytebuf` in `bufptr`.

7 *Returns:* The previous value of `bufptr`.

`using state_type = typename Codecvt::state_type;`

8 The type shall be a synonym for `Codecvt::state_type`.

`explicit wbuffer_convert(`

`streambuf* bytebuf,`  
`Codecvt* pcvt = new Codecvt,`  
`state_type state = state_type());`

9 *Requires:* `pcvt != nullptr`.

10 *Effects:* The constructor constructs a stream buffer object, initializes `bufptr` to `bytebuf`, initializes `cvtptr` to `pcvt`, and initializes `cvtstate` to `state`.

`~wbuffer_convert();`

11 *Effects:* The destructor shall delete `cvtptr`.

## D.23 Deprecated locale category facets

[depr.locale.category]

- 1 The `ctype` locale category includes the following facets as if they were specified in table [Table 102 of 28.3.1.2.1](#).

`codecvt<char16_t, char, mbstate_t>`  
`codecvt<char32_t, char, mbstate_t>`

- 2 The `ctype` locale category includes the following facets as if they were specified in table [Table 103 of 28.3.1.2.1](#).

`codecvt_byname<char16_t, char, mbstate_t>`  
`codecvt_byname<char32_t, char, mbstate_t>`

- <sup>3</sup> The following class template specializations are required in addition to those specified in 28.4.2.5. The specialization `codecvt<char16_t, char, mbstate_t>` converts between the UTF-16 and UTF-8 encoding forms, and the specialization `codecvt<char32_t, char, mbstate_t>` converts between the UTF-32 and UTF-8 encoding forms.

## D.24 Deprecated filesystem path factory functions

[depr.fs.path.factory]

```
template<class Source>
path u8path(const Source& source);
template<class InputIterator>
path u8path(InputIterator first, InputIterator last);
```

<sup>1</sup> *Requires:* The `source` and `[first, last)` sequences are UTF-8 encoded. The value type of `Source` and `InputIterator` is `char` or `char8_t`. `Source` meets the requirements specified in 29.11.6.4.

<sup>2</sup> *Returns:*

- (2.1) — If `value_type` is `char` and the current native narrow encoding (29.11.6.3.2) is UTF-8, return `path(source)` or `path(first, last)`; otherwise,
- (2.2) — if `value_type` is `wchar_t` and the native wide encoding is UTF-16, or if `value_type` is `char16_t` or `char32_t`, convert `source` or `[first, last)` to a temporary, `tmp`, of type `string_type` and return `path(tmp)`; otherwise,
- (2.3) — convert `source` or `[first, last)` to a temporary, `tmp`, of type `u32string` and return `path(tmp)`.

<sup>3</sup> *Remarks:* Argument format conversion (29.11.6.3.1) applies to the arguments for these functions. How Unicode encoding conversions are performed is unspecified.

<sup>4</sup> [Example 1: A string is to be read from a database that is encoded in UTF-8, and used to create a directory using the native encoding for filenames:

```
namespace fs = std::filesystem;
std::string utf8_string = read_utf8_data();
fs::create_directory(fs::u8path(utf8_string));
```

For POSIX-based operating systems with the native narrow encoding set to UTF-8, no encoding or type conversion occurs.

For POSIX-based operating systems with the native narrow encoding not set to UTF-8, a conversion to UTF-32 occurs, followed by a conversion to the current native narrow encoding. Some Unicode characters may have no native character set representation.

For Windows-based operating systems a conversion from UTF-8 to UTF-16 occurs. — *end example*]

[Note 1: The example above is representative of a historical use of `filesystem::u8path`. To indicate a UTF-8 encoding, passing a `std::u8string` to `path`'s constructor is preferred as it is consistent with `path`'s handling of other encodings. — *end note*]

## D.25 Deprecated atomic operations

[depr.atomics]

### D.25.1 General

[depr.atomics.general]

- <sup>1</sup> The header `<atomic>` (31.2) has the following additions.

```
namespace std {
 template<class T>
 void atomic_init(volatile atomic<T>*, typename atomic<T>::value_type) noexcept;
 template<class T>
 void atomic_init(atomic<T>*, typename atomic<T>::value_type) noexcept;

#define ATOMIC_VAR_INIT(value) see below

#define ATOMIC_FLAG_INIT see below
}
```

### D.25.2 Volatile access

[depr.atomics.volatile]

- <sup>1</sup> If an atomic specialization has one of the following overloads, then that overload participates in overload resolution even if `atomic<T>::is_always_lock_free` is `false`:

```
void store(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
T operator=(T desired) volatile noexcept;
```

```

T load(memory_order order = memory_order::seq_cst) const volatile noexcept;
operator T() const volatile noexcept;
T exchange(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,
 memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
 memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,
 memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
 memory_order order = memory_order::seq_cst) volatile noexcept;
T fetch_key(T operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T operator op=(T operand) volatile noexcept;
T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) volatile noexcept;

```

**D.25.3 Non-member functions**

[depr.atomics.nonmembers]

```

template<class T>
void atomic_init(volatile atomic<T>* object, typename atomic<T>::value_type desired) noexcept;
template<class T>
void atomic_init(atomic<T>* object, typename atomic<T>::value_type desired) noexcept;

```

<sup>1</sup> Effects: Equivalent to: `atomic_store_explicit(object, desired, memory_order::relaxed);`

**D.25.4 Operations on atomic types**

[depr.atomics.types.operations]

```
#define ATOMIC_VAR_INIT(value) see below
```

<sup>1</sup> The macro expands to a token sequence suitable for constant initialization of an atomic variable of static storage duration of a type that is initialization-compatible with `value`.

[*Note 1*: This operation possibly needs to initialize locks. — *end note*]

Concurrent access to the variable being initialized, even via an atomic operation, constitutes a data race.

[*Example 1*:

```
atomic<int> v = ATOMIC_VAR_INIT(5);
— end example]
```

**D.25.5 Flag type and operations**

[depr.atomics.flag]

```
#define ATOMIC_FLAG_INIT see below
```

<sup>1</sup> Remarks: The macro `ATOMIC_FLAG_INIT` is defined in such a way that it can be used to initialize an object of type `atomic_flag` to the clear state. The macro can be used in the form:

```
atomic_flag guard = ATOMIC_FLAG_INIT;
```

It is unspecified whether the macro can be used in other initialization contexts. For a complete static-duration object, that initialization shall be static.

ready, 1524, 1620

redefinition  
`typedef`, 168

`ref-qualifier`, 184, 1644

reference, 75  
assignment to, 146  
call by, 118  
forwarding, 438  
lvalue, 75  
null, 188  
rvalue, 75  
`sizeof`, 129  
reference collapsing, 188  
reference lifetime, 60  
reference-compatible, 207  
reference-related, 207  
references  
normative, 2  
`<regex>`, 510, 978, 1508, 1670  
`regex_iterator`  
end-of-sequence, 1533  
`regex_token_iterator`  
end-of-sequence, 1534  
`regex_traits`  
specializations, 1516

region  
declarative, 28, 34  
intervening, 35

`register`, 18

`register` storage class, 1663

regular expression, 1506–1539  
grammar, 1537  
matched, 1506  
requirements, 1507

regular expression traits, 1537  
`char_class_type`, 1507  
`isctype`, 1508  
`lookup_classname`, 1508, 1539  
`lookup_collatename`, 1508  
requirements, 1507, 1516  
`transform`, 1507, 1539  
`transform_primary`, 1508, 1539  
`translate`, 1507, 1539  
`translate_nocase`, 1507, 1538, 1539

reified object, *see* object, reified

`reinterpret_cast`, 18, *see* cast, reinterpret, 116, 412, 413, 1638

relational operator function, *see* operator function, relational

*relational-expression*, 141, 1640

relative path, *see* path, relative

*relative-path*, 1466

relaxed pointer safety, 67

release sequence, 81

remainder operator, *see* operator, remainder

remote time zone database, 1315

replacement  
macro, *see* macro, replacement

replacement field  
format string, 742

`replacement-list`, 461, 1652

representation  
object, 72

value, 72  
 represents the address, 76  
 requirement, 113  
     compound, 114  
     nested, 115  
     simple, 114  
     type, 114  
*requirement*, 113, 1638  
*requirement-body*, 113, 1638  
*requirement-parameter-list*, 113, 1638  
*requirement-seq*, 113, 1638  
 requirements, 478  
     container, 805, 828, 842, 843, 1523  
         not required for unordered associative containers, 827  
     iterator, 928  
     numeric type, 1161  
     random number distribution, 1180–1182  
     random number engine, 1178–1179  
     regular expression traits, 1507, 1516  
     seed sequence, 1176–1177  
     sequence, 1523  
         uniform random bit generator, 1177  
         unordered associative container, 828  
**requires**, 18, 113–115, 360, 1638, 1650  
**requires-clause**, 360, 1650  
     trailing, 183  
**requires-expression**, 113, 1638  
 rescanning and replacement, *see* macro, rescanning and replacement  
 reserved identifier, 17  
 reset, 648  
**reset**  
     random number distribution requirement, 1181  
 resolution, *see* overloading, resolution  
 restriction, 500, 501, 503, 1686  
     address of bit-field, 283  
     anonymous union, 286  
     bit-field, 283  
     constructor, 269  
     destructor, 276  
     **extern**, 166  
     local class, 287  
     operator overloading, 353  
     overloading, 353  
     pointer to bit-field, 283  
     reference, 188  
     **static**, 166  
     static member local class, 287  
     union, 285  
 result  
     glvalue, 92  
     prvalue, 92  
 result object, 92  
**result\_type**  
     entity characterization based on, 1173  
     random number distribution requirement, 1181  
         seed sequence requirement, 1177  
 rethrow, *see* exception handling, rethrow  
**return**, 18, 159, 160, 1641  
     and handler, 451  
     and try block, 451  
     constructor and, 160  
     reference and, 207  
**return statement**, *see* return  
 return type, 192  
     covariant, 292  
     overloading and, 324  
**return-type-requirement**, 114, 1638  
 reversible container, *see* container, reversible rewritten candidate, 331  
 right shift operator, *see* operator, right shift  
**root-directory**, 1466  
**root-name**, 1466  
 rounding, 97  
 rvalue, 91  
     lvalue conversion to, *see* conversion, lvalue-to-rvalue, 1675  
 rvalue reference, 187

**S**

**s-char**, 23, 1636  
**s-char-sequence**, 23, 1635  
 safely-derived pointer, *see* pointer, safely-derived integer representation, 67  
 sample, 1114  
 sampling distributions, 1205–1210  
 satisfy, *see* constraint, satisfaction  
 scalar type, *see* type, scalar  
 scope, 1, 28, 34–40, 164  
     anonymous union at namespace, 286  
     block, 37  
     class, 38  
     declarations and, 34–36  
     destructor and exit from, 159  
     enumeration, 39

*iteration-statement*, 156  
 macro definition, *see* macro, scope of definition  
 name lookup and, 40–53  
 namespace, 37  
 overloading and, 326  
 potential, 34  
*selection-statement*, 154  
 template parameter, 39  
 scope name hiding and, 40  
 scope resolution operator, *see* operator, scope resolution  
 scoped enumeration, *see* enumeration, scoped

`<scoped_allocator>`, 509, 680, 1670  
 secondary comparison operator, 321  
**seed**  
 random number engine requirement, 1178  
**seed sequence**, 1176  
 requirements, 1176–1177  
**selected destructor**, *see* destructor, selected  
**selection-statement**, 154, 1641  
**semantics**  
 class member, 119  
`<semaphore>`, 511, 1612, 1660  
**sentinel**, 929  
 separate compilation, *see* compilation, separate  
 separate translation, *see* compilation, separate  
**sequence constructor**  
 seed sequence requirement, 1177  
**sequenced after**, 79  
**sequenced before**, 79  
**sequencing operator**, *see* operator, comma  
`<set>`, 509, 510, 867, 868, 978  
`<setjmp.h>`, 550, 1685  
**shared lock**, 1592  
**shared mutex types**, 1592  
**shared state**, *see* future, shared state  
**shared timed mutex type**, 1593  
`<shared_mutex>`, 511, 1587, 1667  
**shift operator**  
 left, *see* operator, left shift  
 right, *see* operator, right shift  
**shift-expression**, 139, 1639  
**short**, 18, 175, 1643  
**typedef and**, 165  
**shuffle\_order\_engine**  
 generation algorithm, 1188  
 state, 1188  
 textual representation, 1189  
 transition algorithm, 1188  
**side effects**, 10, 69, 79–81, 83, 84, 154, 311, 317,  
 468, 503  
 visible, 83  
**sign**, 23, 1635  
**signal**, 80  
**signal-safe**  
`_Exit`, 520  
`abort`, 520  
 evaluation, *see* evaluation, signal-safe  
**forward**, 582  
**initializer\_list** functions, 536  
**memcpy**, 801  
**memmove**, 801  
**move**, 582  
**move\_if\_noexcept**, 582  
**numeric\_limits** members, 513  
**quick\_exit**, 521  
**signal**, 551  
 type traits, 707  
`<signal.h>`, 550, 1685  
**signature**, 7  
**signed**, 18, 175, 1643  
**typedef and**, 165  
**signed integer representation**  
 ones' complement, 127  
 two's complement, 74, 222, 733, 1551, 1559  
**signed integer type**, 73  
**signed-integer-class type**, *see* type,  
 signed-integer-class  
**signed-integer-like**, 936  
**significand**, 23  
**similar types**, 96  
**simple assignment operator function**, *see* operator  
 function, simple assignment  
**simple call wrapper**, 687  
*simple-capture*, 107, 1637  
*simple-declaration*, 163, 1642  
*simple-escape-sequence*, 21, 1635  
*simple-requirement*, 114, 1638

# Index of grammar productions

The first bold page number for each entry is the page in the general text where the grammar production is defined. The second bold page number is the corresponding page in the Grammar summary ([Annex A](#)). Other page numbers refer to pages where the grammar production is mentioned in the general text.

# Index of implementation-defined behavior

The entries in this index are rough descriptions; exact specifications are at the indicated page in the general text.

- #pragma, 473
- additional execution policies supported by parallel algorithms, 737, 1048
- additional `file_type` enumerators for file systems supporting additional types of file, 1479
- additional formats for `time_get::do_get_date`, 1364
- additional supported forms of preprocessing directive, 461
- algorithms for producing the standard random number distributions, 1193
- alignment, 67
  - alignment additional values, 68
  - alignment of bit-fields within a class object, 282
  - allocation of bit-fields within a class object, 282
  - any use of an invalid pointer other than to perform indirection or deallocate, 64
- argument values to construct `ios_base::failure`, 1392
- assignability of placeholder objects, 700
- behavior of iostream classes when
  - `traits::pos_type` is not `streampos` or when `traits::off_type` is not `streamoff`, 1376
- behavior of non-standard attributes, 240
- behavior of `strstreambuf::setbuf`, 1692
- bits in a byte, 57
- choice of larger or smaller value of *floating-point-literal*, 23
- concatenation of some types of *string-literals*, 24
- conversions between pointers and integers, 124
- converting characters from source character set to execution character set, 12
- converting function pointer to object pointer and vice versa, 124
- default configuration of a pool, 678
- default `next_buffer_size` for a `monotonic_buffer_resource`, 679
- default number of buckets in `unordered_map`, 891
- default number of buckets in `unordered_multimap`, 897
- default number of buckets in `unordered_multiset`, 906
- default number of buckets in `unordered_set`, 901, 902
- defining `main` in freestanding environment, 86
- definition and meaning of `__STDC__`, 475, 1680
- definition and meaning of `__STDC_VERSION__`, 475
- definition of NULL, 507, 1681
- derived type for `typeid`, 121
- diagnostic message, 4
- dynamic initialization of static inline variables before `main`, 88
- dynamic initialization of static variables before `main`, 87, 88
- dynamic initialization of thread-local variables before entry, 88
- effect of calling associated Laguerre polynomials with  $n \geq 128$  or  $m \geq 128$ , 1239
- effect of calling associated Legendre polynomials with  $l \geq 128$ , 1239
- effect of calling `basic_filebuf::setbuf` with nonzero arguments, 1446
- effect of calling `basic_filebuf::sync` when a get area exists, 1447
- effect of calling `basic_streambuf::setbuf` with nonzero arguments, 1433
- effect of calling cylindrical Bessel functions of the first kind with  $nu \geq 128$ , 1240
- effect of calling cylindrical Neumann functions with  $nu \geq 128$ , 1241
- effect of calling Hermite polynomials with  $n \geq 128$ , 1242
- effect of calling `ios_base::sync_with_stdio` after any input or output operation on standard streams, 1386
- effect of calling irregular modified cylindrical Bessel functions with  $nu \geq 128$ , 1240
- effect of calling Laguerre polynomials with  $n \geq 128$ , 1242
- effect of calling Legendre polynomials with  $l \geq 128$ , 1242
- effect of calling regular modified cylindrical Bessel functions with  $nu \geq 128$ , 1240
- effect of calling spherical associated Legendre functions with  $l \geq 128$ , 1243
- effect of calling spherical Bessel functions with  $n \geq 128$ , 1243
- effect of calling spherical Neumann functions with  $n \geq 128$ , 1243
- effect of `filesystem::copy`, 1491
- effect on C locale of calling `locale::global`, 1341
- encoding of universal character name not in execution character set, 22
- `error_category` for errors originating outside the operating system, 504

exception type when `random_device` constructor fails, 1191  
 exception type when  
`random_device::operator()` fails, 1191  
 exception type when `shared_ptr` constructor fails, 660  
 exceptions thrown by standard library functions that have a potentially-throwing exception specification, 504  
 execution character set and execution wide-character set, 14  
 exit status, 521  
 extended signed integer types, 73  
 file type of the file argument of  
`filesystem::status`, 1502  
 formatted character sequence generated by  
`time_put::do_put` in C locale, 1367  
 forward progress guarantees for implicit threads of parallel algorithms (if not defined for `thread`), 1047  
 growth factor for `monotonic_buffer_resource`, 680  
 headers for freestanding implementation, 486  
 how `random_device::operator()` generates values, 1191  
 how the set of importable headers is determined, 251  
 interactive device, 10  
 interpretation of the path character sequence with format `path::auto_format`, 1479  
 largest supported value to configure the largest allocation satisfied directly by a pool, 677  
 largest supported value to configure the maximum number of blocks to replenish a pool, 677  
 linkage of `main`, 86  
 linkage of names from C standard library, 487  
 linkage of objects between C++ and other languages, 239  
 locale names, 1340  
 lvalue-to-rvalue conversion of an invalid pointer value, 95  
 manner of search for included source file, 465  
 mapping from name to catalog when calling  
`messages::do_open`, 1373  
 mapping from physical source file characters to basic source character set, 13, 1662  
 mapping header name to header or external source file, 16  
 mapping of pointer to integer, 124  
 mapping physical source file characters to basic source character set, 12  
 mapping to message when calling  
`messages::do_get`, 1373  
 maximum depth of recursive template instantiations, 422  
 maximum size of an allocated object, 131, 527  
 meaning of ', \, /\*, or // in a *q-char-sequence* or an *h-char-sequence*, 16  
 meaning of `asm` declaration, 236  
 meaning of attribute declaration, 164  
 meaning of dot-dot in *root-directory*, 1467  
 negative value of *character-literal* in preprocessor, 464  
 nesting limit for `#include` directives, 465  
 NTCTS in `basic_ostream<charT, traits>& operator<<(nullptr_t)`, 1420  
 number of placeholders for bind expressions, 685, 700  
 number of threads in a program under a freestanding implementation, 81  
 numeric values of *character-literals* in `#if` directives, 463  
 operating system on which implementation depends, 1459  
 parameters to `main`, 86  
 passing argument of class type through ellipsis, 118  
 physical source file characters, 12  
 presence and meaning of `native_handle_type` and `native_handle`, 1572  
 range defined for *character-literals*, 22  
 rank of extended signed integer type, 78  
 required alignment for `atomic_ref` type's operations, 1547, 1550–1552  
 required libraries for freestanding implementation, 9  
 resource limits on a message catalog, 1373  
 result of `filesystem::file_size`, 1496  
 result of inexact floating-point conversion, 97  
 return value of `bad_alloc::what`, 527  
 return value of `bad_any_cast::what`, 623  
 return value of `bad_array_new_length::what`, 527  
 return value of `bad_cast::what`, 530  
 return value of `bad_exception::what`, 533  
 return value of `bad_function_call::what`, 701  
 return value of `bad_optional_access::what`, 608  
 return value of `bad_typeid::what`, 530  
 return value of `bad_variant_access::what`, 622  
 return value of `bad_weak_ptr::what`, 657  
 return value of `char_traits<char16_t>::eof`, 763  
 return value of `char_traits<char32_t>::eof`, 763  
 return value of `exception::what`, 533  
 return value of `type_info::name()`, 529  
 search locations for "" header, 465

search locations for <> header, 464  
 semantics of an access through a volatile glvalue, 174  
 semantics of linkage specification on templates, 361  
 semantics of linkage specifiers, 237  
 semantics of non-standard escape sequences, 22  
 semantics of parallel algorithms invoked with implementation-defined execution policies, 1048  
 semantics of `token` parameter and default token value used by `random_device` constructors, 1191  
 sequence of places searched for a header, 464  
 set of character types that iostreams templates can be instantiated for, 1339, 1376  
 signedness of `char`, 175  
`sizeof` applied to fundamental types other than `char`, `signed char`, and `unsigned char`, 129  
 stack unwinding before call to `std::terminate`, 455, 459  
 startup and termination in freestanding environment, 86  
 strict total order over pointer values, 5  
 string resulting from `--func--`, 214  
 support for always lock-free integral atomic types in freestanding environments, 486  
 support for extended alignments, 68  
 support for *module-import-declarations* with non-C++ language linkage, 237  
 supported multibyte character encoding rules, 762  
 supported *root-names* in addition to any operating system dependent *root-names*, 1466, 1467  
 text of `--DATE--` when date of translation is not available, 473  
 text of `--TIME--` when time of translation is not available, 473  
 threads and program points at which deferred dynamic initialization is performed, 87, 88  
 type aliases `atomic_signed_lock_free` and `atomic_unsigned_lock_free` in freestanding environments, 486  
 type of a directory-like file, 1486, 1488  
 type of `array::const_iterator`, 842  
 type of `array::iterator`, 842  
 type of `basic_string::const_iterator`, 768  
 type of `basic_string::iterator`, 768  
 type of `basic_string_view::const_iterator`, 792, 794  
 type of `default_random_engine`, 1190  
 type of `deque::const_iterator`, 845  
 type of `deque::iterator`, 845  
 type of `forward_list::const_iterator`, 849  
 type of `forward_list::iterator`, 849  
 type of `list::const_iterator`, 855  
 type of `list::iterator`, 855  
 type of `map::const_iterator`, 869  
 type of `map::iterator`, 869  
 type of `multimap::const_iterator`, 875  
 type of `multimap::iterator`, 875  
 type of `multiset::const_iterator`, 882  
 type of `multiset::iterator`, 882  
 type of `ptrdiff_t`, 139, 508  
 type of `regex_constants::error_type`, 1514  
 type of `regex_constants::match_flag_type`, 1513  
 type of `set::const_iterator`, 878  
 type of `set::iterator`, 878  
 type of `size_t`, 508  
 type of `span::iterator`, 915, 920  
 type of `syntax_option_type`, 1512  
 type of `unordered_map::const_iterator`, 887  
 type of `unordered_map::const_local_iterator`, 887  
 type of `unordered_map::iterator`, 887  
 type of `unordered_map::local_iterator`, 887  
 type of `unordered_multimap::const_iterator`, 893  
 type of `unordered_multimap::const_local_iterator`, 894  
 type of `unordered_multimap::iterator`, 893  
 type of `unordered_multimap::local_iterator`, 894  
 type of `unordered_multiset::const_iterator`, 903  
 type of `unordered_multiset::const_local_iterator`, 903  
 type of `unordered_multiset::iterator`, 903  
 type of `unordered_multiset::local_iterator`, 903  
 type of `unordered_set::const_iterator`, 898  
 type of `unordered_set::const_local_iterator`, 898  
 type of `unordered_set::iterator`, 898  
 type of `unordered_set::local_iterator`, 898  
 type of `vector::const_iterator`, 860  
 type of `vector::iterator`, 860  
 type of `vector<bool>::const_iterator`, 865  
 type of `vector<bool>::iterator`, 865  
 underlying type for enumeration, 222  
 underlying type of `bool`, 75  
 underlying type of `char`, 74  
 underlying type of `wchar_t`, 74  
 unit suffix when `Period::type` is `micro`, 1267  
 value for `least_max_value` default template argument of `counting_semaphore`, 1612  
 value of bit-field that cannot represent assigned value, 146  
 incremented value, 120

initializer, 201  
 value of *character-literal* outside range of corresponding type, 22  
 value of `ctype<char>::table_size`, 1346  
 value of *has-attribute-expression* for non-standard attributes, 463  
 value of multicharacter literal, 21  
 value of `pow(0,0)`, 1169  
 value of result of inexact integer to floating-point conversion, 97  
 value of wide-character literal containing multiple characters, 21  
 value of wide-character literal with single c-char that is not in execution wide-character set, 21  
 value representation of floating-point types, 75  
 value representation of pointer types, 76  
 values of a trivially copyable type, 72  
 values of various `ATOMIC_..._LOCK_FREE` macros, 1546  
 whether `<cfenv>` functions can be used to manage floating-point status, 1162  
 whether a given `atomic` type's operations are always lock free, 1554, 1555, 1558, 1560, 1561, 1564, 1566  
 whether a given `atomic_ref` type's operations are always lock free, 1547, 1550–1552  
 whether an implementation has relaxed or strict pointer safety, 67  
 whether functions from Annex K of the C standard library are declared when C++ headers are included, 486  
 whether `get_pointer_safety` returns `pointer_safety::relaxed` or `pointer_safety::preferred` if the implementation has relaxed pointer safety, 642  
 whether locale object is global or per-thread, 1338  
 whether pragma `FENV_ACCESS` is supported, 1162  
 whether `rand` may introduce a data race, 1210  
 whether sequence pointers are copied by `basic_filebuf` move constructor, 1443  
 whether sequence pointers are copied by `basic_stringbuf` move constructor, 1430  
 whether sequence pointers are initialized to null pointers, 1429  
 whether source file inclusion of importable header is replaced with `import` directive, 465  
 whether source of translation units must be available to locate template definitions, 13  
 whether stack is unwound before calling the function `std::terminate` when a `noexcept` specification is violated, 459  
 whether the implementation is hosted or freestanding, 486

whether the lifetime of a parameter ends when the callee returns or at the end of the enclosing full-expression, 117  
 whether the sources for module units and header units on which the current translation unit has an interface dependency are required to be available during translation, 13  
 whether the thread that executes `main` and the threads created by `std::thread` or `std::jthread` provide concurrent forward progress guarantees, 85  
 whether `time_get::do_get_year` accepts two-digit year numbers, 1365  
 whether values are rounded or truncated to the required precision when converting between `time_t` values and `time_point` objects, 1271  
 which functions in the C++ standard library may be recursively reentered, 502  
 which non-standard-layout objects containing no data are considered empty, 59  
 which scalar types have unique object representations, 722  
 width of integral type, 74

# British Standards Institution (BSI)

BSI is the national body responsible for preparing British Standards and other standards-related publications, information and services.

BSI is incorporated by Royal Charter. British Standards and other standardization products are published by BSI Standards Limited.

## About us

We bring together business, industry, government, consumers, innovators and others to shape their combined experience and expertise into standards-based solutions.

The knowledge embodied in our standards has been carefully assembled in a dependable format and refined through our open consultation process. Organizations of all sizes and across all sectors choose standards to help them achieve their goals.

## Information on standards

We can provide you with the knowledge that your organization needs to succeed. Find out more about British Standards by visiting our website at [bsigroup.com/standards](http://bsigroup.com/standards) or contacting our Customer Services team or Knowledge Centre.

## Buying standards

You can buy and download PDF versions of BSI publications, including British and adopted European and international standards, through our website at [bsigroup.com/shop](http://bsigroup.com/shop), where hard copies can also be purchased.

If you need international and foreign standards from other Standards Development Organizations, hard copies can be ordered from our Customer Services team.

## Copyright in BSI publications

All the content in BSI publications, including British Standards, is the property of and copyrighted by BSI or some person or entity that owns copyright in the information used (such as the international standardization bodies) and has formally licensed such information to BSI for commercial publication and use.

Save for the provisions below, you may not transfer, share or disseminate any portion of the standard to any other person. You may not adapt, distribute, commercially exploit or publicly display the standard or any portion thereof in any manner whatsoever without BSI's prior written consent.

## Storing and using standards

Standards purchased in soft copy format:

- A British Standard purchased in soft copy format is licensed to a sole named user for personal or internal company use only.
- The standard may be stored on more than one device provided that it is accessible by the sole named user only and that only one copy is accessed at any one time.
- A single paper copy may be printed for personal or internal company use only.

Standards purchased in hard copy format:

- A British Standard purchased in hard copy format is for personal or internal company use only.
- It may not be further reproduced – in any format – to create an additional copy. This includes scanning of the document.

If you need more than one copy of the document, or if you wish to share the document on an internal network, you can save money by choosing a subscription product (see 'Subscriptions').

## Reproducing extracts

For permission to reproduce content from BSI publications contact the BSI Copyright and Licensing team.

## Subscriptions

Our range of subscription services are designed to make using standards easier for you. For further information on our subscription products go to [bsigroup.com/subscriptions](http://bsigroup.com/subscriptions).

With **British Standards Online (BSOL)** you'll have instant access to over 55,000 British and adopted European and international standards from your desktop. It's available 24/7 and is refreshed daily so you'll always be up to date.

You can keep in touch with standards developments and receive substantial discounts on the purchase price of standards, both in single copy and subscription format, by becoming a **BSI Subscribing Member**.

**PLUS** is an updating service exclusive to BSI Subscribing Members. You will automatically receive the latest hard copy of your standards when they're revised or replaced.

To find out more about becoming a BSI Subscribing Member and the benefits of membership, please visit [bsigroup.com/shop](http://bsigroup.com/shop).

With a **Multi-User Network Licence (MUNL)** you are able to host standards publications on your intranet. Licences can cover as few or as many users as you wish. With updates supplied as soon as they're available, you can be sure your documentation is current. For further information, email [cservices@bsigroup.com](mailto:cservices@bsigroup.com).

## Rewrites

Our British Standards and other publications are updated by amendment or revision.

We continually improve the quality of our products and services to benefit your business. If you find an inaccuracy or ambiguity within a British Standard or other BSI publication please inform the Knowledge Centre.
